We have our first view of the herd in a meadow by the side of the Medway, where four lots from Mr. Fowler's sale are undergoing quarantine. The white nine-year-old Seraph, of the Sweetheart tribe, retains much of the massiveness which enabled her to win three cups in her day. Near her are the two roans Nymphalin and Pipalce, own sisters, by Bull's Run, from Sylphide; and the big, deep-fleshed heifer Knightley's Grand Duchess, by Fourth Grand Duke, from Nymphalin, still nineteen days short of two years, and a proof of what "Bates upon Fawley" can effect. She was a 210-guinea purchase, and Mr. Leney and Mr. Sheldon fought in their best style. The wind nipped so shrewdly that an adjournment was made to a long shed, and the biddings gained spirit by the move.

A few years ago Mr. Leney merely bought calves to make into steers, with which he won three silver cups at the Ashford Fat Show and two at the Maidstone. In 1862 he desired something better, and bought sixteen of Mr. Golding's, of Hunton, in a lot. Clifford by Fourth Duke of Thorndale, from a cow of Mr. Fawkes's blood, bought at Mr. Hales' sale was used for three seasons, and was then replaced by Mr. Harrison's Waterloo Duke. With him came May Queen and Lady Blanche of the Anna by Pilot and Blanchett of the Sockburn Sall tribe; and, at Mr. Langston's sale he could not resist Columbine of the Chaff tribe and two or three others. At Mr. Tanqueray's, he still followed the Fourth Duke of Thorndale blood, and bought Second Kentish Gwynne, Charming by Mameluke, and her four daughters by Fourth Duke of Thorndale, her grand daughter and old Sweetbriar, also of the Chamer tribe. The May Morning of '67, in Kent, did not lack some of his cheerful, sonorous bids; and, Second Lord Oxford 200 gs. ("the lame bull" of the Willis's Rooms day), and Ninth Grand Duchess, a doubtful breeder, were added to his store. The cow was condemned to salts and starvation at Starve Crow, and Second Lord Oxford caught her at last, and she calved Grand Duke of Kent. Maiden hair of the Rosy tribe (80 gs.), was another Betts' purchase, and on the following day Mr. Leney returned from Mr. M'Intosh's with Fawley Third (190 gs.), a daughter of

Coquelecot; which, although only four years old, has already bred three calves. Columbia of the Walnut tribe, at the Marquis of Exeter's, and Knightley (100 gs.), a Charmer bull, followed. The Columbia purchase turned out so well, that her dam and sister recently came to bear her company from Mr. Sheldon's. Princess Alice of the Cold Cream sort (180 gs.) fell to Mr. Leney's lot after some very decisive biddings at the Royal Home Farm sale in '67, and then the party adjourned to a Windsor hotel, to discuss the lots of "Sheldon of Geneva, Illinois." It was here that the "short, sharp, and decisive" style came out in its highest force, and Seventh Duchess of Geneva (700 gs.); Fourth Maid of Oxford (800 gs.), a doubtful breeder; and Seventh Maid of Oxford (360 gs.)—all departed to Orpines. Well might Mr. Leney's opponents say: "*You travel so fast, we could hardly keep round.*" Two Sweethearts at Lord Dartmouth's, Garland at Mr. Gilbert Wood's, Wild Duchess (105 gs.) at Lord Penrhyn's, Ruby (60 gs.) and Rarity (71 gs.) of the Charmer sort, at Mr. Chaydon's; Maryland (90 gs.) of the Rosy tribe (a pure Knightley), and Spangle (160 gs.), of the Sweetheart tribe, &c., have been added since then. At present the herd contains six Duchesses, five Oxfords, fourteen Charmers, eight Sweethearts, seven Rosys, three Walnuts, two Gwynnes, two Wild Eyes, two Lilies, three Chaffs, four Lucy Longs, two Surmises, one Cold Cream, and six Garlands.

In May last the herd was 120 strong, and Mr. Leney tried the experiment of a draft sale. The stock sold did not average more than eleven months, and the 19 males (including the 500-guinea bull) averaged 256 9s., and the 23 females 270 5s. 3d. There were no Duchess or Oxford females in the sale, and Messrs. Foster and Moore took the three Charmers to Cumberland at 200 guineas, 235 guineas, and 175 guineas. The 500-guinea Grand Duke of Kent, by Lord Oxford 2nd, from Ninth Grand Duchess, was not delivered, owing to illness, and Lady Oxford (100 guineas), from Columbia, departed for America. Bates and Knightley are the tribes on which Mr. Leney takes his stand, with a strong feeling for the Jennies. His plan is to breed from them early, and let them suckle their own calves. He never prepares them for Shows; but he has taken Smithfield Club honours with his steers, to wit, a second with one not of his own breeding, in 1865, and a first the next year with one of his own Cliffords.

The sale-meadow is a very pretty one, close to the house, and half-flanked by shrubberies. You look right up the vale of the Medway, and within a mile or two are the woods of Mereworth Castle, where Lord Falmouth has his residence for the greater part of the year. His lordship's breeding paddocks are there, with Queen Bertha, Hurricane, and Flax as their leading matrons; and Kingscraft, Atalantis, Gertrude, and Guy Dayrell have been no unworthy scions of the '67 foal-crop.

Most of Mr. Leney's large fields are furnished with sheds facing the south, for the sake of isolation in case of any disease. They are all built of wood, and roofed with felt, so as to keep up an equable temperature in summer and winter. Those in the park, near Wateringbury Place, shelter a large number of hoppers during the season; they witness strange gambols by day, and stranger when the wild revellers "dance by the light of the moon." The Park is one of the principal cow meadows, and we found there quite a parliament of ladies, headed by Chorus 1st by Fourth Duke of Thorndale, of the Charmer sort, a thick roan. There is a good deal of gaiety about the American Maid, or Fourth Maid of Oxford by Imperial Oxford, and her loin is worthy of note, while 7th Maid of Oxford is remarkably nice in her under line, but a little slack behind. Jenny 8th

by Clifford has much of the look of old Moss Rose, and a very nice roan, if she was a little more filled up behind the shoulder. There is no more promising milker in the herd than the sweet-headed Jenny 12th, but she made a *faux pas*, and had a calf at 21 months. There, too, are Columbine, a fine red, of the Chaff sort, Columbia, and Miss Knightley, own sisters, by Sir Charles, May Queen, with the old fashioned head, and dating back through Anna by Pilot and Fawley 8th to Fawley by Little John. Grand Duchess 9th, a 210-guinea purchase at Mr. Betts' is all hillocks now, and one horn curls round almost into her eye; and old white Maryland, one of the last that Sir Charles Knightley bred, is also among the has-beens.

Miss Thornton, an old white, by Welcome Guest (18497), from the Clifton pastures, is the only "bit of Booth" on the ground. The two-year Rarity 2nd, a heifer of great substance and gaiety, and Garland 5th, from old Sabrina, a red, with a very neat breast, are near her, and so is Twin Duchess 4th, with a head to model from. The massive Seventh Duchess of Geneva, a grand massive white with that remarkably prominent Bates nostril, is the grand centre-piece of all, and Mr. Leney tells how, although sorely tempted, he refused 1,500 gs. for her and her heifer-calf by Fifteenth Grand Duke on his return from Mr. Bowly's sale. Oxford Fawley is small, and with a very nice head; but Sweetbriar has got a game leg in the tenth year of her age, and has sadly failed in consequence. Lord Oxford 2nd knocked her over, but she bore him a good bull-calf notwithstanding.

Duchess of Oxford, from Maid of Oxford 7th, is a gay little occupant of one of the calf partitions in the shed, and her dam is one of the seven selected as an illustration for the last volume of the Herd Book. At the other end we found Grand Duke of Kent growing into a lusty well-fleshed bull, and quite recovered, except in his sprawly mode of walking, from his recent illness. The shed is rather rich in calves, a good white heifer by Fifteenth Grand Duke from Seventh Duchess of Geneva, and his half-sister from Spangle; two bull-calves, one a Sir Charles Knightley from Dew of the Valley, with most beautiful bone; and the other by Lord Oxford 2nd from Maiden-hair. Mr. Leney draws attention to Seventh Maid of Oxford's calf by Fifteenth Grand Duke, which has fallen a white, while its predecessor by the same bull was a red.

Princess Alice, a fine rich-haired calf, going back to Cold Cream, is an appropriate preface to Lord Oxford 2nd, a big white bull, with a grand head and forehead, but gouty in one leg. He is by Fourth Duke of Thorndale out of Oxford 18th, and had a reserve on him of 200 gs. at Mr. Betts'. It was thought that he would never get up after Mr. Leney paid for him; but still he is quite able to bull the young heifers. His length is very good, and his hair remarkably silky, and there are several good roans among his heifers. Knightley by Barleycorn from Columbine is a pure Charmer bull of a peculiar stamp, such as we never met with before. He is thick, level, and deep-fleshed, with a peculiar crest and short, shaggy head, which, with rather tucked-up horns, somewhat detracts from his gaiety. His son—the two-year-old Sir Charles Knightley—has a much nicer head, and just one cross of Fourth Duke of Thorndale in his Charmer escutcheon; but he has not got his growth yet, although he has a lusty promise. Fifteenth Grand Duke by Fourth Grand Duke out of Twelfth Grand Duchess by Imperial Oxford has no trace left of his lameness; but he is rather small, with capital thick thighs, and a nice eye and crest. He was bred by Mr. Bolden; then Mr. Tanqueray bought him; and he came into Mr. Leney's hands with some Charmers and Gwynnes in cattle-plague time. He is a deep-fleshed one, and likely to get them with good steaks

and boiled beef as well—that delight of “La Belle France.” Mr. Leney has thus Oxford, Charmer, and Duchess blood at hand for a cross; and so far this year he has had eight heifer and three bull calves.

Third Countess of Wateringbury by Lord Oxford 2nd from Chorus 2nd and 2nd Countess of Wetherby by Lord Oxford greeted us as we left the yard for the park, which lies about half a mile away. We found there Jenny 9th and 12th, both by Clifford; the long, low, and thick Sultana, which goes back like the Jennies to Matilda by Highflyer; Sharpe's Pauline; Ninth Grand Duchess, in-calf from July; Columbine, with fine depth of rib, bred by Sir Charles Knightley, and one of his last; and Chorus 2nd, big and broad across the back. Something brings back the conversation to Fourth Maid of Oxford, and we learn that she was a perfect martyr. Still 300 gs. worth of American stock was not to become mere butcher's meat without a struggle. She sometimes walked fifteen miles a day, and finally worked six hours a day in a pugmill, preparing clay for bricks, which combined processes took nearly 30 stone off her.

We adjourn to the meadow near the east houses, where many of the older cows are grazing. One of them, Second Kentish Gwynne, a thick, white, and rather

cushioned behind, once shared the honours of penal servitude with the Fourth Maid. There, too, is the shadow of old Sabrina, and with her that deep good cow Sultana 2nd. So are Ruby, the dam of Rarity, Maiden-hair, and Chorus 2nd, which figures with her calf Countess of Wateringbury in the last volume of the Herd Book, Spangle, of the Sweetheart tribe, and Columbine, a low thick cow of the Chaff; and Fawaley 3rd (190 gs.) soon, makes you ask her name and belongings. The eleven-year-old Jenny has a true Yorkshire milking character about her, and we are not surprised to hear that she is good for six to seven gallons per day in the height of the grass. “The grand tour” ends in a yard hard by Mr. Leney's own brewery, where we find Princess Alice, a gay and pretty heifer with Cold Cream and British Prince in her veins. Old red Charming is there too, with that length and quality which first charmed the ring when she was sold at Mr. Adkins' sale in '50, and induced Mr. Leney to buy her in a lot of eight from Mr. Tanqueray's; and with Seventh Maid of Oxford, another picture elect, we closed our note-book in Kent, and bid good-bye to the most spirited Shorthorn buyer that it ever possessed.

H. H. D.

THE YIELD IN 1869.

These advices were presented to the *Mark Lane Express*. The analysis, or condensed statement of the results, will be found in the annexed table, which, so far as the returns will admit, gives an exact view in a few lines of the average yield of the different cereal crops. We say, so far as the returns will admit, for we still have to complain that so many of our correspondents continue to comprise the classification of a large portion of their returns under the indefinite term “under average,” which may mean a trifling or a large deficiency. We believe, in fact, that in numerous cases those words do represent a much larger per-centage than their use would imply; but which it would not become us to act upon. We have placed this matter in the foreground of our table in the hope that our corresponding friends may take it into consideration before another season comes round for sending us their reports. The following is a summary of the results of the late harvest of cereals:

Classification.	Malt.	Barley.	Oats.	Beans.	Peas.
Failure and three-fourths under average	1	...	3	32	42
Two-thirds under average	10	46
Half	3	10	7	30	...
One-third	27	31	18	19	65
One-fourth	25	16	4	11	28
One-fifth	3	20	...	1	1
One-sixth	5	1	8
Under average	231	199	210	158	120
Average	183	185	209	167	98
Over average	27	27	22	18	9
One-sixth over average
One-fifth	2	...
One-fourth	3	4	1
One-third	9	...
One-half	3	1	...
Two-thirds
Totals	511	489	491	452	408

The season of 1868-9 has been a very different one from that of 1867-8 in many important respects. The

autumnal sowing was effected under favourable circumstances, but the spring was unpropitious, and a wet March was against the wheat crop, as well as every other cereal. The summer, too, was ungenial, and two or three frosty nights at the latter end of June, when the wheat was on the bloom, inflicted considerable injury on that crop. The atmospheric changes continued unfavourable until July, when the weather cleared, and we had several weeks of ripening weather, which lasted until a large proportion of the grain crops were matured and housed in excellent condition. But the mischief was past cure, and the different cereal crops came light to hand, promising a very different result, for the wheat especially, from that of the previous harvest. It is true the wheat crop of 1868 was an exceptional one in the extraordinary yield, both in weight and measure and the unusually early period of its ripening. So low, too, were the stocks reduced, as well on the Continent as in the United Kingdom, that, early as the new crop came upon the market, it was at once made available for consumption, which was from a month to six weeks earlier than usual. This extended the period for which it was required to supply the wants of the country to an equal extent, and when the recent harvest commenced there certainly was not more than an average stock of old wheat, if so much, in the hands of the growers.

The farmers generally were disappointed in the result of the wheat crop. There was no deficiency in the number of plants, the ground being well covered. But as soon as the harvest commenced the weight of the sheaves, in a large majority of cases, told too plainly of a deficiency in the yield; and our analysis of the returns sent us explains the average result. As compared with the crop of 1868 the difference is enormous. On a reference to the tables of last year, we find that out of 528 returns there are only 18 under average, whilst of the remaining 515, 381 were above it. On the contrary, this year the proportions are 295 under and 216 an average and above it, the number of these latter being only 82.

With such a deficiency as these figures indicate the growers had reason to expect a corresponding price for their grain, and here is the most serious disappointment they have had to meet. If we compare the state of the markets in those two seasons we shall find a most extraordinary discrepancy. With the largest crop ever harvested that of 1868, the year closed with a six weeks' average of 50s. 7d. With a crop deficient to the extent of at least one-fifth, and probably one-fourth, the average struck at the same period of the year is only 44s. 7d., and prices have ever since suffered a further decline. This state of things is owing to the large arrivals during the last three months of the year and up to the present time, with a knowledge that a fleet comprising several hundreds of grain-laden vessels are afloat, destined for the United Kingdom, as the only market open to them at present.

The barley crop is rather less unfavourable than that of 1868, but is still far from being a good one. We show 277 returns under, and 212 an average and above it. Last year there were 332 under, and only 171 an average and over. In both seasons there has been a large proportion of the produce thin and of a dark colour unfit for malting purposes. The deficiency has been supplied by importations to a certain extent, but still more by the use of sugar, which is now largely employed by the public brewers, to enable them to meet the increased and increasing demand for malt liquors. But for the large importations of foreign barley, a considerable proportion of which was fit for malting, the price of this grain would have ruled very high. As it is, with a foreign supply last year of about seven million hundred-weights, the last six weeks' average is only 85s. 11d. per qr., against 48s. 10d. at the same period of last year—the highest price being 39s. per qr. We think the crop cannot be taken at more than three-fourths of an average—probably three-fifths, the quality being much inferior to that of last year, owing to the sudden setting in of the

dry weather when the plant was not forward enough to withstand it.

The result of the oat crop has much surprised us, having previously from many quarters had favourable accounts. There are 250 under, and 241 averages, or above, against 387 under and 108 average and over. Some of the returns speak of a very thin quality, but generally both quality and condition good. The price, however, of this grain is quite out of proportion with the deficient crop. The imports are large, and have driven the quotations for the six weeks' average at the end of January down to 20s. 10d. per qr., against 27s. 7d. at the same period last year, the highest price for potato oats being quoted at 23s. The yield of this grain cannot be estimated at more than three-fifths of an average; and we fear some of our correspondents will think even this estimate too high.

With respect to the bean crop, we remark that in numerous cases the returns include two results, one for winter the other for spring sown. The former are invariably good, and the latter as invariably bad, and these of course being taken separately, increase the number of entries in our summary. As they appear, there are 261 under average, and 191 average and over it; but amongst the former there are 32 entire failures, and 71 ranging from one-fifth to two-thirds deficiency, and we fear we shall estimate the crop too high at three-fifths of an average.

The pea crop is, if anything, worse than the bean, there being 300 under average, and 108 averages and over. Amongst the former there are 42 cases of failure, 46 from one-half to two-thirds, 65 one-third, and 26 one-fourth deficiency. This crop, chiefly the late-sown, was greatly injured by the fly; the early-sown, like the beans, being generally good. Taking all into account, we cannot estimate the crop at more than half an average one. Owing to the large importations, the price of both beans and peas is low, considering the smallness of the returns.

THE REPEAL OF THE MALT TAX AND THE USE OF SEMI-MALTED GRAIN.

After the reading of Mr. ANDREW JOHNSTON'S paper at the Essex Chamber of Agriculture, the following discussion took place:

Mr. SEAMAN said so long as the farmer was prohibited using the produce of his own farm as he pleased, so long there would be adulteration of manure and cake. It must be clear to any one that there would be a great demand for manures and feeding stuffs when the food of animals was really dearer than the food of man, the best linseed cake being £13 10s. per ton, and wheat and barley only £8 per ton. And he believed the greatest culprits in this matter were the Houses of Parliament, who prevented the farmer using his own produce as he liked. They had been told by Mr. Lawes, who undertook to conduct experiments for the Board of Trade in 1865, that malted grain was superior to the grain from which it was produced for feeding animals upon, and it might be recollected during the discussions in Parliament, in which Mr. Du Cane, late member for North Essex, took a prominent part, that he (Mr. Seaman) threw out a challenge of £500 that he could produce more mutton in a given time by using malt as he should direct (semi-malted grain) than Mr. Lawes could produce from double the quantity of raw material with double the number of sheep. Mr. Du Cane asked the Government to accept this challenge, but it did not suit their purpose. Mr. Lawes, however, used the grain as for making beer, instead of using it before it went to the kiln, which was the proper stage at which it ought to be used for feeding animals. He had a sample (which he forwarded to the chairman) at the stage at which it should be used, but unfortunately the excise were

just as strict in regard to it at that stage as at the full stage of malting. He was in a position to prove that 14lbs. of that grain per week, with half a peck of turnips daily, and straw chaff, would produce 3lbs. of mutton, at a cost of 1s. per stone (and he would leave them to guess what was the value of 3lbs. of mutton), while the best linseed cake, which cost £13 10s. per ton, for 12 weeks, would not produce more than 2lbs. of mutton per week, so that actually they could get more mutton by using a shillingworth of this semi-malted grain than they could by using eighteenthpennyworth of linseed cake. He also spoke of this semi-malted grain as a very healthy article of diet (and being a veterinary surgeon he should be an authority).

Colonel BRISE (the Chairman): Excuse me, but how many hours has this grain been steeped?

Mr. SEAMAN replied that it had been steeped 48 hours, but it took 10 days to arrive at that stage. He urged also that this prohibition by the excise caused adulteration of manures, for if farmers were allowed to use grown maize, barley, or wheat, it was well known they would have most excellent manure. He saw a gentleman in that room who in 1865, when legs of mutton were worth 1s. per pound, was producing 3lbs. of mutton upon each sheep per week with nothing but grown wheat and barley, and he would undertake that cattle, however poor, if they were healthy, could be fed up in eight weeks upon his principle of using semi-malted grain, if they could have enough to eat, and there was not the fear in using this that there was in using other articles. It was both exceed-

ingly nutritious and perfectly harmless, and that was what they wanted.

Mr. JOHNSTON : It is illegal in the present state of the law to make use of this article?

Mr. SEAMAN : Yes, the exciseman would prevent you making use of it.

Mr. JOHNSTON : Are you sure there is not an exciseman present? If there is he will be down upon us.

Mr. CLAYDEN said that Mr. Cornell was feeding 500 sheep upon this article during the recent great scarcity of food, but when it became known he was prevented using it further. If the law could be altered in this respect it would greatly prevent the adulteration of feeding stuffs.

It was here mentioned that Mr. Seaman had written to the Board of Inland Revenue asking for permission for farmers to prepare this grain, but they replied that they were of opinion that a compliance would involve a risk to the revenue which would be greater than they would be justified in incurring.

Mr. WADE suggested that if Chambers of Agriculture would direct their attention to securing such an alteration of the law as would enable farmers to make and use this semi-malted grain they would be likely to succeed, if they would stop there, but when the effort was associated with the repeal of the malt-tax they would agitate at great disadvantage; and it was impolitic to defer such a wholesome result until it could be effected by the repeal of the malt-tax. If the former case was put before parliament it would obviously so just that permission would be given. The malt-tax was based upon financial considerations with reference to the manufacture of spirits and beer, but had no reference whatever to the feeding of animals.

The CHAIRMAN : A farmer is permitted to use this if he mixes it with cake, is he not?

Mr. CLAYDEN said the chairman was doubtless alluding to "Gladstone's mixture."

Mr. CHARLES SPENCER said there was never a better time than the present to agitate for the repeal of the malt-tax, but as to Mr. Wade's suggestion of getting permission to use this sprouted grain, if they got that farmers would soon find their barrels filled with beer (No, no, and laughter). He spoke both as a maltster and a farmer, and they would find this an insuperable objection. But it was very easily got rid of if they would not tax malt at all, and tax the beer instead.

Mr. BARNARD said they must all feel greatly indebted for the able and practical paper which Mr. Johnston had read, and they ought to come to some practical resolution upon the subject. He proposed a resolution, which he said was on the suggestion of Mr. Johnston, asking the meeting to recommend that there should be an official person appointed to make analyses of food and manures for the members of this chamber.

Mr. JOHNSTON said he was a little taken by surprise by Mr. Barnard's resolution, because it was not the one he suggested. What he suggested was that a branch or committee of the Essex Agricultural Society should be asked to give their attention to this subject.

Mr. BARNARD said his only desire was that something should be done, either by this Chamber or the Essex Agricultural Society, to protect their members against adulteration in cattle food and manures.

Mr. JOHNSTON : The resolution suggested was something after this form—"That in the opinion of this meeting the formation of county associations, or committees of the existing county agricultural societies, for the purpose of testing by analysis the manures and cake purchased by their members, is the best method of preventing adulteration."

Mr. BARNARD said he was prepared to move this resolution.

Mr. JOHNSTON : I will second it for the purpose of discussion.

Mr. CLAYDEN pointed out the advantage to farmers of becoming members of the Royal Agricultural Society. Those who joined would be well repaid, because Professor Voelcker analysed for that society, and always did his work fearlessly and well. The greatest guarantee farmers in that neighbourhood had always felt was in purchasing their cake and manure from good and respectable man. Mr. Johnston had said that was not at all times a guarantee, but they had found it so. He believed all the manures sold by substantial men in this locality were thoroughly honest. Professor Voelcker, indeed, had returned some of it as being worth £1 10s. more than it was sold at. They could not go into any agricultural market,

however, without seeing a large number of vendors of manure, a good deal of which was not what it should be. If gentlemen joined the Royal Agricultural Society they had at once the opportunity of having it tested. Mr. Seaman had alluded to the germination of their own grain. That would be a most practical and good thing, for there was no article which would be of greater use in making beef. The farmer could prepare this kind of food without expense upon his own premises, and he (Mr. Clayden) had observed that the alteration made in cattle after taking it for only two or three weeks was most extraordinary. It was good alike for horses and sheep. It had been used on farms in this neighbourhood to a very great extent.

Mr. SEAMAN : As much as twenty sacks a week has been used on many farms.

Mr. CLAYDEN : When corn is cheap, of course it is an exceedingly valuable adjunct. I only trust some means will be devised by which farmers may be enabled to use this kind of food. Nothing could more effectually obviate the adulteration of feeding stuffs.

The CHAIRMAN said it seemed to him that the whole pith of the resolution was, after all, that the remedy was in their own hands. Men of experience had very little to fear in making their purchases of cake and manure, while those who were not sufficiently experienced, if they were members of the Royal Agricultural Society, had their remedy in being able to submit articles for analysis to Professor Voelcker. For the benefit of those gentlemen who were not members of the Royal Agricultural Society it was suggested generally, by this resolution, that some steps should be taken by county associations to form a committee, which should protect them in like manner. He did not think Mr. Johnston recommended any further legislation on this question, and he quite agreed with him on that point. They had a great deal of interesting discussion in the House of Commons last session on the Adulteration of Seeds' Bill. When that bill first came into the House, he thought very little of it. He thought then, as he did now, that the remedy was in the hands of the farmers. However, he altered his opinion after hearing the evidence of the committee. He believed that evidence was of great advantage to the agricultural community generally, and he was not at all sure if a committee of the House of Commons should be appointed to inquire into the subject of manures but that they would hear many things to astonish them, and that would very likely be of great benefit to them. But what surprised him most was the source from which the Adulteration of Seeds' Bill was promoted. The promoters of the bill turned out to be seedsmen themselves, and he (Colonel Brise) certainly had this opinion, that if the manure manufacturers were as conscience-stricken as the seedsmen showed themselves to be, and if they thought it was high time to open their hearts and tell the agriculturists all the tricks and frauds they had been practising upon them, and wished to have any legislation upon the subject, the House of Commons would be happy to get through any bill they desired to pass; otherwise, he confessed he thought legislation had no business to interfere.

The resolution was then submitted to the meeting, and carried.

Mr. CLAYDEN said he felt he was in order in moving another resolution—namely, "That in the opinion of this meeting it is very important farmers should be allowed to germinate their grain for feeding their own animals, as they feel it would in a great degree obviate the adulteration of feeding stuffs, and at the same time produce meat at a less cost to the consumer; and that efforts should be made by the Chamber of Agriculture to get an alteration of the law in that respect." It was perhaps not generally known throughout the kingdom, or even throughout the county of Essex, as it was in that neighbourhood, that germinated grain was an exceedingly valuable and healthy article of food for animals. The article was at their own doors, and while, unlike some feeding stuffs, it was not dangerous to animal life, it would be much cheaper and produce more meat.

Mr. PORTWAX said he would be happy to second the resolution which Mr. Clayden had moved. It was a most important thing that farmers should be allowed to use germinated grain. He agreed with the previous speaker that it did not affect the animal in any injurious way, whereas if they gave a little overdose of oilcake or a few beans too many great harm was fre-

quently produced. As an illustration of the value of germinated grain he might mention that on one occasion he had a horse which was said to be rotten and good for nothing, and which was wasting away very rapidly. The animal was attended by two or three veterinary surgeons, and at last, after they had given the case up, he (Mr. Portway) said: "Now I'll try my remedy," which was to give the horse steeped barley, like that shown to the meeting by Mr. Seaman, and that horse within three months was as fat and as well as a mole, and within five months he was offered £100 for it.

Mr. WADE wished to suggest a means which he thought would tend to carry out the object which Mr. Clayden and other gentlemen had in view. If Mr. Clayden would only agitate this question with half the energy that he advocated the repeal of the malt-tax, and only let that question alone for a little time, his efforts would doubtless soon be crowned with success.

Mr. BARNARD said legislation was wanted which would permit the farmer to use barley in the condition referred to with impunity.

Mr. JOHNSTON: In practice the difficulties either are, or are said to be, insuperable. I think Government officials are very apt to make insuperable difficulties when there are no insuperable difficulties at all; but the difficulty in this case is said to be that of drawing a distinction between steeping barley and making malt. If it were not for that I think no Government or member of the House of Commons or the House of Lords, or anybody else, could for a moment resist such an obviously just demand on the part of the agriculturist as that he should be allowed to use the product of his own farm in his own way, and it is the very ease and facility with which such a demand, on the first blush of the thing, ought to be granted that makes me think there must be serious difficulties in the way of granting it without in some measure laying the Excise open to fraud in the matter of malt. I am rather disposed to think that instead of drawing back, as Mr. Wade suggests, from agitating for the repeal of the malt tax, the desirability of having this germinated barley ought to unite us in a more earnest endeavour to get rid of that law. But some things are necessary before we should have any chance of this. In the first place we must be able to point out to Government some way out of the difficulty

which is always thrown in our teeth about that unfortunate six millions of money which the malt tax brings in. We must make up our minds tolerably clearly how we are to supply that. I believe that reductions of the malt tax short of total abolition will be of very little use, but I think we ought to demand that a portion of every surplus—and the Government seems to be producing surpluses as fast as a hen can lay eggs—should be devoted to reducing that duty, not as an end of the matter, but with the view ultimately of getting rid of it altogether. And then I would observe we must have more unanimity and strength in the agitation. I have been struck with the fact that although I am a malt tax repealer, and although I made the subject a prominent point in my address to the electors of South Essex, I have not had a single word said to me by any farmer or anybody else commending me for the side I take, or showing any interest in the matter whatever. I don't mean to say they do not feel it, but, apparently, they don't feel it sufficiently to make it worth their while to communicate with their representative. I have had objections raised by people to my putting the malt tax in my address, and I was told by one of my own party that it would lose me a great many votes, but I have never had any commendation or credit for putting it in. Then another important matter is, by all means not to make this a party question. I was very much afraid that it was so regarded in some quarters, when the chairman of an anti-malt tax meeting in my district, speaking in reply to a vote of thanks, said he was always glad to take part in that or any other good Tory movement. Nothing could be worse than to treat the question in that way, because if you shake the malt tax in the face of one side and declare that it is rather a good move on the other, it is rather like shaking a red flag in the face of a bull, and they don't like it. I should like to see this question kept wholly free from party politics, and therefore I made it a prominent point in my address, because I suppose the supporters of the abolition of the malt tax are rather more on the other side of the house. I am glad to think no party considerations have weighed with me, and I hope they will weigh with nobody else when the time comes for making a strong pull, a long pull, and a pull altogether.

The resolution was carried unanimously.

THE MIDLAND FARMERS' CLUB.

The sixth annual general meeting of the members was held at Nock's Hotel, Birmingham, the president, Mr. G. A. May, in the chair.

In the absence of Mr. J. B. Lythall, through illness, the report was read by his brother, Mr. A. LYTHALL. It stated that, owing to the diminished source of income and accumulated deficiencies in past years, the accounts showed an adverse balance of £48 3s. 6d. Nine new members had joined during the year, and the Club had lost by death and resignations 22, leaving the number now on the books 214. The committee regretted to state that the subscriptions now in arrear amounted to the large sum of £71 ls.

Mr. T. B. WRIGHT, in moving the adoption of the report, regretted that the financial statement was not more satisfactory; but he hoped the arrears of subscriptions would soon be paid up. When the Club was commenced, he anticipated that it would number many more members than it now did. The proposal for its establishment was made by Mr. Alderman Wiggins (a gentleman who took much interest in agricultural matters), and was supported by Mr. R. C. Chawner and others, the impression being that the commercial gentlemen of the town would join in large numbers, since many of them were interested, from early association, in farming pursuits, whilst all were concerned in them from a common ground of interest; but he was sorry to say that this had not been the case to the extent which was expected. The promoters of the Club thought—and the result had shown the impression to be correct—that a farmers' club, the members of which did not come exclusively from any one locality, would stand in a very independent and useful position. He was sure that all who had joined the Club had received money's worth for the subscriptions in the valuable papers which had been read, and

the discussions which had taken place on various important subjects.

Mr. J. H. LEE seconded the motion, which was passed.

The PRESIDENT said he quite agreed with what Mr. Wright had said in regard to the club being made the vehicle for conveying much valuable information, not only to farmers, but to all classes. Although it had been said by many that they conducted their business in an ultra fashion, and that things were sometimes said which ought not to be said, he did not coincide in that opinion. It might be that there had on one or two occasions been some free expressions, as for instance on the subject of the game laws; but, a man bitten by game was like a man bitten by a dog—he was rather apt to go mad. But he was bound to say that, in regard to the general tenor of their discussions, every question which he had heard introduced before the club had been treated in a manner at once both intelligent and proper. His own term of office having expired, he begged to thank the members of the club for the kindness which had been shown to him, and to nominate Mr. William Brewster as his successor.

Mr. R. H. MASEY seconded the motion, and said he felt grateful to those gentlemen who first promoted the club, but his gratitude would be much increased if he saw a renewal of their exertions and a repetition of their attendance. He did not like a man to put his hand to the plough and then to look back; and he thought those gentlemen who had allowed their names to be placed upon the list of committees should at any rate occasionally put in an appearance. It was the commercial men who founded the club, and he hoped they would attend its meetings in augmented numbers.

Mr. J. BOWEN JONES, of Shrewsbury, read a paper "On the Relative Merits of the Four Course and other Systems of

Cropping." He said, the object of a system of cropping, as they were all aware, was to prevent that exhaustion of the soil which would arise from the elimination of its particular elements of nutrition by the growth of plants; and therefore in considering the best rotation of cropping to pursue on any sort of land, the point to arrive at was how to get the largest amount of remuneration in return, and at the same time to prevent the soil declining in its productive power. Another object must also be to increase the fertility of the soil by the judicious use of manures, and by good cultivation, &c., through which means they would insure the growth of larger crops. The nature of the soil, the climate, and situation principally, with a variety of minor circumstances, must guide them in the attempt to carry out these considerations; and although in a review of the subject it would be seen that the progress of modern times had in some degree abolished their original impotence when opposed to nature, they would still find that the quality of the soil and climate would continue to give a distinctive character to crops grown on different soils and in different districts. He proposed to divide soils into three different sections, and to consider their exigencies, as far as possible, in separate order: 1st, Heavy; 2nd, Medium, 3rd, Light Soils. The first section would include clays and very strong loams; the second, loams of a mixed character; and the third sandy loams to light sands. First, heavy soils. The strong soils were originally farmed on the principle of taking all out by continuous cropping of white and leguminous crops, and then reuscutating by means of the bare fallow. Experience showed that this description of land possessed the power of growing wheat and beans; and practice proved that, when it was foul and exhausted, fallowing, in addition to cleaning the land, increased its fertility also. Both practice and the researches of science showed that cultivation of a thorough character would develop the stores of nutritious elementary substances (contained in them in forms of combination before valueless) into active fertilisers, as well as render them accessible to the crop from the improved mechanical condition of the land. Taking these truths into consideration, how far could they improve on the old system, and in what way? The quality of the soil was such that it did not require the rest of an alternate green crop, as provided by the four-course system; the too frequent repetition of the root crop proved too expensive, from the difficulty of preparing such soil for its successful growth; and there was a practical difficulty in removing the crop sufficiently early to prevent damage to the land; while its consumption upon the land by sheep would, in its mechanical action, be an obstacle to the preparation of a good seed bed for the succeeding crop. Neither did the soil itself require chemically recouping in this way for the growth of an extra crop; so that the four-course system was not one which must always be strictly adhered to, or which must necessarily be regularly carried out on this class of soils, especially where only the ordinary appliances used in agriculture a few years back have not been improved upon. A very important consideration for the British husbandman was the production of beef and mutton as a profitable method of farming, and it remained therefore a question as to what extent the growth of root crops should be pursued in the cultivation of this description of land. This question forced itself on their minds more especially at the present time, from the relatively high price of meat and low price of cereals. Foreign supplies of grain would always prevent high prices remaining of long duration in this country, and we should have no chance against regions blessed with sunny climates, and fertile land, with, in some instances, a low rate of wages, and nominal rents, together with extending facilities for delivering their produce, except by increasing our own yield by improved culture. There could be no doubt that the manufacture of beef and mutton, combined with the production of better grain crops, was the object which must be steadily kept in view for the successful cultivation of land in this country. In the general system of cropping clay lands, although the nature of the crops was varied to suit the circumstances of different localities, the bare fallow was the key to the rotation. After considering the relative merits of the various modifications of the four-course system, Mr. Jones went on to say that difficult as clay soils were to contend with, the fallows might be thrown in more frequently, and used very advantageously in the growth of mangolds and

swedes for winter consumption, or vetches, rape, or cabbage for summer and autumn food, which would enable them to form a medium for the production of meat, through the feeding of which the straw would be again returned to the land in an enriched state, and the necessity for heavy outlay in artificial manures obviated. If, however, they could get rid of the bare fallow, with the year's loss of rent and charges, and heavy working expenses, they must take care to remember the principles on which its action had proved of so much value, and introduce them in any other rotation that might be adopted to its exclusion. Thus, by wide sowing of green crops, considerable cultivation could be effected as well as during the growth of roots. Good horse and hand hoeing, frequently carried out, would also make up in some degree for its loss. It was not easy to lay down on this, of all other classes of land, a fixed rotation as the best to pursue. On such land the success of operations of preparation depended, more than on any other soils, on the weather, and despatch might often make the difference of a crop. His argument was intended to encourage the growth of roots, and by shortening very long rotations, and introducing other green crops, enable the land to carry more stock. Such a course as the following would fulfil these conditions, and would be a step in the direction we must ultimately arrive at when our appliances were more generally perfect:

HALF.
Mangolds and turnips.
Oats and wheat.
Beans.
Wheat.
Seeds.
Wheat.

HALF.
Fallow, vetches, rape, and other green crops.
Wheat.
Barley.
Seeds.
Seeds.
Wheat.

They here got a proportion of green crops and cereals (including beans) of five to seven, and although the larger portion of them would be summer feed, there was a certain provision from the root crops and clover hay to carry the same quantity of stock in the winter as in the summer. Among the soils comprised in the second division of his subject would be found our most fertile arable land, the capabilities of which were, as a rule, sufficiently great to grow more than an alternate green and straw crop, or two corn crops in four years, as adopted in the four-course system. An extension to the five-course would offer several points worthy of consideration. A longer interval would take place between the repetition of red clover, which, although thriving on such soils, was apt to fail if too frequently grown, except on the very richest land. The acquisition of a good root of red clover ensured a succeeding heavy crop of wheat. An extra corn crop might be taken without overtaking the natural powers of the soil by a rotation running thus: Roots, wheat, barley, clover, wheat. The root crop should consist of a portion of mangolds and the rest swedes. The mangolds might be followed by autumn wheat, the remainder of the root ground being sown in the spring, and a portion with Talavera, which would be well adapted to such a soil. Barley would next be most suitably grown, and laid down with seeds, which the following year would form a good preparation for wheat, the last crop of the rotation. The continuation of the clover root a second year, and turning this into a six-course rotation, was a system often adopted, and had the advantage of being the means of increasing the stock-keeping powers of such land. This, however, was done at the expense of the extra grain crop that the land could well bear, and did not materially add to the winter stock of food. At times like the present, or should the land show signs of want of rest, it might be readily substituted without altering the rotation. He thought they would all agree that on the stronger loams they ought to endeavour, if possible, to precede barley with wheat; in doing which, and adhering to the four-course system strictly, they were compelled to carry out the rotation as follows: turnips, wheat, barley, clover. They lost the benefit of the clover preparation for wheat by following this arrangement, and got two green and two white crops together. He saw no particular advantage to be derived from following clover with roots, as (alike though there was no reason why mangolds or swedes should not thrive well if taken at this period) the clovers could not be used much later in the season than if they had been succeeded with autumn wheat, as it would be necessary to plough them early in order to decay the turf, so

so to provide a good seed-bed for the turnips in time for sowing in the spring. If this order was observed (with high farming), he saw no objection to a portion of the ley ground being occupied with early winter oats, followed by a green crop, after being harvested, the consumption of which would permit the subsequent sowing of wheat, and keep the course intact. With regard to the light soils, they were by nature more unfitted for the growth of crops from the absence of those ingredients of which the structure of plants was partially formed. The prosperous cultivation of this land was more dependent upon the production of beef and mutton than was that of any other description; and if they had found it incumbent upon them to keep this object in view to meet the demands of an increasing population in farming stronger soils, they would find it was absolutely requisite on the lighter ones. This class of land possessed the advantage of having soil the mechanical texture of which admitted of easy cultivation, which, by its porosity, was always dry and workable, and which, together with its warmth of temperature, admitted of the rapid growth of plants and their early maturity. Its drawbacks were its sterility, its tendency to grow weeds quickly, and its capacity for disposing of manure, which, when not received by the growing plant, was soon dissipated in the subsoil. What, then, were the essentials necessary to develop its natural advantages and combat its defects; and how far did the four-course rotation of cropping accomplish them? By providing an alternate green crop, fed on, with a white one, any considerable diminution in the condition of the land was prevented, although the two off-going crops of grain would not be fully returned by the consumption of the straw and green crops. One of the most complete courses of cropping which had come under his (Mr. Jones's) personal observation was pursued on a farm of a variable but moderately light nature in part, in Hampshire, and consisted of the following modification of the four-course system: wheat, followed by trifolium incarnatum, sown in the autumn on one-fourth of the

stubbles, vetches sown about the same time on another fourth, and the other half left for mangolds, early swedes, or early roots. The trifolium was followed in June by swedes on the portions first cleared, and by common turnips, rape, or transplanted cabbages on the later removed portions. The whole of the fallow crops were succeeded by barley, one-half of which was seeded by red clover; the other part being laid down with a mixture of white Dutch and trefoil, with a small proportion of rye grass. The results were very satisfactory, the crops all being exceedingly heavy. It was difficult to determine by an array of figures how far one method of cultivation exceeded another in cost. Perhaps it would be equally unsatisfactory; for he must confess he agreed to some extent with the late Sir Robert Peel, that "nothing is more fallacious than figures." The value of the return of produce must be the standard by which the merits of any system must be measured; and, provided the cost of raising a crop did not equal its value, it mattered not adding to the expenses of cultivation to effect this purpose. He looked forward in good hopes and with faith to the more regular employment of steam power as one of the great means for improving the general cultivation of the country, both from the greater despatch as well as from the superiority of culture that would be attained by its application. His conviction was that the basis of good farming in the ordinary run of arable land must be to alternate, as far as it was practicable, restorative green crops with cereals (which exhaust more particularly the nitrogenous substances of the soil), which was the principle of the four-course system; but he thought the time had come when the strict adherence to a hard and fast rule should be forgotten as a thing of the past, and it was in many an instance a cause of loss to the occupier, without being a gain to the owner, and consequently it was an act of folly under these circumstances to pursue it.

After a brief discussion a vote of thanks was given to Mr. Jones for his paper.

THE FORMULA—FORAGE, CATTLE, CEREALS.

[TRANSLATED FROM THE JOURNAL D'AGRICULTURE PRATIQUE.]

It may be said that the doctrine of chemical manures, as presented by M. Georges Ville, involves two perfectly distinct operations: first, a work of destruction seeking to show the present insufficiency of farming by farm dung; and secondly, a work of instruction, which consists of raising upon the ruins of the ancient system of husbandry, the new one of chemical manures. "This is," they say, in speaking of the doctrine propounded, "the agricultural system that ought to prevail; for according to M. Ville, it is necessary to aid intensive culture by a permanent importation of manure to regulate the share performed by cattle in the advantages procured by it, and to do away with the necessity of producing dung at whatever price; in other words, according to the formula, pastures, cattle, cereals, the doctrine of chemical manures is opposed to the new formula—the employment of manures, cereals, cattle. On this principle the cattle is no longer the starting point for agriculture; it is its apex. If it yields a profit they develop it; if it involves a loss they reduce it, and even suppress it to the extent that they have, in an extreme case, only the teams and a few animals to consume the products of a sale, more or less, impossible.

Evidently M. Georges Ville is no longer so peremptory as in the first period of his enlightenment; but it is enough that in his first attempts he had opened up high questions of rural economy without having previously reflected upon the bearing of his formulas; that for a very long time, if not for ever, his opponents will make no account of his recent concessions. Is he, on the other hand, sincerely converted? That is, at least, doubtful. A chemist above all things, the Professor of the Museum has studied rural economy only when it was too late, after having extolled a system, after being placed in that state of mind in which, in spite of themselves, men possessed of a predominant, imperious, and absolute idea, regard as secondary and inopportune all that opposes their principle con-

ception. When, therefore, M. Ville says forages, cattle, and dung, even, in a good sense, we are on our guard and deem it a purely oratorical artifice, an insinuation, a means of engaging the attention, in order to lead it back presently to a ground on which chemical manure will shine alone with the greatest brilliancy.

To the extreme M. Ville has neglected nothing in order to disparage agriculture with dung, that is, by pasturage and cattle. As a chemist, he has demonstrated that dung is a compound mass, of which four-fifths of its weight are inert matter. An improvised economist, an accountable inspector of figures, a reader of agricultural works, led by temperament and occupation to mount the pedestal of reformers, disdaining, as such, half measures and middle situations, he has striven to demonstrate that dung is dearer than is generally supposed, and even so dear that the farmer marches to his ruin by engaging to the utmost in the production of cattle.

This part of the work of M. Ville is what I call his work of demolition, and it is what I propose to take part by part. It is perhaps known that I look upon the promoter of the doctrine of chemical manures as a man who has originated a grand and useful agricultural agitation. In presence of this service rendered, and knowing besides how much a cause gains by being presented without passion or party feeling, I shall endeavour not to forget that, at this moment, I am addressing at once very devoted partisans and as determined opponents of the doctrine of M. Ville, and that, consequently, I must not reckon on the favourable attention of either except on the essential condition of not stumbling for a single instant before the impartial truth.

I insist upon this fundamental point, that it is going too far to advise placing a head of cattle or its equivalent upon every hectare (or 2 a. 1 r. 35 p.) of cultivated land. But on the other hand, one excess does not authorise another, and at

the same time we may charge the ardent Professor of the Museum with acting against that advice, to the extent of recommending the cultivation of cereals as a means of arriving at the production of forage crops. There is in this an eccentricity which, in spite of all the concessions of the last hour, places its author in a very false position. It is true that this manner of astonishing the mind is often employed in our days. We ought even to admit that it sometimes succeeds. At the end of the account reflecting men, if they have allowed themselves to be surprised, finish by coming back to reality. The charm is dispelled, and they repeat with the ancient masters: pastures, cattle, and cereals.

Undoubtedly, farming by forage crops and dung has not always yielded profits; and it was not without very well grounded motives that, in order to demonstrate its limited power, M. Ville has cited the example of many celebrated undertakings, especially those of Roville, Grignon, Bechellbronn, &c. Roville was worked with a *capital insufficient* for extensive culture, and produced only average returns. Grignon had a large capital, but the want of information prevented him from employing remunerating cattle, and his demonstration of the gross profits arising from large capitals were not so conclusive as we might wish. Bechellbronn was an experimental, rather than a productive, farm. Like Roville, the capital was below the requirements of an agriculture of great returns.

An important fact overrules all the citations of this kind that can be urged against forage agriculture; that, generally, in the first half of this century we launched into *alternate culture with stabulation*, the prototype of the period, without fulfilling the principal conditions which might have secured its success. The more we operate upon poor land the more we are convinced that it is necessary to improve them very quickly by a distribution of crops with a preponderance of roots and large crops of mowing grasses. Thus have been accumulated enormous capitals on lands, which too often have been resold or farmed out without any regard to the improvements of which they have been the subject. A fatal fall, if it was one; for, without going back to the true cause, Science is condemned for it: and this is how, in the countries where it occurs, agricultural progress proceeds so slowly. It ought to be known that there are forages and forages; and that if roots and pastures of large returns are one of the essential supports of a rich intensive cultivation, there are situations where it is better to have recourse to the bare fallow and pasturage—at least upon a part of the land not provided with sufficient dung for a *maximum* crop. M. Ville, to my knowledge, has never taken into consideration the utility, more or less provisional, of pastures and fallows. Habituated to high aims, he loves and extols only intensive culture. He is in this sense, but with some reservations, a man of the future more than of the present.

One of our professors of rural economy, the more remarkable for his aptitude for embracing agricultural questions in their largest generality, Rayer, had characterised the several periods of the fertility of the soil by the crops that ought to predominate in each of the periods. At the bottom of this productive scale he placed the foresting period, thus designated because that then the lands can be only estimated by the growth of the timber. Then came the pasturage period, in which the lands, possessing a degree of herbiferous aptitude, lend themselves to the adoption of a pastoral or mixed pastoral cultivation. The third period was termed the forage period, and corresponded with that state of fertility of the soil, in which the cultivator, in order to produce grain profitably, ought to appropriate a large part to roots and hay. The cereal period came at that moment in which, without danger of exhausting the soil, the production of grain may have the ascendancy over the production of forage. The commercial period marked a fresh progress: it represented fertile lands in which the crops for exportation, or commercial crops may, occupy large extents of land. Lastly, the gardening period, or the kitchen gardening crowned the edifice; we are then at the summum of fertility, before a numerous population who contend for the soil in order to subdivide it and cover it with crops by hand labour.

It is not necessary to adhere too closely to the letter of this ingenious classification of Rayer, for it is certain that the succession of the systems of cultivation is not always and everywhere in this methodical order. There is, for instance, poor land which under the influence of a rapid increase of openings are brought almost suddenly under very extensive culture; and,

reciprocally, there are rich lands which from want of capital, hands, local commerce, &c., remain under pastoral culture when even the nature of the soil itself is suited to arable culture. Still, it is that in taking a general view of the land intended for the plough, pasturage, fallows, and forage crops are the first resources of a commencing agriculture which seeks the improvement of the soil. Such is the predominant law; the cereals come afterwards.

Is there in this a fact to be regretted; one of those facts that authorise us to regard cattle as a necessary evil?

According to M. Ville we should be tempted to believe so; but to look at things less systematically, and knowing that the public consumption requires at once bread and meat, and other animal food, we are compelled to acknowledge the wise arrangement of a system of cultivation which in the distribution of crops devotes it conjointly to forage crops, cattle, and cereals. It is thus that agricultural production, in organising itself for consumption, secures reproduction of crops by the manure; and thus it is that agriculture works at once for the present and the future.

And at what moment have they chosen to organise a crusade against cattle, regarded as a manure machine?

It comes at the very time at which the consumption of animal food is increasing to a very large extent; when the country places themselves, now provided with roads, demand every day more butcher-meat, more butter, more cheese, more milk for their own wants.

Agriculture feels this fortunate transformation in the habits of the public consumers. It formerly practised the triennial course in the north, and the biennial in the south, and thus exhausted the soil by the too-exclusive culture of cereals. It now supports itself on forage crops, and it is clearly seen that it harvests by that system alone more grain than formerly. Whatever M. Ville may have said in the *Official Journal of the Empire*, our agriculture is not the most backward in the world, and everything leads us to believe that it will increase its productive power in proportion with the increase of the demand for animal food. This species of demand has raised the prosperity of English agriculture, by leading to the production of *bread through meat*. The same causes will produce the same effects in France, and if, until now, our rural economy has not felt itself benefited by the increased consumption of butcher-meat in the cities, it has the greater cause to congratulate itself for the tendency of the rural population to consume better food. Comfort in the village, as I have often said, is the great maxim of our future husbandry; it does not exclude, but rather the contrary, that of the cities. I say simply that in a country essentially composed of rural populations, everything of a nature to increase the general well-being of the villages will, by the same rule, also stimulate, more than all other encouragements, the progress of agriculture. And I add, that unfortunately we have lost much time in what relates to this species of improvements.

Must we still further insist on the merits of forage crops in the work of the fertilization of the soil? Is it necessary to speak of their aptitude to draw largely from the atmosphere, to eradicate weeds, to facilitate the cleansing of dirty lands, of the assistance they afford in the feeding of cattle in all seasons? Must we repeat that the variety of crops is one of the means of better arranging agricultural labour, of guarding against commercial and atmospheric vicissitudes, and of better employment of the income? Is it necessary to enumerate the advantages of this admirable law of alternate husbandry—that natural law which advises us not always to impose the same crop on the same land, but to change the plants according to a certain order? Must I show the myriads of insects, the vegetable diseases, which become the scourges of a too-exclusive cultivation, of crops too often repeated?

No! it is not without study or without numerous motives that European agriculture has been brought to seek its fulcrum in the production of forage crops and cattle. By this fulcrum it has obtained abundance, variety, and security of its crops. By it, its expenses have been reduced—it has given satisfaction to the varied interests of consumption; and in short, has systematised the labours of the rural populations whom the exclusive culture of corn crops condemned frequently to idleness and small wages. These are titles that range themselves under the protection of the best principles of political economy, because the prosperity of agriculture and of the public are thereby made to depend on each other.

M. Ville has done well to make concessions in certain points, but there is in his formula chemical manures, cereals, cattle—a manifest contradiction. In it the professor of rural economy places the plough before the oxen. I shall not occupy myself for one moment with his formula of manures. I maintain only that there is a want of clearness in his instructions when, after having written on the frontispiece of his edifice, “chemical manures, cereals, cattle,” he declares that the cultivator according to his requirements will go by the side of cattle or cereals. Evidently, if chemical manure is applied to the production of cattle first, the former formula is set aside. Why then have proposed it? Why, taking the reverse of the agricultural doctrines hitherto respected, has he sought to make a breach in agriculture at the base of forage, cattle, and manure? Should this, by chance, have been a sensational formula, which, having affirmed, he quits, after it has produced its effect, to fall back upon concessions of detail?

The doctrine of chemical manures, as it appears to me, does not imply an obligatory reform of the systems of agriculture. It had comprised the knowledge limited to the use of chemical manures adapted to the soil and plants, and which, satisfied with rendering this great service, would leave agriculture free to produce cattle, cereals, or manufacturing plants in the proportion demanded by circumstances. But M. Ville is ambitious to play another part, and believes he can free agriculture from the obligation of cattle; and in this state of mind he has written and rewritten “Chemical Manure, Cereals, and Cattle.”

In an economic point of view, this is the weak side of the doctrine; and certainly there is nothing attached to our efforts

or those of our collaborateurs that could not lead the readers of this Journal to a more hearty appreciation of the utility of chemical manures. At every instant it has repeated that by these manures we can make at will either forage or cereal crops. Therefore, in our opinion, and in regard to the present at least, the agricultural revolution announced by M. Ville has not the capacity he attributes to it. From the large quantities of manure the mineral kingdom can furnish, it by no means follows that cattle are no longer one of the most valuable auxiliaries of production of cereals. Agriculture disposes of more fertilising matters than formerly, which is the result of the alternate culture. As to the system itself, it depends, as always, on circumstances of soil, climate, markets, and population.

I conclude, therefore, with the conviction that the old doctrine of forage husbandry will continue to subsist, in spite of the doctrine of chemical manures as presented to us by the learned Professor of the Museum. The more forage crops we grow, the more corn we shall harvest. In other words, it is not sufficiently proved that, reversing the terms of the proposition, it can be generally economic, even with the help of chemical manures, to prepare for forage crops by extensive cultivation of grain from the beginning of the operation. The agricultural pyramid remains on its ancient basis, with this difference, however—that, in order to reduce the net cost and increase the gross produce of forage crops, contemporary agriculture employs abundantly manures, supplementary with dung. It can thereby make quicker progress, and that is much.

E. LECOUTEUX.

FARM HORSE DUTIES.

The following correspondence has been published:

“Easton, near Grantham, Jan. 27, 1870.

“Sir,—Observing in the newspapers a letter from the Exchequer stating that horses kept solely for the purposes of husbandry should be liable to duty if employed in carting stones for the repairs of parish roads, will you allow me to ask information on the following case, viz., the tenants on the estate under my management are bound by their agreements to furnish a waggon, with a team of horses and a driver, one day in each year for £75 of rent, for any purpose the landlord may think fit, without charging any satisfaction for such team.”

“The occupiers of farms on the property have for many years discharged this obligation by carting coals to the mansion on the estate occupied by the landlord, and I beg respectfully to inquire if I am correct in assuming that the horses so employed are still exempt from duty, on the ground that the service thus given by the tenants is, in fact, an equivalent for rent, and must therefore be held to be a purpose of husbandry?”

“I have the honour to be, sir,

“Your most obedient, humble servant,

“JOHN T. RUTHERFURD.

“The Right Hon. Robert Lowe, M.P.,
“Chancellor of the Exchequer.”

“Inland Revenue, Somerset House, London, W.C.,

“Feb. 3, 1870.

“Sir,—The Chancellor of the Exchequer having forwarded to this department your letter to him of the 27th ultimo, I am desired by the commissioners to acquaint you that they will not insist upon payment of duty for a horse kept solely for agricultural purposes, which may occasionally only be employed in drawing coals, bricks, &c., to its owner's house, or to the house of the farmer's landlord, in conformity with any provision in that behalf contained in the lease under which the farm is held.

“I am, sir, your obedient servant,

“W. M. ROSSSETTI, Assistant Secretary.

“John T. Rutherford, Esq.”

FARM-HORSE LICENCES.—The following explanation has been given: 11, Downing-street, Whitehall, Jan. 29.

SIR,—In your letter to the Chancellor of the Exchequer dated the 27th inst., you inquire whether farmers will be charged licence duty for their farm-horses when used—1. To draw coals, which is done in some instances with the sole object of relieving the labourers in the farmer's employment, or other poor persons from the cost of carriage. 2. To draw material for repairing the parish roads. In reply Mr. Lowe desires me to inform you that in law farmers would be liable to duty for any of these acts, but in practice—1. The Board of Inland Revenue will charge the duty if the horses are “let out for hire” for the purpose of drawing coals; but if the drawing of the coals is only done occasionally and as an act of charity, without any profit, the liability will not be enforced. 2. Farm-horses used for drawing materials for the repair of the parish roads will be charged if (as is mostly the case) the farmer receives any remuneration, whether in money or in abatement of his rates. I am, sir, your obedient servant, C. RIVERS WILSON.
Mr. W. E. Welby, M.P.

THE SUPPLY OF BEEF AND MUTTON.—The *Food Journal*—a new monthly periodical devoted to social and sanitary economy—should take a good place in serial literature. There is plenty of room for the new venture. Adulteration, it would seem, has become the rule rather than the exception; and we heartily welcome the *Food Journal* as a periodical intended to expose the deliberate frauds that are daily being perpetrated on the public. But there is a vast difference between good advice and sensational statements. Throughout the *Journal* there is an evident tone of Gamgeeism that goes a great way to defeat the ends the new monthly has in view. Professor Gamgee we know to be a clever man. But it requires something more than mere cleverness to solve what is doubtless the most important problem of the day—the best method of producing nutritious and cheap food supplies. “The beef and mutton” says Professor Gamgee, “of the Russian steppes, of the South American pampas, of our Cape farms and Australian runs, must repair the injury inflicted on us by thirty years' disease amongst British live stock.” But it is a fact that cannot be denied even by Mr. Gamgee that the beef and mutton of the United Kingdom, from which we have been receiving so much “injury” for

thirty years, is infinitely superior to the beef and mutton of the Russian steppes, the South American pampas, and the Australian runs. There is no blinking this fact. It is about as patent before the foreign animal is shipped as it is when his stringy carcass is seen hanging in a second-rate butcher's stall. Then Mr. Gamgee goes on: "Medical men have, it is true, failed to discern any great connection between human and cattle diseases." But Mr. Gamgee knows

better than all the medical men of the age. He knows "that human beings occasionally suffer from foot and mouth disease." Will he give us the details of one case? The pen and mouth disease—known as *cacoëthes scribendi* and *cacoëthes loquendi*—is unfortunately too common among human beings. Until greater moderation is exercised, until sweeping generalisations are abandoned, the food question, even in the *Food Journal*, will remain where it is.—*The Sportsman*.

FOREIGN AGRICULTURAL GOSSIP.

The lumber trade of Michigan for 1869 reached a total value of about \$4,000,000 dollars. The lumber cut amounted to 2,029,372,255 feet, valued at \$0,293,325 dollars, to which must be added 3,500,000 dollars worth of shingles, lath, and staves. It is estimated that up to the close of 1869 there had been manufactured in Michigan 7,200,000,000 feet of lumber, and that to obtain this quantity 1,920,000 acres of land had been stripped. It is calculated that 4,000,000 acres of land still remain unstripped, which will yield 15,000,000,000 feet of lumber more. The total value of the future products of the State in lumber, shingles, lath, &c., is estimated at 800,000,000 dollars; and it is thought that 15 or 20 years will be required to cut and send to market the trees now standing. In 1869 Chicago received for consumption and shipment 27,000,000 bushels of wheat, 23,000,000 bushels Indian corn, and 12,000,000 bushels of other grain. The quantity of flour manufactured at Chicago during the year was 600,000 barrels. In the course of 1869, 1,872,000 hogs and 400,000 head of cattle were marketed in the same great western centre of American commerce and enterprise. The expenses of the agricultural bureau at Washington are 1,000,000 dollars per annum, and a New York paper thinks it too much. Kentucky is anxious to encourage immigration. The olive has been cultivated in Florida and on the coast-lands of Georgia for nearly half a century. The oil produced from it is represented as fully equal to the best quality of French oil. The report of the American official Commissioner of Agriculture presents among other interesting facts some encouraging statistics as to the Southern States of the Great Republic. Thus the commissioner returns as follows the value of the live stock in the several States named on February 1, 1868, and February 1, 1869:

State.	1868. Dollars.	1869. Dollars.
Virginia	35,148,573	37,705,568
North Carolina	26,032,156	24,434,747
South Carolina ...	10,693,117	15,361,888
Georgia	26,563,875	31,692,001
Florida	4,190,184	5,097,999
Alabama	21,126,833	27,265,962
Mississippi	16,815,802	28,515,453
Louisiana	8,492,468	15,162,289
Texas	33,608,563	52,651,895
Arkansas	15,309,989	20,366,380
Tennessee	38,708,762	53,136,552
Kentucky	40,491,619	49,189,403
Missouri	50,728,285	64,490,717
Total	327,808,626	408,000,854

From these figures it appears that all the Southern States, with the exception of North Carolina and Texas, have very materially increased the quantity of their live stock within a year. A lot of Californian beetroot sugar has been made, and the business is regarded as established, with every prospect of a speedy and large development. On the 10th of December, 1869, the question of satisfactory and successful production was set at rest by the making of 150 lbs. of crystallized sugar from white Silesian beet grown on the borders of the American river, and leaving an unexpectedly small proportion of molasses. The experiment was conducted by Mr. W. Wadsworth, who had studied in European sugar works, and who is well versed in the various processes in vogue in France and Germany. It is expected that a number of

beet-sugar mills will be erected under the present encouraging circumstances, and that in a few years California will be independent of foreign sugar supplies. The per centage of Californian beet will be shortly made known. The receipts of grain at Buffalo in 1869 were 37,407,121 bushels.—A sale of Durhams will take place at the French Imperial establishment at Corbon on Saturday, Feb. 26. The sale will comprise eight bulls of from 12 to 23 months old, and eighteen cows and heifers of all ages.—The Agricultural Society of Cherbourg, on being called upon to pronounce its opinion as to the effects of treaties of commerce and other matters affecting French agriculture, decided by a majority of 53 to 2 to ask for a continuance of the Anglo-French treaty of commerce of Jan. 23, 1860, and of the treaties concluded subsequently on similar bases between France and other nations. The Society unanimously called for a reduction of railway tariffs, and it also called for a diminution in the military contingent which French rural populations have to furnish annually.—The Society of Agriculturists of France is now holding its second annual meeting at Paris under the presidency of M. Drouyn de Lhuys. The president, in opening the proceedings, glanced especially at the agricultural congresses which had marked the course of 1869. M. Drouyn de Lhuys recalled the facts that during 1869 the Society had been invited (through its delegates) by England to Manchester, and by Germany to Treves. He also stated that during the past year the Society had been enabled to inscribe upon its list of members the names of His Majesty King George of Hanover, His Royal Highness the Prince of Wales, His Highness the Khédive and his minister Nubar Pacha, His Highness the reigning Prince of Roumania, and His Excellency General Buenaventura Baez, president of the Dominican Republic.

We learn from Chili that the occupation of parts of the Araucanian territory is about to be undertaken at once. The Chilean Congress has placed an extra item of 250,000 dollars for this purpose on the estimates. It will be remembered that some time since Mr. Josiah Harris was deputed to get samples of the Guanope Island guano, for the purpose of analysis. These samples, thirteen in number, were duly inspected recently in the finance department, in the presence of many influential gentlemen who had been asked to come, and among others her Britannic Majesty's Minister at Lima. On that occasion the samples were divided, Mr. Harris taking one to the Royal Agricultural Society of England, while the other half of each sample was entrusted to Professor Raymondi, an Italian gentleman and an analytical chemist of some repute. The Professor's report has just been published; it will doubtless be read with some interest in Europe and the United States, as it sets forth the quality of the Guanope article, which is the one which will be supplied for some time to come. The Peruvian Government, while thus frankly giving to the world the analysis of Professor Raymondi, appears to maintain a policy of reserve with respect to particulars of guano deposits upon the main land. Of these, nothing definite as to quality or quantity can be ascertained, beyond the vague rumour of there being some valuable deposits in various localities, affording a supply for years to come.—We have encouraging intelligence as to the settlement of the English colony of Frayle Muerto, in South America. The crops last year were very good, and the English settlers, having turned all their labour and attention to agriculture, were likely to realise splendid returns, especially in their wheat crops. A Mr. Melrose has about 800 acres under grain, which he expects will yield him over £4,000 sterling, clear of all expenses. The

other Englishmen are equally sanguine; they number in all about 150, and the total extent of land under tillage exceeds 4,000 acres. The farms lie within a radius of five or six square leagues of the town of Frayle Muerto, the largest proprietor being Mr. Melrose, who bought last year the land on which the town is built and all around, to the extent of 40,000 acres, for £3,600 sterling, while the property is now said to be worth three times that sum. Mr. Melrose sells small farms, unfenced, at 5s. to £1 per acre, equal to £1,600 to £2,500 per square league; and he stipulates that the buyer must fence in his land within twelve months. There are about 150 English and American ploughs worked by the settlers, who use both horses and oxen for ploughing; there are also 80 reaping machines and 10 thrashing machines at work. The ploughs most in favour are those made by Messrs. Ransome and Sims or Messrs. Howard, while the favourite thrashing and reaping machines are those made by Messrs. Clayton and Shuttleworth and Messrs. Ransome and Sims. Mr. Melrose had engaged 300 Basque labourers for harvest work at 3s. 4d. per day besides board. The farmers will sell their grain at the Frayle Muerto station, whence it will be sent by rail to Rosario. If the harvest realizes the favourable anticipations formed respecting it, there will be a great influx of English settlers next year.—At present each steamer from England brings out half-a-dozen, some with capital, some without, but all fine active young fellows.—The corn crop in New England (United States) ripened slowly in many localities last autumn, and the general average for the year is about 18 per cent. less than for 1868. On the margins of streams much damage was done by heavy rains in the early part of October. Severe drought along the Atlantic coast in July and August affected grain injuriously; but the favourable weather of the autumn gave fresh vigour to the growth, although in the valleys of Maryland and New Jersey violent October rains created floods which swept away stacks of corn: still, the loss from this cause was not so great as to exert a marked influence upon the general average. In Virginia and North Carolina

the drought was severe last year, making the corn crop light. The crop of Alabama and Mississippi, although better than that of some of the other Southern States, is not an average one. An increase on the crop of the previous year is reported from Texas, while in Kentucky the corn was damaged to a certain extent by October frosts. In Missouri a good crop was gathered in. In Illinois there was a reduction of 17 per cent., as compared with 1868. In Ohio, Indiana, and Illinois the ripening of the maize was delayed by the wet spring, followed by a cool summer. In Michigan, Wisconsin, Minnesota, and Iowa a reduction in quality as well as quantity per acre is reported.—Messrs. Parks, proprietors of the Glen Flora Stud Farm, near Chicago, Illinois, have gone into the breeding of Shorthorns on a limited scale. Messrs. Parks have purchased five of the best heifers of W. R. Duncan, and they hope in a few years to have as good a Shorthorn herd as any in the United States. Glen Flora would seem to be growing into a large breeding estate. Alderney cattle are being introduced into Virginia, Mr. Arnold Graef, a newly-adopted citizen of the State, having imported a famous Alderney bull (Governor) bred by Messrs. Seiger and Grabner, of Flox Pond Hill Farm, Long Island.—An American paper says: "A barrel of corn is five bushels shelled in most States, but in New Orleans a flour barrel filled with ears is a barrel of corn, and in some parts of the west one hundred ears represent a bushel."—California is legislating to prevent the adulteration of milk.—An Illinois farmer having 1,400 acres of land derives his whole income from pasturing cattle for his neighbours, receiving for the service two dollars per beast per month.—As a specimen of American progress, it is stated that the greatest farmer in Minnesota began life on a capital of ten cents, pre-empting his first tract of land.—In one of the Cincinnati pork-packing houses 760 hogs periah daily. The carcasses are cut-up with the utmost celerity. One portion goes out in hams and another is transformed into sausages—over ten tons per day. All the lard is extracted by steam, and from it a large quantity of oil is obtained.

CALENDAR OF AGRICULTURE.

Sow spring wheat in places where that crop is approved, as in the northern and north-western counties, where it answers a good purpose, on some strong green crop lands, and on the later fallows of autumn. Throughout the month sow oats, and also barley in the latter part, on the best lands that are dry and early. To cover oats on leys, three double times of harrowing may be required: one lengthwise behind the sower; the second straight across the furrows, which completely demolishes the comb or slice of soil, and pulls it into the cavities over the seed; the third time, lengthwise, finishes the process, which must exhibit a level platform of fine alluvium, without a mark or ripple of any kind. The footprints of the horse must be filled up, or the land is not in a sowing condition. Barley is well covered by two double times lengthwise.

Sow beans broadcast on stubble lands, or in narrow drills made by a ribbing plough across the well-harrowed surface of ground, and covered by a double tine along the drilling; or with a machine with long coulters, that make runs in the land to hold the seed, and cover by a harrow-ag. Sow peas thickly, in not less than four bushels on an acre, in order that the plants may cover the surface of the ground by intertwining and locking the tendrils to retain moisture and exclude drought. A thin, straggling crop of legumes is a most pernicious inhabitant of cultivation, in which weeds of all sorts find a vacant room to row, and mature seeds unmolested, as they cannot be taced by hand or hoe.

Sow vetches for green food early in the month, as soil and climate will permit, being the first sowing in most lanes, and the second in the earliest districts. Make another sowing in the last end of the month to procure a recession of herbage for summer use of the most valuable

plant for that purpose. Seed the ground of leys or stubble thickly, with not less than four bushels to an acre, with a portion of oats or barley, of which the stems will correct the extreme juiciness of the succulent vetch. A large attention is due to this plant to maintain the green food of the farm. At least one acre must be allowed for each work horse on the farm; pigs, calves, and milch cows will require some portion.

Sow Incerne on well-prepared grounds, by trenching, deep ploughing, and the manuring of previous crops, in 10 or 12 lbs. to an acre, well harrowed and covered by a heavy rolling. A plot of ground near the homestead will afford a change of green food in several cuttings of a young age of herbage. The use of the plant does not extend into a comparison with clover in mixture, being very harsh and woody in the matured growth.

Sow flax on good lands, after a green crop, well cleaned and manured. The management of the crop is very troublesome, is only adapted for cattle-farming, and ever disappears before improved agriculture.

Sow parsnips and carrots on good lands, and sandy and earthy loams, rich by previous cropping, and without the application of fresh dung plant the crop in rows 18 inches distant on the flat ground. Steep the seeds in lees of urine, and encrust with hot lime. Sow sainfoin, which may be dressed with gypsum. Apply auxiliary and artificial manures, as top-dressings on young wheats and clovers as salt, rape-dust, gypsum, malt-combs, and nitrate of soda, the last at one to two cwt. on an acre, and also pigeous dung, which is probably the most powerful manure that is known.

Sow cabbage seeds on rich plots, for plants to be used in May and June. Finish the dunging of grass lands.

Set traps, and spread mole hills; bush-harrow the surface, in order to tear and scatter any substances gathered into lumps, and roll with a heavy weight, to smooth the surface for the scythe, and gather any stones.

Plant hops on deep dry lands well prepared by previous cultivation; place the hills six feet distant each way, which best admits the scarifier; put four sets in each pit, one in each corner; use well-rotted dung, and cover lightly with earth, lowering the upper end of the set just in the light of day. The hop being a nettle plant, requires the best qualities of lime, with frequent and ample applications of strong manures in highly concentrated and oleaginous bodies to supply with nutriment the large number of widely-spreading fibrous roots, like to the cabbages, but more widely spreading.

Continue the planting of trees and of young hedges; but cease if dry weather sets in. The cutting of underwoods, and the felling of timber will now be finished.

The earliest water-meadows will now afford a green food, chiefly used for ewes and lambs in grazings by light stock. In cases of extensive floodings, a part of the herbage may be cut, and carried to the homestead, being the finest green food of the year, which to procure the rivers of any country may be pumped into reservoirs on the highest grounds, and thence irrigate the lower grounds. An early green food admits not any value being fixed to its use.

Set traps for vermin, and spread mole hills in all necessary places.

Remove all turnips from the fields; better done in last month. Begin to cross-plough the stubble lands for the early-root crops, as potatoes and mangold wurzel; also the clay lands for bare fallows, when the season of time permits. An early stirring of ground is very beneficial.

In wet weather that prevents sowing thrash and deliver grains, which will be mostly ended in this month, except a portion left for summer straws. Carry the dung from the cattle yards to the heaps in the fields, and strew the yard with straws, cut short, to be made into manure during summer by the constant use of green food, when the quality of the article will equal the winter-made dung, and the quantity will be very considerable. Carry brush-wood and timber, with draining materials, where wanted.

In most districts this month will be the busiest with the ewes dropping lambs. Feed largely with juicy, succulent food—as beet, cabbages, and turnips, and provide the necessary shelter, which in many cases is as beneficial as the food itself. Remove the ewes and lambs to the pasture fields, regularly, as the young progeny get strong.

The fattening of hogs for bacon will be finished this month, which ends the season of curing meat—the young pigs will go into summer stores, and become the earliest for next winter's fattening. The last sales of stall-fed cattle will empty the stalls for the season, and all animals not ripened must become the earliest bees of the grass field, if not pushed forward feeding from this month.

Set poultry on eggs for hatching, and exchange eggs with any neighbour, the breeds being near akin. Feed amply with boiled roots mixed with meals and light grains, with clear running water. Provide a warm, clean accommodation for the young broods, with a separate apartment for each kind of animal. It is both pleasant and profitable to see a numerous and healthy stock of poultry on any farm.

CALENDAR OF GARDENING.

This month is the time of business, and every favourable moment must be used, because the varied character of the weather is not only likely to perplex, but it frequently happens that drought sets in for the spring about the third week, and then it will be too late to hope for the success of many of the lighter seeds. Begin, therefore, early to dig plots for the reception of the main crops, on lands manured in autumn, or from bearing previous crops in the first part of the month. Sow peas in the early varieties that have been mentioned, and the taller kinds of the same catalogue after the middle of the month to the end. During the same time sow beans, the broad and the early long pod, in rows, a foot to two feet apart; carrots in rows, one foot apart, on sandy loams, rich from former treatment, without any fresh manure, which encourages the growth of fibres, stems, and leaves, more than roots. Sow beet and parsnips on stronger grounds, in rows, a foot apart, over trenches of fresh dung half-rotted at a depth in the ground.

Plant cabbages, Brussels sprouts, brocoli, cauliflowers, and kales, all on the best grounds that are deep and rich; cauliflowers should go into the richest lands, much of the manure lying in the bottoms of the trenches under the roots. Guano water is an excellent liquid application to the young plants. The dwarf and Walcheren varieties of the last plant—dwarf green curled and cottager's kale. Cabbages: the Early York and Enfield market. Brocoli: the early white and Walcheren. Brussels sprouts: Tall best to be imported, unless local selections can be depended upon; the Roseberry dwarf variety with larger sprouts. Carrots: the French Horn, and James' scarlet for shallow soils. These names are the most modern designations.

Transplant and sow for summer hearting cabbage; sow a little Dutch red cabbage seed, and green curled savoy for Michaelmas.

Sow the best French lettuce seeds, the Paris white cos; also round spinach, and repeat these sowings every three weeks; in the meanwhile the winter prickly spinach will continue to yield freely for some months, if the weather prove showery.

Sow onions on good encouragement with strong manures, as the contents of privies mixed with fine earth. The true white Spanish variety for large bulbs, the Strasbourg, or brown globe, for the common kitchen use. The sowings should be early on rich deep lands. Sow London leaks to be transplanted.

Sow on light rich lands Wood's early radishes, of which a good crop demands an early sowing on lands that are rich and light, with moisture and warmth sufficient to push the plants rapidly forwards. For these reasons, a frame and glass may be advantageously used; the expense is small and the trouble very slight, to procure an early vegetable of the most favoured relish. Sow a sprinkling of Dutch or early store turnips, a little celery for succession, small salading, nasturtiums for pickle, parsley, basil and pot herbs—namely, fennel, dill, borage, burnet sorrel, all at different times during the month.

Plant mint, thyme, sage, marjoram, lavender, rosemary, and rue in rows of borders, or in separate beds or grounds.

Plant potatoes in rows, a foot apart, the cut tubers placed on the breast of the trench, over a spit of rather dry well rotted dung, the sets being six inches apart and covered by the earth of the next digging. The earl

ash-leaved kidney is yet the foremost variety; and the second early, as the champion and the prolific that ripen in August, should be ready, avoiding manure and choosing or preparing peaty or sandy ground if possible.

Peas and potatoes are the chief vegetables of the garden in general estimation. At least two sowings of peas must be done during the month in the early climates, about the 10th and 25th in the Early and Second Early varieties; in medium climates, the first sowing may be early in the month, and in the second, in the end of it; or, one large sowing in the middle of the month in later localities, deferring the second sowing into next month; which in every case requires lands moderately rich by previous dressings and without any fresh dung, which promotes the growth of leaves and stems rather than of fruit. Potatoes require the same condition of ground and may be richer, as the plant is stronger than a legume; but still without fresh dung. A very careful attention must provide for the early and abundant produce of these two vegetables in the early planting on the proper grounds to ensure success, or without them the garden loses its name, and the kitchen its reputation.

FRUIT DEPARTMENT.

If any trees or shrubs be planted, be sure to finish the work by the middle of the month—puddle in the roots, and cover with abundance of mulch; for if drought set in, the trees will be fatally checked.

Begin to graft apples and pears; cherries and plums do better by budding in summer.

Lightly fork the soil between the rows of currant-bushes, gooseberries, and raspberries; then cover the ground with earthy compost manure. The covering of the intervals between the rows of any vegetable growth with any substance whatever, increases the quantity of produce; a treading of the ground by the foot answers the same purpose, and is very beneficial to early crops of peas on light lands in dry seasons. This application is very cheap, and easily done.

Dig shallow the ground around rhubarb plants, and cover with moist manure of good quality, and thickly placed, as the plant is very strong and succulent, and requires a powerful support.

Plant strawberry sets in rows two feet apart, on beds, and the plants six inches asunder. Single rows in borders should be a foot away from the edging, and as far from any vegetable or shrub. The plants may be permitted to thicken by off-sets in any amount, but not to fill the ground with runners, unless with the object to obtain a new supply. Strawberries require good lands, highly fertilized, or in a wholly fresh condition. The best sorts are the Keen for an early and large crop, the Old Pine for flavour, the British Queen for size and middle bearing, and Knight's Elton for a late, rather tart, but more beautiful fruit.

FLOWER GARDEN.

Sow hardy annuals after the middle of the month, as the pink, larkspur, and mignonette; the half-hardy are raised in frames. Herbaceous plants may be set or divided, or placed in new situations.

Prune roses to well-placed low beds; mulch round the roots with compost, and fork it in. The moss, maiden's blush, and many old varieties can be made standards, with good figure on their own foundation.

Cut box, plant edgings, turn gravel or put down fresh, sweep lawns, roll walk, remove all litter, and keep every place in neat order.

Never discontinue to convey to the dug pit that is bricked or cemented all litter and vegetable refuse, also straws and animal droppings, and frequently baled over with much liquid matter and soap suds from the house. A rich moist manure is thus provided for the strongest crops; for the lighter purposes the dry compost heap is formed with earths and mild limes, and similar substances, for flower beds and the pots of seeds.

AGRICULTURAL REPORTS.

GENERAL AGRICULTURAL REPORT FOR JANUARY.

Although the wheat trade has been very inanimate during the past month, owing to the continuance of heavy imports, the downward movement in prices has not been considerable. Towards the close of the month the condition of the samples sent forwards to market showed a great falling-off, being generally damp; while a decline took place in the value of such produce, which, however, was more apparent than real, as the quality of the wheat was greatly depreciated. All fine samples have commanded full prices; and, being scarce, have sold somewhat freely. Stocks in warehouse have been on the increase; but it may be observed that really good wheat is still scarce, as a large proportion of the recent arrivals have consisted of American and Russian descriptions, the receipts from New York having been particularly heavy. On the other hand, the shipments from the Baltic and from Denmark have been comparatively small, the harvests having proved partial failures in those quarters. We give below a statement of our imports since September 1st, which will show their extent as compared with the previous year:

IMPORTS OF GRAIN, &c., INTO THE UNITED KINGDOM.

For the week ending January 22:

	1869-70.		1868-69.	
	Cwt.	Cwt.	Cwt.	Cwt.
Wheat ...	1,338,774	2,034	636,829	—
Barley ...	270,229	11	283,982	1,095
Oats ...	357,441	240	133,510	717
Peas ...	54,383	213	26,157	225
Beans ...	57,583	—	72,884	48
Ind. Corn	409,072	—	267,986	—
Flour ...	237,434	807	98,561	306

Since September 1:
1869-70.

1868-69.

While therefore it was calculated that an import of eight millions of quarters spread over the year would have been sufficient to meet the requirements of consumption, our receipts have been at the rate of fourteen millions of quarters annually. Hence the rapid fall which has taken place in prices during the past six months.

There appears to be no immediate prospect of returning animation in the wheat trade. With large stocks on hand and a further considerable supply afloat there is reason to apprehend great caution on the part of millers in operating. Stocks on the Continent are heavy, while the accumulation on the canals and at the lake ports in the United States is very large. So far, too, the winter has been a mild one, and the navigation appears not to have been completely suspended at any of the more important ports of shipment. Exports have therefore been kept up until a late period, and there is now a probable total of 1,500,000 quarters of wheat afloat for the United Kingdom. In the face of these heavy supplies, therefore, it is hopeless to look for any improvement in the quotations.

The young wheats have made considerable progress. The plants are well above ground, and are looking healthy and

strong. A continuance of frost is desirable, however, in order to check too forward growth.

Spring corn generally has ruled dull. Oats were much depressed at the opening of the month, but a firmer tone has prevailed towards the close. Maize has continued in request, and has maintained full currencies. Beans and peas have given way 3s. to 4s. per quarter, and at the reduction it has been difficult to effect sales.

The Metropolitan markets have been liberally supplied with potatoes, which have been forced to market through the fear of their not being in a proper condition for keeping. The trade has consequently ruled very dull, and prices have been unusually depressed. English Regents are not quoted above 85s. to 100s. per ton.

The hop trade has been particularly inactive. Home growths of choice quality have become scarce, and have commanded extreme prices. American descriptions have met with some inquiry; but foreign hops generally have been neglected, until within the last week, when there appeared more disposition to purchase.

The transactions in wool were above the average at the opening of the month, owing to the cheerful feeling which existed in the yarn trade. Now, however, that the supply of cotton promises to be more abundant, and the demand for woollen goods less extensive, there is less activity in the demand for the raw material. Prices, however, have ruled firm, and rather higher on the average. It is now proposed to hold five series of Colonial wool sales in London in the year, instead of four as formerly.

REVIEW OF THE CATTLE TRADE DURING THE MONTH OF JANUARY.

The year has opened very satisfactorily so far as the Cattle Trade is concerned. The beasts now coming to hand are generally in excellent condition, being weighty and full of meat. The Norfolk season has commenced very well, and there is reason to believe that we shall receive a large supply of beasts from that quarter for some time to come. The past year has proved a favourable one to graziers, as they were enabled to keep their stock out for a much later period than usual, owing to the abundance of feed in the pastures. In this way much expense was avoided, on account of their being able to dispense with artificial food to a very considerable extent, and the large supply of meat that has been raised has been produced at a minimum of cost. Prices have, therefore, tended downwards; but it must be observed that there is no disposition on the part of graziers to force sales, as the herds are still below the normal point as regards numbers, owing to the great depletion which was rendered necessary at the close of 1868 by the long continued drought. Those sanguine persons who hope, therefore, for any further considerable decline, will probably be disappointed.

Among the foreign animals recently exhibited at the Metropolitan cattle market have been some remarkably good French and Spanish beasts. The former are daily gaining favour with London butchers, who state that they "cut up" well; but they will not bear comparison with prime English beasts. Nevertheless, regarded from a monetary point of view, they are likely to continue to be well received, owing to their useful character.

We continue to hear reports from various quarters as to the foot and mouth disease, which does not yet appear to have been stamped out. It is satisfactory to find, however, that a very great diminution has taken place in the number of animals affected.

An early consignment of South American cattle may be looked for, as a line of steamship has been completed to open up the trades between London and Monte Video. It is not probable, however, even should the experiment succeed, that the beasts will arrive in sufficient numbers to influence the market here.

The arrivals of sheep have been on a fair average scale, and the quality and condition of the animals have been good. Prices, however, have continued to rule high, though with a tendency towards a lower range. Best Down sheep have sold at 5s. 6d. to 5s. 8d. on the average; but as much as 5s. 10d. has been realised.

Calves and pigs have not come to hand very freely, nor has the trade shown any great activity. Nevertheless the quotations have been without material variation for pork and veal.

There is a large stock of feeding stuff now in the country. Roots generally are plentiful, and are obtainable at comparatively low prices; while there is an abundance of hay and clover on offer for the time of year. Meadow hay is quoted at 75s. to 84s., red clover at 90s. to 130s. per load. Cakes have ruled dull, and prices generally show a reduction of 5s. to 10s. per ton.

The total supplies of stock exhibited in the Metropolitan Market have been as follows:

	Head.
Beasts	19,251
Sheep	91,760
Calves	1,127
Pigs	965
Total	113,103

COMPARISON OF SUPPLIES.

Pork	3 4 to 4 2	3 8 to 4 8

The dead-meat markets have been moderately supplied with meat. The trade, on the whole, has been quiet, at our quotations: Beef from 3s. to 5s., mutton 3s. 2d. to 5s. 2d., veal 5s. to 5s. 6d., and pork 4s. 2d. to 5s. 8d. per 8lbs., by the carcase,

GENERAL AGRICULTURAL REPORT FOR
FEBRUARY.

We have experienced somewhat severe weather since the opening of the month. Navigation has been much impeded, and this fact, coupled with the bad state of the roads, has prevented the supplies of wheat reaching market, except in limited quantities. The trade, however, has ruled very dull, and at the opening of the month a decided tendency towards lower rates was noticeable. Rather more firmness was apparent on the return of frost towards the middle of the month, and a slight reaction took place in the quotations. Since then, however, a relapse has occurred, and the month closes with an extremely heavy tone, and a general indisposition among millers to operate. Nevertheless, there are some features in the trade which must sooner or later exert a beneficial influence upon prices. Stocks of foreign wheat are on the decrease; and this diminution will make further progress, as our imports in the immediate future are likely to be much less extensive than during the past few months, the quantity of English wheat afloat for the United Kingdom having undergone considerable diminution. We give below the stocks of grain of all kinds in granary in London—so far as can be ascertained—on January 31st, which shows that the withdrawals from warehouse during the first month of the year were something considerable:

STOCK OF GRAIN, &c., IN LONDON.

	Jan. 31, 1870.	Jan. 31, 1869.	Nov. 30, 1869.
Flour ... cwts.	328,000	318,000	180,000

Total bulk* 1,018,380 1,120,869 770,639

*Except flour and cottonseed.

Consumption will now have to be met by further withdrawals from the granaries, as the arrivals will probably not be sufficiently heavy to meet current wants. Nevertheless, our imports during the month have been large, and the receipts of foreign produce show a formidable total as compared with last year. Since the 1st of September to the present date, they have been as follows:

	IMPORT.	EXPORT.	IMPORT.	EXPORT.
	1869-70.	1869-70.	1868-69.	1868-69.
Wheat...	22,824,236	126,710	13,637,534	134,490
Barley...	3,853,481	11,510	5,635,728	60,288
Oats...	5,429,862	42,576	3,139,226	51,613
Peas...	722,055	7,119	707,908	5,767
Beans...	952,571	1,167	1,463,420	3,065
1. Corn	10,073,275	7,874	6,348,824	522
Flour...	3,460,009	8,437	1,874,484	19,509

It may be remarked that the stocks of English wheat in the hands of farmers are large for the time of year—a singular circumstance when the undoubted deficiency of our last harvest is taken into consideration; but this is owing to the fact that farmers have held back their wheat as long as possible, and have disposed of their barley and other produce as being the more paying articles. Seeing that the return on last year's crop was under the average, farmers naturally expected prices high in proportion; but in this hope they have been grievously disappointed, owing to the excessive importations. We have little hesitation in saying that the past

season has been a very unfavourable one to English farmers, and we doubt whether speculators in floating produce have covered the severe losses they sustained a month or two back. It is as yet too early to pass any opinion upon the growing wheats. The young plants look strong and healthy, and the frost has had a beneficial effect in checking too rapid vegetation.

Spring corn has ruled dull throughout the month, and prices of all descriptions of feeding stuffs have been on the decline, though rather more firmness prevailed, owing to cold weather.

The potato markets were much glatted at the opening of the month, and prices were very low. Supplies, however, were much curtailed on the setting in of frost, and more activity prevailed, accompanied by a decided rise in values. The quality of the arrivals has not been good, all being more or less frosted.

There has been no feature of importance in the hop market. Choice qualities of English have ruled very scarce, and prices have been supported; but yearlings and foreign sorts have been altogether neglected. The continental and American markets have remained dull and nominally unchanged.

Hay and straw have come to hand pretty freely, and prices, after having suffered a relapse, have closed at about the same point as last month: Prime meadow hay £3 15s. to £4 2s. 6d., inferior £3 to £3 10s., Rowen £3 10s. to £3 5s., prime clover £5 15s. to £6, inferior £5 to £5 10s., prime second cut clover £5 to £5 10s., inferior £4 to £4 10s., straw £1 6s. to £1 10s. per load.

Wool has ruled quiet but firm. Some demand has been experienced for English lustras and demi-lustras, but staplers have refused to make any concession on any quality. The first series of public sales of colonial wool are now going on. The attendance of buyers, both home and foreign, has been good, and prices fully equal to the closing rates of last series have been paid.

REVIEW OF THE CATTLE TRADE DURING THE
MONTH OF FEBRUARY.

There has been an absence of any important feature in the cattle trade during the month. The receipts of stock from our own grazing districts have been about an average, and there has been a decided improvement in the quality of the stock. From abroad, however, owing to the tempestuous weather, the arrivals have been on a less liberal scale. As regards beasts, the condition of the Norfolk arrivals continues to bear out an assertion that the season would be a favourable one, a considerable increase in the weight of meat being noticed. From Scotland, also, the receipts still give satisfaction. In the trade a want of animation has been observable. Even for the choicest stock the demand has been restricted, and the value of the best Scots and crosses has fallen to 5s. 2d.; in fact, this quotation has been quite the extreme, many really good beasts having been disposed of at 5s. per 8 lbs.

With sheep the market has been fairly supplied, and some prime breeds have been forwarded. We regret to notice that, notwithstanding the severity of the weather, some shorn sheep have made their appearance. It is to be hoped that the attention of the proper authorities will be drawn to this matter, and that an effectual stop may be put to the practice of shearing sheep during inclement weather. In reference to the state of the trade, more firmness has been apparent, and the value of the best Down and half-breeds has been steady at 5s. 10d. to 6s. per 8 lbs.

A few lambs have come to hand, and have found buyers at about 7s. 6d. to 8s. per 8 lbs.

The supply of calves has been limited. The trade has been firm, and the quotations have had an upward tendency.

There has been a moderate supply of pigs on offer, for which the demand has been quiet, at about late rates.

The demand for feeding stuffs has improved, the supply of grass being much less extensive. However, there being still a large quantity of hay and roots unconsumed, values have not advanced to any material extent.

The total imports of foreign stock into London during the month have been as under:

	Head.
Beasts	3,349
Sheep	16,097
Calves	878
Pigs	1,060
Total	21,384

Imports at corresponding periods:

Total in 1869	27,988
" 1868	4,877

Veal	4 8	to 6 4	4 0	to 5 8
Pork	3 0	to 4 2	3 6	to 4 6

The dead-meat markets have fairly supplied with meat. The trade, generally, has been quiet, at our quotations: Beef has sold at from 3s. to 4s. 10d., mutton 3s. 2d. to 5s. 2d., veal 5s. to 5s. 8d., and pork 3s. 8d. to 5s. 8d. per 8lbs., by the carcase.

SOUTH LINCOLNSHIRE.

We have not much of any agricultural value to report. The weather has been unusually changeable and severe. Sunday (the 13th instant) was a day long to be remembered from its boisterous and stormy character and intensity of cold—perhaps the coldest day we have had since Christmas 1860. Sheep, as usual, suffered considerably. Cold, however intense, does not affect our Longwools much unless accompanied with stormy winds and drifting snow. This was the case on Sunday (the 13th instant) and part of the following Monday. The number of storm-struck sheep is considerable; but as the weather "has taken up" we hope they will soon recover. Upon our own farm we have only had to slaughter one. The

others are coming round. The turnips have deteriorated in quality from the biting frost, and were so hard that the sheep could not eat them, and had to be sustained from the mangold graves or other resources, as chaff, pea-haulm, and hay. In other respects the flocks have thus far wintered favourably. Our markets are already supplied with store stock, particularly sheep, which are readily sold at high prices relatively, when taken into account with the low price of corn. The fear of the holders appears to be in the great probability of a reduction of prices, both from the low price of corn, and the abundance of sheep. The high price yet received for mutton will keep up the value of all forward animals, but those in low condition must give way. The number of fatted cattle in this district is limited, and the prices are well sustained. Pork is a little cheaper, but store pigs are still very dear. It is interesting to know the cause of the high price pigs have so long made in the market. The statistical returns give a falling off in the number of pigs last year to near 600,000; but as pigs are almost as prolific as rabbits, the stock will soon be replenished. It is but a short time since they were scarcely worth breeding. Piglings sold readily at 2s. 6d. each. The lambing season is just commencing. The ewe flocks appear to be in a favourable condition. Great caution should be taken that no unusual disturbance takes place amongst them. They cannot be kept too quiet nor have their food too regular. We have not been able to do anything upon our arable lands for some time, but as the ploughing is forward no great anxiety is felt. The seeding of peas will be proceeded with as soon as the land is in a good state to receive them. The wheat-plant has been sadly cut by the late keen winds, but not destroyed. No winter-proud wheats this year. We never saw them "backward," but there is a fair plant throughout. The grass lands don't exhibit a blade of green, and bear ample testimony to the severity of the frost and wind. Our stack-yards look thinly stocked and the thrashings have been very unsatisfactory. A scanty yield, a light weight, and low price; a bad farmers' year. Potatoes have kept pretty well; the yield of good ware is light, and the price not remunerative. The culture of potatoes grows more unpopular daily, and the probability is that we shall plant a much smaller area than heretofore in this district. The expenses are very great, and if we cannot realise from fifteen to twenty pounds per acre, they are unremunerative, and must give way to mangolds and Swedes, to be grown for stock food. True, we consume through our stock large quantities of diseased potatoes, and thus aid the returns of the potato crop, but the weight per acre is so greatly inferior to mangolds and Swedes that we cannot profitably grow them for stock food. Winter grazing, or the fattening of farm stock in the winter, is gradually on the increase, and the culture of mangolds keeps pace with it. This is quite right, and farmers will ere long find it their best practice. The production of meat rather than grain will become more and more their aim, and no doubt will ultimately yield them the best returns.—Feb. 10.

BEDFORDSHIRE.

For the past three months we have had various weather, sometimes frost, at others very mild, but on the whole a dry winter. During the past week, or for the last ten days, the cold has been very severe, with the wind either north or north-east, with occasional flights of snow. The frost we have no doubt will be very beneficial for the land intended for spring cropping; but at the same time it is to be feared it may injure the young and backward wheat crops. The price of this grain at the present date can scarcely pay a farmer for his expenses of tillage, &c., for the crop, especially as the last year's growth was so deficient in yield; we have in several cases known where there has not been more than 2 to 2½ qrs. per acre on good land. There are a few pieces of peas and beans sown, but they will not be much earlier than those that are sown later, on account of the sharp weather. We shall commence on barley as soon as we get a favourable change in the weather; this corn has also deteriorated in value. It is not worth so much by some 6s. or 7s. per quarter as it was some two months back. Farmers, in general, who have thrashed their corn out immediately after harvest have been much more successful for several years past in their price for all kinds of grain. This will be

a bad year for a farmer who is wholly (or nearly so) dependent on his stack-yard, as all kind of grain yields very badly. Beans and peas in very many cases are not worth the expense of thrashing, so the stock are being foddered with them in the straw. Mutton has been making good prices, and sheep appear to thrive better on the roots than in some previous winters, on account of the dry weather. There are a few haggets now being clipped for the butcher, but the weather has been very cold for the poor animals. All kinds of feeding stuff for cattle have been cheap, so we doubt not there will be a great deal of meat in the country.—Feb. 18.

WEST SUSSEX.

Winter seems to be come at last. We had very heavy rains at the beginning of the week, causing heavy floods on the low lands; but the temperature was mild, and many men beginning to think that spring was commencing to exert its kind influence. But on Wednesday afternoon came a frost, "a chilling frost," very suddenly, and since that time we have had nothing but very sharp frost, lots of snow, and a nipping east and north-east wind. What effect these sudden changes may have on vegetation is yet to be seen, but they must be trying. The wheat plant in this district is small and backward. Much wheat was sown rather late, and it came up slowly, and on some of the ley ground appeared to suffer from slug and wireworm. There is no such thing to be seen as a piece of "winter proud" wheat. The young seeds and artificial grasses are generally well set on the ground, and give promise of a good crop. Fat stock has been selling well all the winter, though it appeared to be a little falling off in value, but this weather must check any downward movement. Lean stock has commanded very high rates. All cattle must now have great care and attention, both as regards food and shelter, or they will rapidly lose condition. This late frost may have a bad effect on the turnips and swedes in the ground, and feed will, perhaps, be scarce in the spring. The hay stacks will also soon look smaller, from the constant calls on them; fortunately the last proved a good crop of hay. The farmers of the present day appear to turn their attention a little more to politics, and even the Government begins to talk of the imperfect manner in which the corn returns are made. I thought every man with a head on his shoulders had known this for years, but farmers are not men to make any general movement. At the time I write there is no sign of any abatement in the severity of the weather; every appearance of more snow.—Feb. 18.

CORK COUNTY.

The winter has been, on the whole, exceedingly favourable, rain not having fallen up to this time in excessive quantity; nor yet has there been continuous frosts of any intensity. Twice the thermometer fell to 19 degrees below the freezing point; but in each instance fresh and open weather succeeded immediately. Now, however, the weather seems to have bed come thoroughly broken, and very little work can be attempted on the field. Spring preparatory operations are well forward, in consequence of the open character of the past season; and potato planting, on friable soils and dry situations, has been pretty extensively carried on. There has been little difficulty in bringing stock thus far through the winter, and food is plentiful all over the county. Turnips and hay are, in consequence, very reasonable in price, and have been sold at prices which do little more than cover the cost of production. For the past three months turnips have averaged from 13s. to 16s. a ton delivered. And excellent hay from 48s. to 52s. a ton, the very best rye-grass seldom exceeding 28s. Straw, from the lightness of the crop, is dearer in proportion, being from 40s. to 60s. a ton, according to condition and quality. In every case the buyer has the best of the bargain, the unfortunate producer having no alternative but to accept his offer, being compelled by dire necessity to turn every available article on his farm into cash so as to meet his liabilities. The purely arable farmer (nearly all poor and needy ones are such) feels the present state of affairs very acutely, as his crops were not only extremely light, but the quality was inferior, and the market value as low as it could well be—so low, in fact, as to make the year an indifferent one, even had the crop been good. Wheat and barley were not quite so much affected by the dry

weather, and those who had a fair proportion of each have not suffered so much, barley having carried a very good price in the beginning of the season for malting qualities. Oats, which are the principal dependence of the small farmer, turned out miserably, many fields not returning the seed; and to make up the money required for rent, rates, and other pressing expenses, they are compelled to sacrifice a portion of their fodder, which can be very badly spared, the few turnips grown having also to be turned into cash. Oats, good enough for seed, can scarcely be had in some parts of the country, samples for that purpose begin now to be looked for, and are worth 2s. a cwt. over the shipping rates. We never recollect to have seen distillers purchase such poor qualities of oats as they have done this season, some lots, although dry and well-harvested, being little else than husk. Of course, could they have got better, these would not have been bought; but heavy oats were not to be had. The very low price of corn has been a great inducement to use it extensively in cattle-feeding, as it is decidedly more economical than cake, there being nearly two tons for one in the case of linseed; and rape having been hard to get of good quality, feeders were shy of using it, preferring corn instead. Rapecake of inferior quality is fit for nothing but manure, as cattle will not touch it; and to persist in placing it before them is a mere waste of time and money, as they will pick out every slice of the turnip, and leave the cake after them in the troughs. The markets have up to this time been very well supplied with beef, and prices have, in consequence, remained at a moderate standard; nor is there much appearance of anything like scarcity till at least a very late period of the season. So quiet is the tone of trade in fat cattle; and so easy is it for butchers to supply themselves, that many lots of store stock, laid in three months ago at long prices, would, if sold now, make but little over first cost. Sheep begin to get scarce, and wethers of good quality bring readily from 8d. to 9d. per lb. At this advanced period of the season the offer is worth a good deal, and enables the buyers to give an extra 1½d. per lb. on the dead weight. Holders of sheep stock are unanimous in the expectation of good prices for lamb and mutton during the ensuing season, and to all appearance there is but little likelihood of their hopes being disappointed. At all the public sales competition for breeding sheep has been wonderfully keen, and in every instance where the flock had a name for the purity of blood, from 80s. to 80s. was freely given for ewes in lamb, regardless almost of condition. The low price of corn has given a great impetus to stock breeding, and the general tone of conversation amongst agriculturists at present would lead one to the conclusion that Lord Carlisle's idea of Ireland was on the eve of being verified, and that she was in reality about to become "A land of flocks and herds." Although the foot-and-mouth disease visited this county, it was not of a fatal or even very troublesome type, the animals getting over it in a few days with scarcely any attention, neither their condition or produce being perceptibly affected. Being so much in the open air, as the cattle are so far south as this, seems to impart a hardness of constitution which enables them to resist the attacks of disease, the thick coat of hair which nature provides under these conditions enabling them to pass through the most severe and sudden changes of weather with impunity. The extraordinary excitement which prevailed a couple of months ago on the subject of "Tenant right" and "Fixity of tenure" has in a great measure subsided, the most zealous promoters of these measures seeming to await, with whatever amount of patience they can command, to see what will be the result of their agitation at the coming sitting of Parliament. It would be hard to conceive of a legislative body conferring the rights of property without purchase, and thus preventing capitalists, the very men who are badly wanting (a poor landlord being a continual source of misery), from investing their money in landed property. It is only reasonable to suppose that there are few wealthy men to be found who would be willing to assume, as partner, a man who contributed nothing to the common stock, and yet whom it was impossible to get rid of without purchasing the share or shares to which he was legally entitled, but for which no money was ever paid. Compensation for improvement on a broad and liberal basis, which should undoubtedly have been the law of the land long ago, is now however confidently expected, and if the present governing party intend to preserve the support of the tenant farmers of Ireland, they will take good care that their hopes on this very important point are not disappointed.

THE CORN TRADE.

BIRMINGHAM, 2nd Month, 3rd.—Owing to the very large arrivals of foreign grain, particularly of wheat, the past year has been one of loss and disappointment to the trade. Our prices are doubtless now lower than they would have been if we had had a good crop at home. Foreign shippers appear to think that England can absorb an unlimited quantity of wheat, and to disregard the fact that our total consumption is only about one-half that of France. When it became clear that our harvest was likely to be deficient, so much grain was sent forward that the extra imports into the United Kingdom during the last five months of 1869 have exceeded the proportion of difference between a good and bad crop. As we think that after making the usual deduction for seed the yield of the last season cannot exceed 11,000,000 quarters, the quantity to be supplied by imports is fully as great as it was after the harvest of 1867, when prices were 20s. to 30s. per quarter higher. The excessive supplies are probably attributable to a great production in America and Southern Russia, combined with an absence of demand in the other corn consuming countries. We have received more wheat from the United States and Canada than in any previous year; but the export thence is now temporarily checked, not only by the frost, but also by the heavy losses which have been sustained by consigners. The low price of bread is a great advantage to the working classes, and must, as heretofore, be the forerunner of an improvement in the general trade of the country; as the less people require to spend on food, the more they have left for other purposes. Meat is relatively very dear, and seems likely to continue so, negating the old saying that, "horn follows corn."

The number of wheat-laden vessels on the way to the United Kingdom is stated at 256, but it is reported that many of these have already been directed to continental ports, on account of the reduced prices in England; this reduction amounts to 8s. to 12s. per quarter, and French prices are now rather higher than ours. The crop in that country is officially reported to be 7,000,000 quarters less than the previous one, and increased imports will probably be required. The stocks in our leading ports are more than double what they were at the end of 1868. Those in the American and Black Sea ports are stated to amount to 1,500,000 quarters, against about 1,000,000 quarters a year ago. It is also probable that our farmers hold more wheat than usual after a deficient crop. A large quantity of wheat is on the way from California, but not of such fine quality as heretofore. Unless shippers are checked by our very low rates, there are also likely to be considerable shipments from Chili, if not from Australia. Our imports of wheat and flour in the year 1869 have amounted to 10,216,975 quarters, against 8,628,987 quarters in 1868. So far, Scotland and Ireland have not taken the usual proportion of the arrivals.

Barley has fallen about 10s. per quarter in the twelve months, or nearly as much as wheat. There are far fewer cargoes on passage than at this time last year, and stocks, unlike those of wheat, are moderate; so that with a backward cold spring we look for some improvement in value.

Throughout the year our chief supplies of oats have again been from Ireland. Only a few cargoes have arrived in Gloucester from France and Holland. Prices have, however, been forced down by the very large sale of Swedish and Russian oats from London and the East coast ports.

Beans and peas have only gone down about 5s. per quarter, and in some of the country markets both sell for as much per bushel as wheat.

Maize continues the favourite article for feeding horses, cattle, sheep, and pigs, although it is not now cheaper than grinding barley and the lower descriptions of oats, and is dearer than Dari and millet. The imports of this article into Gloucester have consequently been very large.

JOSEPH AND CHARLES STUBBS.

THE SEED TRADE.

At the opening of the seed season, we beg respectfully to submit the result of our information as to the growth in this country, and also on the continent and in America, of the most generally used descriptions of agricultural seeds,

RED CLOVERSEED.—This season's red cloverseed, it must be borne in mind, is sowed from seed sown in the spring of 1868; and as, owing to the excessive drought of the following summer, a large proportion of this failed, the acreage left was very small, and the plants being unusually poor and thin, the yield of 1869 has consequently been very deficient. This failure in the clovers was the cause of the unprecedented demand for *Trifolium incarnatum*, &c., which prevailed during the autumn of 1868, which was needed to fill up the deficiency of plant. The English growth of red has accordingly been exceedingly short, and the quality for the most part very indifferent. These remarks may also be applied to Germany and the North of France. The quantity of seed imported from the former country during last spring was something extraordinary—the reverse is the case this season—the Germans having actually been competing with us in the French market for their own home consumption. America has shown she has but little old stock on hand, and a very small crop of new, by the large orders which have been transmitted to this country for seed of American growth; such seed to the extent of several thousand bags, although two or three years old, has been recently re-shipped to New York; no other description, except the produce of the States, being admissible without the payment of a heavy import duty. The only parts where any supply of red clover seed may be expected from are Brittany and the South of France; and the English and continental demand has now nearly exhausted the growth of these districts, and occasioned an advance there to prices relatively higher than those ruling here.

ALSKYE AND WHITE CLOVERSEED.—The yield in this country is small, for the reasons given above, but the quality is satisfactory. We are largely dependent upon Germany for our supply of these sorts, but the quantity offering thence is limited. Prices are high, and from the scarcity will, it is thought, go still higher.

TRIFOIL.—This is a very deficient crop, both at home and abroad. Fine new seed is exceedingly scarce, and readily commands high rates. There is, however, a considerable stock of old seed, which can at present be bought on moderate terms.

FRENCH-ITALIAN RYEGRASS.—The growth is moderate, and stocks are light. Its great superiority over English, Scotch, and Irish seed causes its use yearly to increase. Prices are advancing both here and in France.

SCOTCH AND IRISH GRASSES are this year very cheap and plentiful.

During the last two years autumn and early purchases have proved disappointing, and, as a consequence, but few country buyers have as yet gone into stocks. This year, however, taking into consideration the limited stocks on hand, and the certainly deficient growths, we anticipate a speedy enhancement in values.

London, February, 1870.

JOHN SHAW AND SONS.

AGRICULTURAL INTELLIGENCE,
FAIRS, &c.

ASHBORNE FAIR.—There was a very small show of cattle, in consequence of the very bad weather. Good barren beasts realised high prices; inferior stock moving off very slowly. A few sheep were shown, which made about 9d. per lb.

BANBURY FORTNIGHTLY FAIR.—There was a good supply of sheep, and the demand was good. The best, in the wool, brought about 6s. per stone. There were a good many cattle in the market. Better prices were asked and obtained.

BLAIRGOWRIE MARKET.—The market opened and closed dull in every department, except for fat cattle, which were considered dear; but all were nearly sold—three-year-old stots ranging from £21, £23, and upwards; two-year-olds, £12 to £15 10s. per head; yearlings, £3 to £9 10s. At the auction mart, fat beef gave from 10s. to 10s. 6d. for first-class, and 8s. 6d. to 9s. for secondary qualities, per Dutch stone. Fat sheep gave 7d. to 8d. per lb., and pigs from 6s. 9d. to 7s. per stone.

BOSTON FAT SHEEP MARKET.—Only a very small supply, which sold readily at from 8d. to 8½d. per lb.

CARLISLE FAIR is generally looked upon as the most important one for horses held in the Border city; but this year there was a great falling off in the show. During the week some heavy sales have been effected, principally in dray horses, for which dealers were willing to pay high rates. Consequently the bulk of the business was done before the market commenced, and this deteriorated from the business character of the market. The agricultural horses exhibited included some nice specimens of the equine tribe, but these were bought up at once, and afterwards the inferior horses sold slowly, and at comparatively low figures. Of hacks there was a poor show, and the same remark will apply to ponies. The two latter classes, however, were seldom inquired for, buyers evidently wanting heavy horses, and these of the very best class. For dray horses the figures paid in the market and on the morning of the market ranged from £35 to £40, £45, and even £50; agricultural horses, £20 to £25; ponies, £0 to £12 10s. each.

DORCHESTER FAIR was pretty well supplied, sheep excepted, and the few of these on sale were of an indifferent quality. Cows and calves realised from £14 to £22; barren mares from £11 to £16; fat bullocks from 11s. to 12s. per score; mutton from 7d. to 8d. per lb. In the horse fair the collection of animals was small, and from 30 to 50 guineas was asked for cart horses, from 45 to 55 guineas was wanted for ran horses; some capital colts were on sale.

DUMFRIES FAIR, from time immemorial, has been the most important for the sale of horses that is held in the commencement of the spring on the north side of the Tweed and Sark. There was an excellent show of draught horses; on some previous occasions there have been a large number of animals brought forward, but the quality has seldom been surpassed. Nearly the whole of the stock was in dealers' hands, the local dealers having, as the custom now is, been scouring the district for weeks, purchasing the best horses that farmers had to sell. The business commenced early and with great briskness, the best young, fresh, and powerful draught horses being quickly bought up. The transactions were chiefly between dealers, not many farmers buying horses. After midday the demand grew slack, and sales were slower of being effected; still, a large number of animals changed owners. Few saddle or harness horses were shown, and these were mostly inferior. Ponies were scarce, and there were few draught colts and fillies shown to breeders. Prices were at least 10 to 15 per cent. up from the Rood fair in September. First class draught horses were selling from £50 to £70, and in a few instances to £80, and in one case to £90. Good useful young horses for farm work from £35 to £48; ordinary animals from £20 to £30. The following are a few of the sales reported: Mr. M. Tennan sold upwards of forty animals, at prices from £30 to £80. He bought from Mr. Gibson, Summerfield, a three years old colt, at £75, and another of the same age at £70—both prize takers. He sold a pair of young horses at £80 each. Messrs. A. and R. Johnstone sold a horse at £58, and a pair at £115; a horse at £55; and a large number to other buyers, at prices from £30 to £53. Mr. Thomas Currie sold three mares at £60 each—altogether, he sold forty animals from that figure down to £35. He bought a two years old colt at £45, and resold him at a profit to Mr. McCall. Mr. James Clark sold a strong horse at £70, a pair of grey horses at £105, and a mare at £60. Mr. Carlisle, Messrs. sold twenty-six horses at prices from £40 to £60. Mr. Hugh Crawford sold a powerful draught horse at the high figure of £50. This animal was the best in the market. He sold a number of others at prices from £40 to £55. Mr. John Brown, Biggar, sold four three years old fillies at £50 each, and two years old colts and fillies from £26 to £35. Mr. J. Smith, Boushawdale, sold twenty-five horses at prices from £40 to £68. Mr. Dunlop sold about thirty animals from £30 to £55. Mr. McKenzie bought a horse at £63, and he sold a mare at £60, and a horse at £59. Mr. Yail, Glasgow, sold a horse at £65, and one at £60 to Mr. Dunlop; he sold a pair at £110. The latter dealer bought and sold horses from £40 to £60.

DUNFERMLINE MONTHLY MARKET.—The stock brought forward was mostly of an inferior kind, very small, and a large proportion of it consisted of stirks from Ireland. A number of cows were also in the market, and a very few fat cattle. Fat cattle brought from 9s. to 10s. per Dutch stone; cows sold at from £9 to £16, and for this class there was a

brisk demand. Irish cattle brought from £2 10s. to £5, but a good number remained unsold. There was a numerous attendance in the horse market, and many animals changed hands at high prices.

FORRES MONTHLY MARKET.—Business was generally very dull, especially in the fore part of the day; but as the dealers began to leave the markets, sellers had to submit to rather low prices. A pretty general clearance was effected in the afternoon. The following are a few of the most important sales: Mr. Mackay, Burgie, sold nine three-year-old crosses at £21, and six Highland two-year-old stots at £54; twenty two-year-old (polled) were sold at £19 10s.; thirteen stots at £23 10s., and a heifer at £30; three two year old crosses at £20; a Shorthorn bull at £17; a fat cow at £15 2s. 6d.; a cow at £14 15s.; a cross stot and a cow for £32 the pair; a pair of cross queys for £30; five two-year old cows at £17 5s.; nine two-year-old crosses at 20 guineas each; a cow a £14 5s.; &c.

GRANTHAM FAT STOCK MARKET.—A very small quantity of stock; plenty of buyers were present, and a brisk competition ensued. Beef sold at 8s. to 9s. per stone, pork same price, and mutton 8d. to 9d. per lb.

LINCOLN FAT STOCK MARKET.—A short supply. Wethers 9d. per lb., beef 9s., and pigs from 8s. 3d. to 9s. per stone.

MEIGLE MONTHLY MARKET.—There was an excellent display of very superior fat cattle; and, with the exception of a few lots, all were sold at what dealers declared to be very high prices. The market was consequently stiff from the beginning to the close. The best beef gave 10s. 6d., and secondary 8s. to 9s. per Dutch stone. The best three-year-old bullocks, in prime condition, sold from £22, £23 10s., £25, up to £29 per head; secondary, from £18 10s. to £20 and £22. Two-year-olds in good order, from £16, £18, and £20. Lean cattle of the same age, £12 to £13. Yearlings ranged about an average of £8; but of the latter two classes there was but a small supply, and no special demand, owing to the scarceness of fodder and the inferior quality of turnips, arising from the effects of frost.

MILNATHORT MARKET.—The stock was not up to the average, and there were no prime fat animals in the market. Best quality sold at from 8s. to 9s. per imperial stone sinking offal. Several transactions in lean stock were speedily effected, while others left the market without changing owners. Milch cows generally met with a ready sale at prices varying from £9 to £18. The following are a few of the sales: a lot of stots at £18 10s.; a lot at £18; a lot at £16; a lot at £15, and a milch cow at £18; three two-year-old stots at £13. In the sheep market, Mr. Hamilton, Tarhill, sold a lot of two-year-old crosses at £1 18s.; a lot of Cheviot ewes at £1 12s.; a lot of cross hogs at £1 3s. Several milch cows left the market without changing owners, from the high prices asked.

MODBURY GREAT MARKET was slackly attended, owing to the severe cold. Supply of cattle was also small, but business generally brisk. Fat cattle 65s., inferior 60s. per cwt., sheep 7d. to 8½d. per lb., cows and calves £14 to £30 per pair.

MORETON GREAT MARKET.—Owing to the extreme cold, and small supply of cattle, high prices were asked, but no particular change from late markets. Sheep pens not all filled, with dull sales.

NORTHALLERTON FAIR.—Hunters were scarce, as a number had been sold in the country. A good show of draught horses had ready sale, at £42 to 50 gs. each. Harness and also carriage horses were eagerly purchased at £60 to £85 each. We had a good supply of fat cattle, which sold at 8s. 6d. per stone, plenty of buyers attending the fair. Lean stock was not in much demand, and much remained on hand. In-calfing cows had fair sale.

RUGBY FAIR.—The prices made were, for beef, of which there was a short supply, from 7d. to 7½d. per lb. Mutton was very scarce, at from 8½d. to 9½d. per lb. Milch cows were rather lower in price, and a short supply. Store beasts were in greater demand, a few useful barren beasts changing hands at higher prices.

SHREWSBURY FAIR.—There was a good show of stock, both cattle and sheep, but the business was heavy, and prices hardly so good as at the last fair. Beef realised from 7d. to 8d. per lb., and Mutton from 8d. to 8½d. High prices were

asked for pigs, of which a good many were shown, but a large number were sent home unsold.

SLEAFORD FAT STOCK MARKET.—Small show of sheep, which met with a brisk trade. Fair show of beef, which was readily sold. Good show of pigs. Mutton from 8½d. to 9½d. per lb., best beef from 9s. to 9s. 6d., second quality from 8s. 6d. to 8s. 9d., and pork from 8s. 6d. per stone.

SWINDON MONTHLY MARKET.—Fat sheep sold at from 5s. 6d. to 6s. the stone, and beef at 12s. to 13s. 6d. per score. Beef met with a slow sale at slightly lower rates.

IRISH FAIRS.—**MACROOM:** Strippers sold at from £8 to £12; springers from £8 to £14; year and a-half heifers £6 to £9; calves from £1 10s. to £4 10s.; bacon pigs rated at 56s. per cwt.; store pigs, which were generally high, from £1 to £2 10s. There was very little demand for store sheep; mutton sold at 7d. per pound.—**NAVAN:** Prime beef might be quoted at from 63s. to 67s. 6d. per cwt.; second and inferior 54s. to 56s. 6d. per cwt. Owing to the severe frost there were not many far advanced springers exhibited for sale, but those that were fetched very high figures, some realising as much as £26 5s. each. Strippers were not in great demand. Three-year-old bullocks rated at from £16 to £25 each; two-year-olds, £8 16s. to £11 10s.; yearlings, £3 10s. to £5 15s. There was a very good supply of mutton, which may be quoted at 7d. per lb.; ewes, fat, £2 15s. to £3 10s. each.—**DUNDALK:** Top quality of prime beef averaged from about 6d. to 6½d. per lb.; inferior, 5d. to 9d. Three-year-old stores rated from £10 to £12; two-year-olds from £8 to £11; yearlings from £4 to £6; strippers from £7 to £11, and in good demand. Dairy cows in limited supply. **HOSPITAL:** Strippers brought £12 to £17 each. In-calf heifers were not considered good enough for our desires, but what were sold brought from £13 to £18; two-year-old heifers, £9 to £11; yearlings, £5 to £7. Several large lots of hoggets brought from £2 10s. to £3 15s. Store pigs sold freely at advanced prices according to size. The business of the day seemed so satisfactory to all that the success of these important fairs may be looked on as certain. The pig fair on Friday last was also well attended. Heavy bacon went slowly at 64s. to 66s.; Berwickers were in good demand at 58s. per cwt.

STOCK SALES.—**EDINBURGH:** The best class of bullocks sold from £22 to £27 10s. a-head, a great number at £17 to £20; small heifers down to £12; cows, £11 to £21 10s. The sheep consisted mostly of hoggs and black-faced wethers. The best class of hoggs sold from 40s. to 48s. a-head, smaller sorts 34s. to 38s., crosses 30s. to 38s., small black-faced wethers 25s. to 38s., black-faced ewes 24s. to 30s., half-bred ditto 44s. to 49s. Fat calves from £3 10s. up to £7 2s. 6d. Pigs from 35s. to £5 a-head.—**HADDINGTON:** Sheep sold from 39s. 9d. to 50s. 9d., hoggs 41s. to 49s., smaller sorts 38s. to 34s. 6d., Cheviot ewes 43s. 6d. to 47s. 3d., rams 42s. 6d. to 71s.; cattle from £20 10s. to £28 7s. 6d., smaller sorts £12 5s. to £19 5s., queys £12 5s. to £20 7s. 6d.; calves from 17s. to 66s.; pigs from 58s. to 130s.—**HAWICK:** Half-bred wethers sold from 42s. to 54s. 9d., Cheviot wethers 81s. to 46s., half-bred ewes 44s. to 66s. 9d., Cheviot ewes 27s. 6d. to 47s., half-bred hoggs 35s. to 48s. 9d.; fat cattle £13 to £27 5s., milch cows £11 7s. 6d. to £22. Mutton may be quoted at 7d. to 9d. per lb.; beef, 8s. 6d. to 8s. 9d. per stone.—**JEDEBURGH:** Small heifers sold from £12 15s. to £15, West Highland bullocks £12 5s. to £12 7s. 6d., bull £27 6s., cow and suckler £26, milch cows £15, calves 26s. to 55s. 6d. A number of lots of small hoggs 41s. 3d. to 45s., young sheep 30s. to 60s., half-bred ewes 26s. to 46s. 6d., tups 53s. 6d. to 76s.; fat pigs £3 3s. to £11 7s. 6d., shotts 30s. to 46s., young pigs 18s. to 28s.—**DALKETH:** Cheviot and half-bred wethers, 46s., 47s., 53s. 3d., 57s.; best hoggs, 52s., 53s. 3d., 55s. 3d., 59s. 6d.; smaller kinds, 46s., 43s. 9d., 44s. 3d., 46s. 3d.; Cheviot ewes, 32s. 6d., 36s., 38s.; black-faced ewes, 25s. 9d., 26s. 3d., 27s. 3d.; tups, 52s., 62s. 6d., 72s. Best cattle sold from £22, £22 10s., £24 7s. 6d., £24 15s.; other sorts ranged from £13 7s. 6d. to £18, and up to £20 17s. 6d. One pig, 106s.—**EARLSTON:** Best bullocks made from £24 to £30 each, or 9s.; secondary, £17 to £20, or 8s. 3d. per stone; best heifers, from £17 to £22; bulls, from £16 to £26 each. Half-bred Dinmonts, from 44s. to 55s.; Cheviots and crosses, from 38s. to 48s.; ewes, 32s. to 36s.; hoggets, 34s. to 49s. Top price of mutton, 9½d.; current, 8½d. per lb. Pigs made from £2 5s. to £5 10s.; skins, from 3s. to 7s. 3d. each.—**ATB:** 3 Ayrshire calving

cows, from £7 to £8 10s.; 9 Ayrshire fat cows, from £13 7s. 6d. to £16 10s.; 6 Ayrshire fat cows, from £11 10s. to £13 10s.; 12 Ayrshire fat cows, from £9 10s. to £11 5s.; 7 Ayrshire heifers, from £14 to £16; 6 Galloway bullocks, from £15 to £23 12s. 6d.; 4 Galloway heifers, from £14 2s. 6d. to £19 10s.; 4 Galloway cows, from £15 5s. to £17; 1 Galloway bull (stock), at £10 10s.; 6 Ayrshire bullocks, from £17 7s. 6d. to £20 15s.; 3 polled bullocks, from £16 2s. 6d. to £20 15s.; 3 polled bullocks (store), from £11 10s. to £12 10s.; 5 cross bullocks (store), from £11 10s. to £13 15s.; 7 Ayrshire bulls, from £12 to £19 2s. 6d. Sheep, cross hoggs, from 35s. 3d. to 44s. 6d.; Cheviot wethers, from 37s. to 41s. 6d.; Cheviot ewes, from 23s. to 45s. 6d.; black-faced wethers, from 44s. 6d. to 50s.; black-faced ewes, from 17s. 6d. to 35s. 3d.; Leicester ewes, 48s. to 54s. 1 pig at £9.

SALE OF SHORTHORNS.—The spring sales in Aberdeenshire of Shorthorn bull calves began by public offer of bulls belonging to and bred by Mr. Marr, Cairnbrogie, and Mr. Campbell, Blairton. Prices were fair, and the result of sale was as under:—Mr. Marr's stock: Livingstone, calved 1st June 1869, Mr. Leask, Swanford, 26 guineas. Forerunner, red, calved 12th January 1869, Mr. Marr, Hatton, Cruden, 23 guineas. Alexander, red, calved 19th January 1869, Mr. Mackie, Mains of Elrick, Ellon, 23 guineas. Mechi, red, calved 16th February 1869, Captain Volume, Longside, 26 guineas. Horatio, red, calved 8th March 1869, Mr. Strath, Coldhome, 30 guineas. Formartine, red, calved 10th March 1869, Mr. Gibson, Brahead, Cruden, 19 guineas. Buchan King, red, calved 13th March 1869, Mr. George Walker, Birkenhill, Turriff, 33 guineas. Buchan Prince, roan, calved 23rd March 1869, Mr. Cock, Crichtie, 21 guineas. Briton, red, calved 23rd March 1869, Mr. Kilgour, Ardlin, Ellon, 17 guineas. Charley O'Malley, red, calved 24th March 1869, Mr. Middel, Tillybrex, 17 guineas. Fortune, red, calved 31st March 1869, Mr. Alexander Simpson, Little Elrick, Old Deer, 29 guineas. Lord Lovel, red, calved 7th April 1869, Mr. Brand, Auchentain, Cruden, 23 guineas.—Mr. Campbell's stock: Gladstone, red and white, calved December 1868, Mr. Slessor, Strichen, 30 guineas. Captain Barclay, roan, calved 20th January 1869, Mr. Lind, Laverockbrae, Taves, 23 guineas. The Pope, roan, calved 27th January 1869, Mr. Clark, Orkney, 34 guineas. The Cardinal, roan, calved 25th January 1869, Mr. Meikle, Crostone, 28 guineas. The Bishop, red, calved 29th January 1869, Mr. Penny, Shanness, Old Deer, 20 guineas. The Priest, red, calved 6th February 1869, Mr. William Gray, Culterculen, Foveran, 30 guineas. Nonpariel, red and white, calved 27th March 1869, Mr. William Hay, Haddo, Crimond, 17 guineas. Buchan Hero, white, calved 6th April 1869, Mr. Kiloh, Inverveddie, Longside, 16 guineas. Blacher, red, calved 28th February 1869, Mr. Burnett, Mains of Philorth, Fraserburgh, 12 guineas.

SCOTCH SHORTHORNS.—The second annual sale of Shorthorns at Mr. Cochrane's farm, Little Haddo, Aberdeenshire, was fairly attended last month. Ten yearling bulls averaged over £30 a-head; the highest brought 40 g., and the lowest 17 g. An old bull realised 35 g. Seven heifers averaged £30 a head; the highest 36 g., and the lowest 17. The highest priced bulls were those after Marmaduke, the winner of two second Highland Society's prizes and Aberdeenshire Challenge Cup.

SALE OF SHORTHORNS.—The small herd of Shorthorns at Lunc Bank, late the property of Mr. Houseman, were sold by auction, by Mr. Vince. The 10 animals realised on an average only £28 each. White Strawberry, 21 g.; Wild Rose, 29 g.; Hartforth Strawberry, 34 g.; Pride of the Harem, 30 g.; Knight of the Harem, 34 g.; Hartington, 40 g. (the highest price obtained); Blencow 22 g., Cloth of Gold 12½ g.

MR. DUCKHAM'S SECOND PERIODICAL SALE OF HEREFORDS was held on the Hereford Candlemas Fair day; but the prices obtained have not been published, and we hear that very few of the lots put up were really sold.

THE BANBURY HORSE SHOW took place the first day of the fair. For the best cart horse, above four years old, £10, Z. Stilgoe, Adderbury; commented, T. E. Beridge, Pimlico Farm, Tasmore; 10 entries. For the best cart mare, above four years old, £5, J. Bury, Hook-Norton; commented, J. Bliss, Waddington; 9 entries. For the best cart

colt, under four years old, £5, W. Fairbrother, Burton Dassett; commended, H. G. Coldicott, Lower Heyford, and W. Denchfield, Easington; 16 entries. For the best cart filly, under four years old, £5, H. Checkley, Wykham; commended, R. Nicholls, Goldington, Bicester, and Gidding, Hook-Norton; 9 entries. For the best cart colt or filly, under two years old, £5, N. Stigoe; commended, Hiorns, sen., Chacombe; 12 entries. For the best hunter, over five years old, £10, W. Golby, Radway, Kineton; commended, T. Sargeant, Churchill, Chipping-Norton; 11 entries. For the best hunter, under five years old, £10, E. Bliss, Maidford, Daventry; commended, Newitt, Westbury, Buckingham; 9 entries. For the best hackney, not exceeding fifteen hands one inch and a half high, £5, J. E. Parsons, Charwelton, Daventry; commended, J. Johnson, Fawley, Daventry; 11 entries. For the best colt not exceeding fifteen hands high, £5, J. Robbins, Tachbrook, Warwick; 12 entries. The judges were Messrs. Elliott, Heathcote, Worcester; Perceval, Wanford, Peterborough; Potter, Witton, Birmingham; and E. Stanley, Birmingham.

THE CONTAGIOUS DISEASES (ANIMALS) ACT.

A FARMER FINED £25.

It will be remembered that some time ago a case came before the Norwich magistrates, in which Charles Huggins, a farmer and cattle-dealer, residing at Banham, in this county, was summoned, on the information of Mr. Smith, veterinary-inspector, for exposing on Norwich Hill a number of cattle affected with the foot-and-mouth disease. The magistrates being of opinion that they had no jurisdiction in the case, declined to hear it, and the Court of Queen's Bench was afterwards applied to for a mandamus. The matter was brought under the notice of the House of Commons on Tuesday night by Mr. Clare Sewell Read, who asked the Vice-President of the Council if he was aware that such doubt existed as to the power of summary jurisdiction of justices under the Contagious Diseases (Animals) Act that the Norwich and other magistrates had declined to hear any summonses under the Act, and if he would take steps to remove the uncertainty which now existed; and if, when the local authorities asked information from the Veterinary Department of the Privy Council, an answer, stating "that it is not within the province of this department to interpret an Act of Parliament," was all the aid local authorities were to receive from the Privy Council in carrying out the Act and orders for suppressing contagious diseases among cattle. Mr. W. E. Forster replied that the Privy Council officers were aware that some doubts had been expressed as to whether a summary jurisdiction was enacted by the Act of last Session; though he could not suppose that there was any doubt at all as to whether it was intended to do so. They had consulted the law officers of the Crown, and were advised that such summary jurisdiction did exist. They were aware that the magistrates of Norwich, among others, had refused, for a time, to issue summonses; but an appeal against such a decision had been heard in the Court of Queen's Bench, which Court had made a rule absolute directing the issue of such summonses. Under these circumstances there would be no necessity for taking any steps to remove uncertainty. As to the second question, it had never been the intention nor the practice of the Privy Council to refuse assistance in carrying out this difficult Act of Parliament. As to the reply to a letter which was referred to in the question, he had looked and found that there was one letter that by pure accident merely contained the statement that had been mentioned; but generally speaking, when no interpretation of an Act had been given, it was the practice at the Privy Council Office not to attempt to give an interpretation, as to pursue such a course would only mislead, because it was not an interpretation that could have any force in a court of law. But the officers of the Privy Council were directed to give all the assistance in their power; where there was any question as to facts, they were to answer it, but they were simply to decline to answer as to interpretations of the law when such interpretations would be misleading.

The case accordingly came on for hearing at the Guildhall on Thursday, before Mr. W. J. UTREN BROWNE, and Mr. J. M. VENNING. Mr. Huggins was summoned at the

instance of Mr. W. Smith, veterinary-inspector, under the Contagious Diseases (Animals) Act, 1869, for unlawfully exposing for sale in the Norwich Cattle Market, on the 20th of November last, a certain number of animals, viz., 16 oxen affected with the foot-and-mouth disease, contrary to the provisions of the said Act, whereby he had incurred a penalty not exceeding £80.

After hearing the evidence,

Mr. BROWNE said: We consider this case has been clearly proved, and we shall inflict a penalty of £25, with the costs, £3 16s.

MARTINGALE.—None loved the Town Moor better than poor James White, or "Martingale." Thirty years ago he was in his zenith, with his book on "Country Scenes," and as a contributor to *Benley*; and his powers knew no decay. He was quite the Prose Poet of Nature, and no man that we ever met with was so keenly alive to her beauties, and could word-paint them so well. Edlington Wood, which seldom fails to produce a fox when the Fitzwilliam call, was one of his special haunts when he was well and vigorous. He seemed to know the haunt of every badger, the name and the note of every bird, and the *genus* of every wild flower that grew on its banks and glades. He liked to wander away from Doncaster "when the mavis and merle were singing," and regardless of the prosaic days in which his lot was cast, take his dinner with him, and "have a word with the woods." Weaving an old legend into shape pleased him best. The deserted hut, where a poacher had lived and died, a very lord of the soil to the last, seemed to conjure up in his mind a network of dark romance; and Sherwood Forest and Merrie Barnsdale were themes which never palled. His racing writings were very numerous; but as he rarely left Doncaster, he was too often compelled to take his description second-hand. In dealing with current racing topics he was far too discursive, and pitched his key-note so high, that matter of fact readers grumbled, that after wandering through such a labyrinth of fine words, they could hardly find one grain of fact. His strength as a turf-writer lay in his "Turf Characters," and his recollections of the Doncaster past. If he was not in the *Gazette* office hard at work at his beautiful small manuscript, with his voluminous velvet cap on his head, or in a chancel-seat in the old church, or in Edlington, or Wheatley, or Sprothorough Woods, Doncaster Moor was a sure find for him, and he was pretty certain to be talking to himself. Seeing those races, and the gallops as well, was his delight, and he generally stationed himself, from old usage, on the St. Leger day somewhere between the Red House and the Hill, to catch the first symptoms of the "pace complaint." St. Leger after St. Leger was to him a scene he could unfold with a master's hand. Every little incident from the Duke of Hamilton's day had been treasured and invested with significance; and as John Jackson, the celebrated jockey, lodged with him for a series of years, he had an opportunity of "posting himself up" during the week, which he took care to use to the full.—*Saddle and Siroin*, by THE DRUID.

THE AGRICULTURAL HALL COMPANY (LIMITED).—At the general meeting called for March 1st, the Directors' report will declare a dividend of 8 per cent. The receipts by the Cattle Show of 1869 are put at £4,717 11s. 2d.

DEATH OF MR. ADCOCK.—This very popular Northamptonshire character, died on St. Valentine's day, at his residence, Farndish, near Wellingborough, in his 67th year. He accumulated a fortune in an extensive business in London when a young man, and retired some twenty years ago to Farndish, where he farmed extensively, as well as at Wollaston. During the last seven years he had collected and bred some first-class Shorthorns, and was a frequent and well-known attendant at most of the great sales. His favourite hobby was to feed six Hereford and six Shorthorn bullocks, at Christmas, which were considered one of the sights at the Northampton Fat Cattle show. Paralysis struck him down some twelve months ago, and though he got out he never recovered. No man was ever more popular both at home and abroad, and his death will be felt by a large circle of friends. We believe his Shorthorn herd will in due time come to the hammer.

A TERRIBLE TITLE.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—Your agricultural contemporary of the 24th January, speaking of the herd of Mr. Oliver, of Sholebroke, communicates the following intelligence:

"A red yearling bull, Satan (27,430), lately left the Sholebroke Lodge herd for joint service in the herds of Mr. Levi B. Bagshaw, of Newton, Kettering, and Mr. Charles Bayes, also of Kettering. Got by Cherry Grand Duke (23,554), the son of Grand Duke 7th (19,877) and Cherry Duchess 9th by Third Grand Duke, the grandam and great-grandam being respectively by Second Grand Duke and Grand Duke; he is from Satanella by Seventh Grand Duke. He is likely to make his mark in Mr. Bagshaw's herd."

I need not say that this startling intelligence has created a great sensation in the States, and I send you the sentiments of the nation upon it, as transfused into verse by one of our greatest poets—a Representative man, of exalted mind and unaffected piety.

I trust that your readers "Love straightforward verse,
And will take it, like marriage, for better for worse."

I am, sir, yours respectfully,

Buffalo, U.S.A.

LOT BOUSFIELD.

"At length—ride last 'Beal's Messenger'—ends
All hope for Bates cattle, their breeders and friends;
For Satan who, twelvemonths ago, from his hold broke
To visit his snug little farmstead at Sholebroke;
Now, leaving the lands he has lately encamp'd on,
To seek 'pastures new' in his shire of Northampton,
Turns Bates, with a view his position of bettering.
And makes a descent, in disguise, upon Kettering.
He came, we are told, like a *serpent* of old,
But practice has made the deceiver more bold;
For in these later days of iniquity fall,
He comes, like great Jove, in the shape of a bull.
To do all the evil he can in his creed,
So he comes as a bull of Kirklevington breed!
Not *incog.*, but beneath an avowed transformation,
Arch-enemy he of the bovine creation.

Not thus his confederates came to the States,
But as Shorthorns earth-born, of the breed 'r'clept 'Bates',
Bulls, heifers, and kine of the blood genu-ine,
Calculated the best of all strains to combine;
And with titles to which, whatsoever the race is,
John Bull still ascribes all perfections and graces.
And though we soon found that the breed wouldn't do,
In spite of grand names, and long pedigrees too;
And ever and aye, grimy nose or horn stout
Suggested uncanny connexions with Cloutie.
We dream'd not what cost us a whole Californy
Of gold, were indeed but *bêtes noires* from Auld Hornie.

This brood of Old Nick's, when roaming from Styz,
No longer on Yankee locations shall fix,
But may go with the herds of Van Diemen to mix.
Hibernia, Australia, refuse all admission
To bulls which would doom the best herds to perdition;
And for Jove-sping Satan we thus prophesy of him
Europa, disgusted, will shortly fight shy of him.

Vainly that Evil Intelligence, 'Bel,
Would throw round these bovine infernals the spell
Of his own fertile fancy, until they expand
Into Shorthorns commanding, majestic and grand,
With pedigrees noble that none can impeach:
What though his use of all figures of speech,
All tools by which thought is to elegance wrought,
From critics impartial the tribute extort
That he *nihil tetigit quod non ornavit*,
His wand-Nickromancing, however, he may wave it,
Though potent to call up presentments unreal,
Can ne'er rule the issue of show-yard ordeal.
The prize-rings expose the consummate delusion,
And whelm the Bates' heroes with constant confusion.

Then let noble lords who implicitly follow
The oracular grunt of the Easton Apollo,
Still, throw, as they may, their loose thousands away
On these imps of the De'il broken loose for a day:

In vain will be all their endeavours to palm
These brutes on the world as the things for the farm—
We find knowing breeders invoking a plague on
Such bulls as, in double sense, cattle of Dragon,
Which, till there's a change in Old Harry's stock radical,
Ne'er can be more than toys aristocratical.
De'il-spawn's a pill they will not have at *aid*,
But go in for the blood of old Waraby still.

Unfortunate Bagshaw! unfortunate Bayes!
Who've both undertaken the Devil to raise;
I fear that ye'll both have the Devil to pay—
The foul fiend is more easy to raise than to lay,
And calves *in futuro* 'his mark' will betray.
And Sholebroke, beware! for sages declare
Of him, whom to name polite circles forbear,
That he will, when accounts he is ready to square,
Not alone have his due, but will render it, too,
To subjects who pay him allegiance true.
And, whatever the debt he may seem to forget,
He has somewhere (of this heavy odds we may bet)
A Roland in store for his Oliver yet.
With a stroke of his claw, he will settle the score,
So as not to have 'Oliver asking for more.'"

THE "ACTION" OF THE CENTRAL CHAMBER OF AGRICULTURE.

Whether we look to the effort or the result, there never was a better justification of the sarcasm "How not to do it" than was afforded by last week's meeting of the Council of the Central Chamber of Agriculture. And the example was all the more remarkable for the contrast offered by another agricultural meeting on the previous day. The Farmers' Club, a company of practical farmers and land agents, with one or two landowners, had assembled on Monday to discuss an important department of farm practice, and they proved their competency throughout—both lecture and discussion being full of serviceable information and trustworthy guidance. On the Tuesday a monthly meeting of the Central Chamber of Agriculture, including nearly a score of members of Parliament, and gentlemen deputed by two dozen provincial chambers, assembled to consider resolutions which had been properly arranged for discussion by a previous "business committee, after a sort of previous digestion, which, as we understand the somewhat complicated procedure, the various topics undergo in the country before they come up for final decision in town. The two principal subjects which were thus arranged for discussion at the latter meeting were Road Maintenance and Agricultural Statistics. On the first of them, resolutions were offered affirming the policy of the simultaneous abolition of turnpike trusts, their debts being liquidated by the national exchequer, and the future maintenance of the roads being made to fall upon "the general wealth of the districts through which they pass." These resolutions and an amendment to them having been submitted to the meeting, Mr. Knatchbull-Hugessen, M.P., made a speech, in which the intentions of the Government on the subject were to some extent announced; and it was thereupon immediately proposed by Sir Massey Lopes, Bart., M.P., that as "Government are going to take up local taxation, to be followed by the road question, it was inexpedient for the Chamber to adopt or recommend any proposal until the Cabinet had announced their promised scheme." So "Sir G. Jenkinson withdrew his resolution, and Mr. Jabez Turner withdrew his resolution;" and, although Captain Craigie urged that they had met that day to give an opinion, and Mr. Hugessen had stated he was anxious to know what were the opinions of the delegates on the subject, the whole plan arranged by the "business committee" fell through and disappeared, and the great organisation for urging the views of agriculturists upon Government obviously failed of its intended purpose.

What, then, was done in connection with agricultural statistics? This, too, had been everywhere discussed and rediscussed for years, and must, we should think, at length be ripe for a definite and conclusive utterance. The first amendment was rejected by a considerable majority; the second was lost by 11 to 7, and finally the original motion was lost by a majority of one! Here, again, we submit, is a remarkable ex-

ample of the failure of the elaborate organisation which was to have urged the opinions of agriculturists upon the attention of the Government.

But really, the kind of reasoning and argument which appeared to command attention at this meeting is even more significant than the result to which it led. If the leading men of the Central Chamber of Agriculture, members of Parliament included, are afraid of knowing the facts of the case—or afraid of letting them to be known—if they must be sure beforehand of what the facts will teach before they will consent to any attempt at their collection!—if they think with Mr. Arkell that “the purpose” for which information regarding facts is sought has any bearing whatever upon the policy of letting truth be known—if the idea that knowledge is power is to be considered, as Mr. Albert Pell, M.P., appears to think

it, “a senseless theory”—then we may congratulate the Central Chamber on their discussion of the agricultural statistics question. It has landed them in just the sort of weak and helpless muddle in which those who hold such notions must feel themselves at home. To an outsider, however, who believes, upon the contrary, that all attempts to make men know their actual circumstances are to be encouraged—that the truth should be sought for, utterly regardless of what it may turn out to be—and made known, never minding what it is—and that the love of ignorance is a great mistake—it appears as if the Chamber of Agriculture was discovering the agricultural mind to Government in a very unfortunate way indeed.

However, let us hope for the best. They are to discuss the policy of *Agricultural Education* at their next meeting!—*The Gardeners' Chronicle and Agricultural Gazette*.

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

February fill-ditch has not kept up its usual character, but brought us a little winter of unusual severity, so that the navigation of the Thames was stopped for a week; but the frost now seems to have left, and we wait to see its effects. It certainly has been more of a check than vegetation seemed to require, but may leave benefits behind it. The plough was stopped, and the work of other implements, but the soil has been penetrated deeply, and we may have a finer tilth than the harrow could have effected, and a good beginning for the planting of spring corn. The wheat has indeed been unprotected, and some fears are expressed as the consequence; but it is one of the hardiest of plants, and may yet yield abundantly. In ordinary times the sudden arrival of such a frost would have sent prices up; and we have, indeed, fluctuated as regards wheat, but the balance has been against the trade fully 2s.—the large stocks here as well as in some foreign ports making millers very leisurely in their purchases from not anticipating any immediate advance. Yet it was reasonable for farmers to expect some compensation for a decidedly short crop, as shown by the recent particulars published by the *Mark Lane Express*; from which we infer that our home produce, out of 3,688,357 acres, has only yielded 11 million quarters, or thereabouts, for so perfect plan has yet been adopted to give us a fully reliable account. The worst features of the case is that every corn crop was a bad one, and we all know that all kinds of grain but malting barley has been bringing very bad prices. If this state of things is to continue, farmers will have to look more closely to their rents, especially if overrun with game; or cultivate more stock, as meat has been fetching such high rates, which still seem likely to rule. We grant that, as regards wheat, for several years England in her yield has stood about first. Hence the foreign imports, if wanted, could not have been so liberally sent, but now America and Russia have had a good yield, and other places about their usual growth; so we have for the time been fairly overdone. And though we calculate, notwithstanding present heavy stocks, we shall want about 5 million quarters by the end of August, there seems little doubt but that it will come, unless foreign houses are dissatisfied with present prices and prospects. Nevertheless, we have, in the course of a large experience, found so many things in favour of unseasonably low prices, that we should much prefer waiting to a certain sacrifice. The new crop is in its infancy; it has many trials to pass through: and who is certain of a favourable gathering? The following rates were recently quoted at the places named: White wheat at Paris 48s.,

red 46s., white at Bordeaux 47s., average rates of the best quality in Belgium 45s. to 46s. 6d., red at Hambro' 39s. to 42s., white 43s., red at Stettin 39s., at Cologne 39s., at Rostock 40s., at Romanshorn in Switzerland 49s., at Berlin 41s., at Vienna 42s., red at Pesth in Hungary 38s. to 37s. 6d., fine new white at Dantzic 49s., cost freight and insurance, old to 55s. ditto, at Alexandria 38s. 6d. free on board, San Francisco 44s. to 46s. cost freight and insurance, No. 1 spring wheat at New York 36s. 9d. per 480lbs., No. 2 36s., No. 3 34s., white Michigan 45s., winter wheat at Montreal 33s. per 480lbs., spring 33s. 6d.

The necessities of the press obliging us to omit the last Monday in January, we commence our review on that day and close it on the 21st February.

The first Monday of this second month of the year began on moderate arrivals of wheat, both English and foreign. The morning's show on the Essex and Kentish stands was improved, both as to quantity and condition, in consequence of the frost of the previous week; but a thaw having then set in, the market became dull, and sales could only be made at 1s. per qr. decline. For the same reason great heaviness prevailed in every description of foreign, holders being generally disposed to accept a like reduction from the previous Monday's rates. With but a moderate quantity of floating cargoes on sale, the demand was slack, holders asking the previous terms. The heaviness of the London trade was fully responded to in the country, the entire week having been wet. Some reports, indeed, quoted no change, but it seemed, from the want of business, several noted a decline of 1s., and about an equal number were down 1s. to 2s.; Liverpool declining 2d. to 4d. per cental for the week, or 10d. to 1s. 8d. per qr. Neither Edinburgh or Glasgow were able to sell at the previous rates, both noting a decline of 1s. per qr., with very little passing. Though a decided fall on the best wheat was not reported in the Irish markets, secondary qualities gave way both at Dublin and Cork.

On the second Monday there was more English as well as foreign wheat reported. The show of fresh samples from Kent and Essex was fair as to quantity, but very bad as to condition, from the damp weather in which it was thrashed. This, coupled with the idea of the permanent departure of the frost, had a most depressing effect on the market, and for a long time millers seemed indisposed to bid at all; but on finding factors anxious to make way, and ready to submit to large concessions, business was finally transacted pretty freely at a decline

of 2s. to 8s. per qr. The sale of foreign was almost suspended till holders were willing to accept 1s. to 2s. per qr. lower rates than on the previous Monday, more especially for the low qualities of American and Russian. Floating cargoes also declined 1s. per qr. The country followed London this week, but not to the same extent, for on Wednesday there were indications of renewed frost, which came with great suddenness and severity. Melton Mowbray, however, and Sheffield were 2s. depressed, and a decline of 1s. to 2s. was noted at Hull, Ipswich, Sleaford, Nottingham, Market Rasen, Gainsboro', Thirsk, and Salisbury; and several yielded 1s., but three or four recovered again on Saturday, and noted 1s. advance; and Liverpool on Friday was 2d. per cental dearer. Glasgow was 6d. to 1s. down, and Leith also 1s. lower. Dublin was dull, and prices little more than nominal for the best qualities.

On the third Monday there was about the same quantity of English as previously, but less foreign; with the Thames so full of ice in the space of the five days' frost that navigation was completely stopped, excepting in very few instances. Kentish and Essex factors were little disposed to offer the few fresh samples sent up, especially as the previous week's sales could not be delivered; but all that was accessible by land recovered value to the extent of 1s. per qr.; and a similar improvement was occasionally realised in the lower sorts of foreign red, but on the whole very little business could be done. Floating cargoes, which began to give way heavily, suddenly recovered to the extent of about 1s. 6d. per qr. on fine parcels. The doubtful rise noted in London was differently viewed in the country; many places, looking upon it as temporary, only noted more firmness; others were 1s. per qr. higher, as Boston, Rotherham, Alford, Rugby, Gainsboro', Lynn, Ipswich, Manchester, Bristol, and Gloucester. Others varied prices 1s. to 2s., as Spalding, Louth, and Stockton; and a few were even more. Liverpool gained 2d. per cental on Tuesday, and lost half of it on Friday. Glasgow was rather dearer, as well as Edinburgh. At Dublin there was only a better demand for foreign qualities.

On the fourth Monday the English supply was small, and the foreign limited to two small cargoes—viz., one from Bremen and the other from Trieste. On this day the navigation of the river was resumed, the ice having sunk, and the temperature being only ordinarily cold. Very few fresh samples appeared on the Essex and Kentish stand, and these were mostly in such poor condition that they met with no attention from millers, though anything really fine was worth the prices paid on the previous Monday. The attendance was but moderate from the country, and buyers seemed to expect to satisfy themselves on lower terms; but these were generally resisted, in consequence of the short supply. Floating cargoes were dull, and lost something of the late advance. The arrivals for four weeks in London were 22,296 qrs. country qualities, 49,185 qrs. foreign, against 18,982 qrs. English, 38,302 qrs. foreign in 1869. The imports into the Kingdom for four weeks ending 19th Feb., were, 3,874,569 cwt. Wheat, 626,280 cwt. Flour, against 2,436,240 cwt. Wheat, 887,723 cwt. Flour for the same period last year. The London exports were 1,185 qrs. Wheat, 850 cwts. Flour. The London averages commenced at 45s. 9d. and closed at 44s. The general averages began at 43s. 6d., and ended at 41s. 9d.

The Flour trade has been very dragging and unsatisfactory for the four weeks, Norfolks having lost value about 2s. per sack, foreign about 1s. 6d. per sack and 1s. per brl.; the demand for the latter being little more than retail; but town prices have kept the top price to 48s., millers alleging they have to pay such high prices for the

best old Danzig and other foreign Wheat to keep up their quality.

With fair supplies of Maize through the month, prices have somewhat fluctuated, leaving the balance against values about 1s., fair quality being procurable at 27s., and excellent at 28s. These low rates have for some time been undermining the value of Beans and Peas; but as in New York rates are dearer there than here, and the only place whence large supplies can for some time come is the Mediterranean, we should not be surprised to find a rally from the present depression. Our receipts in four weeks have been 49,899 qrs., against 43,884 qrs. 1869.

Barley has come to hand very scantily, both as respects home supplies and foreign: yet the general dullness of trade appears so to have reduced the demand for Malt, that the best malting sorts have found little inquiry, and have gone back in value 1s. to 2s., and all qualities of foreign have receded about 1s. per qr.; fair grinding sorts may now be had at about 33s. per qr., or even less. The imports for four weeks in London have been 12,450 qrs. British, 28,888 qrs. foreign, against 15,103 qrs. British, 192,503 qrs. foreign at the same period in 1869.

There has been a great falling-off in foreign Oats during the month; but after a few fluctuations, prices remain much as they previously were: good fresh Swedes are procurable at 19s. per qr., and fair Russian at 18s. to 18s. 6d. With such low rates it was not to be expected any would come from Scotland, and there have been but few of home-growth and from Ireland. The four weeks' supplies were thus: native 2,747 qrs., Irish 1,940 qrs., foreign 79,017 qrs., against 2,181 qrs. English, 1,252 qrs. Scotch, 7,653 qrs. Irish, 88,403 qrs. foreign in 1869.

The supply of home-grown Beans has been moderate, while scarcely any foreign have arrived. The want of these latter has lately sent up the price of old about 2s. per qr. suddenly, from the scarcity; but the English sent up by farmers, being nearly all new and rather soft and unfit for splitting, have not advanced, though not so difficult of sale as lately, and the price has become so low—say 34s. for Mazagans. With a short crop we do not seem likely to see a further reduction, not many being expected from Egypt. This sort, lately worth only about 34s., would now bring 37s. per qr. The imports for London in four weeks were 3,186 qrs. English, 70 qrs. foreign, against 1,904 qrs. English, 11,960 qrs. foreign in 1869.

The supply of Peas has been limited; and though we had a severe frost for a week, it did not last long enough to bring a good demand for boilers, but only hardened values—say to 34s. or 35s. per qr., duns remaining dull. The English arrivals in London for four weeks were 1,969 qrs., the foreign 529 qrs., against 812 qrs. English, 110 qrs. foreign last year.

Linseed has been very firm through the month, the receipts being light, and Cakes have gone off well, from the sharpness of the weather. The frost occurring at the beginning of the Seed season has quite put it back, though Cloverseed, both red and white fine, have been high-priced, and rates have lately been advancing in France. The sale of spring Tares has also been stopped, but must soon recommence, good small spring being 37s. to 38s. per qr.

GLASGOW, (Wednesday last).—There has again been large arrivals, upwards of 2,000 cheese being laid down. Sales very slow, but prices unaltered. Cheddars 58s. to 70s., Dunlop 56s. to 65s.

CORDEROY AND CO'S CHEESE CIRCULAR, (Thursday last).—The provision trade in general has been dull and awkward during the week. Fine butter, however, has been wanted, owing to the small arrivals (in consequence of the severe weather), and high rates for this article have prevailed. The extensive lack of employment is still to be deplored. We can only hope that as spring advances this evil will be in some degree mitigated. Supplies of most descriptions of cheese from various quarters are fully equal to the demand. Cheap cheese are inquired for, and good useful Cheshire lumps at 62s. to 68s. are saleable. Anything tender in condition or damaged cannot readily be sold. American cheese are in moderate supply; prices for the very best are firm, ranging from 70s. to 75s.; common qualities are entirely neglected. The arrivals reported since our last are 7,234 boxes.

CORK BUTTER MARKET, (Friday last).—Ordinary first quality export 136s., country 132s., second, export 130s., country 127s.; third, export 106s., country 103s.; fourth, export 82s., country 79s. Mild-cured: first quality, export 135s., country 132s.; second, export 130s., country, 127s.; third, export 112, country 109s. Currency: Ordinary Butter 10s. per cwt. less; mild cured, 10s. ditto; sponged, 2s. ditto; thirds, fourths, fifths, and sixths of kegs, 4s. less.

POULTRY, &c., MARKETS.—Turkeys, cocks 5s. 6d. to 12s., hens 4s. to 6s. 6d.; Geese, 6s. to 7s.; ditto Irish, 4s. to 5s. 6d.; Goslings, 6s. 6d. to 8s. 6d.; Ducks, 2s. 6d. to 3s. 6d.; ditto wild, 2s. to 3s.; Ducklings, 4s. to 6s.; Surrey Fowls, 4s. to 6s.; Sussex ditto, 3s. to 4s.; Boston and Essex, 2s. 6d. to 3s. 6d.; Irish, 1s. 6d. to 2s. 6d.; tame Rabbits, 1s. 6d. to 2s.; ditto wild, 2s. to 1s. 6d.; Pigeons, 6d. to 9d.; Hares, 3s. 6d. to 4s.; Widgeon, 1s. 9d. to 2s.; Teal, 1s. 6d.; Woodcocks, 3s. 6d. to 4s. 6d.; Snipes, 1s. 6d.; Gold Plover, 1s. 6d.; Black ditto, 1s. each; Larks, 2s. 3d. per dozen. Eggs, 10s., seconds 7s. 9d. per 120.

COVENT GARDEN MARKET.

We have but little change to notice in respect either of supply or price. Hothouse Pines are in somewhat better request, and some good fruit from the Azores have been offered this week, chiefly of the Cayenne varieties, for which fair prices have been obtained. Grapes are quite sufficient, comprising Muscats, Alicante, Barbarossa, and Lady Downe's. Continental imports include the usual varieties of saladings, Artichokes, Carrots, &c. The Potato market continues dull; and in consequence of the severe weather plants in flower are rather scarce.

ENGLISH WOOL MARKET.

LONDON, MONDAY, Feb. 21.—The English wool trade has ruled quiet but firm. Some demands continue to be experienced for choice qualities, including lustres and demi-lustres, so the quotations are firmly maintained. The attention of manufacturers is now chiefly directed to the public sales of colonial wool which opened on Thursday last. The attendance at this series has been good, and both home and foreign buyers have operated with freedom. Prices have consequently had an upward tendency, though no quotable advance has taken place.

CURRENT PRICES OF ENGLISH WOOL.	s. d.	s. d.

Super ditto.....	0 11 to 1 0	

BRADFORD WOOL MARKET, (Thursday last).—The tone of the market is again quiet, but not more depressed than of late. Buyers of wool operate to a small extent in various classes, but only for the supply of their current requirements. The trade is looking forward with some interest to Mr. Firth's public sale this afternoon, and this induces buyers to adopt a waiting policy as far as possible, until they see whether prices are fully maintained. The opening of the London Wool Sales to-day (at which, from the short supply, an advance is looked for), and the near approach of Bristol Wool Fair have a similar influence, and at the same time cause holders—of down wools, at any rate—to be firm. Staplers generally are not willing to take less, although buyers usually try to buy on rather easier terms; and, in some cases, where dealers are wishful to quit their stocks, a slight reduction has, no doubt, to be allowed. The influence of these repeated quiet market days is unquestionably in favour of easier rates, but hitherto quotations have been, as a rule, very fairly maintained.—*Bradford Observer.*

LEEDS (ENGLISH AND FOREIGN), Friday last.—There is on the whole a quiet state in the English wool trade, but not much alteration in prices, nor does it seem likely that there will be any material change for some time. Colonial wool is in moderate demand, and prices are firm. As buyers are numerous in London, and the arrivals small, there will be a rather brisk competition for the qualities most in demand. The consumption in this district is rather below an average.

BRESLAU WOOL REPORT, Feb. 17.—We had again a moderate attendance of home and foreign manufacturers, who chiefly purchased the inferior and middle fine descriptions of Volhynian, Polish, Posen, and Silesian Wools at from 50 to 65 thalers per cwt. Some large transactions have been in the mean time effected in Charkow scoured wools at about 65 thalers, as well as in alipes, from 35 to 45 thalers per cwt. Fine qualities continued comparatively neglected, and met a very slow sale. Prices in general were very much the same as hitherto, yet owners were, in many instances, obliged to yield to the pretensions of purchasers. The whole amount of sale arises to about 3,500 cwts., whereas fresh imports were about 2,000 cwts. The result of the current London sales is looked for with great interest, as they will have a very decisive influence on the further march of business on the continent.—GUNSBERG BROTHERS.

THE OILCAKE TRADE.

LONDON, MONDAY, Feb. 21.—There is no improvement to notice in the Oilcake trade, so the general tendency of price has been in a downward direction.

NEW SERIES.

VOL. LVIII.

1870.

NO. CXXXV.

PLATE I.

THE PRINCESS OF YETHOLM,

A PRIZE SHORTHORN COW.

THE PROPERTY OF SIR WALTER CALVELEY TREVELYAN, BART., OF WALLINGTON, NEWCASTLE-UPON-TYNE.

The Princess of Yetholm, a red and white cow, bred by Sir Walter Trevelyan, and calved August 10, 1864, was by Gipsy Prince (17965), out of Young Honeysuckle, by Daisy Bull 2nd (14364), her dam Honeysuckle 2nd by Ravensworth (10681)—Hepatica by Lonsdale (9305)—Fuchsia by Wizard (6688)—by Wiseton (2848)—by Walter (2811)—by Mercury (2301)—by Star (1479)—by Weallesey (1571)—by Western Comet (689)—by Phenomenon (491)—by Chieftain (135).

Gipsy Prince (17965), a red roan bull, bred by Mr. W. H. Ripley, of Lightcliffe, and calved January, 14, 1860, was by Prince Tallyrand (16765), out of Gipsy by Grand Turk (12969), her dam Ursula by Captain Edwards (8929)—Fair Rosamond, by Senator (8548)—Emily, by Sir Philip (8588)—by Premier (2448)—by Alfred (2985). Gipsy Prince was purchased by Sir Walter Trevelyan, in whose herd he has been chiefly used. Gipsy Prince has also distinguished himself on the show ground, as at the Leeds meeting of the Royal Agricultural Society of England he took the third prize in the class of yearling bulls, and first prizes during the same season at the Durham, the Northumberland, and the Tyneside meetings; while in the following year he was "the reserve" in the class of two-year-old Shorthorn bulls at the Great Battersea Exhibition of the Royal Agricultural Society.

Young Honeysuckle, a roan cow, bred by Mr. Thornton, of Stapleton, and calved on September 23, 1859, also went early into Sir Walter Trevelyan's herd, in which there are five very promising heifers out of her. One that has gone wrong in her breeding is now in training for the Christmas shows at York and Leeds in December 1870; while another is at present at Captain Gunter's at Wetherby, to be served by 3rd Duke of Wharfedale.

The following is a list of the prizes taken by The Princess of Yetholm:—Prize of £8 as the best Shorthorn cow, at the Northumberland Agricultural Society's meeting at Cornhill, in August, 1868; first premium of £10, as the best Shorthorn cow, and the Corporation Cup, value £20, as the best female in the Shorthorn classes, at the York Christmas fat show, in December 1868; first

prize of £20, as the best Shorthorn cow, and the President's Cup, value £25, as the best animal in the show-yard, at the Leeds Christmas fat show, in December, 1868; first prize of £15, as the best Shorthorn cow of her class, and the extra prize of £20, as the best animal in the female cattle classes at the Birmingham Fat Cattle Show, in November 1869; first premium of £25, as the best Shorthorn cow in her class, and the silver cup, value £40, as the best animal in the female cattle classes, at the Smithfield Club Show, December 1869. We remember seeing the Princess of Yetholm exhibited as a breeding cow at the Wetherby Meeting of the Yorkshire Society, in 1868, when she commanded no notice from the Judges; and she was also once beaten as a calf by Miss Beverley 17th.

In our report of the Birmingham Show, we said, "There travelled up from Newcastle-upon-Tyne a certain Princess of Yetholm, bringing with her a very high repute, which she has quite maintained in the Midlands. She is a very neat, not large cow, nicely fed, fashionable in her appearance, and kindly in her touch, so that she looked to place herself readily enough as the best Shorthorn cow. Some, indeed, went further, and, as 'bred and fed' by Sir Walter Trevelyan, would have made her the best on this condition also, and so of course the best of all the Shorthorns, while this would have led on to her being not merely the best of all the females, but the best in the yard. Not but that some of her company kept her in countenance."

That anonymous authority, known as "one of the Judges," thus speaks of the best of all the cows in the Smithfield Club's own report: "She was a deep-framed short-legged cow, of almost perfect form, and fed as level as possible, her fault being that she was a little too low before."

The Princess of Yetholm, had only just "qualified" with one calf, a heifer called Queen of Yetholm by 2nd Earl of Oxford (23843), that has also gone on a visit to 3rd Duke of Wharfedale, at Wetherby.

PLATE II.

PERO GOMEZ.

THE PROPERTY OF SIR JOSEPH HAWLEY, BART.

Pero Gomez, bred by his present owner, Sir Joseph Hawley, in 1866, is by Beadsman out of Salamanca, by Student (son of Chatham), her dam Bravery, by Gameboy—Ennui, by Bay Middleton—Blue Devils, by Velocipede.

Beadsman, bred by Sir Joseph Hawley in 1855, is by Weatherbit, out of Mendicant by Touchstone. He won the Derby; but his career on the turf was not a very long one, and his stock came out in 1863, when he was credited with one winner in Mulberry, followed by Merry Wife in 1864, Caryophyllus in 1865, Arapelle, The Palmer, and Red Shoes in 1866, Belphegor, Blue Gown, Green Sleeve, and Rosierucian in 1867, and Pero Gomez, Morna, and Acorn in 1868. It is noticeable that nearly all these winners are the property of Sir Joseph Hawley, Beadsman having had very few mares, until latterly, beyond those of his owner. He stood last season at Hurstbourne Park at a subscription of 35 mares at 100 gs. each.

Salamanca, bred by Mr. W. Blake in 1859, came out in Sir Joseph Hawley's colours, but she was no great performer, nor, with the exception of Pero Gomez, has the mare been very successful at the stud. Her first foal in 1864 was Arapelle, by Beadsman; in 1865, Adosinda,

by Beadsman; in 1866, Pero Gomez, by Beadsman; in 1867, Salamis, by Asteroid; in 1868, a filly, by Fir-Roland; and in 1869, a colt, by Beadsman.

Pero Gomez is a rich brown horse, without white, standing fifteen hands three inches high. He has a plain head, with a not very nice expression, a good neck, and well-laid shoulders, although his forehead is by no means elegant or blood-like. He has good depth of girth, with strong muscular quarters, and a great big-jointed set of limbs. He has, however, a certain slackness of rib, and stands very upright before. Indeed, Pero Gomez is not a taking horse, as he shows a coarseness throughout, although at the same time something of a plain likeness to his sire, but standing nearer to the ground. He can scarcely even when winning the St. Leger be said to have fulfilled all his early promise; and with his legs at one time during the past season as round as soda-water bottles, his career seemed about closed at Ascot, although since, what with fine nursing, he has been quite set up again. Pero Gomez is still about the best of his year, as after being disappointed in the race, he ran Pretender to a head for the Derby, and over a longer distance of ground he beat Pretender far enough for the Leger.

SEWERAGE DIFFICULTIES.

BY CUTHBERT W. JOHNSON, F.R.S.

The improvement of the public health is a question becoming more and more interesting to my readers. Sanitary improvements are no longer viewed as matters of indifference. These facts are not now confined to those places where large masses of people are congregated. It has been shown that the health of even our rural villages is capable of great improvement, and perhaps on no occasion more clearly than in a recent valuable paper by Mr. Bailey Denton, to which I shall presently have occasion to refer (*Jour. Roy. Ag. Soc., N.S., vol. vi., p. 208*). As then it will be necessary to attend to the sanitary improvement of many at present neglected rural districts, it may be useful if we avail ourselves of a little practical experience, and endeavour to understand the task required of those who undertake to improve the health and comfort of a country town or village.

In taking a survey of the town, we shall commonly find that the houses are supplied with water from wells; that the house-drains lead to cesspools, which are constructed of porous materials, so as to allow the sewage to leak into the surrounding soil, and that very commonly the same stratum, from which the well derives its water.

The task which we have to fulfil is therefore evident; for omitting to notice other minor nuisances, we have to find, first, a copious supply of good water, and, second, to provide a drain for every house, and, third, arrange for the purification of the large amount of liquid manure received by the sewers.

These three great public objects must all be accomplished. It is idle to conclude that either of these may be neglected, and the others usefully rendered available. It is, however, satisfactory, and most encouraging to find that in ordinary cases the revenue derived from the water

rate and the disposal of the sewerage goes very far towards the payment of the interest and repayment of the money borrowed to carry out these great improvements. But to proceed with our object of clearing away difficulties, and avoiding erroneous conclusions, let us examine the best sources of obtaining a water supply, and next examine into what the sewage of a town really consists.

Before we do this, let us pause to consider for our encouragement the great saving of life that is in our power to accomplish, and on this point we may with advantage hear Mr. Denton, who remarks at the commencement of his paper on "Village Sanitary Economy":

"It is true that the annual reports of the Registrar-General maintain the views commonly held, that the degree of mortality amongst our rural population is much less than amongst that of our towns, for by comparing the death-rates of the 10 years ending 1866, it is found that the mean annual death-rate per 1,000 persons in the chief towns of the kingdom amounts to 24.59, while that of an equal population living in small towns, villages, and scattered dwellings in the country reaches only 20.10, showing a difference of 4.49 per 1,000 persons in favour of rural life. This comparison extended to 9,000,000 of people of each description. It appears by the same authority that over like periods, though of earlier dates, the average annual death-rate of 30 large town sub-districts was 28.01 per 1,000 persons, while that of 63 selected healthy country sub-districts was as low as 17.53 per 1,000 showing a maximum difference between large towns and rural districts of 10½ per 1,000 persons in favour of the latter. If we acknowledge this latter rate (17½ per 1,000 persons) to be a fair standard of healthfulness under favourable natural circumstances, without resting to show that it might be

The Duke of Devonshire
by J. G. G.
London, Published by the Proprietors, 1877

further reduced by the aid of sanitary works, we have a means of testing the sanitary condition of all rural places, and may take it as a rule—subject, of course, to exceptions, in which local and special causes counteract human provisions—that those districts in which the rate of mortality is above $17\frac{1}{2}$ per 1,000 are susceptible of sanitary improvements, and a reduction of mortality. To satisfy those who are disposed to regard with sympathetic interest the condition of our rural poor, that the mean of $17\frac{1}{2}$ per 1,000 persons is not an extremely low death-rate, it will be presently shown that many rural districts have a much lower rate. In the Farnborough district in Surrey, for instance, the death-rate is as low as 16 per 1,000; Bromley, in Kent, 16; Cranbrook, 17; considerable parts of Sussex and Hants, 17; while Alresford, in the latter county, reaches only 16 per 1,000, and Easthampstead in Berkshire has the same rate. In Northumberland and Cumberland the rates of mortality are as low as those of the southern counties, the Bellingham sub-district being 14 per 1,000; Glendale and Rothbury, 15; and Bootle 16 per 1,000. To appreciate fully the natural advantages possessed by the rural over the urban population, and the agricultural over the manufacturing classes, in a sanitary point of view, it should be understood that the number of deaths varies very considerably in different towns, increasing in number as the towns partake of a manufacturing character, whereby the risk to life is increased. In London, for instance, where the proportion of the manufacturing class is comparative small, the annual mortality averages 24 per 1,000, while that of Manchester is 32 per 1,000; so that, compared with the average death-rate of the most healthy rural districts, the mortality of Manchester, our largest manufacturing town, is greater by $1\frac{1}{2}$ per 1,000 persons, and, compared with the average death-rate of the chief towns of the kingdom, is higher by $7\frac{1}{2}$ per 1,000 persons.

"Again, although our rural poor suffer much from the cold and wet of the two winter quarters ending December, and March respectively, the rate of mortality in towns indicates much greater suffering in the same periods of the year. In the three months ending December, the average death-rate in our chief towns is 24.78 per 1,000, and in the March quarter 27.88 per 1,000; while the average mortality of the country districts in the same periods was 19.15 and 23.26 respectively.

"But, satisfactory and encouraging to the rural classes as these comparisons may be, there is little to be said in favour of human providence to maintain the advantage, for it is a fact to be demonstrated by special local statistics that many of our villages are little better than nests of disease, showing even greater mortality than many of our large and crowded cities. The thatched roof, the low dormer window the cob walls—graced as they frequently are by the ivy, the rose, and the jasmine—the filthy ash-heap, the leaky cesspool, the excrement-sodden soil, the saturated subsoil, and the polluted well, are all conducive to fever, diarrhoea, diphtheria, and phthisis, and explain with irresistible force to the sanitary reformer, who has more regard to the statistics of the Registrar-General than the charms of the picturesque, why it is that in so many of our villages

"Childhood's cheek no longer glows,
And village maidens lose the rose."

"It is, indeed, impossible to over-estimate the evils incident to and tacitly permitted in villages, because they are small in size, and the constituent dwellings are low in value, when it is certain that if those evils existed in large towns they would be summarily dealt with as nuisances of the worst character."

The water-supply will first demand the attention of the sanitary improver. This, be it ever remembered, is the

foundation stone on which the other portions of his task rest. It is idle to construct sewers (which require to be regularly flushed), and attempt to introduce water-closets, without a copious supply of water. In seeking for that supply, the nature of the locality will influence its selection; if a pure spring can be obtained that will supply the town by its own gravity, of course that is the best; but failing this, then most commonly, if a supply from a public well can be obtained, it is to be preferred before that from a river, or from gathering grounds, the water obtained from which widely varies in purity in different seasons. The daily quantity of water needed for a town is very considerable, in some cases 25 gallons per head suffices, whilst in other places 50, and even 100 gallons per head are consumed or wasted. The cost of the water-works in small towns (*and the water-works should always belong to the public, and never to a public company*) is commonly small (two or three economical plans are given by Mr. Denton); that of large towns has been furnished by Mr. Baldwin Latham, the engineer to the Croydon Board of Health, in his valuable report on the permanent sanitary works of that town. He observes—

"The cost of water-works is generally compared by stating the full cost of the works, and dividing it by the number of million gallons of water supplied per day. The Croydon Water-works, when complete, will have cost £70,000, and will furnish a supply of 3,000,000 gallons per day; so that the cost per million gallons supplied daily will be £23.333. The following will show the cost of some other water-works in comparison with Croydon:

Place.	Cost per million gallons supplied daily.
Croydon	£23.333
Glasgow	59.280
Manchester	60,000
Liverpool.....	115.115
New River	100,000
West Middlesex	77,000

At Croydon, the town is supplied from two wells, sunk in the chalk formation, and these yield a daily supply of more than 3,000,000 gallons of water. This is raised by three Cornish engines into a covered reservoir, which is constructed on a rising ground 142 feet above the town, from whence (aided for the supply of some elevated portions of the parish by a water-tower) the water is supplied to the consumers by its gravity. The composition per gallon of this water will be seen by the following recent analysis by Dr. Odling of that obtained from two wells.

	Old Well. Grains.	New Well. Grains.
Total solid matter	21.609	21.946
Mineral matter	21.364	21.455
Volatile matter245	.490

" after boiling.....	8.0	3.4°
Specific gravity	1.00031	1.00031

The house drainage is the second great branch of our inquiry, and here our great difficulties commence. It is far too commonly believed that in the drainage of a town it is the produce of the water-closets that is to be chiefly regarded. From this erroneous conclusion all kinds of schemes have been propounded—patents taken out, and strong arguments adduced; deodorizers of several kinds; mechanical contrivances for working pumps; carrying away the sewage in carts, either in its liquid state or mixed with earth; evaporating the mixed earth and excreta to dryness, then using it again; drying the mixture over and over again, then carting it away; receiving the sewage into settling, or what may be well described as stink-producing tanks, and allowing the clearer portion to escape into the adjoining streams, either before or after it has had precipitants added, such as lime or certain salts. These plans, as they have all proved, or will in all reasonable certainty prove to be failures when attempted on a considerable scale, have mainly originated from their concoctors not remembering that for the sewage of a town we have to provide for not only the water-closets, but (1) the sinks, (2) the wash-houses, (3) the rainfall on the roofs of the houses, (4) the rainfall in the streets, and (5) the waste water of certain manufactories.

Now, sewers must be provided for all these; and the nature of four of these is so impure that, without previous purification, they are not admissible into a river. The water of a road even, if that road is paved or formed with broken granite, contains far too large an amount of impurity to be allowed to drain into a stream. Professor Way some time since analyzed the surface-water obtained from the granite-paved and macadamized portions of Oxford-street, in London (*Jour. Roy. Ag. Soc.*, Vol. 15, p. 149). He found in an imperial gallon of that:—

	Soluble Matters. Grains.*	Insoluble. Grains.	Total. Grains.
From the paved.....	276.23	537.10	813.33
From the macadamized...	194.62	390.30	584.92

The soluble matters of these consisted of:—

	Paved.	Macadamized.
Water of combination, and some soluble organic matter.....	77.56	29.07
Silica	0.51	2.81
Carbonic acid	15.84	12.23
Sulphuric acid	36.49	38.23
Lime	6.65	13.38
Magnesia	—	23.51
Oxide of iron and alumina, with a little phosphate of lime.....	9.58	1.25
Chloride of potassium	—	10.99
Common salt	53.84	44.88
Potash	82.76	18.27
	276.23	194.62

It will be seen, added the Professor, that the soluble matters of these samples of street water consist of salts of potash, magnesia, lime, and soda. The sulphuric acid (in the states of sulphates of lime, potash, &c.) owes its origin most probably to the large quantities of sulphur daily thrown into the air from the coal burnt in the metropolis. This sulphur, in whatever form it might originally exist in the air, would rapidly be oxidized, and brought down by rain. The large quantities of potash in these waters—amounting in one instance to 80 grains in the gallon—are due to the disintegration of the granite by the united action of mechanical friction and the sulphureous and the carbonic acid of the London air. In country towns, where the number of the inhabitants and the amount of traffic in the streets are in relation to the area occupied much smaller than in London, it may be a question whether the admission of the rainfall and the

land-drainage waters into the sewers is advisable or not. But so far as London is concerned, and considering only the composition of the liquid which reaches the sewers in the time of rain from the streets, it seems pretty certain that it would be as valuable in a manuring point of view as the ordinary contents of the sewers. There would seem therefore no reason to exclude such waters on the ground of the dilution and deterioration of the sewage, to which they might be supposed to lead.

The third important object is the purification of the sewage before it is allowed to escape into the adjoining stream. Now, on this great question, her Majesty's Commissioners, appointed to inquire into the pollution of rivers, have recently made a report, in which they arrive at the conclusion that by no known contrivance can that purification be accomplished nearly so well as by the irrigation of grass land. It is the vegetable world only that can profitably extract from sewage its soluble, and that its most fertilizing portion. And how well the grasses thus purify the sewage of Croydon may be seen by the result of some examinations by Dr. Odling of the thus purified drainage matters of the town. In this case the samples analysed were taken every quarter of an hour by the Doctor's assistants on the 23rd and 24th of November, 1867. The account I take from the report of Mr. B. Latham, to which I have already referred, who observes:

"The sewage at the time was flowing over 30 acres of land, on which it had been continuously flowing for about two days; the volume of sewage passed on to the area in the twenty-four hours was 3,274,300 gallons, and the effluent water, flowing off after purification, was 2,245,300; so that 81½ per cent. of the whole volume was lost by evaporation and absorption. As the land was completely saturated prior to the experiments, it may fairly be taken that 15.75 per cent., or one-half the entire loss, is due to evaporation through the plant and from the water surface. This would tend to condense any impurities that remain in the effluent water in the proportion of the reduction of volume. In the analysis given, the result that would be obtained by condensing the water supply, is shown in the second column:

	Sewage of Croydon after purification by irrigation Nov. 24th, 1867. Grains per Gallon.	Water supply of Croydon, condensed to same extent as sewage. Grains per Gallon.
Total solid residue	26.180	25.233
Mineral matter	25.025	24.807
Volatile matter	1.155	.426
Chloride of sodium	3.400	1.684
Ammonia043	.037
Nitrogen as ammonia032	.030
Nitrogen as oxides419	.251
Nitrogen as organic matter...	.144	.023

"A comparison between the two columns will show how nearly the sewage has returned to the state of the pure water as supplied to the town. It may be observed, that the total amount of organic and volatile matter contained in the effluent water after passing over the land, is less than the average amount contained in the water supplied by any one of the existing London water companies; and, therefore, it may safely be laid down that sewage after such purification is fit to be turned into any fresh water course. It may be remarked, that the analysis of the sewage was made at a period of the year very unfavourable to the system. We must all have seen that, as the process of applying sewage to land has become successful in effecting the purification, doubts have arisen

as to the probable effect of spreading large volumes of it over areas in the immediate vicinity of populous places. The result of the application of sewage to land, in a sanitary point of view, is equally assuring; for we find, upon examination, that Norwood, with its irrigation area close to the inhabited district, during the three years the system has been applied to the land, has had a mortality of 18.17 per thousand in 1865, 15.13 in 1866, and 14.21 in 1867; while the same area, but inclusive of more distant localities, has had, during the same period, the respective mortalities of 21.26, 20.04, and 16.60; so it appears that, in the rapid growth of the plant, the assimilation of nitrogenous and carbonaceous matter, and the elimination of large volumes of oxygen by the plant, we have the antidote for what might have been thought to prove baneful in its effects."

One great, yet common public delusion as to the superior value of the insoluble or mechanically suspended matter of sewage, has led to many expensive failures. Its value is far inferior to the chemically combined or soluble portion. At Croydon, we can only with difficulty dispose of these matters, though we offer them at only two shillings a ton—that of the Leicester sewage works is offered at one shilling per ton—the dried night-soil of Rochdale only commands the same price. If we contrast these prices with the value of the grass annually produced on the sewage irrigated fields of Beddington and Norwood (30 to 32 tons per acre), we hardly need a chemical analysis to show which is the most valuable portion of town sewage.

It will be instructive if we inquire as to the value of the night-soil when it is collected under favourable circumstances, such as in large towns by well organised collectors.

In a recently published report of the commissioners appointed to inquire into the pollution of rivers they have given the following table. This contains the returns from certain large towns, and includes, 1, the population, deducting the estimated number using water-closets; 2, the tons of manure removed from privies, more than three-fourths of which must be ash and cinder waste; 3, the value annually received for it at the dépôt

from the cultivator; and, 4, the amount thus annually received per head of the population (*Agricultural Gazette*).

Town.	Population Using Privies.	Tons of Manure Annually.	Money Received.	Value per Head.	
			£.	s.	d.
Liverpool...	350,000	138,777	8,000	5	5
Wednes ...	12,000	1,800	150	8	0
Salford ...	120,000	38,600	4,000	8	0
Manchester	300,000	73,594	6,740	5	4
Bolton.....	75,000	22,465	1,587	5	0
Bury	29,000	7,000	100	0	8
Oldham ...	77,000	50,000	2,000	6	2
Ashton ...	37,000	6,637	95	3	2
Southport..	15,000	9,000	740	8	8
	1,015,000	347,573	23,392	5	5

Upon these facts the Commissioners remark: "The sum of £23,392, which is here quoted as representing the money-value of all the house waste of about 1,000,000 people, is indeed all that is received from 1,236,000, that number being the whole population of the towns named, and that sum being all that is received for what the scavenger collects, so that the annual value individually of man as farm stock in Lancashire may be put down as less than 4d., and this supposes the ash and cinder waste with which the excrement is mixed to have no share in the valuation."

The fair conclusion, then, to which we must arrive, I take it, is this—that all attempts to collect night-soil, by manual labour, except on a small scale, will only end in failure. The city of Paris has, after a lengthened, well-conducted, trial, abandoned the disagreeable system. When, indeed, we reflect that, if we adopt the water-closet system, and provide a town with a good supply of water, we moreover have to provide sewers for the various impure waters to which I have alluded, then we must be led to conclude with her Majesty River Commissioners, that no system hitherto suggested for the utilization of the collected sewage approaches in usefulness the irrigation of grass.

JUDGES AND JUDGING.

It has been a very pleasing duty of late to speak to the marked improvement in the conduct of the *Journal* of the Royal Agricultural Society of England. The numbers now come well timed to the period at which they are issued, and, in place of a series of heavy papers of no particular point, there are many subjects of passing interest to command attention. Dr. Voelcker and the Editor go to Belgium; M. Le Cornu writes well on the Potato in Jersey. The systems of cheese producing in Cheshire and America are put in comparison one with the other; while we hear of steam cultivation from the North, and of straw-chaff from the East. We are told how reclaimed land should be cultivated, and sanitary economy in villages enforced. These, and similar topics, come fitted to the hour, and, as Mr. Jenkins has already proved that he can do something more than merely revise or compile, the Society may be honestly congratulated on an appointment that in the outset was condemned even before it was ratified.

Nevertheless, it is sufficiently evident that this *Journal* can never be anything more than a matter of secondary consideration. The fortunes of the Royal Agricultural

Society must still mainly depend, as they have from the first depended, on the success of the great summer show. Regarded on the whole, the result here has been something more than satisfactory. The meetings have continued, almost year by year, to increase in attraction and importance. In fact, at this moment the question is only one of good management. If the direction do its duty, the exhibitors and the public will give their support. Not, however, but that these gatherings have been occasionally in danger. The leading implement-makers, for instance, rebelled, as the Council at one time threatened to give way and adopt a course that so far as any effective entry of machinery could be concerned would have been simply suicidal. Another attack is now being made from another quarter. It would seem that the judges of stock do not possess sufficient knowledge of that they are about, and the Council will accordingly endeavour to have these gentlemen better informed. At the next monthly meeting in Hanover Square, on Wednesday, April 6th, Mr. William Torr will move that "the judges of live stock be provided with catalogues in the same manner as judges of implements now are." Should this resolution be ac-

cepted, we believe that it will be attended with the most damaging consequences, as we cannot, so far, see one sufficient reason for its adoption. The judges themselves would in their actions be laid more and more open to suspicion and adverse criticism, while the standard would promise to be lowered rather than raised. Many an incompetent man who now very prudently declines to accept the appointment would hardly hesitate to do so on the understanding that he should be provided with full particulars. He would almost inevitably go for name rather than form, and if only *quite* sure that he had put Booth first and Towneley second, he would have no further fear, however little such an award might be otherwise justified. Moreover, any such alteration as that proposed would be grossly unfair to younger or less known exhibitors. Let us imagine that, if only out of compliment to the founder of the tribe, Captain Gunter were induced to send one of his Bates' heifers to the coming show at Oxford; her attendant would be probably unknown, and without the catalogue she would take her chance on her actual merits with the remainder of the class. Whereas, with the catalogue in his hand a judge would, of course, at once rest his eye on her, and that first sight has a deal to do with it. It may be argued that judges of much practice will soon come to recognize particular animals as they do the servants. The men like "Cuddy" or long Ward they can, of course, identify; but they are not always so certain about the stock, and there are no few cases on record where judges of character have awarded the prize to one beast under the impression that it was another. If possible, we should of course prefer to have these cowmen, shepherds, and grooms excluded while the awards were being made, but this with bulls and stallions would not be practicable, although otherwise there would seem to be no reason why the men should not be "barred out," as they are at the fat cattle shows. A short-wool breeder can scarcely help greeting the old shepherd from Babraham, and at the last Newcastle Royal meeting the joke of the week was that the worst heifer from Scotland took the first prize because the Warlaby herdman led her into the ring. A really good, straightforward judge would say, "the less I *know* about any of the animals the better I like it;" while a weak, a bad, or a "trimming" judge can hardly know too much. At the meeting of the Dorchester Farmers' Club last week, Mr. Spooner, of Eling, who has repeatedly acted as a judge at the meetings of the Royal Society, said he "must refer to a proposed alteration in the judging at the Royal Agricultural Society's shows. It was proposed, he said, that the judges should be furnished with catalogues showing the pedigree of the animals and the names of the various owners. Now he thought nothing could be so detrimental as that; he should be very sorry to act under any such conditions. At the Chelmsford meeting he overheard a conversation as to what a terrible thing the judges had done—they had absolutely given the first prize to Prince Albert's horse; every one would say they had awarded him the prize because he was the Prince. But the judges had not the slightest idea as to whether the animal belonged to a prince or a peasant." There is another story, touching on the Prince Consort's entries, which the late Mr. Fisher Hobbs was wont to tell with great glee. At one of the Smithfield Club shows a judge, who was known to have something of a weakness for great people, held out very determinedly for a certain bullock, the impression with the stewards being that he thought this had come from one of the Windsor farms. His fellows eventually gave way, and then, alas! it was discovered that the beast put first enjoyed no such Royal recommendation, although one of the discarded did. With catalogues in their hands, the judges at Chelmsford

would most assuredly have been unfairly treated, as very probably on the same conditions the beasts would have been at the Smithfield Club.

At a recent meeting of the Council of the Royal Agricultural Society it was determined, at the instance of a judge, who is also a member of the Council, to pay the expenses of members of Council who act as judges at the Society's meetings. Let the members of Council be next duly furnished with catalogues, and let them then appoint each other as fast as they can, and make sure of their expenses accordingly. Nothing could be nicer, and nothing but the coupling and carrying of these two companion resolutions would promise to so thoroughly damage the character of the Royal shows. At a committee meeting of the Suffolk Agricultural Association, on Wednesday last, Major Wilson said they had received a request from the Royal Agricultural Society to recommend gentlemen as judges; and Mr. Manfred Biddell said, "they had had that request for many years, but he never knew one chosen from those gentlemen recommended." Precisely so; and if things go on as they have been going a man to stand any chance of being made a judge should first of all be made a member of Council. "And what shall I mak' you?" said the Prime Minister not very well pleased, and in a strong Northern accent, to a place-seeker, who had saved the life of one of our Georges. "What shall I mak' you, mon?" "Well," answered the other, coolly, "I think in the first place you had better make me a Scotchman."

At the great Horse and Hound show at Middlesbrough, at which we were present, Mr. Parrington placed the catalogue complete in the hands of his judges, but *he has never done so since*; and Mr. Parrington's arrangements are infinitely superior to those of the national Society. He will not even suffer a fussy steward to show himself off in the ring, but these officials are placed at the entrance to pass in the classes. Whereas at the Islington Horse show any great man or any very particular friend of any body else is bowed in, and the judges go to work duly armed with the catalogue. And nowhere, as a rule, is the judging so false or so bad as at Islington. At the last exhibition there was scarcely a first prize properly awarded. The best weight carrier, the best of the other hunters, the best thorough-bred stallion were none of them the best, as the decisions in their favour were continually corrected during the summer, and some of these during the very next week. Of late the Council has been tampering with the Royal show. Putting its head in the mouth of a local committee was a mistake, making a precedent of the payment of Messrs. Sanday and Bowley's expenses was a mistake, but a far graver error will be furnishing judges with the stock catalogue. The actual responsibility of a judge, who is really worthy of his office, cannot be too great, but we go far to destroy such authority in its entirety by a list of names and particulars, the interference of stewards, and the loquacity of Veterinarians.

A CENTRAL VETERINARY MEDICAL SOCIETY.—We have in the agricultural world the very type of an actively useful central society, having no political bias, but practically wielding an immense influence in the affairs of the farming community. Farmers' Clubs are even more plentiful than Veterinary Medical Associations, but they are all represented in a great measure by the Central Farmers' Club, which, in its place, is the kind of Society we desire to see established in the veterinary profession. The first step in the development of this scheme is to obtain a competent and energetic Secretary, who at the beginning must work "for fame, not fortune." The Society once fairly established should, however, be prepared to remunerate their Secretary, as this is just the kind of work which demands fair payment.—*The Veterinarian.*

OUR IMPORTS AND EXPORTS.

The publication of the revised Board of Trade returns for 1869 enables us to take a comparative retrospect of the fluctuations in our foreign food supplies, and the sources from whence they are drawn, in the last year or two. This is a subject which requires some consideration from the farmer, who is equally, if not more, interested in it than the merchant or importer. Although our agriculturists have not been idle of late years, but are developing to the full the resources of the soil, we are yet dependent, and are likely to continue so, on foreign countries to meet many urgent food wants. We do not speak, of course, of tropical and other special productions, for which our climate is totally unfitted, although these are articles of necessity we cannot do without, but of cereals, and dairy produce, and animal food in general.

First, let us take our grain supplies from abroad: Of wheat we received in 1869 37,695,000 cwts., or 5,000,000 more than in the previous year, and 3,000,000 more than in 1867. But the sources of supply are somewhat changed, as we draw more largely from Transatlantic countries, and less from Egypt, the Turkish provinces, and Europe generally. The foreign imports of barley, oats, and pulse have not varied very materially in the past three years. Barley alone shows an increase as compared with the entries in 1867. There is a remarkable increase in the imports of maize, which amounted to 17,500 cwt., or double the quantity received in 1867. This, probably, is chiefly used for feeding stock, as the consumption in meal, or Indian corn flour, cannot have led to this great advance. Rice shows also a large and steady increase, amounting to 5,327,000 cwt. in 1869, or double the imports in 1867. This may be partly accounted for by the larger use now made of this grain for laundry starch and other manufacturing purposes, owing to its abundance and cheapness as compared with wheat. The continental manufacturers of starch, in France, Belgium, Holland, &c., are now beginning to follow the example set them in this respect by British starch makers. Our foreign supplies of wheat flour last year reached 5,403,000 cwts., or nearly 2,000,000 more than in 1867. France and the United States sent us the chief supplies, and Canada is also able to furnish largely. The imports of Indian corn meal keep comparatively steady, the changes in the figures of the last three years being but slight. The quantity of foreign hops received last year from the continent was larger than usual, being 322,500 cwts. against 231,700 in 1868. The exports of beer and ale to foreign countries were, however, not larger—indeed, they were about 23,000 barrels below 1867; so that the home demand must have been greater for ale and stout. A curious item in our foreign indebtedness is dried yeast, amounting last year to nearly 121,000 cwts. from Holland.

Turning to dietetic articles, we still pay about £100,000 a-year in duty alone for foreign-grown chicory, although our home supplies are about 14,000 cwts., so that the taste for this adulterant does not diminish. There is little variation in the consumption of coffee, although it is rather on the decline than otherwise, at the rate of about a million pounds a-year. Cocoa, on the contrary, which has hitherto not been largely used, seems to be increasing at the same rate—namely, a million pounds a-year. There was a large decline in the quantity of tea used last year, about 15 million pounds. Is this to be accounted for by the rubbish which has recently been shot on the market, of which we have heard so much in the public prints lately? consisting of warehouse sweepings and re-dried leaves sold to the poor. The quantity

of foreign raw sugar used in the last three years has been remarkably stationary, scarcely varying at all from 11,200,000 cwts. per annum; in refined there was, however, an increased consumption last year of 227,000 cwts. A new item in the returns is the home-grown sugar made from beetroot, a manufacture commenced here in the close of 1867, and which last year amounted to 29,284 cwts. Dried fruits still keep steady at 1,156,000 cwts., and a miscellaneous lot of spices, gradually increasing, make up the total of our foreign vegetable supplies. There remains one large item which chemists class as food, but which enthusiastic opponents tell us is poison, and that is tobacco, of which we used 41,720,000 lbs. last year, being a gradual annual increase of about a quarter of a million pounds a-year. This article, coupled with wine and spirits, tea and sugar, coffee and cocoa, bring into the revenue about 23 millions sterling.

Having dealt with the substances derived from the vegetable kingdom, let us now glance at the foreign animals and animal products we purchase. In the live stock imported from abroad there has been a steady increase in the past three years in sheep and horned stock. In dairy produce butter shows a steady increase, and reached 1,259,000 cwt. last year; but how much of this is tallow-manufactured Dutch butter the returns do not specify—our readers must guess for themselves. Foreign cheese is also on the increase, reaching now nearly 1,000,000 cwts. Eggs also show the enormous demand prevalent here, the only surprise is where the poultry are found which supply us annually with 442 millions of eggs. Our demands for American lard keep steady at about 250,000 cwts. Salted meats are in demand, principally, we suppose, for the royal and merchant navy and emigrant ships, as our imports last year were 1,157,000 cwts. A novel item in the returns is "meat not otherwise described," to the extent of 90,000 or 100,000 cwts. This, we presume, must be the tinned and other Australian meats, for which a market has lately been created, and public monthly sales commenced in London.

If we take the other side, and see what agricultural food we send away of home production, we find the figures are by no means contemptible, and evidence a busy industry on our farms, and a steady foreign demand. We sent away last year about 100,000 cwts. of home-cured bacon and hams, and 20,000 cwts. of beef and pork. This is somewhat below the usual average. The butter exports keep steady at 270,000 cwts., and British cheese is shipped to about 110,000 cwts. We only sent away to foreign parts 2,217 British horses last year, against 4,100 in each of the previous years. Pickles and sauce making must be a prosperous business, when the declared value of those articles exported last year is returned at £406,451.

There is a little item of strong drinks and beverages, home and foreign made, which enters into the consideration of our food supplies, and forms no inconsiderable figure in the returns before us. We used up 47,705,000 bushels of malt for beer last year, of which about 1,290,000 bushels are estimated to have been used in the beer exported. We consumed in the United Kingdom last year 21,621,590 gallons of home-made spirits, besides more than 8,000,000 gallons of foreign spirits; and we also added to this about 15 million gallons of strong wines.

There are many items of small articles of foreign produce which are not of sufficient importance to enter into the monthly Board of Trade Returns, such as potatoes, fruit, dead meat, and poultry, &c., which only come into notice in the more elaborate blue book forming the annual abstract of the trade and commerce of the United Kingdom.

CROPPING.

At the last quarterly meeting of the Carmarthenshire Farmers' Club, Mr. MORGAN, of Llwyn, read the following paper:—

The subject which I have chosen for this day's discussion is "Cropping," a subject upon which great varieties of opinion are entertained by the theorist, and one of vast importance to the practical farmer, for it is upon the skill and energy which he displays therein that the quantity and quality of his produce will depend, and its good effect be seen in stock, flock, or stud. I, however, propose limiting my remarks to the growth and respective values of cereal and green crops, which are generally grown in this country: I shall also adopt as the basis of my remarks the four course system, which is in my opinion (for at least a certain number of years) the most economical and efficient system of cropping. I say "for a certain number of years," for my own experience has satisfied me that after about twelve years' cultivation under that system, it will be necessary to give such land rest, by laying it down in grass. And this is what we would naturally expect, for by no other means—not even by a thorough knowledge of chemistry—can we hope to restore to the exhausted earth those qualities which have been continually drawn from her by constant cropping. Now, I will suppose myself entering upon a farm (which has already been treated on the four course system) at Michaelmas, and will consider what I had best grow in the "clover ley." I have no hesitation in saying, that if I purpose growing wheat at all, I would plough it up and set the old red Lamas wheat in it—taking care that it should be in the middle of October—as I am pretty sure that, taking the average of seasons for the last fifteen years, moderately early sown crops have been by far the best. If the clover crop had been a good average, and had been grazed on the land, perhaps the field would require no autumn dressing with manure; but if in the spring you find your crop does not look as thick and luxuriant as you could wish, I should strongly recommend a top-dressing of nitrate of soda. It has been tried with excellent results by some of the best farmers in our neighbourhood—amongst others, by Mr. Gwynne Vaughan, of Cynghordy, and Mr. Davies, of Glanrynia. I think the best time for the top-dressing is about the middle of March, which having been attended to, I think we must then let it take its chance, with the exception of a rolling or two and a run through it, to take care of any of Mr. Brodie's friends that may show themselves—I mean weeds. I must here remark that in nine cases out of ten the wheat is permitted to become sadly over ripe before it is reaped. The effect is seen not only in the shrivelled, crimped appearance of the grain, and in the scant yield of flour, but common sense and scientific testimony point to an enormous deterioration in the value of the straw. Now, gentlemen, I have intimated a doubt as to the wisdom of growing wheat at all in this neighbourhood, but especially in the upper part of the county. Having fairly given the matter my best consideration, I have arrived at the conclusion that an oat crop in clover ley is the more remunerative of the two. Thus I take the average amount of wheat grown per acre upon land of 20s. rental to be 25 bushels, which at 6s. 5½d. per bushel—the average for the last seven years—will make 28 0s. 11½d. per acre. Now let us see what oats, set on the same land and under similar circumstances, will make. We can safely calculate upon a yield of 50 bushels per acre, which, taking the seven years' average at 2s. 11d., will make 27 5s. 10d. per acre. But in favour of the oat crop you have four whole months' grazing of the land, which cannot be put at less than 5s. per acre; then the difference in the cost of seed will amount to 7s. 3½d., leaving an apparent balance in favour of the wheat crop of 2s. 5½d. per acre. If these figures are correct, I would ask you, which would you prefer, a field of wheat or a field of oats, when you take into consideration the extra risk which attends the harvest of wheat? We have not hitherto spoken of the relative value to the farmer of wheat and oat straw. And here I shall most likely run counter to the opinions of many, if not all the gentlemen present, for I am going to claim a decided superiority for the oat straw. I was born and bred in the possession

of quite a different idea; nor should I have been convinced now were it not for the observations and arguments of a very intelligent neighbour of mine (Mr. Davies of Penlan), backed up as he was by an analysis made by Professor Voelcker (one of the best chemists of the day). Oat straw heads the list for all flesh and fat-forming properties. Barley straw comes next, and wheat straw, which is the highest priced in the market, is the least valuable of all. Such being the result, I think I am justified in submitting it to you for discussion. I should add that in my opinion the weight of straw per acre would be in favour of the oats, while no one can doubt which is the more hardy and most to be relied on, taking the average of soils. We must now proceed to treat the land preparatory to the next crop, and I shall practically confine myself to the swedes and mangolds as being the most valuable roots grown for the maintenance of stock. As soon then as the pigs, poultry, &c., have picked up what ears and corn may have remained after hauling, I send in the scarifier with the broad spuds (or tines) on, and scarify it thoroughly two or two-and-a-half inches deep, and, if necessary, to secure a thorough paring, I would recommend a cross-scarifying—then harrow it with a light harrow, say once a week till the middle of October—by that time the grass, roots, weeds, and stubble, will have been reduced into a compost of considerable manurial value. I then spread over it what I consider to be a half-coating of farm-yard manure, plough it in as soon as possible, not deeper than about four inches. I then shut up the field, leaving it to the mercy of wind, rain, frost, and snow, until the beginning of April, when you will find it reduced to a powder. This time plough as deep as you can—harrow it well—then send the cultivator through it—repeat the harrowing, and unless the land is very stubborn, you will find it fit and ready to be cobbled into ridges. Previous, however, to the ridging process, we must remember that it has had only half the allowance of manure; I therefore, to act honestly by the land (for there is nothing that will carry tales sooner), purpose giving the other half now in the shape of artificial manure. I have found two cwt. of superphosphate, and one cwt. of guano per acre, sufficient to produce an excellent crop of mangolds and swedes. Mangolds should always be set before the end of April. I only set as much as is necessary to keep my cattle on from the time that the swedes are done, i.e., about the latter end of March, until they are turned out to grass. I have found them of very great use for young calves; which I have sometimes housed during the summer months, but there can be no doubt that, in such cases, vetches or cut clover are as good and more economical than mangolds and hay. I have frequently kept them in good order till July, and on one occasion I had some quite healthy in the early part of August. Still, I only grow them sparingly as I have not grown anything like such a weight per acre of mangolds as of swedes. I should like swedes to be set during the first fortnight in May. I, last year, set a considerable portion in the last week in April, and a better crop I have never seen. In favour of early setting there is the obvious advantage that then the land is more moist and better calculated to make the seed vegetate than under the broiling sun of June, when the land, after repeated ploughings and harrowings, is as dry as a bone, and so long as the drought lasts the seed might as well, or perhaps better, have been in the seedman's warehouse. I am well aware that some object to such early sowing of swedes, on the ground of their being the more liable to mildew. I can only say that I have not found that to be the case, and have sometimes suspected that the objection has been made merely to cover the farmer's remissness in not setting his crop in good time. I like the ridges raised about twenty-seven inches apart, for then you will be able freely to send between them the horse-hoe, that most important implement in the successful cultivation of green crops. Whatever sins, gentlemen, are pardonable in the farmer (and I confess there are a select few to which I plead guilty), I can admit no excuse for the man, who having incurred very great labour and expense in setting a field of turnips, permits the plants to

be choked and the land overrun by foul and poisonous weeds. A light roller sent over the ridges prepares the way for the drill, which should have its coulter so as to form a groove for the seed to fall into. There should be no rolling after the seed is put in; for unless the land is perfectly dry it compresses the earth, which, when dried, becomes a hard crust, through which it is useless to expect the young plant to force its way. If we have a plentiful supply of plants I would, as soon as they have got into the rough leaf, send the hand hoes through them, striking off the unnecessary plants, and only leaving small bunches of four or six at the distances at which you intend growing your permanent crop, and until the plant that is to remain can well dispense with the other's company, which will be when it is about two inches above the ground. I like to see swedes thinned about ten inches apart, much preferring two moderate sized to one very large turnip. They are generally firmer and keep better. I store my swedes about the end of November, being satisfied that if sown at the time I suggested, they will have reached their full maturity. I have them topped and tailed in the field, charging the men not to cut the leaves too close, for by so doing a considerable quantity of winter food is lost, and the tubers have not so good a chance of standing the frost. I then tilt them about three or four feet high by as many feet wide, against the high bank of a hedge, running nearly north and south, which, with the assistance of a good covering of refuse of straw, the plasterings of hedges, and such stuff, effectually protects them from frost. I have adopted this simple plan for years, and have found them keep perfectly sound and healthy to the end of March. Mangolds require much greater care. I store mine in a house built for the purpose, placing between the mangolds, at thicknesses of about two feet, layers of small branches, which act as ventilators, and prevent fermentation setting in. I should remark that mangolds require to be thinned at greater distances than swedes. I should say about fourteen inches, and when drawn the tops should on no account be cut close; for once the crown is cut, the keeping properties of the mangolds are materially injured. Now, gentlemen, for our last white crop, I would, as a rule, recommend my favourite—oats: because it is more hardy and better adapted to the generality of soils than wheat or barley. Still, if you have a field suitable for the growth of barley, it is a crop with which the farmer can hardly dispense. Its feeding properties, and its superiority over even oats in many respects, are too well known to require enumerating. But it is only when that oppressive and unjust impost, "The Malt Tax," shall have been repealed that the full value of barley to the farmer will be realized. Successive governments have turned a deaf ear to the demand of this measure of justice, chiefly because they know the agricultural interest to be a loyal and much enduring class. But there is a limit of endurance, and to secure the repeal of this tax, I think the exertions of every member of agriculture and of every farmer's club should be directed. Well, gentlemen, it only remains for me to advise you to sow, with the barley or oats, the very best clover grass seeds you can get, although, after the important disclosures made by Mr. Brodie as to the enormous adulteration of seeds at our last meeting, the warning may hardly be necessary. And now I have done. I must, however, thank you for the very kind attention which you have given to what I have so imperfectly said, and I trust that no member present will refuse to give us the benefit of his opinion upon the subject before us, for I maintain that full and free discussion is the very soul of societies such as this.

Mr. JONES (Penycroft) said: It would be just to say that the consideration of the system of cropping would be putting the cart before the horse, unless they considered how to put the land in proper order for sowing seed. Any farmer before he adopted a system of sowing or cropping would first ascertain the qualities of the land he was about to plough. Personally, he was not an advocate for ploughing old land before it had been manured. Farm-yard manure, if it could be got, was very good. Lime and earth he often thought good. As to the four course system he had tried it many years ago, and followed that system for seven years. During the first round he found it answer very well, but when he came to the second round he found the land was too light to bear a heavy crop. That crop was generally wheat. When the land had been one year in grass he put in wheat which looked very well indeed until it came to the ear; but when the wheat crop came to the

ear he found the stem was withering at the root, and the land was too light to hold it. In fact the land would not hold it. It was then he discovered that the four course system would not do. He would tell them what he had been doing since. He afterwards followed the six course system. First, he had two years in grass, then he put in wheat, then he limed it as well as he could after the turnips, and then had a crop of barley or oats according to the nature of the soil. Then he had turnips, and then barley or oats again according to the seed, then two years in grass. He had found that system to answer well, and he was still carrying it on. He believed Mr. Morgan's land was somewhat similar to his own. It might be that Mr. Morgan found a four course system to answer very well. But whatever system any farmer should adopt he would advise him to lay down his land in good heart, to clear all the weeds, and then there would be no bar to an abundance of grass, and also there would be plenty of room for any other roots as desired.

Mr. BRODIE (Tyrdail) said he had expected Mr. Morgan would have launched out a little more; however, he was much obliged to him for his information as to what he was doing up above. It appeared to him that there was no general rule that could be laid down for cropping. The climate, the quality of the soil, and other things varied so much that a general rule was rendered impossible. For example, look at the rain-fall in South Wales. There was one thing which appeared to him certain, viz., that no two crops of any sort should succeed each other. He did not think that was properly acted up to in Wales, and the day seemed to have gone by far having any stringent conditions in leases. He fancied now that if a farmer had got anything in his head, or anything in his pocket, he should never suffer himself to be bound too tightly by a lease. He should go with the times and his own inclination. Of the four course system he did not approve. He never adopted it himself except upon one small farm, and that had a clay soil. It went on well for a time, but it told upon the land eventually. The land required after some of the crops a good deal of getting up again, as it was exhausted. Mr. Morgan had spoken very much in favour of nitrate of soda. He could not himself say that he had found it very satisfactory. It might do for a hay crop, but nothing else. It was like a man who wanted to get a good bit of work out of himself and so took a few glasses of beer; but on the next morning he would be found very seedy. If they would only notice the land after nitrate of soda had been used, they would find it was not a very profitable thing for the farmer. He might be wrong on the point, but anyhow such was his experience. He did not exactly comprehend what Mr. Morgan meant in his reference to the malt tax. He did not think that the malt tax had anything to do with cropping.

Mr. MORGAN: It has to do with barley.

Mr. BRODIE agreed that if the duty were taken off a corresponding favour would undoubtedly follow in favour of the foreigner. He did not see what the country could gain by beer being reduced in price.

Mr. LEWIS (Llwynedwen) said that he thought it would have been more practical if Mr. Morgan had attempted to show what system of cropping was best for Carmarthenshire. But on the contrary, Mr. Morgan had never alluded to any system of cropping; he had been talking only of the rotation of cropping. He must say that he himself perfectly agreed with many of the remarks which Mr. Morgan had made, but there were others from which he dissented. His own opinion was, whether right or wrong, that when land was worth 25s. per acre, it would not answer for any rotation of cropping. It would be better then to keep it in permanent grass. Besides there was very little land in Carmarthenshire that would produce wheat to the extent Mr. Morgan had mentioned, viz., five and twenty bushels per acre. On the average he did not think the best land would produce that quantity. He could speak from experience because he occupied some very good land himself. He had inferior land, of which it would be nearer the mark to say that it produced the half of 25 bushels per acre. And as to the comparative value of oat straw and wheat straw he ventured to say that wheat straw was the more valuable. It afforded more nourishment to the cattle. It had been said that the land also required rest. He quite agreed with the remark that unless the land had rest there would not be a good succession of crops afterwards, but the rotation whatever it may. And it would be wrong to say

that during a period of rest the land was idle, because there would be a better production in future. As to the malt-tax, although it was hardly the subject for discussion, yet he quite agreed that the Carmarthenshire farmers ought to agitate for its repeal.

Mr. HARRIS (Abersnann) contended that in discussing the question of cropping they must ascertain what mode would best help them to pay their rates and taxes. As to the four-course system he believed it was quite practicable if they had a summer fallow. The first thing he would do after having a summer fallow would be to put in a crop of oats. If after that he could put in a crop of turnips he generally did so. He believed that was the old system, and they must adopt that until they could gain the opportunity to drain their farms; then they might regularly resort to the four-course system. It was easy enough for gentlemen to talk in theory about what was suitable for Towy-side and what was not suitable, but he wanted to hear something practical; he wanted to hear speakers relate what they had tried to do themselves, and how it answered. And he would repeat also that when speakers talked about the expense to which they had gone they should also answer if that enabled them to pay their rent. If that were done if they looked at farming as a thing that was practical and that must be made to pay the rent, it would often be found that certain systems would cause them to come far short on the rent day. And as to manuring, they ought to be very careful. They ought not to use such manure that in winter the essence which should sustain the crop would be washed away. Old manure was best for the purpose.

Mr. DAVIES, the vice-chairman, said that when he heard of the subject for discussion, viz., cropping, he took it for granted that every man would be considered to have proper manures, or the means to supply himself with such manures. Then there would be some room for discussion on the subject of cropping. Some of the speakers had advocated the four-course system. He did not advocate that entirely. He agreed with Mr. Morgan that there should be a rest occasionally. They all knew what the four-course system meant, and that when one course had been carried out it might be followed for another four years with proper manuring. But he took it that a man should never pursue a system so that he must feel he could never pay his rent and taxes. He should take care as far as possible by his mode of cultivation and his manuring that he obtained a sufficient crop. After the four-course system had been pursued twice, he maintained that the land in Wales was not capable of producing another crop without having a rest of 3 years. In that he held a firm belief.

Mr. FOOTMAN (Havodwen), alluding to the capability of land in Carmarthenshire, said that it could carry 25 bushels per acre and a little more.

Mr. PROSSER (Tygwyn) remarked that he could not speak on the subject of cropping, unless he spoke against it. He was quite tired of cropping. Ten years ago he used to cultivate on the average about 40 acres under different crops, but now he had reduced that quantity down to 16. And he saved a good deal by it: he saved a pair of horses and a man, and he repeated that he reckoned that a good deal. Upon the 24 acres formerly under crops he could keep about 20 head of cattle, in fact, he could keep 3 cows with the grass formerly required for the two horses. Now, if the farmers present would pause for a moment to reckon up the difference between his former and present situation they would find he was making a better profit now than formerly by cropping. Besides, look at the anxiety when a man had 40 acres of land under corn, and when he saw the thunder clouds gathering and showering down day after day. The anxiety of that man was tremendous. On the other hand the cattle would thrive nicely during the stormy weather. A man's mind was rendered a good deal easier if only owing to that. Then last year the yield of corn had been very indifferent, and they now also found the price down very much. Therefore it was he could not speak at all in favour of cropping. The reason he kept 16 acres under crops was, that he wanted straw. He could not do without that or something of the kind. He kept four acres of land in wheat, and it always depended on the size of the field whether he put in wheat or oats or barley. He also had four acres of green crops, and sometimes more than four acres.

The CHAIRMAN: But there must be a difference between your yield now upon sixteen acres and your former yield upon forty

Mr. PROSSER: Yes, but I make more profit on my money, and I also do it much easier.

Dr. HOPKINS after promising to reduce his remarks to a small compass said he compared farming to gardening on a rough scale. Farmers should endeavour to keep their land in heart as much as possible. Whenever a certain crop had been taken out of the land it was always a bad plan to follow it with another crop of a similar kind, that is, it was a bad plan to have too many cereal crops or corn crops. They could not do better than to have a fallow crop after a heavy crop, especially in high land which was generally poor. It would be a great deal better to do that than to plough the land and have nothing at all. Crops that had a great surface absorbed more from the atmosphere than from the soil. Therefore when they were turned back into the soil there was a great deal to be gained from it. Ever since he had held a conversation with the agent of Mr. Dillwyn, M.P., he had been of opinion that corn crops could not be grown in this part of the country with advantage, especially wheat. He quite agreed with the introducer of the subject, that as a rule, taking into consideration the different kinds of land, the best crops to be grown were oats and barley. If the land was light a barley crop was very nice. Oats could be grown upon land that would not so well grow barley. Some lands would not even grow turnips or mangles because it was so poor, so clayey, or so indifferent. The different fields on their farms must therefore be farmed according to their capabilities. Every farmer, he was sure, would be fully aware of that. He was strongly of opinion with one or two of the speakers that the more they grew of grass crops in Wales the better it would be both for the contentment of the farmer's mind, and the increase of his pocket, for there would not then be so much fuss made about farming, and money would be accumulated with much greater ease. His opinion was that they should dress as much as possible the surface; that was the most important thing, generally speaking, for cropping. It would be absurd, however, for farmers to call or consider themselves the inheritors of the old independent farmers of the country if they did not grow as much wheat as was wanted, and as much corn crops for feeding their cattle and so on, but not to make it too strongly a point of income. He would repeat, however, that the best plan was to adopt the plan of cropping to the nature of the soil to be cultivated. The soil varied a great deal in Carmarthenshire. One of the speakers had praised highly the farm he occupied. He must be better off than those who lived on the higher banks. Besides, undoubtedly, he was a good farmer, and a thoroughly practical farmer. Nor would he himself deny that considering the price at which corn was brought over here from foreign countries, that they might crop the land in Wales generally to great advantage. Before sitting down he would observe that as a rule farmers in this part of the country could not do better than keep as many cattle as they possibly could, and fatten them as much as possible.

Mr. THOMAS (Derllys) differed from Mr. Morgan on a few points. Mr. Morgan commenced with clover laying. If it was nice clover it would undoubtedly pay better for a few years. When he commenced the cultivation of a field he considered he had finished with that field when he had set it out for four years. With regard to cropping, no one had made mention of hay crops. Mr. Prosser had talked of reducing his corn crops to a very small quantity, but not his hay crops. Now, with the little experience he had himself had he found that hay crops, if not so exhaustive as corn crops, were very nearly so. If a farmer grew corn crops he might continue them for a great number of years. But with hay the land required manure every two or three years. The best farming they could have, in his judgment, was to grow as little hay as possible, keeping as large a quantity of stock as possible on a given acreage of arable land. There was no doubt that a greater quantity of stock could be kept on arable than on pasture farm. But as a great many speakers had expressed their opinion that land that was wet would raise turnips, but not so large a quantity of straw as required, therefore he should say they ought to grow more turnips. By that they would retain a better and larger quantity of stock than otherwise.

Mr. J. P. JONES (Llanllw) formerly had a farm in Pembrokehire loftily situated, on which he found the best system of farming was that he could not grow too many turnips. It was essentially necessary that a farmer should have a good

stock of manure. One gentleman had said that nitrate of soda was the only thing that would pay. He differed from him on that point. Some had spoken strongly about growing turnips and mangels. He would not mention the latter, but when they got a good crop of turnips, it was only a *quid pro quo* that a good cereal crop should afterwards be realised.

Mr. W. E. B. GWRN, the chairman, was happy to say that he agreed with a great deal that Mr. Morgan had said in his able paper, although there were several points on which he disagreed with him. For the sake of discussion he would mention the points on which they disagreed. And first of all with regard to the four-course system of cropping. He did not think, as had been said by Mr. Jones, of Penycroed, and other speakers, that the soil of this part of the country was fit for a four-course shift. Another reason was this, he always looked forward to having very good grazing upon the second year's laying. He had adopted the system of sowing a good mixture of seeds after a green crop, and he invariably obtained a most excellent year's grazing after a second year's laying. That was a most important consideration, and ought to be borne in mind. He always sowed a good mixture, and what he meant was he put down seven or eight different sorts of seeds. Some bloomed and ripened early, and some would not grow so well in autumn, and when the former became dormant the latter were coming up to take their place. That also was a material point. Great stress had been laid upon the mischief of growing corn. But if they kept a large stock of cattle they were bound to have a large supply of corn, if only to obtain a large supply of straw for fodder. He knew from experience that unless they gave bedding to the old and young stock to lie upon, they might feed them as much as they liked, but they would not thrive so well as they would upon a good bed. But speaking of the land of this country he maintained that it would be better for to till it with corn than to let it be in grass. There were thousands of acres in the country that would grow grass well enough, but the difficulty was how to make it grow corn. On the very poorest land, if a certain quantity of artificial manure were used, corn might be grown very well; indeed, it might be made to grow corn better than anything else. On the low land corn would grow very well; it was on the high and dry land where the difficulty was felt. Let a farmer use three or four hundred weights per acre of bones or dissolved bones or phosphate, and his land might be made to produce something better than those miserable crops of ferns which could now be seen where the land was in a state of nature. Oats could easily be grown on such land. It had been well said that it was a great advantage for a farmer to have a good supply of oats in his haggard. He did not agree with Mr. Lewis respecting the value he had got upon oat straw. But there was a peculiar crop he grew himself, which was a mixture of barley and oats, and was called shipris. He had about twenty-five acres under that crop, and had always found it to pay. When the barley was inferior the oats were good, and *vice versa*. He had grown that crop for the last five-and-twenty years, and could safely say that during that long period the crop had not missed three times. Well, it might be asked—What are you going to do with it? He would answer that it was better than barley and better than oats. He did not mean to say that it was more feeding than barley, but the cattle would eat it better. He did not like to give oats to any cattle except horses. With those who kept a large quantity of stock it was becoming very general to give young cattle corn, because it saved hay. They had been cramming it down the throats of the poor beasts, whereas if they had been fed with some good harvested straw it would have

been much better for them. He would recommend to those who reared and kept stock to try the mixture he had named. He could assure them that the crops he realised were exceedingly large. Some of them might think he was wandering from the subject. Another crop that had been spoken of was furze. He had been thinking of growing furze himself; but until this year had not been able to find a suitable place. Nobody knew the value of a crop of furze except those who used them. He had seen cattle on the mountain side in winter when he had been hunting looking well, and when he saw a good round-looking cow he always asked what she was fed upon. Now, upon inquiry, he had learned that those cows on the mountain were fed upon furze. Perhaps Mr. Brodie would laugh at him, but he was convinced that the growth of the furze was deserving their attention. In North Wales it was a very common thing for a crop of furze to be sold for £10 to £15 per acre.

Mr. LEWIS (Llwynfedwen) remarked that in the growth of furze there would be no danger or anxiety about the harvest.

The CHAIRMAN endorsed Mr. Lewis's remark. Then there was another great consideration—viz., their rain-fall. The rain-fall in the north of England was much greater than in South Wales. It was not the number of very wet days they got in South Wales which broke their hearts. They had many days when the rain-fall was next to nothing; but it was the drizzling rain which ruined the harvest, and which proved so very harassing. Turning to the question of manure he recommended that the poor land should have a good supply of artificial manure. The cost would not be enormous—say, from £1 to £1 3s. per acre. And every sovereign a man invested in artificial manure he would get back in the crop of corn realised, and as a rule he would get more than the worth of his money.

Mr. JONES (Penycroed) inquired how the Chairman used his manure?

The CHAIRMAN said he applied it to corn. When he first used artificial manure, he went to one of our most able men, and asked his opinion, and in consequence he tried two crops of barley as an experiment, the one with artificial manure, the other without. He could assure them that the field that had the manure applied to it ripened a week before the other. It got the start from the commencement, and kept it all through. Ever since then he had used manure to the corn. His system of cropping was a six years' course. He begun with breaking up the clay, either for barley or oats. He did not grow wheat except for home use. First came a crop of either wheat or barley or oats. Then followed another crop of corn with either 2 or 3 cwt. per acre of artificial manure. Then he had a grass root crop. Then he had barley with seeds for the mixture of which he had spoken. Then he mowed his first crop of hay, taking care never to let the hay get ripe. It did quite as much injury to let the hay crop get ripe as to take a crop of corn out of it. Then he had a second year's crop of hay.

Mr. JONES inquired whether the Chairman laid his manure for two years for his grass crop.

The CHAIRMAN answered in the affirmative. The first year's grass would be of artificial growth, the second year's grass a natural growth. The third year's grass would hardly be worth reaping.

Mr. JONES further inquired whether in a crop of shipris the barley and oats ripened together.

The CHAIRMAN answered in the affirmative.

Mr. MORGAN criticised the various observations passed upon his paper, contending that it was sound in its theories, and justified by experience.

THE OVER-PRESERVATION OF GROUND GAME.

One of the best attended meetings that the members of the Shropshire Chamber of Agriculture have had since the Society was inaugurated, was held in Shrewsbury, on March 18, when the question of the over-preservation of ground game was discussed. The meeting was presided over by Mr. D. F. Atcherley, the vice-president of the Association.

The subjoined letters were then read by the Secretary:

House of Commons, March 11th.

Dear Sir,—I am sorry that my parliamentary duties here

will prevent me from attending at the Shropshire Chamber on Tuesday next. I have a particular objection to the over-preservation of ground game, and should be glad if any remedy could be devised which would be acceptable to the tenant and the landlord. I consider that rabbits are the worst of all vermin to the farmer, and most destructive to all crops in the open field, as well as to young plantations. Hares are not so bad, unless they are extremely numerous; and I should be sorry to destroy them entirely, as I have some consideration for those

who are fond of coursing, which I am not. The only way that I think we could obviate the evil would be to make ground game property, and thus render it liable for damage done to the holder of the soil. I should be very glad to know the decision of the Chamber on the subject, which is very important. I went from the Central Chamber, a few days ago, to the Chancellor of the Exchequer, on the subject of the malt tax, and from the expressions that fell from him I think it not improbable that he will transfer the duty from malt to beer. I also attended on the subject of the savings banks, but we could do nothing with him as to preserving the present rate of interest to depositors.

Yours faithfully,

J. R. ORMSBY GORE.

London, March 12, 1870.

Dear Sir,—I regret very much that the day for the discussion of the subject of ground game should unfortunately have been fixed just at the time when the state of Parliamentary business quite prevents my coming down, but, as you request my opinion on the subject, I have great pleasure in giving it. In considering this subject, our attention must not be confined to it as it relates only to landlord and tenant. Indeed, if that were the only aspect of it, I question whether it were not the best thing to leave it to contract and good feeling; but of late years the question has been much complicated by the system of renting shootings, which is now done to a very great extent by people who, being strangers to the neighbourhood, and, for the most part, ignorant of country pursuits, are liable to do injury both for want of knowledge and from self-interest. These lessees having no interest in the land, and too often no sympathy for the farmer, it often happens that they care nothing about the injury done to the occupier of the land, caring only to cover their own expenses of rent, keepers' wages, &c., by the sale of the game, and especially the rabbits, and, in the present state of the law, they are able to do this with impunity, unless very stringently tied down by agreement. It appears to me that the most simple way of getting over this difficulty would be to do away with the "fiction" that game is the property of no one until it is dead, and to make it subject to the same laws as other property, both for its protection, and for the liability on the part of the owner to pay for any damage done by it. By this means the saddle would be on the right horse, and he who derived the benefit of the game, would be responsible for the loss which it occasioned to others. I know that it is often objected that you cannot tell to whom the game belongs, but this can occur but in very few instances. There is very seldom any real doubt about the ownership. It must in reason be the property of him who has the beneficial use of it. I send you a bill on the subject of the game laws in Scotland, not that I approve of it generally, and some parts I consider very objectionable, but the main difficulty, that of simplifying the recovery of damage done, is met by the clauses 6 and 12, and I am disposed to think that if those two clauses alone were to become law, we should hear very little more of the game difficulty. When the owner knows that he will have to pay for the injury done by it, he will give up excessive preservation. Hoping that these hastily sketched ideas may be of some use in eliciting something more useful from others,

Faithfully yours,

EDWARD CORREY.

Cabley, Bewdley, March 15th, 1870.

"Sir,—In consequence of ill-health, I much regret not being able to attend your meeting to-day on that important question—the over-preservation of ground game—and I will ask you to convey my views through the presiding chairman, which are—That nothing less than the placing of ground game entirely in the hands of the tenant farmer will meet the necessity of the case. I trust if the over-game-preserving landlords could once be made aware of the enormous injury done, not only to crops, but personal feelings, they would no longer resist; and to those who are satisfied with such a moderate quantity of game as would afford healthful recreation in pursuit of, the alteration in the law would make little or no difference, but once in operation would add just as much more good feeling between landlord and tenant as the present system tends to prevent. The gamekeeper could no longer be required, dictating to both master and man upon the farm, and his nocturnal visits across the homestead with his dog, to entice the domestic cats to some trap laid a distance off

to snare them, would be dispensed with. Then thequire would not be so often detained to hear reports from his confidential keeper as to this or that tenant having committed himself by some breach or other of their local game laws, but would have more time to ride over his estates and view the great improvements that would be sure to result from the alteration; and in meeting his tenants he may see a smiling cheerful countenance instead of a grim, care-worn face, with empty pockets, which a few years' occupation of a game farm is sure to produce. I speak from eighteen years' experience, and feel sure that during that period I am a loser of eighteen hundred bags of corn, through the destruction by hares alone, not saying a word about loss of mutton, beef, &c., to the public as well as to myself.

Yours truly,

BENJ. DUDFIELD.

The CHAIRMAN said he had been told the other day by a gentleman, who, he thought, was a little overdoing the matter, that in Shropshire one-half the farmers had the shooting themselves ("No, no; and a voice, "Not one-tenth.") Well, many farmers had farms of their own, which, of course, altered the matter. At any rate he thought it ought not to be treated as a class question.

Mr. R. JASPER MORE, who was very warmly received, said he was aware strong views were entertained for and against the game-laws in Shropshire; he felt it his duty, in the interests of the Chamber, to counsel that whilst all facts which tended to illustrate any views should be freely stated, the sensitiveness of many persons on that subject should be borne in mind by those who take part in the discussion. He noticed that the noble president of that Chamber stated in the winter that he would have voted in favour of another subject being discussed at that meeting, but he did not gather from his remarks, as reported, that he was averse to the discussion of the subject at all, for he himself set the example of discussing it at the annual dinner of the Chamber, though the county members present, as Lord Granville remarked last year, did not venture within a hundred miles of it (laughter). If the rabbits were really given on all estates to the tenants, as he believed Lord Bradford said he gave them on his property, or if they were systematically kept down, he believed that sensitive persons would have no reason to fear agitation on the game-laws. He would, however, ask that meeting to bear in mind that the over-preservation of game was one question, and the game-laws, to a great extent, another. The game-laws embraced fiscal questions of licences for killing and dealing in game as a means of taxation and revenue, as well as the varied questions of the preservation of birds in this country not here indigenous, the law of trespass in pursuit of game, the jurisdiction before which poachers are brought, the punishments they are to receive, the power entrusted to the constabulary in bringing them there, and, lastly, the payment of the expenses of their prosecution and the maintenance of their families, which is the consideration which most of all jeopardized the existence of the game-laws. For this latter Mr. Read and he proposed a remedy in the rating of woods and game, for which they introduced a bill, the principle of which he found would in part, at all events, be adopted this year by the Government. Now it was clear that the Chamber might pass a resolution against the over-preservation of game without proposing the abolition of a single game-law. It was against the over-preservation, not the preservation of game, that the resolution was directed; in the abuse of sport that is distasteful, not its legitimate use. That was a question on which public opinion might be more likely to be efficacious than law, as well as more productive of immediate results. A committee sat to inquire into the game-laws in 1846, and that committee, contrary to general usage, reported in a different sense to what the chairman, Mr. Bright, desired and expected. No legislation that he was aware of followed from the recommendation or the inquiries of that committee. But when Lord Granville came there and made a speech, which not only all who heard it would always remember as one of the best speeches agriculturists ever had the privilege of hearing, but farmers in all counties felt obliged to him for it—(cheers)—the results of his condemnation of the rabbit where so immediately that in one neighbouring county only he heard that seven landlords gave their tenants the right to destroy rabbits on their farms (applause). He should now content himself with stating that he believed the exact point of the farmer's grievance was, where it existed, against which that resolution was framed, and to meet which a bill was to be proposed

in the House of Commons on Wednesday, and at the same time invited their particular attention to the circumstances out of which it had arisen. The common law, which was founded on the wisdom of their ancestors, gave the game to the occupier. The occupier in nine cases out of ten signed away his right to the landlord, who was then able, by statute law, to appoint any one else to kill it for him. Pheasants and partridges, together with ground game, were equally the occupier's by common law; and this point an excellent relative of his, who was President of the Wenlock Farmers' Club at the time when the game law committee was appointed, and they sent a witness to be examined on their behalf, told him he found farmers did not seem to understand then, but he hoped all in that room were aware of the fact now. Perhaps in the majority of cases farmers did not care for shooting at all, and were perfectly ready to preserve game for their landlords. The extent of their grievance, he believed, was, that when they had signed away their right, they found hares and rabbits often increase to an extent that interfered with agriculture (applause). The object of a resolution passed against the over-preservation of ground game by a Chamber of Agriculture was, he took it, to draw attention to the fact that hares and rabbits did that injury to agriculture which rendered it obligatory on the landlord, when he had received the right of shooting from the tenants, to keep ground-game down. He would quote, in proof of the great damage done by game, not from a farmer, or from a game-keeper, but from the President of the Royal Agricultural Society, an extract given by Mr. Corbet, secretary of the Central Farmers' Club, in his essay, which was probably the best that had ever appeared on game-preserving. Mr. Pusey says, "With respect to trials of the relative amount of food consumed by hares and sheep which used to go on at the time of the game-law committee, that though two, three, or four hares may not eat more than a sheep, you cannot keep them in one place like a sheep; that he should like to decide for himself, if he were a farmer, whether hares should eat his green crops or not; it is an interference with the farmers' crops; and where a man has been taking pains with his land, and spending a good deal upon artificial manure, and endeavouring to grow good green crops, it must try his temper very much;" and Mr. Corbet adds, "And his pocket too" (applause). The bill which Mr. Wykeham Martin would introduce on Wednesday, contained the following important clauses, but directed only against rabbits, to which Mr. Beaumont, a leading county member, added "hares" (Cheers): "From and after the twenty-fifth day of September, one thousand eight hundred and seventy, it shall be lawful for any tenant, or any person employed by him, and having his authority or permission, to kill rabbits on the lands occupied by him, any agreement or covenant to the contrary notwithstanding; and any agreement reserving the sole or exclusive right to kill rabbits shall be null and void." Amendment of Mr. Beaumont: Leave out after first "the" and insert "passing of this act hares and rabbits shall not be deemed game within the meaning of the game laws, nor shall any of the provisions of those laws apply to the taking, killing, or destroying of hares or rabbits" (cheers, and cries of "Beaumont for ever"). The question they may expect to be argued in Parliament was whether it is desirable that the state should intervene between landlord and tenant. Of course now that both sides of the House of Commons had agreed that the state should so step in, in part of the empire, the doctrine of state interference could not be repudiated as formerly. The question that would be asked was, was game-preserving a case in which on grounds of public policy landlord and tenant should not be left entirely the agents in England, as it had been settled they shall not be in other respects in Ireland? Already in England the State did interfere in contracting, as, e. g., the truck act prevented employers to contract to supply food to the employed. But it might not be argued on Wednesday at all; for if the Government brought in a bill for Scotland, they may allow the mover of the bill to apply it to England, which he would do if the Scotch bill is satisfactory. Having thus stated the question he was desired to do, he would express his hope that this discussion would, in fresh cases, relieve the tenant, without causing ill-feeling between him and his landlord (applause). He would repeat that in Shropshire, as far as he knew it from the Southern Division, game was not especially over-preserved. It was a county of which it was difficult to affirm any general

proposition, because it may be felt there were cases of great individual hardship, but on the whole it was not considered a game-preserving county, as Mr. Corbet, in his essay, testified; for he ranks the game-preserving counties in the following order: Norfolk, Suffolk, Nottingham, Lancashire, Yorkshire, Cambridgeshire, and Essex, but he did not mention Shropshire. He would end by stating that it was not the preservation, but the over-preservation of game that was objected to. He was glad to make this as clear as possible, for the preservation of game, as the game-laws were seldom spoken of at a farmers' meeting without some one making what, as a humble member of them, he felt was a disgraceful imputation on country gentlemen, that they would not reside on their estates if it were not for the game, as if game was the only tie between them and their responsibilities (applause). But that argument, which was extensively used, more frequently became what he may term the "paterfamilias" argument, that, unless game were preserved up to battue point, fathers of families were afraid eligible young men would not visit their houses, as if the charms of their daughters ought not to be superior to shooting, as he found young ladies' charms generally were (laughter); or as if men, who visited only on such terms, should not be made to know that in this day, if they are to maintain their position, it was necessary for gentlemen's sons to be something more than mere leaders of the sports of the people (applause). He concluded by moving "That, in the opinion of that Chamber, the over-preservation of ground-game should be discountenanced."

Mr. JOHN BRIDGMAN seconded the motion. In that neighbourhood, or in Shropshire generally, a much better feeling had sprung up in reference to game during the last few years, for many landlords were now giving the game to their tenants, especially ground game (applause). If he could see this generally done with respect to ground game it would be nearly all he could desire, and he believed there were many more of his fellow-farmers who were of a similar opinion (applause). He thought they had more to look forward to from themselves and their landlords than from anything the state may do (applause).

Mr. EVAN DAVIES thought that was one of the most important questions that that Chamber had yet undertaken. He believed he was echoing the sentiments of everyone there present, as well as of every farmer in England, when he said that he should deeply deprecate any remedy for the over-preservation of game that would have the effect of debarring the nobility and gentry of the country from a fair amount of field sport; but, at the same time, he could not help thinking that the present system of sporting was un-English, and unwise, and unaccompanied by that healthy exercise that ought to accompany it. It could not be kept up and pursued without repeated and murderous affrays between poachers and keepers, and without engendering in the hearts of the tenant-farmers of the country an unmitigated evil. He well remembered the time when the gentlemen of England were content when they went out shooting if they could kill a sufficient quantity of game for their own tables; but since that foreign system had been introduced they were not content unless they could turn out in the middle of the day, and, in the course of two or three hours, shoot down a load of game (Hear, hear, and applause). He did hope and trust that their landlords would see the evil of this system ere it was too late. Mr. Gladstone, in introducing the Irish Land Bill, made a remark which might equally well be applied to the question they had then under discussion. It was, that if the wants of the people had been attended to thirty years ago, they would have been satisfied with a much less sweeping measure than they would be at present. He repeated that he hoped the gentry of England would see the evil of their ways, and would no longer permit the over-preservation of game on their estates. He most sincerely wished that Mr. Mechi, who had raised his voice against the destruction of the small birds, would raise his voice against the destruction of the birds of prey, which was carried on to a very great extent by the preservers of game. Mr. More had justly pointed out that the game was the property of the tenant; but, he would ask, how could the tenant avail himself of that while he subjected himself to a six months' notice to quit? (applause). When a man's capital was invested in the soil he was tied to his farm, and could not leave even when he was overrun by game. Let them, then, give the tenant an Act enabling him to claim compensation for his unexhausted improvements, and it would be

a step in the right direction. He believed that by continued agitation they would get what they needed—indeed there were many landlords who were already beginning to see the ill effects of the over-preservation of game. He had read that day in *Bell's Messenger* an instance of a landlord who had given his tenants notice that they could destroy all the hares and rabbits upon their farms (applause). He repeated that if they continued to agitate, and put the matter fairly before their landlords that they would not be unmindful of the wants of their tenantry (applause).

The Rev. G. BOTTFIELD would just tell them what his own practice in reference to game was, and if it did not meet with their approval, he did not wish them to say that it did. His practice was this—rabbits, his tenants may kill as many as they pleased (Hear, hear). He did not let them shoot them, however; for, in the first place, they could not keep them down merely by shooting; in the next place it caused difficulties with the keeper, and he thought also that the farmers' young sons got into the habit (the remainder of the sentence was unheard, in consequence of the general expressions of disapproval). As to hares, tenants could course them whenever they asked permission. If he thought that those regulations were pressing heavily upon his tenants, he would rather by the half give up the game altogether than be on ill terms with anyone. There were one or two words he would like to add, and that ought to be borne in mind in reference to the damage done to the farmer's crops by game. It had been said that that damage could be settled by arbitration; but he did not think himself that that would be satisfactory (No, no). He believed it would be the cause of perpetual dispute between landlord and tenant, for there might be a lot of the crops destroyed, and they could not say how it was done, whether by the game or what (No, no, and other expressions of dissent). Well, he would just make this other remark. When he gave his tenants the right to kill rabbits, he found that they increased to a considerable extent, and if the tenant was to be protected by having the game in his own hands instead of the landlord, the landlord should be protected in some way also. If they did the landlord damage, he should be allowed to kill them, for they destroyed the landlord's plantation, and would do him as much harm as the tenant (A voice: "Well done," and laughter). It had been said that the game was the property of the tenant. So it was; and it was because the tenant gave up his right to it that the difficulty arose. Let farmers all say they would make their own reservations as to the game, and they would gain their point at once; otherwise, they must have legislation to help them, which he for one should be sorry to see, for he thought it would not be at all satisfactory. If a man came to him whom he knew to be a good farmer, he should not like to refuse him a farm merely over a question of the game, and but few landlords, he hoped, would do so. He would repeat, in conclusion, that if farmers as a body would say what they believed to be the proper mode of procedure, that, as public opinion was brought to bear upon the question, they would get what they desired—freedom from the excessive preservation of game—and for himself, he would add, that he would rather see game abolished altogether than that any ill-feeling should exist between tenant and landlord.

Mr. LEGH (Foxall) said as to an agreement it was true, as Mr. Davies had remarked, that with a six months' tenancy it would not have the desired effect; for, however good a landlord may be, a new landlord may step in and alter the agreement entirely. He thought himself that if the ground game were done away with the matter would be settled at once.

Mr. FOWLER would relate to them some of the sufferings he had undergone in consequence of ground game. Some twenty-five years ago, when a young man, he took a farm under a gentleman he had every confidence in. For some years they met on the most friendly terms. When he entered on the farm he used to produce 18 bushels to the acre. He laid out his entire capital upon the farm, and brought it up to forty bushels to the acre (applause). He repeated that his entire capital was laid out on the farm, and at the end of some years his landlord was laid up in consequence of ill-health. He suffered for some time, and the management of the estate and the game came into the hands of another party. That person went over different parts of the estate, and the result was that he said "Oh, Mr. So-and-so has a well-cultivated farm; see what crops he has got; his farm is too cheap; what is to

be done? We must have more rent from him, or we must stop him having the game." He must "cry back" here, and state that when he took the farm it was understood that he (the speaker) was to have the game. He had the right to destroy every rabbit, but the person in charge of the estate had made up his mind to take possession of the game even to the rabbits. He (the speaker) said, "No, it was my understanding that I should have the game, including the rabbits, which I have systematically destroyed." Well, the agent came to him one day with two documents in his hand and said, "Will you give me the entire right of the game?" He said "No, I will do nothing of the sort" (applause). He refused to sign an agreement to that effect, and upon that the agent produced the other document, and said "Then you must take this." It was a notice to quit (cries of "Shame, shame"). "Which will you take," the agent repeated, "That or this" ("shameful")? He (the speaker) was a young man at that time, and, very naturally, he was rather taken by surprise. He begged for a limited time, till the next day, to consider the matter, but, said the agent, "It must be done now" (renewed expressions of disapproval). "Well," said he, "Will you give me two hours? I will ride as fast as I can to my father, who is in Birmingham, and ask his advice." The agent repeated, "One or other, whichever you like" (cries of "Who was the landlord?"). He would not name the landlord, but if they wished it he would. Well, he signed the agreement and gave up the right of destroying the game, and from that time forward he was smothered with them to an extent that completely destroyed his crops. He would give them an instance of it. During the last harvest that he gathered off the farm himself, the keeper—that gentlemanly man the keeper—(laughter) said, in a very patronising manner, "Oh, will you please to sell me a load of barley." He said, in reply, "There are fourteen acres of barley there which ought to have produced forty bushels to the acre, and instead of a load I will measure four acres out of the middle of the field, providing you will be at the expense of clearing it away" (laughter). That was one field only. He had another field of wheat, of seven or eight acres, the manure for which he had bought at the rate of 7s. per ton, and had carted it from Birmingham, and for which he had two years' rent and other payments to make. That field had been well attended to, and kept as clean as possible, and when he went there at harvest-time, what did they imagine the produce to be, off that eight acres of land? Why, he never put a scythe or sickle into it, because, after a careful calculation of the expenses, he found it to be to his entire advantage to give up the field and the crop upon it together (Shame). His successor tried to get the crop in, but he went on only a very short time. He thought they were very short of statistics to show the quantity of game in the country, and the damage it did. That it was a difficult thing to get at he readily admitted, but urged that something may be done by observing the quantity of hares and rabbits sold in the markets, which would, he thought bring them somewhere near it (hearty applause).

Mr. POOLE (Bicton) suggested that by fencing off a portion of a field, so as to keep out the game, and comparing it with the produce on the other part, they might come to some conclusion as to the damage done.

Mr. MATTHEW WILLIAMS would ask them, in the first place, whether the tenant farmers present had at any time suffered, or been disturbed in their tenancy, by the over-preservation of game, or by the undue interference of keepers? (Loud cries of "Yes, yes"). That being so, he thought he might proceed with what he had to say, for it could not be said, as it had been said of a former discussion, that they had not been able to make out "a case"—a fact, however, which he denied, for he thought they had on that occasion, as on the present, a very good case. "The question of game was a very vexatious one, and had caused more unkindly feelings in the mind of the tenant than anything he knew; indeed, it had, in many ways, a most injurious and prejudicial effect upon the tenant. That being so, he thought it would be admitted that there must be something radically wrong in the over-preservation of game, and he felt pleased at being the humble instrument by which that question had been brought forward for discussion. He had had a discussion with some of his friends on that subject, and they said "What do you want troubling yourself with this matter? You live under a landlord that never interfere with his tenants."

A MEMBER: Who is it?

Mr. WILLIAMS replied that his landlord was the Duke of Cleveland, and he was proud to add that there were some others in the county who also gave to their tenants the great privilege of killing the ground game. These were the good landlords, and he hoped it would be borne in mind that the laws of the land were never made, or intended for the good man. But all were not good either among landlords or tenants, or any other class. If every landlord was a good, honourable, and well-intentioned man, there would be no need to talk about the game laws, but it was a fact, that he hardly knew a year to elapse without seeing the tenancy of some good and worthy man sacrificed to the vexatious question of game, either—as had been remarked by the veteran chairman of the Wenlock Farmers' Club—by the interference of the keeper or the agent (applause). Much as he admired their worthy friend at the other end of the table (Mr. Botfield) more especially on the occasion of his very able speech on the Education question, yet he thought Mr. Botfield's suggestion in that case would be at best but a very slow process of arriving at the object they had in view (Hear, hear, and applause). There must be a blow struck, firmly and emphatically. Let them depend upon it they must have a legislative enactment to help the farmer before any real good could be effected (applause). He, for one, had been a farmer all his life and he believed he should end so, for it was but few of them who could look forward to anything but being men of toil, all their lives, yet he for one should be sorry, and hoped the time would never arrive when the tenant farmers of England would wish to debar landlords and their friends from the legitimate right of coming to sport over their farms (Hear, hear, and applause). All this he believed farmers generally were ready to admit, and he thought a line may be drawn which would settle the question satisfactorily. If all men were honest, he repeated that there would be no necessity for law, but as such was not the case he could not help thinking that the law must step in. If tenants had the undisputed right of killing the ground game—he meant the hares and rabbits—he had that confidence in the tenants of England that they would never debar the landlords from shooting on the farms, but that they allow it quite as willingly, at least, as they did under existing circumstances (applause). What had been lately said by a Shropshire worthy in another county did not, if it were true, redound very much to the credit of Shropshire. What he meant was some remarks that had been made in reference to game preserving in the county; but he did not think, he must say, that the observations he was referring to would bear the light of day, and he would not refer to them further. He contended that every landlord ought to be anxious to be honoured and respected, not only by his tenantry, but by in all the neighbourhood, and what could be more likely to foster in the mind of the tenant an ill-feeling than to see a landlord let out the game to a person who often had no interest in it except as a mere article of merchandise (applause). The capital of the agriculturist was sunk very largely in the land, and they relied upon "mother earth" for a reasonable return for that capital, and he thought it was a fact that would be borne out by everyone that anything that tended to promote the laying out of capital must be to the interest of the landlord, for a man laying out his capital with judgment was improving his landlord's property. But what could deter a man more from laying out his money than to know that those night marauders and plunderers—the hares and rabbits—were continually on the alert; and when things should look pleasant, and when he should be in expectation of a pleasant and profitable harvest, instead of getting it, he would only see more plainly how far the rabbits and hares had gone, for although some said hares were harmless—(a laugh)—anyone could, by going a little way into a field of barley, gather the crop up in armfuls (applause). By looking at the outskirts of the cover they may think that very little harm was done by those animals, but what was done by the rabbits, but that was not so. He could not see what there was in the shape of a "national sport" in the shooting of hares and rabbits. One set of men went in and drove the animals out, and it was, to him, only like shooting down so many dogs. Yet it was, it seemed, a bit of amusement they liked, and he supposed there was a bit of profit attached to it, for those hares and rabbits, fed by the tenant, by-and-by found their way to the market, and enriched the pockets of the landlords ("Hear, hear," and applause).

He hoped he should not hurt the feelings of any one present if he said he did not believe that those who killed their game and sent it to a market town for sale could in any way be considered benefactors of their country (applause). He thought it helped to fill their workhouses and to swell their county rates, and he could not help thinking, while he and others like him were rated pretty highly, the landed proprietors were not very highly rated (Hear, hear). Tenant farmers felt the oppressiveness of the present state of things in a good many ways, directly and indirectly. If landlords would stand up and say they would do what was right between man and man, and if they would do it, they would get over the difficulty very easily, but unless they did so, the difficulty would be got over in no other way than by bringing the attention of the country and of Parliament to bear upon it (applause). Mr. More had told them that game was, legitimately, the property of the tenant. No doubt it was so, as also that the right of destroying it had been handed down to the tenant by law, but "might" had been brought to bear, to the great injury of the tenant farmers of England, and had taken the place of "right;" and so the full improvement of the soil had been prevented, to the great injury, not only of the tenant, but of the country at large. In his boyhood days it was a pleasure to him to see men out for a legitimate day's sport. There was something invigorating in it, something that tended to create a good feeling between landlord and tenant. He had no doubt tenants generally felt a pleasure at seeing their landlords have plenty of sport (Hear, hear), but no true lover of sport could call what was at present in vogue "sport." He had even heard of a gentleman who begged a lot of birds, which he let out upon a field before they were wanted, and said to his friends, "There, go and shoot them" (laughter). Was that sport? (renewed laughter). If it was, the sooner the better they abolished such sport altogether. The question was one that ought to have been disposed of many years ago (applause).

The CHAIRMAN: Here is a proposition, and until that is disposed of we can discuss nothing else.

Mr. WILLIAMS: I have suggested one remedy, which is to give the ground game to the tenant.

Several VOICES: Make them vermin (applause.)

Mr. WILLIAMS: Aye, anything you like to call them. I do think landlords ought not to prevent us killing hares and rabbits.

Mr. J. BATHER said no one could deprecate the over-preservation of game more than he did. He had no game himself, and there was nothing he disliked to see more than good crops spoiled by game. But the question was, how was the evil to be prevented, and he must say he had heard nothing that day that led him to suppose they were in the right way to get the question settled. They had heard from Mr. More, and he had no reason to doubt that that gentleman was wrong in his law, that when a man took a farm without any stipulations to the contrary, the game would belong to him and no one had a right to put his foot upon that land but the tenant himself, or those he may give permission to. But what did they do? Why, the first thing they did was to sign away all their rights (a laugh). Of course they said they could not help it, that they would get no land if they did not do so. But, he would say, let them go to their landlord, and let them show him (expressions of dissent). His sympathy, he assured them, was with the tenant, there was no doubt about that; but if a tenant took a large tract of land—say, at 30s. per acre, and signed an agreement that the landlord should have the game, he could scarcely look upon it as fair for the tenant to go to the landlord and say, "Let me have the land, with the game, at 30s." If tenants wished to have the game they must show the landlords that they were willing to pay such an amount in extra rent as the game was worth (applause). It was a commercial transaction, and should be put upon that footing (Cries of "Nonsense"). Mr. More brought to them an Act of Parliament, and he said it should enact that the ground game should belong to the tenant, but his (the speaker's) experience was that no sooner did it belong to them than they would sign it away again. And what was to prevent them? No Act of Parliament could. The law may say that no tenant shall sign away his rights, but he knew something of lawyers, and he knew they would soon find a way for him (the tenant) to do so, and the landlords would very soon have the hares and rabbits the same as before (Hear, hear). Farmers had their rights already as re-

garded the game, and if they gave him up, what had they to complain of? (Hear, hear). And if they did do so now, who could tell that they would not do it again? But there was a remedy, and it was what he had before suggested, in discussing another subject—to make a good agreement with a good landlord (Hear, hear). If they took a farm from year to year they were liable to be turned out at six month's notice, and he said it was a contemptible and miserable state of things that land should be let in that way without any security to the tenant. He repeated that the only remedy, in his opinion, was a good, well-considered, agreement between the landlord and the tenant (applause).

Mr. M. WILLIAMS asked Mr. Bather what he proposed to do with all the existing agreements, as what that gentleman suggested would only affect those that may be entered into in future. Nor did he agree with Mr. Bather's remarks, for there could be no doubt that if a man who applied for a farm had any crotchets about the game, he was refused the farm in consequence, and there were always plenty more ready to take it. He would ask Mr. Bather how he proposed to deal with existing covenants?

Mr. BATHER thought if the question were put at all it should be put through the Chairman.

The CHAIRMAN called attention to the resolution before the meeting, and inquired if any gentleman had any further remarks to make upon it.

Mr. EVAN DAVIES would also like to ask Mr. Bather a question, or at any rate to make a few remarks upon what that gentleman had said. Mr. Bather had told them that all the evil lay in the mode of taking and letting the farms, and that it was a simple commercial transaction between landlord and tenant. But were the landlords and the tenants in the same position for making a contract? Were not the landlords' interests bolstered up in every way, while the tenants' interests were not? (applause).

The CHAIRMAN must say he disliked the use of the phrase "a commercial transaction" as used by Mr. Bather, for he should be sorry to see what ought to be pure good feeling between landlord and tenant become a mere transaction of that sort. He would remind them that there was a proposition before the meeting, and as Mr. More claimed the right of reply he would put that gentleman in the possession of the meeting if no one else wished to speak.

Mr. MORE said he wanted the sense of the meeting to be taken on his resolution, and then anyone who wished it would be able to propose a rider, so that gentlemen would have another opportunity of saying what they wished upon the subject. All that he wished to say upon the resolution, before it was put, was to make a remark or two in reply to Mr. Bather's observations. Of course he did not measure his experience against that of Mr. Bather, and he could only say that he was extremely obliged to that gentleman for what he had said, as it was what he (Mr. More) would have said if he had only had the moral courage to have done it (Hear, hear, and laughter). He (the speaker) had told them what the outside world said about farmers when they took a farm and signed away their rights. The speaker then proceeded to show that it might be concluded from Mr. Bather's arguments that that gentleman should be in favour of the Irish Land Bill being extended to England, for the remedies he suggested were substantially the same as were proposed in that measure.

Mr. BATHER: No, no; nothing can be more to the contrary.

Mr. MORE said it was, then, an undesigned coincidence. He (Mr. More) urged the desirability of farmers keeping together to support their own rights, and remarked, incidentally, that an instance had occurred in the county of 3,000 acres being thrown upon the hands of a landlord, the farmers declaring they would have nothing to do with the land until the rabbits were destroyed. Mr. Moore also suggested that farmers should, if necessary, pay for the game at the rate, say of one shilling an acre, although it was, in some cases, valued as low as sixpence. Surely it would be worth while for farmers to make some such offer as this. Mr. Botfield had told them that the landlords' interests had to be considered as well as the tenants', and that if the latter had the game they would preserve more than was preserved now (A voice: "No danger"). Well, hear what Mr. Corbet, the farmers' friend, and secretary of the Central Farmers' Club, who had given the best description of the farmers' grievance that had ever been published,

says. That gentleman gave an instance of a landlord who gave his tenant notice because he (the tenant) preserved so much game. He (Mr. More) assured them he had been in some parts of Norfolk where he had seen a nobleman's estate on which every tenant had the right to shoot, and he never saw more ground game than he saw on those farms. On one occasion he had the pleasure of dining with a Norfolk farmer, and, being late, he excused himself by saying, as was the fact, that he had to drive very slowly up to the house for fear of being upset by the numbers of hares and rabbits that were in the way (laughter and applause).

The Chairman then put Mr. More's resolution to the meeting, and it was carried with acclamation.

Mr. M. WILLIAMS proposed as a rider that hares and rabbits should be the property of the tenant, subject to the landlords' right of shooting.

The CHAIRMAN: They do belong to him at present until he signs them away.

Mr. WILLIAMS: Then I will put it in this form, "That the words 'hares and rabbits' should be struck out of the Game Laws."

Mr. PINCKNEY (Cressage) seconded this.

Mr. EVAN DAVIES maintained that tenant-farmers were not in a position at present to make an agreement with their landlords as to the destruction of the game; for instance, in the taking of farms men of small capital were put in competition with men of large capital. This being so, men of small capital were compelled to take farms on almost any terms, or go without them altogether. Tenants could get no compensation for the money they laid out from the landlords, and there was the evil. The tenant should be put in the position of making a good bargain with his landlord, and then he could make one, and it would be his own fault if he did not. At present he was not in that position (applause).

Mr. BATHER objected to Mr. Williams' proposition, urging that it was out of order, as they had not come there to discuss the Game Laws. He would ask the Chairman for his opinion upon the subject.

The CHAIRMAN said he agreed with Mr. Bather that, strictly speaking, it was not in order, but at the same time he (the Chairman) was very unwilling to offer any technical opposition to what may be the wishes of the meeting (applause).

After some discussion, Mr. BOWEN JONES pointed out that while the Chairman was very anxious to have a full discussion of the question of game, he was of opinion that strictly speaking Mr. Williams was not quite in order. It was their duty to support the Chairman (applause); and he (Mr. Jones) would suggest that, if it were thought necessary, they should have a meeting to discuss the whole question of the Game Laws (applause). He hoped they would allow Mr. Atcherly to do what he believed to be correct (Hear, hear, and applause).

Mr. EVAN DAVIES thought they should allow the Chairman to exercise his own judgment.

The CHAIRMAN thought it would be better to have a discussion upon the Game Laws generally than to introduce them into that discussion.

After some other observations from different members of the Chamber, Mr. Williams withdrew his former resolution and proposed, "That in the opinion of this meeting all tenants ought to have the right of destroying the hares and rabbits upon their farms."

Mr. PINCKNEY seconded this, and it was carried.

AN UPRIGHT JUDGE.—EVANS v. HUGHES.—Peter Evans, farm servant, sued police-constable Hughes for the value of a coat of which he alleged that the officer had despoiled him. The fact of the policeman having possession of the coat was admitted, and he accounted for it in this way: that, passing a field in which the plaintiff was at work ploughing, he saw him with a gun in his hand; a partridge got up on the wing, and he saw the plaintiff shoot it and take it up, and he halloed at him. At this stage the judge interposed, and asked the defendant what possible business he had to interfere in a poaching case? (Applause). The judge cautioned him, and all other police-officers, remarking that it was quite enough for the ratepayers of the county to pay policemen for doing the duties required of them; and if people wanted gamekeepers, they must pay for them out of their own pockets.—*Carnarvon Herald*.

A BELGIAN FARM OF TEN ACRES.

(From Professor Voelcker and Mr. H. M. Jenkins' Report in the new number of the R. A. S. Journal.)

The question has frequently been asked whether a farm of ten acres is sufficient to enable a man to keep his wife and family in comfort, and to occupy profitably and completely his own time, without having recourse to other means of earning money, or filling up leisure hours. We propose, therefore, both with a view of giving an example of *la petite culture* on rather strong land, and for the purpose of showing what can be done with ten acres, to give a detailed account of a farm having, excluding buildings and fences, as nearly as possible that area. This little farm is situated in the commune of Haeltert, near Alost, and to a student of *la petite culture* it is almost worth making the journey to see.* The farm belongs to the occupier, Madame Van Weyenberghe, a widow, who has three grown-up sons. Until recently this was the working staff, but now that one of the sons has gone into the world, his place is supplied by a hired man. The grass land is rather more than two acres in extent; about an acre is cultivated as a garden, and the remainder, about seven acres, is farmed on a seven-course system, different from that in vogue in the light-land district. The shift is (1) potatoes or flax, (2) wheat with clover, (3) clover, (4) mixture, (5) colza, followed by turnips, (6) mixture, (7) rye. In the garden about a quarter of an acre of tobacco is grown every year, besides green vegetables of every description; and the spare time of the two sons is profitably employed in budding roses, grafting fruit-trees, and other similar operations, all of which bring in their modest profits.

The land for potatoes is manured with farmyard and liquid manure, and also with guano. No manure is given for wheat, which is sown in October; and the clover (cow-grass) is sown on it in January or February. After the wheat is harvested, a little clover is sometimes got the same year, but not usually. The next year it is cut the first time in March, and immediately afterwards receives a dressing of either liquid manure or Dutch ashes, but the former is preferred. Two other cuttings are got the same year before September; but in that month there is a great prejudice against using it, as people say it has "spiders' webs," and hurts the cows. The succeeding crop (mixture of rye and wheat) receives no manure, but soon after harvest the stubble is well manured and prepared to receive the colza-plants for the next year's crop. The seed having been sown in the previous August, the seedlings are ready to be planted out in October and November. If the season is mild, each plant gets a dose of liquid manure; but if hard frosts are expected, this stimulant is carefully withheld, for fear that the water should freeze and kill the plants. The colza harvest is got in June, when the land is immediately manured, ploughed, and sown with turnips. This catch-crop is got in October, the turnips being pulled and housed; and during the winter the land is sown with mixture. After that has been harvested the stubble gets a heavy dressing of manure, and is sown with rye, which is followed after harvest by stubble turnips. We thus return again to the potato course, in the preparation of the land for which the spade is used as already described. One-tenth part of this course is sown with flax and carrots, the land being prepared for it with extreme care, so as to obtain a perfectly fine and even tilth. The flax (Riga) and carrot seeds are sown together, from the beginning of March until the end of April, according to the weather, but the sooner they are got in the better. A few mangolds are also sown in this course.

The stock kept consists of three milch cows,† and two pigs fattened for home use. In summer the cows are fed on clover and grass, mostly given cut in the stable; they also have a

drink, which consists of nearly a quart of linseed, 4 or 5 lbs. of rye-meal, and 20 quarts of water boiled with a certain quantity of mangold tops. This is enough for two drinks for three cows, so that each cow gets something less than a gallon each time. The first drink is given at seven o'clock in the morning, and the other at four or five o'clock in the evening. When the cows are at work they get, in addition, three meals of rye bread per day, the quantity given being 2lbs. per head each time. In the winter they each get a daily allowance of nearly 4 bushels of turnips and 1lb. of meal. One-half the turnips are boiled, the meal is mixed with water, and the whole, including the uncooked remainder of the turnips, is mixed together and given to the cows in two equal portions, one in the morning and one at night. If a cow has been an unsatisfactory milker during the summer, or when one gets beyond the most profitable limit of age, carrots are given instead of turnips in the autumn and winter, and with this simple alteration in the diet the cow is fattened for the butcher. Pigs are usually bought at four weeks old, or thereabouts, at prices varying from 4s. to 16s. They are fed with boiled potatoes, rye or wheat meal, and buttermilk mixed together, and they are given as much as they can eat. They are killed at ten or twelve months old, weighing from 20 to 24 score, and the meat is kept for household use, butcher's meat not forming an item in the dietary of the family.

The grass land is manured every March with either liquid manure or guano; it is mown in July, and a great part of the aftermath is grazed, the remainder being soiled. Nearly a ton and a half of guano is bought yearly for this little farm. Of the garden culture we shall say nothing, except that it was remarkably well done. Every inch of ground was occupied; and from the number of successfully budded roses and fresh-grafted fruit trees (all destined for sale), as well as from the abundance of healthy vegetables of such species as find a ready sale in the large towns, we inferred that this piece of ground, cultivated during "hours of repose" from the more arduous labours of the farm, added no inconsiderable sum to the family income. In this garden, and on a patch of ground in the farm, we found some of the finest tobacco plants which we saw in Belgium. The young plants are bought at 1 franc per thousand; they are carefully planted in well-manured land by the two brothers, as soon as all danger from frost has ceased, and each plant is attentively watered with liquid manure from time to time. The produce will sell at the rate of £160 to £200 per hectare (4,000 to 5,000 kilos. at 1 franc.), so that our modest area of a quarter of an acre (one-tenth of a hectare) will fetch the respectable sum of £16 at the lowest estimate.

The yield of other crops was very large compared with that on the average run of small farms—namely, in 1868: Wheat, 35 bushels per acre; mixture, 40 bushels; rye, 45 bushels; colza, 1 ton per acre; potatoes, 8 tons. This little farm, remarkable in many respects,* was in none more noteworthy than for two implements beyond the ordinary plough, harrow, and roller. One of these was a turnip-cutter—of primitive construction certainly; but it was the only one we saw throughout Belgium on so small a farm. Its essential parts were—(1) an inclined grating, forming the lower side of the hopper which received the turnips; (2) a wooden roller beneath, fitted with a spiral of hoop-iron knives; and (3) the fly-wheel, which had wooden spokes and a hoop-iron rim. There was no handle; but the machine was put into action by turning round the fly-wheel by means of the rim in a "hand-over-hand" sort of way. Including the wooden frame on which it was set, it cost thirty shillings, and was made by the village blacksmith.

The other "implement" was a waggon. Ordinarily, on even large farms as well as small, one sees a heavy three-wheeled cart (tambri) of the clumsiest description. The Belgian waggons are immensely long in the body, about one and

* The commune has the advantage of being under the sway of a most excellent burgomaster, M. van Meldert, to whom we are extremely indebted for much valuable information and kind assistance.

† The proportion here is one cow to 3½ acres; but no food for them or the pigs is bought; they are entirely fed on the produce of the farm.

* The manure was kept in a water-tight midden, out of doors, under the shade of some trees; and it absorbed, therefore, the greater portion of the liquid.

a half times the length of an ordinary English waggon, and very narrow; the fore-wheels are often placed in *advance* of the head of the waggon, and the hind-wheels at the very extremity of the tail, just *not* projecting beyond it. The waggon on the little farm was designed by one of the brothers, and was built in the village under his direction. The general contour of the body was a modification of that usually seen in Flanders, but it was scarcely more than half the usual length, and was very much wider in proportion; then the wheels, instead of being placed as far apart as possible, were, *tout au contraire*, as near together as could well be. Throughout our tour it maintained its place in our minds as the best designed waggon we had seen in Belgium.

The question has been asked more than once, "What is really the annual income of a holder of 10 acres, one year with another? Does he get, as labourer, the same wages which he pays for assistance; and does he get, in addition, any profit per acre in his character of a farmer?" These questions are difficult to answer even approximately; but we venture to offer the following reply as regards the small farm which we have described. It must be borne in mind, however, that so favourable a statement could hardly be given for many small farms in Belgium.

Our calculations will be simplified by the following facts: The cattle, the pigs, and three persons are fed by the produce of the farm; therefore, as our small farmer cannot eat his corn and sell it too, we shall not include either rye, "mixture," carrots, turnips, potatoes, or clover in his money receipts. We shall also assume that the pigs are invariably killed for home consumption. On the other hand, we shall include no *pur-chases* in the expenditure, except guano and young pigs; and we shall also consider that when a cow is "fattened" off during the winter she will realise just enough to buy a milch cow in her stead. We also think we are justified in considering that the wheat is sold; that is, indeed, the almost invariable practice. Seven acres cultivated on a seven-course system give exactly one acre per course; but we have only the crops off two complete courses to sell—viz., wheat and colza. In addition, we have one-quarter of an acre of tobacco and one-tenth of an acre of flax (excluding the seed), which are prepared at home, and therefore yield the utmost possible amount. The crop of flax with a good farmer weighs about 725 kilos. per hectare when prepared; this will give about 30 kilos. for one-tenth of an acre, and in the following balance-sheet we have taken about the mean price paid in December, 1868,

according to the return issued by the Courtrai Chamber of Commerce. The price of wheat after the harvest of 1868 is taken from the same source, and the amounts given for colza and tobacco were actually realised. The butter finds a very ready sale in the neighbouring towns, and the price given is about the mark. The wages, rates and taxes, and the price of guano, are at the current rates. The garden produce will probably not be thought too highly rated at £10.

Estimated Receipts (1868).

	£	s.	d.
1 acre wheat, 35 bushels at 7s.	12 5 0
1 acre colza, 1 ton at £21 10s.	21 10 0
1-10 acre flax, 30 kils. at 4 fr. say	5 0 0
¼ acre tobacco, 400 kils. at 1s.	16 0 0
Butter from 3 cows, say—			
240 lbs. each = 720 lbs.* at 1s.	36 0 0
3 calves at 15s.	2 5 0
Garden produce	10 0 0
			103 0 0

Estimated Expenditure.

	£	s.	d.
Wages of 1 man, at 1 fr. per day, taking the average of the year	14 10 0
1½ ton guano at £12	18 0 0
Rates and taxes 3s. 3d. per acre	1 12 6
2 pigs 4 weeks old at 7s. 6d.	0 15 0
			34 17 6

Gross profit ... 68 2 6

Against this return we must put the wages of two men, on the same scale as if they were hired; but we think that nothing need be allowed for the wages of the proprietress, who is very old. A man gets 75 centimes per day and his food in summer, and 45 centimes in winter with nourishment. Taking the larger sum all the year round, on account of the additional labour, which they perform in the garden, &c., the amount will be £23 16s. The rent is another item which should be deducted; and computing this at 45s. per acre, it would amount to £23 10s. We therefore have a remaining sum of £23 16s. 6d., or 45s. 6d. per acre as the farmer's profit; while the actual income of such a peasant proprietor, if unenumbered, would be £56 14s. 6d., after paying for his food. That a considerable sum of money is really saved is shown by the fact that the existing farm buildings were erected only a few years ago at a cost of more than £800.

EXTENSION OF THE HALF-TIME SYSTEM TO AGRICULTURAL DISTRICTS.

At a meeting held in Leicester, a paper upon this subject was read by Lieutenant-Colonel ARROYD, M.P., who said: Hitherto the only plan of compulsory attendance at primary day schools, which has received the sanction of the Legislature, is that under the half-time system embodied in the Factory and Workshops Act—that is, half-day attendance at work, and half-days at school. Where the conditions of labour permit of this arrangement, the system works admirably. I can speak with the authority of a long experience, having for upwards of twenty years taken an active part as manager of my own factory schools, where there is now a daily average attendance of 900 half-timers, 230 day scholars, and 300 infants, a total of 1,430. Under this system, the enforcement of the attendance of children at school is imposed on the employer, as a condition of admittance to work; and he must obtain from the schoolmaster a voucher proving the attendance of the child at school during the previous week. These provisions are enforced by penalties, to which both the employer and the parent are liable. No child is permitted to work under eight years of age; and the period of half-time attendance at school continues from eight to thirteen. Under the cumbrous system in America, there is the greatest possible difficulty in enforcing school attendance; and, although special officers—called "truant officers"—are appointed for this purpose, yet the number of truants, compared with the number of children at school, is exceedingly large. There is no such difficulty in enforcing school attendance under the indirect compulsion of the Factory Act. In the year 1868, there were about 81,000 half-timers, and out of this number there were

only 90 convictions against persons employing children without school vouchers, and 27 informations; and this, notwithstanding a very strict inspection. Thus, with a simple machinery, at a very slight cost, strict and regular attendance at school is enforced. Respecting this principle of indirect compulsion, I am happy to adduce the evidence of Mr. Tremeneheere, one of the commissioners on the employment of children, young persons, and women in agriculture. In clauses 76, 77, 78, and 79, of the Second Report, he says: "The only principle approaching the nature of compulsion, in regard to the education of the young of the labouring class above the grade of paupers, that has, up to this time, been admitted into the legislation of this country, is that of connecting the obligation of school attendance with wages-earning employment. This principle rests on a just view of the extent to which parental obligation may be enforced, and permits the Legislature to say that if a parent benefits by the labour of his child, he shall be compelled to apply a portion of the child's earnings in the fulfilment of his duty to his child, and for his child's advantage—viz., in procuring for it a certain amount of education. Public opinion in this country justly sanctions the enforcement of such an obligation upon the parent by fine or imprisonment. The Workshops Regulation Act, which embraces all kinds of handicrafts, not included in the Factory Acts, in defining 'employment' to mean occupation in any

* We should have placed this item somewhat higher, but for the fact that the cows are used for tillage and draught purposes.

handicraft, whether for wages or not, under a master, or under a parent, thus describes the liability of the parent in case of a child being employed in contravention of the Act." (Sec. 7.) "The parent of, or the person deriving any benefit from, the labour of, or having the control over the child . . . shall be liable to a penalty of not more than 20s., unless it appears to the court before whom the complaint is heard that the offence has been committed without the consent, connivance, or wilful default of the parent or person so benefited, or having such control." "And by sec. 12, this penalty is recoverable summarily in the manner directed by the Act 11 and 12 Vic., c. 43, which gives the power of imprisonment if the penalty is not paid." The question remains to be considered, how the principle is to be applied to the children employed in agriculture, and how it is to be adapted to the altered conditions of labour in the rural districts. It must be remembered that all children, save and except those engaged in agriculture, are now subject to this condition of compulsory attendance at school, as a certificate to half-time work. We may best estimate the amount of educational work still to be done by an approximate calculation of the total number of children of school age—say between five and twelve or thirteen—engaged in outdoor labour in the agricultural districts of England and Wales. Mr. Tremmaheere, in clause 82 of the report before alluded to, resting his calculations on the census returns of 1861, arrives as a total of 41,090; that is, about one-half of the number of those already in attendance at school under the factory half-time system. The figures are not formidable. Already a large proportion attend the national or other schools, and hitherto school accommodation has been in excess of school attendance. But the universal complaint on the part of school managers and masters is, that children leave the day school for work at the age of ten or eleven, and drop their attendance after that period. This complaint is confirmed by the table issued by the Committee of Council on Education, showing the comparative age of scholars in schools inspected by the inspectors of schools in Great Britain. In 1868 no less than 72.28 were under ten years of age, and 9.91 were between ten and eleven, 7.85 between eleven and twelve, and 5.52 between twelve and thirteen; that is a total of 23.28 between the age of ten and thirteen, or together 95.56 under thirteen, leaving only 4.44 above the age of thirteen. For the most part the great proportion of the education of the agricultural children ceases at ten years of age, and can be of little avail in after life. No primary instructions worthy of the name, which shall form the habits and ripen the intelligence of the pupil, can be given unless regular attendance be secured at day schools to the age of thirteen years. Evening classes are worse than useless for children of tender years, who are more ready to fall asleep than to learn lessons, which it is cruelty to enforce. Hence the conclusion is forced upon us that some limitation of children's working hours is absolutely necessary to make room for school attendance. But, first, the age at which work shall commence ought to be fixed. On this point there is a difference of opinion between the two commissioners, Mr. Tremmaheere and Mr. Truettell. The latter inclines to believe that ten ought to be the age below which no child ought to work, and that ultimately it might be raised to eleven or twelve; whilst the former considers that no minimum age should be required, under which children should not be employed; except in the case of those who look after horses, when he would fix ten as the minimum. He further states that in many counties—as Yorkshire, to wit—children go out to work at eight or nine years. From this conflicting evidence, I draw the conclusion that there is no valid reason why there should be any deviation from the minimum age of eight fixed by the Factory Acts. Moreover, under this limit, there is abundant opportunity for attendance at infant schools, and the acquisition of the art of reading before entering in the half-time schools. A satisfactory examination in reading at or after the age of eight might be insisted upon before the child goes to work at all. This preliminary examination has been tried with beneficial results by Mr. Paget, of Ruddington, formerly M.P. for Nottingham. We proceed to consider the adaptation of half-time system to agricultural labour. Clearly, half-day attendance is out of the question. Half the day would be lost in going backwards and forwards from work to school. Alternate days' schooling has been tried by Mr. Paget; but as farming operations depend much on the weather, the system could not be

strictly applied. During harvest all school attendance must of necessity be suspended. Of all the plans proposed that of the Hon. Edward Stanhope, her Majesty's Assistant Commissioner, seems to me the most feasible. Fortunately he is himself present at the conference to explain his own proposition; and the value and importance of the meeting will be considerably enhanced by his presence. I may add that his inquiry extended over the county of Leicester. Briefly stated, Mr. Stanhope's proposition is to require 100 days' school attendance in each year, from eight to thirteen, which would hardly interfere a single day with the exigencies of the farmer, and put the parent to no expense beyond the payment of small school fees. These 100 days' attendance might be given almost exclusively during the winter months, so as to interfere to the slightest possible degree with farm labour. That feature of the plan which most commends itself to my approval is its complete harmony with the principles of the Factory Acts, and with all past legislation. One further condition might be necessary to insure a sufficient amount of instruction, namely, that no child who should have attained the age of thirteen, after the passing of the promised Education Bill, should be allowed to work full time without a certificate of competency under the 5th standard of the Revised Code. An outcry may be raised should these provisions for compulsory attendance be enacted, that there is a deficiency of schools. This would be a refreshing change from the present state of things, where the complaint is that there is a lack of scholars to fill existing schools. But what are the facts as to existing school accommodation? In the report of the National Society for 1869 it is stated that, "as far as the Church of England alone is concerned, the Society's census of schools reveals the fact of the 14,709 parishes, chapelries, and other ecclesiastical districts in England and Wales, only 398 are destitute of week-day schools, and at the same time so far removed from schools in adjoining parishes that children cannot attend them. Most of the places unprovided with schools are thinly inhabited, thirty-five per cent. having a population of less than 500. From this statement it appears that there are few parishes destitute of schools, or beyond reach of school attendance. Where new schools are required, I cannot doubt their being built by voluntary effort, aided by Government grants, bestowed more liberally than is usual in poor districts; indeed, voluntary agency is more certain and less fluctuating than Government aid. Periodically the Chancellor of the Exchequer uses the pruning-knife, and cuts down the education estimates, as in 1864 and 1865. Wherever the Factory Act has been introduced, rendering it to the interest of employers to provide school accommodation, there has never been any lack of schools. In the smaller hamlets, where schools do not exist, a convenient cottage-house might often answer every purpose of a school. I have tried the experiment, with satisfactory results, in a village in the East Riding of Yorkshire, where I spend the autumn. An ordinary room in a cottage, with a brick floor and a fire-place, comfortably accommodates a group of about 20 children in a day school under a mistress. The same place is used as a club room in the evening, where the farmers' lads and young men can sit and smoke and read the newspapers. During two evenings in the week an adult class is taught by a schoolmaster from a neighbouring village. Upon the whole, I believe that a habitable room of this kind is preferred by the pupils, children or adults, to a more handsome and pretentious fabric, built strictly in accordance with the regulations of the Committee of Council on Education. Of the success of this proposed extension of the half-time system to the agricultural districts, if fairly tried, I have not the slightest doubt. Small farmers may at first take alarm at the condition of a school attendance, and the interference with the children's work; but this alarm will vanish after a slight experience, as it has done with employers brought successively under the operation of the Factory Acts. All trouble of making out the certificates of school attendance rests with the schoolmaster, and the farmer has only to send the children to school for the requisite number of days. Intelligent labour is in the long run cheaper than ignorant labour, and the introduction of scientific farming has necessitated the training of a superior class of labourers to that of the old clodhopper. Any pecuniary loss of work by school attendance will be more than compensated to the employer by the improved character of the farm servants. Let us hope that the social condition and morality of agricultural labourers will be thus gradually improved.

THE FACTORY SYSTEM OF CHEESE-MAKING IN DERBYSHIRE.

A meeting of the members of the Derbyshire Agricultural Society has been just held to receive the report of the committee appointed at the annual general meeting of the society on the 24th of December. The chair was taken by the Duke of Devonshire. The secretary read the following report of the committee:—

At the annual general meeting of this society, held on the 24th December last, a committee, consisting of Lord Vernon, the Hon. E. K. W. Coke, Lieut.-Col. Wilmot, V.C., M.P.; the Mayor of Derby (T. W. Evans, Esq.), J. G. Crompton, Esq.; Mr. Murray, Mr. Nuttall, Mr. Coleman, Mr. Grestorex, Mr. Sims, Mr. C. Canner, Mr. Faulkner, Mr. T. Travis, Mr. M. Walker, Mr. Jacob Smith, and Mr. C. Finney, was appointed to take into consideration the question of manufacturing cheese by the factory system as adopted in the United States of America and Canada, and the desirability of its introduction into this county. Dr. Hitchman and Mr. Alderman Roe were subsequently added to the committee. The committee have met frequently and gone into the subject fully. They have invited opinions against the system, and in favour of it, and the result of their deliberations is, they consider that there are satisfactory grounds for expecting, should the system have a fair trial, the following advantages: 1st, Greater uniformity in the quality of English cheese than at present existing. 2nd, Enhancement of the quality and value of the product of milk in dairies which from poor plant and absence of good accommodation, is now producing an inferior quality of cheese. 3rd, The removal of an arduous occupation, frequently deterring men of capital, from domestic considerations, from entering upon farms in which cheese-making forms a prominent feature. 4th, Improvement in the value of land, from improvement in the value of product. 5th, Generally, the introduction of uniformity of system, best plant, best skill and supervision, into a manufacture hitherto subject to great uncertainty and vicissitude. They have decided that one factory shall be established in Derby, and another in a dairying district in the country. Mr. Alderman Roe has placed at the disposal of the committee a most suitable building situate in Siddal's-lane, Derby, rent free for the first year. It is considered well adapted for the purpose, and the thanks of the committee have been accorded to him for his generous assistance. The situation of the country factory has been a matter of grave consideration with the committee. It was thought at the outset that it would be necessary to erect a building specially for the purpose, whatever quarter might be selected; and, as the committee concluded it would be out of their power to build a factory, and that it would be unfair to expect any gentleman to do so at his own cost, without some guarantee that in case of the failure of the system he would be recouped in part the cost he had incurred, it was suggested by the committee that it would be desirable, under the circumstances to establish a guarantee fund to induce offers to erect such factory. It has been accordingly arranged that a fair rent should be paid for the building after the first year, and that in case the system failed in the course of three years time, 40 per cent. of the cost of the building should be refunded to the proprietor. The committee have great pleasure in being able to state that the necessity of erecting a building for the sole purpose, has been obviated by the liberal offer of the Hon. Mr. Coke, one of the members of this committee. Several districts were selected as suitable for the situation of the country factory, and local meetings have been held in each to ascertain the facilities that could be offered for establishing a factory, and the quantity of milk that could be supplied to it. The result is of the most satisfactory character, and has far exceeded the most sanguine expectations of the committee. The districts whose claims have been tested by the committee are Sudbury, Shardlow, Longford, Etwall, and Weston-under-Wood, but several other localities were named to the committee where the farmers were anxious to have the system at work, and almost equal facilities as to the building and sufficient supply of milk were offered. After careful consideration,

the committee unanimously selected Longford as the most desirable situation, the Hon. Mr. Coke being prepared to find a house and buildings that could be converted into a factory, and in case it should be ultimately deemed insufficient for the requirements of the case, he would erect a suitable building at his own cost, subject to the conditions guaranteed, and would make satisfactory arrangements for the carriage of the produce from and haulage to the factory. There are absolute promises from farmers in that district to supply the milk of more than 500 cows. The committee cannot omit to mention the liberal proposal of Mr. C. E. Newton, who also offered to erect a factory at his own cost (subject to the guarantee) on his land near Etwall. The Committee think it would be unfair to those farmers who have, in order to test the system, agreed to supply their milk to the factories, not to place them in such a position that in case of failure they would be secured against loss; and they have, after mature calculation, determined to guarantee 6½d. per gallon for the milk, and divide the profits to be derived from the disposal of the whey, together with any other that may be obtained, after paying working expenses, *pro rata*, among those who supply the milk. This Committee have been greatly assisted by the advice and information volunteered by a member of an eminent firm in London who are now the largest exporters of factory-made cheese from America. It is through this firm that they have been enabled to secure a person thoroughly conversant with the manufacture of cheese by this system from America, and who is now on his way to this country. He is engaged for one year, and to superintend both factories. It is with gratification this Committee alludes to those noblemen and gentlemen who have with such public spirit come forward to form a guarantee fund for the purpose of establishing experimental cheese factories in this county, and providing for the additional expenses to which a new undertaking of this description must of necessity be liable. The fund now raised exceeds £3,000, but the Committee think that this trial is of so much importance to the dairy interest of the county, and the landowners in general, that they hope to see this amount largely and widely increased, so that the call on each guarantor may be as light as possible. The Committee have expressed their thanks to their Chairman, Lord Vernon, the Hon. E. K. W. Coke, Mr. Crompton, and to Mr. Nuttall, Mr. Murray, Mr. Coleman, Mr. Canner, Mr. Jacob Smith, and Mr. Finney, for the trouble and time they have given to this movement in attending as deputations to the several districts. The Committee find that the method of making cheese in America differs so widely from that pursued in this country that they think it prudent to proceed no further in alteration, or arrangements in buildings, until the arrival of the manager from America. They however fully expect to see the system in work about the beginning of April.

This report was unanimously adopted.

THE SALE OF CORN.—At a meeting of the Essex Chamber of Agriculture at Chelmsford, Col. Brise, M.P., in the chair, the following resolutions were proposed by Mr. J. Youngman, and adopted: "1. That the deductions made by corn buyers, on payment to farmers for their corn, are inconsistent with modern methods of transacting business; and the prices returned to Government, by which the tithe-rent charge and corn-rents are regulated being more than the farmer receives, the payments he has afterwards to make are inequitably increased; therefore such deductions ought no longer to be made. 2. That this Chamber hereby requests the discontinuance of such deductions, and that the Council do endeavour to obtain the concurrence therein of the buyers in the Essex markets; also, if necessary, that farmers be invited to unite in refusing to sell their corn to any but those buyers who will agree to pay them in full." Mr. J. S. Gardner moved: "That in the opinion of this Chamber the present mode of getting returns for the tithe averages is fallacious; and

that returns should be made from every corn market in duplicate from the producer and one from the first purchaser." The resolution was adopted, as was another, also moved by Mr. Gardiner, to the effect "That it is desirable that all kinds of grain should be by law sold by weight instead of by measure."

A discussion arose on the Education Bill, Mr. Round, M.P., giving a general outline of the measure. Mr. Jostling proposed, that the Chamber should express its general approval of the Bill; but the suggestion met with some opposition, and ultimately the discussion was adjourned.

AGRICULTURE AND AGRICULTURAL AUTHORITIES IN THE EAST.

At the last meeting of the Lavenham Farmers' Club Mr. FISH read a long roundabout paper on "The Waste of Force in the Economy of Agricultural Production," for which we have not room. The following discussion ensued:—

Mr. HITCHCOCK said it was quite evident from the paper they had heard that Mr. Fish had sat at the feet of his Gamaliel, Mr. Mechi, to some purpose, for he adopted his views; whether they would agree with them was another matter. First, as to the £4 per acre produced by each English and Irish acre of land annually, Mr. Mechi's remedy for this was to break up the twenty-two millions of pastures existing in the country; but if this plan were adopted, what, he should like to know, would become of the 1,500 Irish bullocks which came weekly to St. Ives's market? Where would they get the raw material to feed them upon? As to the philosophical parts of the lecture as to the waste of force, he did not understand them, but as to the loss of force, Mr. Fish would have them believe that there was a great loss of force in having the horses at length, and that two horses abreast would do as much work as three at length; Mr. Fish did not say so, but that was what it came to.

Mr. FISH: I believe they would.

Mr. HITCHCOCK said this argument did not apply to the spindle from an engine; it did not matter whether it was seventy or sixty feet long, or quite close, the driving power was the same, and in thrashing machines the work was done better with the engine at a little distance than when quite close. If the horses were steady pullers and well trained, he did not think there was much waste of force. As to the unnecessary weight of their implements, he quite agreed with Mr. Fish that it would be much better and less expensive if they could do the same work with a waggon weighing 15 cwt. as they did with one weighing 25 cwt. Then again, about leases, they were very good things, but the thing that Mr. Fish and gentlemen of his school, who were talking about leases, wanted, was fixity of tenure.

Mr. FISH: Not I, Sir.

Mr. HITCHCOCK said this idea meant that those who had once got possession of land were to keep it. Mr. Mechi once referred to a farm where they cultivated by steam three feet deep, and where a walking-stick might be run down to that depth. He (Mr. Hitchcock) was at that farm on the previous day, and found that the gentleman who was farming it cultivated 320 acres of sugar beet last year as an experiment, and this year he had 1,850 acres ready for sugar beet, while next year he intended to grow 2,000 acres.

Mr. HAWKINS said he wished to allude to the waste of force in labourers going some distance to their work. One of the evils of the existing system of tenure was the great difficulty there was in providing cottages for the labourers near the farm, and it was a difficulty which the tenant could not overcome unless the landlord would step in to help him. In the neighbouring county of Norfolk Lord Leicester had built good substantial cottages upon the farms, the tenant paying him five per cent. interest upon his outlay. He "himself as a tenant should be pleased to guarantee his landlord five per cent. on his outlay if he would provide good cottage accommodation. He believed there was a great deal of truth in what Mr. Fish had said, but he hoped that no labourers in their neighbourhood had to come four miles to their work, although it might be so near Bury, because there the farms were larger. He believed himself that there was no tenant who would not gladly guarantee his landlord five per cent. for good cottage accommodation near or on his farm.

Mr. TALBOT said he did not know where Mr. Fish got his statement from that the land in the kingdom only produced on the average £4 per acre.

Mr. FISH: I quote from Mr. Mechi.

Mr. TALBOT said Mr. Mechi might be an authority, but he had heard that his farm grew eight or nine sacks of wheat before he took it.

Mr. HAWKINS: We have been told that he has never grown so much on it as the previous tenant.

Mr. TALBOT said he must have used his capital very badly, then. He thought, to say that the land of the country did not produce more than £4 per acre, was a very great absurdity. As far as his experience—which extended over twenty or thirty years—had gone, he must say that he never heard the estimate put at so low a figure. He quite agreed with what had been said about improving the land, while believing that many farms were so well cultivated at the present time that they grew all the corn possible. He believed by an unlimited application of manure, land might be made to produce a great quantity of mangolds and turnips, but then where was the quality?

The CHAIRMAN, Mr. Biddell, thought a six months' notice much too short, and that once or twice that length would conduce to better farming. He agreed with some of Mr. Fish's points; their implements were much too heavy, but in advocating a light steam-engine for the land he was two years behind the manufacturers, for it had been tried and given up, more power being required in drawing the engine across the land than in drawing a certain quantity of rope. As to Mr. Mechi, although one of the pleasantest men he ever met, he thought him a bad authority, and an argument should not be backed up by his statements. He would rather take Mr. Fish's authority than his. He challenged Mr. Fish to show a body of men who cared more for their men than the farmers. The manufacturers only looked upon their men as so many hands. He should be glad to see the labourers better off, but they could not expect a man with capital to join a man who had none. If he did, he should think one had brains and the other had not. There were many things in Mr. Fish's paper which would afford them matter to think over before their next meeting.

Mr. FISH said he did not hold himself responsible for the views of Mr. Mechi, or any other person. He should be sorry even to hold himself responsible for what some of the Liberal party might have said about land or the relation between landlord and tenant, or on Tenant-right. He only held self responsible for his own words, and what he had said was that in order to draw more capital into the land it was necessary that the tenant should have the protection of a lease. He had no sympathy with fixity of tenure; he did not believe it was practicable to give two persons a fixed right in the same land for an indefinite period. But if they wanted to draw out the productive powers of the land, they must give those who invested capital security that they might recover it. The system of leases had worked well in Scotland, and he believed with a good system of leases the tenantry would be contented, and that the prosperity of Ireland would date from the extinction of tenancy-at-will. As to the labourers they overlooked the important part of his argument. He did not say out of the goodness and charity of their dispositions they were to feed and clothe their labourers well, but that simply as a commercial transaction it was a good thing for them to do. They made a great mistake to suppose that the less they paid for their labour the cheaper it would be; on the contrary, the more they gave for it the better it was, for if a man had not the power in him he could not put it on the land. The subject on which he had addressed them that evening was at present very incomplete, and therefore he might meet them on some future occasion to discuss its other branches.

THE EDUCATION QUESTION.

BY THE CROTCHETY FARMER.

Here at least I am on my own ground; for of all the questions which are coming up for discussion in this restless discursive agitating country of ours, there is none in connection with which there is so much that is crotchety as that of education. Take them as they come up before us, as discussed at our public meetings, or promulgated through our public press, we find their name is "legion." And seeing what is broached in them, does it not seem to be quite an impossible thing for a common platform to be made upon which we all can meet? so thoroughly antagonistic do they seem. Am I crotchety in saying that the position of the education question reminds me of the story of the nigger sailor who was taken up to be flogged, and to whom a neat sermon was delivered by the Captain while the nigger was standing with bare back waiting for the operation? Tired at last with the harangue, nigger remonstrated in fashion thus: "If you talkee, talkee—if you floggee, floggee; but not talkee and floggee both." Now we have been for many years talking much more than doing; and talk, "talk talk," as the Yankees phrase it, seems to be more the order of the day than ever. We have an Education "League" and an Education "Union;" but how much "union" is there amongst us? how much of a league together to do is there? Echo answers where, which is all that echo generally appears to be able to answer, and which will typify what we as a nation are *doing* in this same matter of education. Is it very crotchety to say, I wonder, that if each party who has a crotchet would attempt to work it out in some practical fashion or other in place of merely talking about it, more good would result than has resulted. Hence it is that while in no way connected with either one party or another, with "league" or "union," while in fact being crotchety enough to desire to *do* something rather than to talk about doing, I am inclined to go in, on the mere practical view of the question, with those who have, albeit mayhap in a somewhat feeble way, done their best to give their crotchets, it may be, a practical place in the world's doings, and to say to those who are very busy at present telling us what they think ought to be done, "why do you not go and do what your neighbours have done? Your plan may be better than other plans which have been tried; but, then, my friends, the difference is this, you have not tried your plan they have tried theirs." And assuredly it cannot be said of their plan that it has not resulted in something practical. No doubt all that could have been done and that ought to have been done has not been done, but still it is something to say that a good deal has been done. It is no small thing to be able to point out the schools which have been built, and the scholars which have been taught in them, as evidence that if all this had not been done so much the more would have been the mass of ignorance amongst us. A grain of practice in such a question as education is worth a ton of theory. This brings me at once, as naturally it brings me face to face with the two leading bodies by which the "education theory" so to call it, for lack of a better name, although better might be found, is represented. I have already alluded to them when I used the words "league" and "union"; and at the outset I have hereby to declare that I am quite independent of either body. I look upon the question as far removed from the narrow circle of opinions which any one or both of the bodies alluded to may have; and I shall be very thankful indeed if either one or the other of the two bodies named be able to carry out a scheme of education which shall be general and effective. I am only so anxious to see education general, as to be quite indifferent to the fact that any one body may have more influence than another, the question with me being which is the speediest way of bringing about a system of education which shall bring within the reach of all who need it a sound useful education. To which end I confess that I am so crotchety as to wish that I could honestly believe that all the "talk talk" that is now going on was something quite apart from party politics, and only influenced by a real desire to have the ques-

tion practically settled amongst us. I cannot honestly think so, and there are many who are of my opinion in this. It may not suit the position of every one to say so, but I can say so freely and fully; for, as I said before, I am an educationist, not a leagist or a unionist. But how can I come to any other conclusion than that I have come to, that the present phase of the question is, to say the least of it—to put it in the mildest term possible, tinged with party politics, when I know that I can, with unerring certainty, tell to which body any one belongs as soon as I know of what colour his party politics are. Knowing this quantity, to put the matter into algebraical form, and I can soon tell you the other: given a man's politics, found the side he takes, the "League" or the "Union." And if so, and so it is, I am in the position, belonging to neither the one body or the other, to say to both that things being so, things are wrong; and just by so much the more that you advocate your views from your side of the question *only*; just so much the more do you retard the chances of a satisfactory system of general education being adopted. "Compromise" is to some an ugly word, but what in reality is our practical daily life but a life of compromise? The "give and take" principle is your true panacea for many of the awkward evils of life. As a business man, I appeal with all confidence to business men, when I ask, Am I not right in saying that we never could get through life comfortably if we all stood always upon our own dignity, and stuck to our own opinions without considering those of others? It will not do, does not do, to stand on our own little "mole-hills" and say to our neighbours "come." No we must mutually approach each other. The meeting of each other half way in our disputes is a much more easy way of settling things than calling in the lawyer and getting, as a result, a shell, while the lawyer gets the oyster. I have by no means said all I wish to say on this subject, for truly one which has given rise to so many discussions, both by press and platform, and for so many years, may afford a crotchety fellow like myself an opportunity of putting forth one or two of my crotchets.

A HEAT RACE IN OLD DAYS.—One of the games but the slowest of the four-milers was Lord Kelburne's Purity, by Octavian, and she finished up another remarkable Doncaster Meeting, in which Humphrey Clinker (the sire of Melbourne), Emma (the dam of Cothertstone and Mundig), Fleur-de-Lis, Actonson, Belzoni (the sire of so many fine, brown, and forge hammer-headed hunters), and Memnon, all won, while Mulatto ran second for St. Leger and Cap. I was the last race of the last day, and run in five two-mile heats. Bill Scott won the first heat on Brownlock, George Edwards running him home on Crow-catcher—so called from his having decapitated a crow, which alighted near him in social confidence when he was in his paddock as a two-year-old. In the second heat Scott led away, and Harry Edwards, on Purity, not fearing anything else, "flapped his wings a bit," as he expressed it, as if setting to, and ran in third. Thales won that heat, and Lord Kelburne began to be very anxious, and could not understand it at all. He came down from the grand stand for an explanation, and Croft took snuff in his quiet way, when he was asked what he was going to do, and replied, "I'm going to saddle the mare, my lord: the fun of the fair's only just beginning." It was time to begin with the third heat, in which Purity beat Brownlock by a head, after a slashing finish. Still the mare had not worn him down to her slow perpetual motion level, and hence it was necessary to get something to make a pace. Accordingly, as the chance of Thales was clearly *nil*, his owner accepted £25 to force the running. Tommy Lye worked away, and as Purity's jockey kept kicking him up with his whip, when he could reach him, Tommy's horse kept giving a series of

marvellous shoots, which were somewhat puzzling at first to the little man. Scott tried to get up between them, but failed; and when he did come in earnest, he made a dead-heat with Parity. Half the people had gone home, and Lord Kelburne, who had backed his mare to win him \$500, said that "there will be no dinner to-day." Officials were not so particular then; but still it is remarkable that Bill Scott did not remember that the fact of two horses, which had each won a heat, running a dead heat, disqualified even Thales, though he had won a heat, from starting again. This oversight decided the fortune of the day. Away went Tommy, and the tickling and the "shooting" began again; and although Parity finished quite black in the flanks with sweat, and could hardly be kept out of the judge's box, she got home first, and landed the Plate for "the crimson body, white sleeves, and cap" of Hawkhead.—*Sadale and Sirloin*, by THE DRUID.

SORTING POTATOES.

The unusual and unexpected "cold snap," which occurred last month, found most of the potatoes in this region in the ground. How many of them have been destroyed by freezing, it is hard to tell, but in the fields where we have been there are certainly a fourth of them touched with frost. As is always the case, many of the larger potatoes, that in growing have come near the surface, are frozen either entirely or at the end that was most exposed.

It is not alone this loss of twenty-five per cent. of the crop that we have to regret—though that is bad enough—but the greater damage that may result from placing these frost-bitten potatoes in a bin in the cellar, or in a covered heap in the field. A potato that has only a very small part of it frozen will be sure to decay, and if it comes in contact with those that are ever so sound, will cause them to decay also. A little leaven is no surer to leaven a whole batch of dough, than are a few frost-bitten potatoes to cause the destruction of the heap in which they are placed. The fact that potatoes form one of the best substances for making yeast should show us that we cannot be too careful about putting potatoes that have been frozen wholly, or in part, among those that are in good condition.

We have worked sorting over potatoes in the winter, among which a few frost-bitten specimens had found their way, either through accident or carelessness, and we know whereof we speak when we say that we were never called upon to perform a more disagreeable duty. Picking stones on a New England stubble-field, or opening ditches on a grainfield on a low prairie that is overflowed by water, are either of them bad enough; but they are pleasant occupations compared with sorting a heap of rotten potatoes. There are many things that are very disagreeable to one of the senses, but rotten potatoes are disagreeable alike to the sense of sight, smell and feeling.

The only way to save ourselves from this unpleasant work, and the only way to save such potatoes as are in good condition now from becoming destroyed, is to take especial pains in sorting out the frozen ones before they are put away. In digging, care should be taken to place those that we see are frost-touched on the other side of the row from where the sound ones are put; in picking them up we should make our examinations still more particular; and a like care must be observed in taking them from the wagon into the basket, and from the basket into the bin. Better take every potato in the hand three times than that even a few unsound ones should get among those that have escaped the frost.

Most kinds of stock will eat frost-touched potatoes that are fed to them soon after they are taken from the ground, unless they have already begun to decay; and if we make a judicious use of the frozen potatoes, we may turn them to considerable account. Cattle will eat them freely, if they are not fed to them in too large quantities at a time, and they are put on the green sward where they will not become dirty. Perhaps, however, the best use that can be made of them is to feed them to hogs. If they can be taken soon after they are dug; boiled, mashed, and receive the addition of a little meal, they will help to make up for the deficiency of the corn crop in producing pork.—*Prairie Farmer*.

THE BORDER AGREEMENT.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—Whilst the noted "Welsh Agreement" is excessively verbose—to say the least of it—that of A B and C D appears to err in the other direction. C D enters his farm on the 25th of March, and it is presumed quits at the same season. What then is the "outgoing crop of wheat" he is to take? does it refer to the *preceding* or the *following* harvest? The clause is exceedingly ambiguous; yet I am inclined to the latter as the correct reading; but in that case who is to pay the rent, rates, hoeing, harvesting, thrashing, and carrying out the above-named out-going crop of wheat? and does the term include the straw and chaff? if not, special mention should be made of the fact. Again, a fourth wheat and a fourth clover or other seeds will then leave half the arable land for the incoming tenant to sow with spring corn or green crops. Now, surely, C D should be either bound to do a certain amount of tillage, being paid for same, or to allow the in-comer to have possession of the land not required for wheat as it became vacant. C D should be *compelled* as well to sow a certain breadth of clover or other seeds, not leaving it optional, as it now stands. Farmers should be much more careful in signing agreements than they usually are: too commonly resting satisfied with a *verbal* promise that some objectionable clause will not be likely to be enforced, thereby oftener than otherwise making a rod at some future time for their own backs: new landlords or agents naturally turn their eyes rather than their ears. I could name a case where a landlord refused to allow his tenant, who farmed his land very highly, to take an extra crop on a field the area of which amounted to just a twentieth of his arable land—not, mark you, because he was injuring the farm, but because his agreement bound him to the four-course system.

I am, sir, yours respectfully,
A SUFFOLK FARMER.

THE GAME EVIL.—Game reservations and game preservation are the main hindrances to leases, without which it would be simply absurd to expect that any great and general improvements in husbandry can take place. The landlord objects to a lease lest he should find a tenant "troublesome about the game," and then might have some difficulty in turning him out of the farm, while the tenant, with a knowledge that his landlord is or may be a game-preserved, is scarcely willing to bind himself for twenty-one years to a farm on which a large proportion of its produce is sure to be consumed by the landlord's game. Again, nothing is more wanted on nearly all estates in England than a number of good cottages placed about the different farms sufficient for the accommodation of the farmer's principal workpeople; yet such cottages suggest to the landlord mind nothing but possible haunts of poachers. Not only economically but socially would a proper number of cottages on a farm be good, for there is no doubt that more kindly influences grow up between the farmer and his family and his workpeople and their families when the cottagers dwell on the farm than when the workmen come from a distant village, and are regarded by their employer as merely hired labourers. All this is intercepted by game. Then again, the existence of game on the farms does lead in a variety of ways to the demoralisation of the labouring of the class in the country. The adventurers are tempted by the sport—illicit sport, and others are tempted by the prices at which hares and pheasants secretly caught can be sold, and so low moral tone is introduced amongst the agricultural labourers which paves the way for absolute crime. We say nothing now of the actual destruction of farm produce, which has been raised by the capital the farmer has employed, caused by game preservation, nor of the destitution and pauperism which result from the enforcement of the game-law penalties. These things too are being seriously scanned by our thinking men alike in the country and in the towns.—*The Economist*.

THE OVER-PRESERVATION OF GAME.

A monthly meeting of the members of the Vale of Avon and Stour Farmers' Club was held at Christchurch, when Mr. John Waterfield, of Winkton Farm, introduced as subject for discussion "The Over-preservation of Game; its injurious effects to the Farmers and the whole Community." In the absence of the president, the chair was occupied by the vice-president, Mr. Druit.

Mr. WATERFIELD said he did not expect to be able to throw any new light upon the question, but he should endeavour to call their attention to the evils resulting from the over-preservation of game, and he should then ask them to consider some resolutions with a view to the amelioration and extensive alteration of the game laws. He acknowledged that he was indebted for many of his observations to Mr. Corbet, the secretary of the Central Farmers' Club, and he should also add a few facts gathered from their own locality. In the outset he declared that he was not an enemy to any manly sport or exercise, and he did not object to the preservation of game under proper limits, the just right of the tenant being respected. He did, however, strongly object to battue shooting, and to the practice of breeding game for the purpose of selling it to the poulterer and fishmonger of the country towns. At a public dinner in Norfolk some time ago, a large practical farmer said, "The squires are fast degenerating into poulterers." But it might be asked, "Has not a man a right to do as he likes with his own? and what is it to us if my Lord This or the Right Hon. That chooses to add to his income by breeding rabbits and hares for sale, just as the farmer does sheep or pigs?" Unfortunately the tenant-farmer had a great deal to do with the matter. If my Lord would only mark his hares and rabbits on the sides the same as the shepherd did his flock, so that when found straying or trespassing they might be pounded, it would be a different matter. But now the question is all one-sided. Many landlords—and he was happy to say that his principal landlord did not—had all the pleasure of shooting the game, or of letting the shooting, while the farmer had the simple satisfaction of keeping the game. He pays dearly enough for the keep of it on his farm; he pays for the keep of the poacher in prison; and he pays for the keep of the man's family in the workhouse. When the poacher comes out of prison, he is looked upon as a thief, and nobody cares to employ him. The farmers don't like to do so, for fear of offending the keeper who, in many cases is worse than the landlord. Increased taxation follows, from the poachers wanting employment, and thus it is not a question how much the landlord gets by every head of game, but how much the tenant loses. No one can deny that a large head of game—or rather vermin, for he spoke of hares and rabbits more particularly—did great injury to the surrounding lands. In fact, the injury was incalculable, and it certainly was not creditable to those noblemen and gentlemen who had so long permitted the continuance of such a plague. The late Mr. Pusey, at one time a game preserver, and president of the Royal Agricultural Society, wrote thus: "Even if you ascertain that three or four hares do not eat more than one sheep, you cannot estimate the amount of injury to a farmer, because the hares are not allowed to help themselves and go everywhere where they ought not to go. The positive loss and annoyance to a farmer is very great. It is an interference with his crops, and must try his temper very much." Mr. Waterfield then stated that an eminent valuer had informed him that whenever valuation and arbitration respecting game were resorted to, he had never yet known the farmer get one-half of that to which he was fairly entitled. He then pointed out at some length the great evils occasioned by the over-preservation of ground game, and observed that he was pleased to see that at a recent meeting of the Leicester Chamber of Agriculture a strong resolution against the prevailing system was passed. Rabbits, he was ashamed to say, were now included in the game laws. Could they, he would ask, call that an enlightened age, in which a man might be sent to prison—and be deprived of his liberty, and his family of his support—who by chance killed or caught a rabbit, perhaps bred and fed on his own garden,

bank, or field? If he be convicted and cannot pay the fine he must go to gaol, out of which he comes a poacher, and feeling strongly the injustice which had been done to him. "Lead us not into temptation" is our daily prayer; but can any one say that the over-preservation of game does not hold out temptation to poor men which it requires a strong mind to resist? He then read the following extract from a letter written by an extensive occupier in one of the best farmed counties in England: "I shall allude to hares in the first instance, considering them to be most objectionable; they are in the habit of congregating together, and there may be seen as many as from 100 to 200 or more in fields of 40 acres, feeding on the best and sweetest herbage. Game chiefly abounds on light soils, and dry seasons greatly favour their destructive habits. The cereals being of kinder growth, and naturally of sweeter quality, be they wheat, barley, or clover, and being constantly eaten day and night, and all the year round by the game, does it not become evident that they destroy and consume wheat which should have been additional food for man and beast? But hares are very destructive to crops in May or June; always on the move, they cut their way through the corn and clovers, and to a very serious extent do they clear off roots, in some instances acres together. Independently of the loss mentioned, which appears as it were sheer mischief, the corn thus cut off will attempt to grow again, but will never be forward enough to cut with the other portion of the field at harvest, and thus injure the sample of produce, already diminished in yield. It may be a pretty sight to see scores and hundreds of hares in an enclosure; but does it strike the beholder they are eating the farmer's produce? Is it just, I ask, that land capable of producing food for the country should be allowed to monopolized by game? Is it not sickening to the farmer, after his best endeavours, to see this sad destruction of his hopes and management by the consumption in excess of game? Game, more or less, must look to the land for its subsistence. Norfolk, Suffolk, Nottinghamshire, Lincolnshire, Yorkshire, Cambridgeshire, and Cheshire may be considered as special over-preserving game counties. Great quantities of game are carried off by poachers—far more than is conceived by the proprietors—which at once demonstrates the folly of such extravagant hordes of game. Yet, I believe, there is a growing disposition to reduce this great evil among landowners, and I believe that it would be carried out more extensively were it not for neighbouring preservers vying with each other who can kill and keep the most game. It may be said we must be aware of the character of our occupation before accepting it. We conceive we do; but it is only by experience that we gain any idea of the amount of destruction caused by an over-supply of game. Looking over the hedge is one thing, and walking through your infested fields is another. It is there we become at once astonished and disgusted. Hares are much attached to swedes, particularly in severe weather, and the amount they destroy on this crop is greater than what is consumed. They attack several bulbs, and as soon as the opening is made, the crows, the wet, and subsequent frosts complete the havoc. The only preventive is to pull the swedes, and cover down; yet here we have an extra expense through the over-preservation of game." Mr. Waterfield, after censuring Mr. Gladstone for his new "sliding-scale certificates" making rabbits game, alluded to the mean practice of sending game to the poulterers or to Leadenhall market. He then remarked that the abuses and injustice traceable to the over-preservation of game were endless, observing that the higher and better the farming, the greater was the damage done. In fact, the farmer paid a terrible tithe for it on corn and in rates and county expenses. Farmers, he observed, could have little to urge against poachers unless it was their maintenance out of the rates. A correspondent of the *Mark Lane Express* writes: "We have seen magistrates the receivers of stolen goods, egg buyers, gentlemen the companions of keepers and watchers, tenants with characters traduced, crops consumed, and no redress, and labourers reduced to evil by the high premium placed upon

success in crime—viz., pheasants' eggs bought at 12s. per dozen." Poaching, continued Mr. Waterfield, is an insidious disease; it grows upon a man; but it is by no means regarded as the highest order of crime, although the fines and penalties and costs are so ridiculously above all other offences, that it reflects a disgrace upon those who enact such laws and upon those who impose such penalties. He next directed a word or two to the agents and bailiffs of estates. There were some sharp, unprincipled agents who made it a point to reserve the right of the rabbits. It was often difficult for the landlord to hear the truth of the matter; but he (Mr. Waterfield) strongly advised all tenants to see their landlords a little oftener, and not let them have their views second-hand. He would ask whether an agent was doing his duty when he witnessed in silence a tenantry half-ruined by rabbits, and who knew that his employer was cursed outright at every farmers' market ordinary? A ten-pound prize, or a fine speech at an agricultural meeting, can never outweigh the abuses which they sanction and the injustice they commit. To the landlord, then, the farmer must look for a redress of his injuries. Let him be content with moderate sport instead of wholesale slaughter; and let him try the experiment of turning to the farmers to provide this sport for him. Let him break up his bands of watchers and keepers. Let him give, on principle, the tenants a right to destroy the rabbits and course the hares, stipulating that no injury shall be done to a neighbouring farmer. Above all, let him not let the shooting over the tenant's head: if he does not care for it, let the other be consulted. He well knew that there was a certain kind of hesitation in some quarters to let the tenants have the shooting on any terms; but they were now getting beyond the times of serfs and slaves. He said most advisedly that some of the worst cases of unpopularity had occurred where a stranger hired the shooting, after, perhaps, the occupier had been for years in comparative quiet. To the landlords alone they must look in order to remedy the present state of things; and the demand was neither unreasonable nor unprecedented. In fact, an alteration must soon come, and those landlords who held out the longest would be the most unpopular. Mr. Waterfield then alluded to a meeting of the Warwickshire Chamber of Agriculture, held on the 28th January, on the subject of the game laws, and quoted largely, in support of his views, from the speeches of Mr. Mann, Mr. Martin, M.P., Mr. Forster, M.P., Mr. Newdegate, M.P., Mr. Bromley-Devonport, M.P., and others. At that meeting the following resolution was unanimously adopted: "That rabbits and hares should be the absolute property of the occupier of the land, and that any agreement to the contrary be null and void." Here, then, they had the opinions of M.P.'s, large tenant farmers, and others, not one of whom upheld the game-laws as they now exist. Depend upon it, the more fully the game-laws are discussed, the more fully will be revealed the frightful evils and injustice that arose from their operation. He sincerely hoped that good counsels would prevail, and that such alterations might be made as would tend to the satisfaction and good feeling of all concerned. What a farce it was for a landlord to give a silver cup, of the value of £5 or £10, for the best crop of mangolds or swedes, at the same time that his hares were destroying scores of pounds' worth of roots. They need not go far from Christchurch to see the shameful destruction which was caused among the swedes by the hares. He lately saw a field where there was not one swede left above the ground, all having been eaten off. Fancy the feelings of a tenant under such circumstances! But what redress for this wrong would he get? He would be told, "Oh, we shall shoot by and by, and then we will send you a tough old hare or two." However, the rabbits or vermin mostly belonged to their sworn friend and protector, the keeper. One loathes the very name. They all knew what authority he exercised, a power very much beyond his position in life, and which he often misused. To him the commonest act of farming was one of suspicion and distrust. The farmer and his men were continually under his supervision. He stands by the mowers to see that they don't harm his nests; he struts into the reaping field to make sure that no one hurts his birds. The boy with his scare-crow, the shepherd with his dog, and the little girl and her kitten, are all objects of his hatred and tyranny. The keeper lays traps for the labourers, and rejoices in the downfall of his fellow men. He whispers characters away in the ears of his employer, and constantly makes ill-

blood between landlord and tenant, and as has been well said by an eminent judge, "He is the greatest blot in the English landscape." The rabbits being mostly his perquisites, these animals which do the farmer so much harm, above all others, he is most anxious to preserve. These vermin, which the law declares the tenant has a right to destroy as vermin, the landlord transfers as a right to his keeper. How, he would ask, can a man properly respect himself when he knows that he is more or less at the mercy of a self-sufficient underling? He may try his best, but all his efforts will be thwarted. What pride can he have in his occupation when hares and rabbits rob him alike of his credit and his profit? Over game preserving lessens the production of the soil, stays the full employment of capital, and more the fair aim of industry. And now came the question—How can such a state of things be remedied? Does not the tenant take his farm with his eyes open? Is not the game in the first instance his own property, unless he choose to sign it away? Has he not a right to destroy hares or rabbits unless he consents to the contrary? What, then, in the face of all this can be done? Abolish the game-laws altogether. Enact that a man should never take a farm without having the game with it. They really did not want to trouble the Legislature at all. Lord Malmesbury made use of a noble expression the other night in that room. He said that when a tenant objected to anything that reasonably ought to be had or done, if his landlord did not consent to it, the landlord ought not to have any property at all. And so said all of them. In a word, let the landlords do to their tenants as they would be done by. The farmers of England were not enemies to sport at the right time and place; they liked to see gentlemen enjoy it, and they did not object to a fair head of game. On the other hand, battue shooting was not fair sport; and the rearing of large quantities of game and then systematically selling it, was slowly but surely undermining the character of the English gentleman. Let the landlord and tenant rely more upon each other. Let the landlords free themselves from the thralldom of the officious, scandal-carrying, mischief-making keeper. Let them address their tenantry as a Noble Duke once did—"Now, gentlemen, I mean to make you my keepers, and I hope when I come you will be able to show me some sport." That hope was always realised, and no one has better sport or stands higher with his tenantry than the Noble Duke. Mr. Waterfield then proceeded to remark that, besides the injury to the pocket and the ruin and misery caused by the over-preservation of game, it was impossible not to deplore the lot of men in their own locality, who had been obliged to leave their farms, ruined in some cases, and broken-hearted in others; and it was not all encouraging to see the high prices that were paid for shooting in that neighbourhood. One thing, however, was certain, the amount that game preserves were let for ought to be rated to the poor. The next grievance to which he would allude was that of allowing the police to be gamekeepers. What right had the game-preservers to the members of this force at the expense of the ratepayers? The persons and property of the ratepayers ought to be protected by the police, but surely a policeman looking after game could not be looking after their property. He would also call upon his hearers to bear in mind that the expense of game prosecutions, coming as it did out of the poor-rates, was a most shameful thing. Why should the ratepayers be called upon to pay for the prosecution of poachers and for their maintenance when in prison? Let the cost fall upon the right shoulders, and they would soon see the game-laws altered. Depend upon it if the great game-preservers had to pay for the maintenance of the poachers they sent to prison, the present game-laws would not long continue. Let no man be sent to prison for taking a hare or rabbit. God never made man to be shut up in a gaol for taking four-footed vermin like these, which ought to be destroyed, because they destroy the very bread which these people too often want. Poaching could never be prevented in the midst of great game preserves and woods of miles in extent, where food for the people ought to be growing, and many a man was made a pauper for life through the operation of these laws. He (Mr. Waterfield) would have a law of trespass, and a moderate fine recoverable in the County Court, but he would not have these cases come before magistrates, most of whom unfortunately were game preservers. After several other observations, Mr. Waterfield concluded by suggesting the adoption of the following resolutions: "That the

keeping of ground game and over-preserving of pheasants is unfair to the occupier, and a check to enterprise and improvement in cultivation; that the rabbits under all circumstances should be given over to the tenant to destroy; and that hares also be the property of the tenant to course, as he may think proper." "That all damages done by game shall be paid for under the award of two practical farmers, one chosen by the landlord and the other by the tenant; and that in case of not agreeing an umpire chosen shall decide, and whose decision shall be final. Such awards ought to be deducted from the rent, and recoverable as all other just claims now are."

Mr. CARPENTER had suffered from game himself, but he believed that the landlords would have plenty of sport if they allowed the ground game to be killed.

Mr. MINTERN said that if the landlords gave the tenants the right to kill ground game, they would have as much sport as now.

Mr. J. DRUITT, jun., was of opinion that the poacher was a thief, and ought to be punished as much for stealing game as for stealing poultry. As to Mr. Waterfield's proposed Act of Parliament, it seemed to be an unnecessary interference between man and man, and there was too much tendency to legislate that way already.

Mr. CHARLES REEKS said that Mr. Waterfield had taken a very one-sided view of the question, and had he (Mr. Reeks) known that that gentleman was about to introduce the subject as he had done, he should have been prepared with a reply. Mr. Waterfield had read portions of Mr. Corbet's pamphlet, condemning the over-preservation of game, but he had omitted those portions in which Mr. Corbet defended the landlords and sportsmen. Game and rabbits, according to the present law, belong to the tenant, and if he transfers his right to the landlord, it is his own act and deed. The farmer does not require a licence to kill hares and rabbits. Mr. Reeks thought that the operation of the game laws was not so bad as Mr. Waterfield had represented; and he remarked that even if they were abolished, a poacher would have no right to go on land and take game. Game ought not to be the property of anyone who could knock it down. There were a great many farmers who liked sport as well as their landlords, and who would not like to see the game laws abolished.

Mr. CARTER was sorry that Mr. Waterfield had left rats out of the question; for they did as much damage as hares and rabbits, and they injured the feathered game by destroying the eggs. He was glad to preserve eggs and game for his landlord, and was always glad when he could provide him with a good day's sport. He rented under a gentleman who allowed him to take the rabbits, and he was sorry he had not more hares to give sport to a gentleman who kept a pack of harriers for the amusement of his friends and neighbours. He was always sorry when he could not find a hare to show some sport.

The CHAIRMAN said they were very much obliged to Mr. Waterfield for introducing the subject, and his paper was a very fair one. They should bear in mind that Mr. Waterfield did not object to a fair day's sport, or to the existence of a reasonable amount of game. That he stated at the outset, he was, however, mistaken in one thing. The game laws had not been entirely overlooked by the Club; for he (the Chairman) had himself introduced the subject some time since. The Club had discussed the subject, and some resolutions were come to representing conclusions which the members believed farmers generally had come to upon it. The game laws were much less stringent in this country than in almost any civilised country in the world. On the continent of Europe, in America, and even in Australia, game laws had been introduced. In France, birds were lost owing to want of preservation. Salmon had been nearly lost for want of preservation, and so had many birds and beasts which formerly existed. Mr. Waterfield had attributed the game laws to the feudal system. Many clever people besides their friend talked a great deal of nonsense about feudalism. He didn't know if many of those present read Smollett, or were acquainted with his novel of "Humphrey Clinker;" if not, he would advise them to procure that book, as it was both amusing and instructive. Smollett made old Mat Bramble express his disgust at the fashion of quoting the feudal system for everything, and said that he expected the use of trunk hose and buttered toast would both be accredited to the feudal system. Their friend traced the game laws to the feudal system, but

there was no connection between the two in fact, but only in his lively imagination. The game laws consisted of two distinct things—one a money revenue on sporting, and the other a protection of property. If sporting was a luxury he did not see why it should not be taxed; he thought the tax on licence might be largely increased, and the increase given in aid of the poor-rate. He thought it would be a righteous appropriation. They knew that laws for the protection of the revenue, whether relating to game, spirits, or tobacco, or anything else, were more stringent than in ordinary cases. Certain penalties were imposed, and if the offence was proved the justices could not mitigate beyond a certain extent. They were bound by Act of Parliament—they might fine £20, but could not fine less than £10. But with regard to all that part of the game laws it was a fiscal matter—it was a Chancellor of the Exchequer's question rather than a farmer's. Beyond this the game laws contained a provision against killing game out of season—that was for the preservation of the species; and there was a provision against killing game on a Sunday. But besides this, the whole game laws consisted of enactments against trespass. Farmers would not object to this. A man should not be allowed to trespass on another person's land under pretence of taking game. No man would like for the vagabonds of the country to trespass over his land, and be allowed to say, "We are gentlemen sportsmen, and come to take game." The only law affecting the game was really one to prevent trespass. The grievance, in truth, complained of by farmers arose not from the law but from the bargains which one man made with another. When a man had possession of the land he had possession of that which ran over it or flew above it. He wished men and boys, too, were prevented from shooting birds other than game birds in fields in the very gardens of the people. The simple fact was that where there was a desirable thing to be had men would try to have it, and if it could be sold for money men would sell it, and after selling it they should be content with the purchase-money and not want also the thing sold. A man desiring to take land might say, "I see you reserve game and rabbits, but land so burdened doesn't suit me, and I won't take it: you have a keeper there." It might be well to recollect that a reservation of game did not necessarily give the right of sending keepers over the land, or raising an excessive stock of game on it. If a farmer took land upon an express condition, which might be even ruinous to himself, with his eyes open, it was his own fault, and he ought not to complain. Some said that a farmer should not be allowed to make such an agreement; that he should be deprived of the power of damaging himself, but farmers generally knew how to take care of themselves. The farmers had no right, as a body, to tie the hands of the landlords, and he hoped it would be a long time before the legislature interfered between man and man. It was true that there was another point of view. They had been considering the matter chiefly from the farmer's side. Looking at what a landlord ought to do or ought not to do—he ought not to use his power to the prejudice of the tenant living on the land; but this was a duty which, however binding on the conscience or right feeling of the landlord, could not be insisted on by others, or made the subject of legislative enactment. Mr. Drutt further observed that one inducement for a man to invest his capital in land was to obtain influence, power, and pleasure; and if they diminished the inclination to purchase land, its value would decline, and the land of the country would become divided, to the great injury of agriculture. He would not advocate the preservation of game and rabbits, he would leave it to a man's sense of propriety and prudence as to what bargain he should make with his landlord; and he believed that farmers, as a rule, were quite able to take care of themselves. He would like, however, to have some alterations made in the law. He would leave every landlord and tenant to make their own bargain respecting the game, but he would like that whenever a man kept a large stock of game or rabbits, to the hurt of his neighbour, he should be liable for the damage. The value of land for game should be subject to poor rates. Every person charged with poaching should have his option, as well as if accused of any other theft, of being tried by a jury. It should not be left to game preservers or their friends or neighbours, but the same choice should be given to poachers as was given to other thieves. At the same time, it was but fair to say, in vindication of the much ridiculed justices, that since the law by which petty thieves had

the option of being tried either by justices or by a jury, only one or two in that district had elected to be tried by a jury, showing, on the part of the accused, a confidence in the justices, who, as owners of property, were not more likely to sympathise with thieves than game preservers with poachers.

Mr. WATERFIELD replied, and the following resolution was agreed to :

"That the rabbits ought always to be the property of the occupier, and that he should be allowed to couse the hares, and that the law should afford a remedy for injury to crops occasioned by game or rabbits preserved by any neighbouring owner."

A vote of thanks having been accorded to Mr. Waterfield the meeting separated.

THE AGRICULTURAL SOCIETY OF FRANCE.

We have been favoured with a copy of the discourse addressed to the members of this Society at their general meeting, on the occasion of the opening of the second annual session by the president, M. Douyn de Lhuys. A month after their first meeting, the council organised a series of provincial congresses, and forthwith a sort of tour of France was commenced.

"In March last the Agricultural Club of Arras invited and received the delegates of the society with the greatest cordiality. Thus, in the midst of a large number of the principal cultivators of the north, a series of most interesting discussions were carried on, upon artificial manures. A little later other districts summoned them. A congress was assembled at Lyons, under the auspices of the society, and during four days' meeting from 500 to 800 persons attended daily. Among these were delegates from the Chambers of Commerce of Turin and Florence, and many representatives from the agricultural societies of Switzerland. Among the questions discussed were agricultural credit, irrigation, the taxes which burden agriculture and land, manures, re-planting woods, agricultural education, the octroi duties, viticulture, and above all the question of the silk-worm, a subject of exceptional importance for the future of the south of France.

"Two months were past, and in the east of France the members stimulated another great meeting at Nancy, which lasted three days. Exhaustive cultivation, the sugar industry, forests, the employment of salt in agriculture, the utilisation of the sewage waters, and agricultural instruction gave rise to serious debates and important resolutions. The proximity of Germany inspired the thought of inviting the agricultural associations across the Rhine to take part in the congress. The appeal was responded to by the presence of intelligent farmers from Prussia, Austria, Bavaria, Wurtemberg, Baden, and Saxony, and valuable information was received as to the model farms of Germany. A distinguished member of this society has established at Nancy, on this model, the first of the kind in France, and the Departement of the Maritime Alps is about to follow the example.

"Viticulture has also had its congress properly organised and carried out. Not only Burgundy, but Champagne, Bordeaux, Charente, Auvergne, the departements of the South, and especially Hérault sent representatives to Beane in the commencement of November; even an Englishman took part in this discussion, not as a producer, but as an intelligent consumer and zealous defender of the free trade in wines for his country. The numerous questions which affected the production of wine were discussed, particularly the octroi and customs duties, and the new disease of the vine. The interesting details given by Messrs. Gaston, Bazille, Vialla, and Planchon on the life and habits of the insect depredator to which this calamity is attributed, were listened to with earnest attention. These detailed labours were the result of a commission appointed by the society to study on the spot the ravages of this scourge. Since then curious information has been received from the Cape Colony and southern Prussia as to this new disease.

"The agricultural conferences held at Angers, and the great congresses of Aix, Beauvais, and Chartres, held under the auspices of the Society, must not be passed by in silence, and many medals have also been granted. Notwithstanding the present limited resources of the society, the study of the important question of fertilisers has been encouraged by the offer of a prize to be given this session. While the society has been thus working in France, the principal agricultural societies of foreign countries have given warm expressions of their sympathy. England invited them to the Manchester meeting of the Royal Agricultural Society, and Germany to that at Trèves.

The sovereigns and princes, seeing in the development of agricultural progress a pledge of universal prosperity and friendship, have given in their alliance. In one year there have been inscribed as members of the society King George of Hanover, the Prince of Wales, the Khédive and his minister Nubar Pasha, the reigning Prince of Roumania, and General Baez, President of the Dominican republic.

"The Agricultural Union of Rhenish Prussia is associated with us as honorary, the Royal Agricultural Society of England has admitted many of our members, and the Minister of Agriculture of Austria has become our colleague. I should never finish my address if I were to enumerate all the legions, home and foreign, who, while preserving their own banners, yet enter upon and unite with us in this peaceful crusade. Finally, our statutes have been approved by Government and our society legalized."

THE PARIS FAT STOCK SHOW.—Four prizes of honour at the great French general fat stock show held in Paris during the last few days were awarded as follows: A crossed Durham beast (white), 43 months old, and weighing nearly 21 cwt., exhibited by M. Boutton-Lévéque, of the Ponts-de-Cé (Maine-et-Loire); a Durham-Charolaise cow (red-and-white), 44 months old, and weighing 20 cwt., exhibited by M. Signoret, of Sermoise (Nièvre); a lot of three Southdown sheep, 23 months old, and weighing 5 cwt., exhibited by the Comte de Bouillé, of Villars (Nièvre); and a pig of English breed, 10 months old, and weighing 9½ cwt., fattened by M. Chaminade, of Sarliac (Dordogne). The show seems to have been highly successful.

THE EAST LOTHIAN AGRICULTURAL SOCIETY'S SPRING SEED SHOW.—280 quarters in all were exhibited, the quality of which was excellent, particularly of barley, the samples of this grain being very superior. The judges—Messrs. Henderson, Byres, Skirling, Luffness Mains; and Hogarth, Gimmers Mills—gave the following awards: 10 quarters of best chevalier barley: premium, Mr. Brach, Duncanlaw; commended, Mr. Wyllie, Bolton. 10 quarters of best barley, of any other approved variety: premium, Mr. Wilson, Sheriffside (Potter's barley); commended, Marquis of Tweeddale. 10 quarters of best potato oats: premium, Mr. Clark, Oldhamstoch Mains; commended, Mr. Wilson, Sheriffside. 10 quarters of best Hopetoun oats: premium, Mr. Ronghead, Myreside; commended, Mr. Howden, Boggs. 10 quarters of best sandy oats: premium Mr. A. J. Balfour, Whittinghame; commended, Mr. Brodie, Littlepot. 10 quarters of best oats, of any other approved variety: premium, Mr. Paterson, Ewingstone (for early Angus); commended, Mr. Ronghead, Myreside (for Longfellow). 10 quarters of best Scotch field beans: premium, Mr. Hope, Fentonbarns; commended, Mr. Inch, Tynefield. 10 quarters of best beans, of any other approved variety: premium, Mr. A. J. Balfour.

THE TREASURERSHIP OF THE TEMPLE.—Mr. Hall Dare, late Secretary to the Royal Agricultural Society of England, has been elected Under-Treasurer to the Hon. Society of the Inner Temple. It is noticeable that within the last year or so Mr. Charles Shaw, Secretary of the Royal Agricultural Benevolent Institution, was elected Under-Secretary of the Middle Temple; the rule now being that barristers shall not hold such appointments.

CHEESE MAKING IN AMERICA.

At the Dairymen's Convention, Utica, Mr. WEBB read the following paper on "Dairy Products as seen from a Mercantile point of view:" The season of 1868-69 wound up with stocks of cheese more completely exhausted than was ever known, both in this country and in Great Britain. There was a very eager demand for new cheese, and tempting prices were offered to induce early deliveries. The first shipments from this side did not meet with much favour; many of the dairies very badly skimmed, and none showed richness of quality. Still the scarcity was so great that even those were sold at full prices, but they gave neither profit nor satisfaction to those who handled them. Your May make of cheese was unusually fine, and found eager buyers, but at such high prices, as to involve a loss to all concerned. Your June make was not nearly so good as that of May, its great defect being limpness or weakness of curd and want of solidity. These cheeses did not stand the passage across the Atlantic at all well. Many dairies that appeared solid and fine were inspected in New York before shipment, showed great looseness and weakness when they arrived at their destination. In fact, I never remember the cheese changing their character on the Atlantic passage to the same extent, as did the make of last June. Perhaps this is partly to be accounted for by the fact, that owing to the keenness of the English demand, prices were extremes, and shippers were willing to take a great deal of green and half-cured cheese. Dairymen, therefore, had every inducement to produce an article which should soon be ripe and ready enough to pass muster in the New York market, without reference to its fitness to stand the test of shipment. Your July make of cheese was also much complained of on the same grounds, of looseness and want of solidity, but the flavour of both the June and July cheese was purer and sweeter than it had been for the previous three years. It was also rich and full of quality. This purity of flavour helped in some degree to atone for the want of solidity, and altogether the quality was much to be preferred to the hot, rank flavour of the July make of 1868, which so greatly disgusted English consumers, and inflicted such heavy losses on shippers. The August, September, and some of the early October cheese, was really fine. It was pure and true in flavour, much more solid and close than the two previous months' make, and of finer curd and texture than any former season. Of the later made cheese, where the milk was not skimmed, and where proper attention was paid to the temperature of the cheese-room, some dairies turned out quality equal to the best of the whole season; but even at its best, this sort is not very desirable for shipment. It does not stand the deteriorating influence of the English climate nearly so well as the early make. To sum up, I should say that the whole season's make shows a decided improvement in the average quality and a larger proportion of really choice cheese than in any former year. I have already said that the price of American cheese rated very high at the opening of the season. There was an eager competition among English dealers for the earliest arrivals. Prices were consequently forced up beyond their legitimate level, and in the reaction that inevitably followed were correspondingly depressed. The excellent quality of your May makes somewhat checked the downward tendency, but when the poor June cheese reached the market, values fell rapidly, and for two months the trade was most unprofitable for all concerned in the buying and shipping of your product. At last the price touched a point that brought on a large consumption of American cheese. The heavy shipments of June and July makes were cleared off almost as soon as landed, which gave this season's hot weather cheese that quick sale they so imperatively required, preventing the usual accumulation of ill-flavoured, badly keeping stocks that in former seasons has been kept hanging over the market for several months. As soon as the English dealers had a taste of the fancy quality of your August and September make—cheese that could be handled, if needful held, with perfect safety—they bought freely, and prices advanced instead of declining as usual in September. It scarcely falls within my province to

speak of the home cheese trade, as there are so many here who can do so with much greater authority than I can; but I think it will be generally conceded that the consumption of cheese in this country is steadily increasing, and in the South very largely so. Indeed the smart rise of price in October was mainly caused by the unusually active domestic demand, for the heavy decline in gold, at that time, put a serious check on the operations of shippers. This activity of the home trade slackened very considerably during the month of November, and the price of cheese has since drooped in sympathy with the rapid fall in the premium of gold. In the English market during the months of November and December prices gave way slightly on medium sorts of American cheese, but the rate for really choice quality has been steadily maintained, the stock being light and very firmly held. Shipments during those two months were moderate, for the reason that the decline in gold was heavier than the decline in cheese, so that the sterling cost of the latter was enhanced in spite of the dull market on both sides of the Atlantic. We will now take a survey of the passing English cheese season, for the position occupied by your chief and indeed only competitors, the English dairymen, cannot be a matter of indifference to you. An unusually mild and wet winter was followed by an early spring. In Somersetshire and other southern counties, the cows were turned out a month earlier than usual; but scarcely were they on the grass when the weather changed. Through April, May, and half of June, there was a full average make in all the cheese-producing districts of England, but the quality was not so fine or the flavour so good as in former years. This is attributable to a cold, damp season, very unfavourable to the production of fine, or to the proper maturing of any sort of cheese. During the latter half of June and all through July, the weather was fine and clear, with a full summer temperature. The heat was in fact, at times excessive, and coming on the unprotected roots of the grass, just as the hay crop was removed, combined with an almost total absence of rain for some weeks, resulted in a very serious failure of the after-grass, and a great scarcity of food for the cows for the time. As a consequence, the make fell off about one-third in quantity, but showed a great improvement in quality and flavour. Early in August came the long-looked for rains, soon restoring the feed in the pastures, and up to the end of October there was a fair, but not excessive, make of average quality. In the beginning of November, a few sharp frosts tended to put an early stop to English cheese-making. In the districts around London, and some other large towns, the foot-and-mouth disease has been very prevalent among the cows. Coming at the fall of the year, this has necessitated the drawing of the daily supplies of milk for those cities from the nearest cheese-making districts, and has to some extent curtailed the make of late cheese. By the end of last March, the stocks of English cheese were more closely cleared out of dealers' hands than was ever before known at that date. Prices for the first deliveries of new cheese were very high, in spite of which, the demand all over the country has been unprecedentedly large the season through, and the best qualities have ruled much dearer in proportion than American. The price of the very finest sorts of English cheese has varied very little since the opening of the season. In the months of August and September, the arrivals of Dutch and American cheese were very heavy, and, as we have seen, went rapidly into consumption. But lower qualities of the home (English) make began to accumulate, but in no part of the country so rapidly as in Cheshire and the adjoining county of Shropshire, where a good deal of the so-called Cheshire cheese is made. But makers of those secondary and inferior qualities held for full prices: therefore, when compelled to sell they had quite an accumulation on hand, and were forced to accept such lower rates than they might have obtained had they freely met the market. At every September fair and market in the Cheshire district there was a large pitch of medium and low quality cheese, which was sold at from 48s. to 60s. These sorts, being lower than even the commonest kind of

American cheese, attracted the attention of dealers, and for a month or six weeks, in October and November, engrossed a large share of the consumption. The bulk of it has now been disposed of, and for what remains, greatly increased prices are asked. These facts seem to me to convey at once a warning and an encouragement to you, the cheese-makers of America. This county of Cheshire, which for very many years boasted, and boasted truly, of making the finest cheese in the world, has now become notorious for the badness of the quality and flavour of the bulk of its make, and for an absolute scarcity of really choice dairies. It is true the cattle plague fell upon this county, with its most desolating force, but that trouble has now been got over. The cows have all been replaced, and I fear this deterioration in the quality of Cheshire's staple productions, must be attributed, rather to the carelessness of her cheese makers, and to their want of system and application, than to any local or temporary cause. A most competent authority writes me as follows: "For all the other districts of England, including Somerset, Wilts, Derby, Leicester, and the smaller cheese-making counties, I do not find any one knowing anything about the business, who can say, that the dairy farmers are making *any* progress toward improvement." The conviction of some of the best judges of these matters, appears to be, that the energy, intelligence, and perseverance, which has been combined with and partly grown out of your factory system of cheese-making, is fast putting you in a position to completely distance the English dairyman in the production of *fine* cheese in *large* quantities, and unless the cheese-makers of the old country speedily rouse themselves to the emergency, applying to this business a like spirit of inquiry, and a like determination to excel, they must very soon surrender the foremost position on their own markets to their American competitors and content themselves if they can with the second place. The speaker then proceeded to sketch the position of other cheese-producing countries. The cheese of Canada is improving yearly in flavour and quality, and is coming to be much sought after by both Lancaster and Liverpool dealers. The season for Dutch cheese opened, as for all other sorts, with a bare market and full prices. The weather in Holland throughout the season was favourable for dairy products, but producers showed a disposition to realize their stocks as soon as ready. The particular size and shape of Dutch cheese limits their use to certain districts, and they can never become a formidable competitor of our article. Scotland is said to be increasing her production of cheese, as well as improving its quality. Sweden sends little or no cheese to the English market. I will give the receipts of cheese in New York city for three seasons: May 1st, 1867 to May 1st 1868, they were in round numbers 1,330,000 boxes; the following year, that is from May 1st, 1868, to May 1st, 1869, they only reached a total of 1,070,000 boxes, a falling off of 259,000, or twenty per cent in the number of boxes alone. Our receipts of cheese in New York city for the current season, that is from the 1st of May last to first day of the present year, were about 1,292,000 boxes. The receipts from now to the 1st of May next, which completes the year, will, I think, bring the total of 1869-70 fully up to the heavy one of 1867-68 which so frightened some of your members. It is true that the cheese do not now average so much in weight as they did that year, but against this I offset the largely increased quantity that has this season gone to Chicago, Cincinnati and other cities direct from the western part of this State. From their figures we can fairly infer a largely increased make over last season. Now let us see how the consumption has kept pace with this large production. Our stock of cheese in New York city Jan. 1, 1870, was liberally estimated at about 30,000 or 40,000 boxes in excess of that held at same date last year, while the receipts to that date showed an excess of about 250,000 boxes over the previous year. This gives us since the 1st of last May an increased consumption of 210,000 or 220,000 boxes, of which Great Britain took about 150,000 boxes. Looking at the total shipments since May 1st, and taking into account the stocks in London and Liverpool and the quantity in transit for these markets on the 1st of January for the last three years, I arrive at the conclusion that the consumption of American cheese in Great Britain has for this season been 140,000 boxes, or 20 per cent. in excess of what it was last season to same date and nearly 100,000 boxes, or at 17½ per cent. more than what it was in the corresponding period of the year before that, namely, 1867-68. Now comes the inquiry, what effect has

this increased make and consumption had upon the price of cheese. The quotations in New York city for choicest dairies on January 1st, for the past three years, are as follows: 1868, 15c. currency, with gold at 134½; 1869, 19½c., with gold at 133½, and 1870, 17½c., with gold at 120½. So that equalizing the gold basis, the price this year is equal to that of last year, and is four cents per pound, in currency, higher than it was January 1st 1868. If these figures have any value, they are ample warrant for my opening a statement as to the increased make, consumption and price of American cheese. Last year was an exceptional one. The make of cheese being everywhere short, prices of course ruled high, but still not so high by an average of 2s. 6d. per cwt., or ¼c. per pound in gold, as they have this season with a heavy production in all the cheese-making countries of the world. In fact, the high range of prices is a striking proof of the extent of the consumption, as, with only an ordinary one of cheese in England and this country, the market must have completely broken down and a very low average value prevailed. It becomes, then, a matter of general interest for us to ascertain, if possible, the causes of this increased consumption. The moderate price of bread in the old country, leaving the working classes a much larger surplus of their wages to spend in other articles of food, has, no doubt, had a good deal to do with it; but other and more potent causes have been, I think, 1st, the great improvement in the average quality of American cheese; 2nd, The sound judgment you dairymen have shown in judiciously meeting the English demands by few sales all the summer and thus retaining your hold on that market. One or two little matters of detail connected with your manufacture now claim our attention. Such of your dairies as have used Nicholl's English fluid annato have produced exactly that shade of light, lively colour which is so popular in London. I can, therefore, recommend the use of the article with great confidence, and the decline in gold should reduce its cost very materially. The boxes from some counties in the Western part of this State, and also from Lewis county are in many cases made from poor, thin, brittle stuff. The sides frequently give out before they reach their destined market, and great damage to the cheese results. Besides the improvement in make, quality, and price, I think you are to be congratulated on the improved opportunities you have of getting information about the state of the market, and therefore of forming an opinion on the probable course of prices. Among the chief of these are the Atlantic cables, those delicate nerves, which connect the brain of the old with the brain of the new world; you can now see the dairy quotations of the English markets just as well as any dealer or shipper; you have another enormous advantage in the increasing diligence and correctness with which the public press caters for your information; not only are the reports of the great New York papers got up with scrupulous care so as to represent the aggregate feeling of the market rather than individual opinion, but your local press, particularly that portion of it which makes a speciality of cheese reporting, has during the past year displayed an eclectic spirit worthy of all commendation. And now what is the conclusion of the whole matter? Chiefly, I think, that you need never to be afraid of making too much fine cheese. This year, with the largest shipments to England ever known, we have the highest average price. A very short time ago one of the largest dealers in the old country assured me that in the course of forty years' experience, he has never been burdened with more fine cheese than he knew where to sell at good prices. Of course, as the gold premium declines, the currency value of your product must more or less sympathise with it, but in the general shrinkage of values rendered inevitable by the improving financial condition of the country your interest appears to me to be one of those that will suffer least. There is every prospect that by the first of May next, stocks of American cheese will everywhere be closely used up, and we shall enter on the new season with a good demand at remunerative prices to the producer. I have done my best to make clear the promising future that lies open before you. If you would insure success in that future you must continue to *deserve* it. What you *have* gained must move you to redoubled effort and not serve as an excuse for relaxation; only in this way can you maintain the position you have so far reached. Only in this way can you hope to advance your product to the first place in the English market; and when that crowning point has at last been achieved, sleepless vigilance alone can insure you in its permanent occupation.

THE FARNLEY SHORTHORN SALE.

A Selection of Stock bred by Mr. F. H. Fawkes.

By MR. H. STRAFFORD, ON THURSDAY, FEBRUARY 24TH.

COWS AND HEIFERS.

Magnolia, red, calved December 11, 1861, by Royal Oak (18873), out of Magenta by Don Giovanni (18893); Magnolia has bred 6 calves, the last October 5th, 1869.—Mr. Blackwell, 19 gs.

Valerian, white, calved October 10, 1862, by Royal Oak (18873), out of Vanilla by Robinson Crusoe (18610); has had 4 calves, the last September 24th, 1869.—Mr. Danby, 23 gs.

Lady Wallace, white, calved July 5, 1863, by Lord Cobham (20164), out of Wild Rose by Sir Walter Scott (18753); has had 7 calves, the last March 11th, 1869.—Mr. Cadman, 35 gs.

Blue Cap, red, calved November 29, 1863, by Royal Oak (18873), out of Blue Bonnet by Lord Clarendon (14807); has had 3 calves, the last April 20th, 1869.—Mr. Blackwell, 51 gs.

Her Ladyship, roan, calved June 2, 1864, by Lord Cobham (20164), out of Ship-a-Hoy by Sir Edmund Lyons (15284); has had 3 calves, the last April 5th, 1869.—Mr. Yorke, 32 gs.

Friar's Balsam, roan, calved August 15, 1865, by Lord Cobham (20164), out of Fatima by Inkermann (13068); has had 2 calves, the last May 19th, 1869.—Mr. Blackwell, 31 gs.

Violet, roan, calved January 10, 1866, by Bon Homme (21300), out of Lady Viola by Lord Cobham (20164); has had 1 calf, February 4th, 1869.—Mr. Marshall, 33 gs.

Lady Leoine, roan, calved January 17, 1866, by Lord Cobham (20164), out of Lioness by Sir Edmund Lyons (15284); has had 2 calves, the last November 22nd, 1869.—Mr. Blackwell, 34 gs.

Lady Betty, roan, calved May 1, 1866, by Lord Cobham (20164), out of La Bonne by General Bosquet (14591); has had 1 calf, May 22nd, 1869.—Mr. Brown, 48 gs.

Lady Margery, roan, calved October 5, 1866, by Lord Cobham (20164), out of Magnolia by Royal Oak (18873); has had 1 calf, August 24th, 1869.—Mr. Lamb, 23 gs.

What Next, roan, calved May 23, 1867, by Reformer (18687), out of Lady Wallace by Lord Cobham (20164); has had 1 calf, November 25th, 1869.—Mr. Brown, 31 gs.

Reaction, roan, calved August 26, 1867, by Reformer (18687), out of Valerian by Royal Oak (18873).—Mr. Swarbrick, 30 gs.

Friar's Balm, red, calved May 18, 1868, by Reformer (18687), out of Friar's Balsam by Lord Cobham (20164).—Mr. Danby, 16 gs.

Valentine Bacon, roan, calved May 21, 1868, by Friar Bacon (21780), out of Lady Valentine by Lord Cobham (20164).—Mr. Danby 28 gs.

Maggie, roan, calved September 8, 1868, by Reformer (18687), out of Lady Maggie by Lord Cobham (20164).—Mr. Ramsden, 21 gs.

Reform, roan, calved September 16, 1868, by Reformer (18687), out of Valerian by Royal Oak (18873).—Mr. Ganett, 18 gs.

Beatrice Bacon, roan, calved December 14, 1868, by Friar Bacon (21780), out of Lady Beatrice by Lord Cobham (20164).—Mr. Darley, 35 gs.

Wild Rose, roan, calved March 11, 1869, by Reformer (18687), out of Lady Wallace by Lord Cobham (20164).—Mr. Yorke, 22 gs.

Fairy Tale, roan, calved March 21, 1869, by Reformer (18687), out of Lady Fairy by Lord Cobham (20164).—Rev. T. Staniforth, 20 gs.

BULLS.

Lucky Boy, roan, calved March 14, 1868, by Lord Cobham (20164), out of La Belle by Royal Oak (18873).—Mr. Graves, 55 gs.

Lord Montjoy, roan, calved November 7, 1868, by Lord Cobham (20164), out of Magnolia by Royal Oak (18873).—Mr. Kaye, 27 gs.

Lord Lyons, roan, calved April 30, 1868, by Lord Cobham (20164), out of Lioness by Sir Edmund Lyons (15284).—Mr. Metcalf, 61 gs.

Leopold, white, calved November 30, 1868, by Friar Bacon (21780), out of Lady Leoine by Lord Cobham (20164).—Mr. Day, 25 gs.

Lord Leopold, roan, calved March 8, 1869, by Lord Cobham (20164), out of Lioness by Sir Edmund Lyons (15284).—Mr. Tyndall, 42 gs.

Lord Bloomfield, roan, calved April 20, 1869, by Lord Cobham (20164), out of Blue Cap by Royal Oak (18873).—Sir M. Ridley, 65 gs.

Lord Bolton, roan, calved April 30, 1869, by Lord Cobham (20164), out of La Bonne by General Bosquet (14591).—Mr. Thompson, 30 gs.

First Lord, red, calved November 16, 1869, by Lord Darlington (26633), out of La Brilliant by Reformer (18687).—Mr. Legard, 10 gs.

Third Lord, red, calved November 25, 1869, by Lord Darlington (26633), out of What Next by Reformer (18687).—Mr. Darley, 27 gs.

Fourth Lord, red, calved December 9, 1869, by Lord Darlington (26633), out of Lady Maggie by Lord Cobham (20164).—Mr. Yorke, 17 gs.

BEAUMONT GRANGE SHORTHORN SALE.

A Selection of Stock, from Mr. W. W. Slye's Herd.

By MR. H. STRAFFORD, ON FRIDAY, FEBRUARY 25TH.

COWS AND HEIFERS.

Nell Gwynne, red, calved December 20, 1859, by Rex (16833), out of Sophy Grange by Young Benedict (15641).—Mr. Foster, 27 gs.

Strawberry, roan, calved March 21, 1864, by Grand Duke of Lancaster (19883), out of Surprise by Royal Duke (16865).—Mr. Moore, 31 gs.

Selina 5th, rich roan, calved April 10, 1864, by Grand Duke of Lancaster (19883), out of Selina 3rd by Garibaldi (17933).—Mr. Dunmore, 41 gs.

Lady Stamford, red and white, calved April 30, 1864, by Oxford (20450), out of Royal Crescent by Royal Duke (16865).—Mr. Dunmore, 28 gs.

Moss Rose 4th, rich roan, calved February 5, 1865, by Royal Gwynne (22784), out of Moss Rose by Lord of Brawith (10465).—Mr. R. Jefferson, 40 gs.

Cherryripe, red, calved April 2, 1865, by Royal Gwynne (22784), out of Surprise by Royal Duke (16865).—Mr. Parker, 26 gs.

Lancaster Gwynne, rich roan, calved April 11, 1865, by Grand Duke of Lancaster (19883), out of Nell Gwynne by Rex (16833).—Mr. Moore, 46 gs.

Hawthorn, white, calved February 25, 1866, by Grand Duke of Lancaster (19883), out of Hopeful by Garibaldi (17933).—Mr. Taylor, 50 gs.

Royal Charmer 2nd, red roan, calved January 21, 1866, by Grand Duke of Lancaster (19883), out of Royal Charmer by 2nd Duke of Cambridge (12743).—Mr. T. Higby, 38 gs.

Countess 7th, red, calved April 26, 1866, by Grand Duke of Lancaster (19883), out of Countess by Young Pompey (13480).—Capt. Gauday, 21 gs.

Sweetheart 3rd, rich roan, calved October 28, 1866, by Sir Walter Gwynne (22921), out of Sweetheart 2nd by Grand Duke of Lancaster (19883).—Mr. Foster, 80 gs.

Fawley Duchess, rich roan, calved March 10, 1869, by Grand Duke of Lancaster (19883), out of Lady Knightley by Oxford (20450).—Mr. Foster, 105 gs.

Selina 10th, red, calved June 7, 1861, by Grand Duke of Ox-

ford (24070), out of Selina 5th by Grand Duke of Lancaster (1883).—Mr. Parker, 19 gs.

Cherry Duchess, rich roan, calved July 18, 1869, by Grand Duke of Lancaster (1883), out of Cherryripe by Royal Gwynne (22784).—Mr. Parker, 18 gs.

Lady Thorndale Bates 2nd, rich roan, calved Oct. 26, 1869, by 4th Duke of Thorndale (17750), out of Lady Bates 3rd by the Duke of Oxford (11387).—Mr. Danmore, 300 gs.

BULLS.

Royal Count, red, calved April 23, 1868, by Sir Walter Gwynne (22921), out of Countess 7th by Grand Duke of Lancaster (1883).—Mr. Haslam, 24 gs.

Cherry Duke, red, calved June 14, 1868, by Grand Duke of Lancaster (1883), out of Cherryripe by Royal Gwynne (22784).—Mr. Hock, 30 gs.

Farsley Duke, rich roan, calved September 14, 1868, by Grand Duke of Lancaster (1883), out of Moss Rose 5th by Royal Gwynne (22784).—Mr. Parker, 45 gs.

Sir Rainald, rich roan, calved September 18, 1868, by Sir Walter Gwynne (22921), out of Grand Duchess of Fawley by Grand Duke of Lancaster (1883).—Mr. Haslam, 30 gs.

Grand Duke of Farnley, rich roan, calved November 27, 1868, by Grand Duke of Lancaster (1883), out of Miss Rose 2nd by Oxford (20450).—Not sold, 100 gs. reserve.

Charmers Grand Duke, red, calved February 25, 1869, by Grand Duke of Lancaster (1883), out of Royal Charmer by 2nd Duke of Cambridge (12743).—Mr. Ray, 28 gs.

Grand Duke of Cambridge 3rd, red, calved March 1, 1869, by Grand Duke of Lancaster (1883), out of Cambridge Moss Rose by 2nd Duke of Cambridge (12743).—Mr. Guico, 50 gs.

Lord Barrington Spencer, rich roan, calved August 3, 1869, by Barrington Oxford (25607), out of Lady Spencer 2nd by Grand Duke of Lancaster (1883).—Mr. Sanders, 30 gs.

The Cardinal, rich roan, calved August 15, 1869, by Barrington Oxford (25607), out of Sweetheart by Grand Duke of Lancaster (1883).—Mr. Biddle, 26 gs.

Lord Barleigh 2nd, red, calved August 30, 1869, by Grand Duke of Lancaster (1883), out of Lady Stamford by Oxford (20450).—Mr. Thorn, 15 gs.

Grand Duke of Oxford 2nd, rich roan, calved October 3, 1869, by Grand Duke of Lancaster (1883), out of Oxford Gwynne by Oxford (20450).—Mr. Smith, 24 gs.

The Roan Duke, rich roan, calved October 6, 1869, by Grand Duke of Lancaster (1883), out of Red Duchess 6th by Oxford (20450).—Mr. Sayer, 15 gs.

Grand Duke of Farnley 2nd, rich roan, calved Nov. 13, 1869, by Grand Duke of Lancaster (1883), out of Moss Rose 2nd by Oxford (20450).—Mr. Tindal, 25 gs.

Cherry Grand Duke, rich roan, calved December 5, 1869, by Grand Duke of Oxford (24070), out of Strawberry by Grand Duke of Lancaster (1883).—Mr. Lethbridge, 36 gs.

Grand Duke of Fawley, rich roan, calved January 24, 1870, by Barrington Oxford (25607), out of Grand Duchess of Fawley by Grand Duke of Lancaster (1883).—Mr. Gibbon, 25 gs.

SUMMARY.

	Average.	Total.
15 Cows.....	£60 18 0	£913 10 0
15 Bulls	29 6 7	439 19 0
		£1353 9 0

30 Averaged £45 2 3

It will be seen that the great feature of the occasion was the sale of Lady Thorndale Bates 2nd.

SALE OF MR. PRYCE BOWEN'S STOCK AT SHRAWARDINE.

—The sale of the farming stock of the late Mr. Pryce Bowen, of Shrawardine Castle, drew together a large attendance. The sale commenced with the Shropshire ewes. The first lot consisted of five animals, in lamb, which were purchased by Mr. Richards, of Llynclys, at 27 per head. The highest bid for this class of stock was that of Mr. Wainman, of Workop, Notts, who gave £65 for a pen of five. The whole of this lot were by Lord Clifden. In about two dozen of the pens the ewes realised from £4 10s. to £7 2s. a-piece, and the remainder averaged about £3 10s. The shearing rams, 24 in number, were sold in pairs, and excited some very spirited competition. The most valuable pair was bought by Mr. Williams, of Leighton, for £30, who also purchased the second best pair for £28. The lowest price given in this class

was £9 per pair. The 170 stock ewes realised £868, or, on an average, £5 2s. each. The 70 shearing ewes brought in £172, or £2 10s. the average. The shearing rams sold for £264, giving an average of £6 10s., and 40 shearing wethers brought £288 15s., or an average of £2 5s. each. Of the whole flock, the average was £4 10s. per head. The sale of cattle commenced at half-past three, and the first lot disposed of were the Herefords. They comprised 62 animals of the purest breed, but notwithstanding this fact, the prices were by no means high. Mr. J. Hill, Felthampton, purchased one, Peeress, for 26 gs., and a pair of useful yearlings for 27½ gs. Milton, a bull that has carried off three prizes from the Royal, and several other Societies, was bought by Mr. A. Mansell, for 27 gs. The bull Master Halston, bred by Mr. Edmund Wright, Halston, was sold to Mr. Wild for 23 gs. Mercury became the property of Mr. Lloyd, Carregrofa, for 25 gs. Milford was purchased by Mr. Broughall for 21 gs. There were six other bulls sold, and their prices ranged from 10½ to 19 gs. Nine of the yearlings, and two year olds, sold cheap, 25 gs. being the highest price realised. The fat stock consisted a score, or so, of remarkably nice animals, which realised from 7½d. to 8d. per lb. Mr. Preece, of Shrewsbury, had the conduct of the sale.

SALE OF SCOTCH SHORTHORNS.—Mr. Milne, of Kinaldie, Aberdeenshire, has had his annual sale of young bulls and heifers. There was a large attendance, and the sale, all things considered, was moderately good. The average of the bulls was about £25 a-head. Of the fifteen heifers offered for sale, thirteen met with purchasers. They were better on the whole than the bulls, and brought good prices. The highest price at 40 gs. was bought by Mr. White, Clinterty. The following is the list of animals sold: *Bulls*.—Lochinvar, red, with white spots, calved 3rd Feb., 1868—Mr. Collie, Lairhill, Fintray, 26 gs. Victorius, red, with white spots, calved 31st July, 1868—Mr. Booth, Mastrich, Newhills, 20 gs. Prince Arthur, red, with white spots, calved 14th March, 1868—Mr. Campbell, Kinneff, 22 gs. Royal Duke, roan, calved 16th August, 1868—Earl of Caithness, 30 gs. Victor, red, calved 12th Jan., 1869—Mr. Scott, Peterborough, Canada, 28 gs. Forest Knight, red, calved 23rd Jan., 1869—Mr. Napier, Burnside, Newhall, 28 gs. Hotspur, roan, calved 11th Jan., 1869—Major Gordon Duff, of Drummur, 30 gs. Volunteer, white, calved 16th Feb., 1869—Mr. Dingwall, Blackmill, Tarland, 20 gs. Knight of Don, roan, calved 1st May, 1869—Mr. Lindsay, Whitelebury, Kinneff, 22 gs. Pilot, red and white, calved 15th April, 1869—Mr. Strachan, Charleston, Nigg, 14 gs. Red Chief, red, calved 2nd Aug., 1869—Mr. Shewan Newton, of Carsindae, Midmar, 19 gs. *Heifers*.—Lady Battersea, red, calved 20th Jan., 1869—Mr. Henderson, Kinclure, Towie, 30 gs. Clara XXVIII., red, calved 11th Jan., 1869—Mr. Lumsden, Braco, Keith, 29 gs. Beauty VI., red, calved 18th March, 1869—Mr. McDonald, The Farm, Huntly, 24 gs.—Queen of May, red, calved 25th Jan., 1869—Mr. Scott, Glendonach, Huntly, 23 gs. Rosie III., roan, calved 15th March, 1869—The Earl of Caithness, 20 gs. Spinster IV., roan, calved 30th March, 1869—Mr. Anderson, Daugh, Coldstone, 14 gs. Sybil XXIV., roan, calved 23rd March, 1869—Mr. Smyth, Tocher, Rayne, 14 gs. Goudspink III., red, calved 21st April, 1869—Mr. Henderson, Kinclure, 13 gs. Camilla IV., red and white, calved 1st June, 1869—Mr. Paterson, Cairnhill, Keithhall, 13 gs. Daisy XXV., roan, calved 20th May, 1869—Mr. Rennie, Wester Fintray, 11 gs. Magnet V., red, calved 3rd June, 1869—Mr. Longmore, Keith, 19 gs. White Spir, white, calved 2nd August 1869—Mr. Burness, Boghead, Kintore, 18 gs. Spicy VI., red and white, calved 15th June, 1869—Mr. Whyte, Clinterty, 40 gs.

SALE OF SHORTHORNS IN AMERICA.—Mr. Sheldon has lately sold to Messrs. Wolcott and Campbell, of New York Mills, near Utica, about half of his herd, some thirty-nine animals. They comprise: 3rd Duchess of Thorndale, 6th Duchess of Thorndale, 12th Duchess of Thorndale, 8th Duchess of Geneva, 6th Duchess of Geneva, 13th Duchess of Geneva, 7th Lady of Oxford, 10th Lady of Oxford, 2nd Maid of Oxford, Blooming Heather, Butterfly Belle, Moneta, Mazurka 9th, Lady Susan and some twenty-five others, among them the bull, Baron of Oxford, now in his fifteenth year. This embraced an average of old and young from among the entire herd, and then, oxen so, the figures were a trifle over an average of 2,000 dollars per head.

THE NEW FARM.

This frost hath enabled us to get through what the bailiff calls a "sight of work." Although authorities are agreed that upon the whole it is best to haul fold manure on the leys and pasture during autumn, inasmuch as thereby the food has time to soak down to and into the rootlets so that they are prepared to strike out vigorously with the first burst of spring, yet having our yards full we were tempted to go on top-dressing as long as the hard surface allowed us without trespass. Were we a green field ourselves our argument would be that good food could come never amiss, so upon that hint we acted, and can only hope that our wishes may be realised in the gathering in of a grand hay crop.

The lambs are falling fast, and as yet we have been very fortunate. The quiet dams look so comfortable in their pens with an infant alongside. We were hurried in our preparation at last, and so adopted a plan which we should adhere to again from its simplicity. With a hay-knife we cut into, or rather hollowed out, a recess around a straw rick, into which we set hurdles at right angles to the stack and about one-and-a-half yards apart. Upon the portion of the hurdles that ran under the straw we laid a tier of spare spruce boards: then some small gorse was pulled through the lower bars, and a long range of most comfortable pens was upon a ready, and that, too, in an astonishing short time.

We got our first crop of water-cresses last week. A mistake I made in planting the bed I may as well recount for the guidance of others. I laid a floor of rich mud for them. Instead of which I should have simply strewn gravel on sharp sand. The leaves run up too luxuriantly and lose their brown hue. The whole crop should, I am told, be lifted every spring and have their root points trimmed. But I shall be glad myself to obtain further information as to the proper cultivation of this wholesome and delicious salad. Our pool lying in a hollow, the water gets too hot by attraction of the sun rays, and makes them too soon a giant cress. I believe, from what I have seen tried, that a bunch of water-cress *does* act effectually as an antidote against the depressing effects of nicotine. Either the juice of the herb or the exercise of picking it out of the fresh water quickly removed my friend's headache. Another simple effect let me record. We all know that dry earth, as well as charcoal, has the power of deodorizing. I was, notwithstanding, I must confess, surprised at the immediate and thorough success which attended cook's throwing some bowlfuls of woodashes from the oven, after baking, down the scullery sink, which, do what we would, could never before be kept from emitting, especially in damp weather, an unpleasant odour which pervaded the whole house. They were careful never before to throw cabbage-water down. Still, do what they might, the bad smells continued. Since I desired her to throw down some ashes it has been altogether removed.

I have had much entertainment during the past week in directing a woodman to cut peeps and glimpses through the woods, which gives some exquisite little pictures of the distant landscape framed within the surrounding boughs, and which will be infinitely more effective when the foliage covers the trees again. A quantity of the superabundant young trees he has been thinning out to split into pales to fence around a rough piece of fern and bramble where the pheasants love to make their nests, and which at present is open to invasion by the pestilent curs of every passer by.

One I helped him to fall; and of course knowing better than he did, and pulling the rope somewhat differently to what he desired me, got well punished by seeing a pet straight young Scotch fir snap off in two like a carrot under the weighty head of the overthrown stick. A lesson for your obstinate conceit, Mr. Vigil!

A mixture of good and bad luck has attended the cow-sheds. One most valuable bull calf has been lost through the stupid attendant giving his dam a feed of frosted swedes. An obstinate diarrhoea took him off. On the other hand our good fortune with the ewes continues, which I attribute in a great degree to their having been very evenly kept during the last three months. It is the up and down feeding that plays the mischief with dam and offspring—now starvation, now abundance—the poor veins cannot stand such abuse. One farmer I knew lost the great part of his yearling sheep last year from this cause. Our best Guernseys have produced us fine heifer calves by a handsome young Shorthorn sire. So we must put the one thing against the other. Keep forging on against a head sea is the grand rule of agricultural life. The storm and current are sure to relax their violence in time.

We have had in the poultry-yard a singular illustration of the difficulty there is in breeding away the characteristics of any new cross one may adopt. Some years since we received some beautifully-marked bantams which had been imported from Lucknow. They themselves crossed a little with some Seabright fowls, but died at an early period, owing, I think, to the strange inclemency of the weather. We saved some half-bred chickens, which have since intermixed with the Seabrights, with the effect only of rendering the succeeding hatches as they grew up more dowdy-looking and leg-feathered. These enlarged hens were very useful for sitting on pheasant eggs, and had a certain wild liking for life in the woods. Last season, however, there got mated a pair of the first cross—that is, own brother and sister—and their produce has reverted to the Lucknow sort. The shape is similar, broad, rather low and lengthy with deep feather in the legs, and a peculiar colour of the plumage. White speckled with bluish red and black represents the imported pair almost exactly. How to go on now is the puzzle. There is, clearly, room for instructive experiment. An eminent Southdown breeder and Southdown judge, who some years since sold off his famous flock and has since been experimenting with a cross, told me that his theory was not the usual one of taking fresh blood through the ewes and then serving the produce with a pure-bred sheep again, but to pair the half-breds. I read the other day that he has managed to produce a beautifully-even flock of an improved and special sort. This history of our bantams would seem to endorse his plan. I shall watch and report further results, when we have tried a variety of combinations.

We have been transplanting ripstone-pippins and filbert-bushes into every wild corner on the hill. What a pull it is to live in a district where the elm, the oak, the chestnut, the apple, and the walnut are really native weeds springing up in every hedgerow and on every bank at random, one might say, and abundantly! I followed my young ones just now into old Melon's fruit-rooms. How they did pocket, the old fellow bursting with delight as he looked on! And then, when the crop is on the trees, how they eat all day long between

school-hours, and seem never the worse, dinner only being worse for it, as their appetites, to my sorrow, seem rather whetted than appeased!

It is no wonder that the vegetarian badger loves the district. There is such a fine fellow has his lair under a rock adjacent to this, close to which he has a raised seat, worn quite hollow on the top, like an ostrich's nest. The labourers call it his "Sunday seat." It commands a magnificent view of the surrounding country.

There has been hot work amongst the fox covers on the further side of the county, in consequence of which Mr. Reynard has migrated to our inaccessible strongholds.

You may hear him bark every evening about nightfall. One fox feasted last week on a guinea-fowl of ours, and winked his eye grandly at the traps all around, which I found the angry bailiff had soothed his wrath by setting. The red robber I love to see so stealthily slipping through the gorse, and am only vexed when, as I saw him the other day, he will keep whirling around his head, then tossing-up and catching and re-tossing an unhappy rabbit, neutralizing by his conduct any sympathy on my part which might have arisen from Mr. Freeman's attacks.

VIGIL.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MONTHLY COUNCIL: Wednesday, March 2.—Present: the Duke of Devonshire, K.G., President, in the chair; the Earl of Lichfield, the Earl of Powis, Viscount Bridport, Lord Chesham, Lord Tredegar, Lord Vernon, Lord Walsingham, Sir Massey Lopes, Bart., M.P., Sir A. K. Macdonald, Bart., Sir H. Vane Bart., Sir Watkin Wynn, Bart., M.P., Mr. Barthropp, Mr. Cantrell, Colonel Chaloner, Mr. Olive, Mr. Davies, Mr. Dent, M.P., Mr. Druce, Mr. Edmunds, Mr. Brandreth Gibbs, Mr. Holland, Mr. Hornsby, Mr. Wren Hoskyns, M.P., Colonel Kingscote, M. P., Mr. Leeds, Mr. Milward, Mr. Pain, Mr. White Ridley, M.P., Mr. Statler, Mr. Torr, Mr. Wells, M.P., Mr. Whitehead, Major Wilson, Mr. Jacob Wilson, Professor Simonds and Dr. Voelcker.

The following new members were elected:—

Arnold, James, 35 and 36, West Smithfield, E.C.
 Bather, Thomas, Maesbury Hall Mill, Oswestry
 Bond, A., Huntstile, Bridgwater
 Brown, Benjamin, Thrusford, Thetford
 Case, James, Upton, Reading
 Castle, George, Sutton, Stanton Harcourt, Eynsham
 Cole, W., Douglas, Bicester
 Dickers, S. S., Golder Manor, Tetworth
 Dodd, F., Rush Court, Wallingford
 Ellershaw, Charles, Bossall, York
 Garratt, R. L., Thorpe, Malsor, Kettering
 Gillett, Charles, Lower Haddon, Faringdon
 Greenslade, John, Balham, Tiverton
 Hale, Bernard, Holly Hill, Hartfield
 Hammond, John, Bale, Thetford
 Harland, H. S., Malton, York
 Hamby, J. H., Ashley, Stockbridge
 Jones, John, Pike's End, Ellesmere
 King, J. Pittman, North Stoke, Wallingford
 Kirk, Charles, Sleaford, Lincoln
 Labalmondiera, George, 32, Craven Street, W.C.
 Lloyd, Robert, Offmore, Kidderminster
 Mace, Thomas, Sherborne, Northleach
 Newton, S. C., The Downs, Croxton, St. Neots
 Nicollis, W. H., Newnham, Shrewsbury
 Owen, C. N., Walton House, Oxford
 Paddison, Edward, Ingilby, Lincoln
 Parsons, Herbert, Elsfield, Oxford
 Parsons, John, Ilfley, Oxford
 Perkins, W. H., Westfield House, Amesby, Theddingworth, Rugby
 Rusher, W., High Street, Banbury
 Statter, John, New Brighton, Chester
 Toder, Edward, Little Carlton, Newark
 Topham, Thomas, The Twemlows, Whitchurch
 Taughan, G. L., Belmont Villa, Leicester
 Walker, James, Bushy Lodge, West Firie, Lewes
 Warden, T. S., Sedbergh, Kendal
 Willows, J. G., Rushton, Kettering

FINANCE.—Viscount Bridport (Chairman) presented the report, from which it appeared that the Secretary's receipts during the past month had been examined by the committee, and Messrs. Quilter, Ball, and Co., the Society's accountants, and were found correct. The balance in the hands of the bankers on February 28 was £1,724 0s. 8d. It was also reported that the committee had had under their consideration two cases of members in arrear with their subscriptions, namely, Mr. S. W. Rayne, of Newcastle-on-Tyne, and Mr. Joseph Chesworth, of Longslow, Market Drayton, and they recommended that these cases be referred to the Society's solicitors, with instructions to take the necessary legal proceedings to recover the arrears of subscriptions due to the Society. The committee recommended that a new valuation be made in the fixtures and furniture of the house, in consequence of recent changes made in the Society's property.—This report was adopted.

JOURNAL.—Mr. Dent, M.P., reported that an application had been made by the Editor of the "Geological Magazine" for the loan of the stone from which the geological map of Belgium, in the last number of the Journal, had been printed; and that the committee recommended that this application be granted on payment of the necessary expenses, with the proviso that due acknowledgment be made of the source whence the map was derived. This report having been adopted, and the committee having announced that the February number of the Journal had been published and delivered to members in the middle of the month, Lord Vernon expressed his regret that the article on cheese factories had not been published earlier, so as to have assisted the dairy farmers of Derbyshire by the information which it contains, in their endeavour to establish cheese factories in England.

FARM PRIZES.—The committee recommended that Mr. Keary, of Bridgnorth, Salop; Mr. Gibbons, of Burnfoot, Cumberland; Mr. Torr, of Aylesby, Lincolnshire, be appointed the judges to adjudicate on the prizes offered by Mr. Mason, late High Sheriff of Oxfordshire, and by the Society, for the two best managed farms in the district round Oxford, to compete for which 22 farms had been entered. It was also recommended that the first inspection should commence as soon as possible, and that Mr. Keary be requested to write the report of the Judges. This report was adopted.

CHEMICAL.—Mr. Wells, M.P. (Chairman), drew attention to the following analyses of bone manures, which had been submitted to the committee by the consulting chemist in his usual quarterly report:—

I. Composition of a sample of so-called bone manure, sent by Mr. S. Bacon, jun., Ratcliffe Culey, Atherstone.

Water	90.19
*Organic matter	21.61
†Mono-basic phosphate of lime74
Free sulphuric acid	3.78
Oxide of iron and alumina69
Sulphate of lime (gypsum)	47.67
Magnesia and alkaline salts78
Insoluble siliceous matter	4.54

100.00

*Containing nitrogen	1.11
Equal to ammonia	1.34
†Equal to bone-phosphate rendered soluble	1.17

It will be noticed that this example of so-called bone manure contained only 1 per cent. of phosphate of lime, and 1 per cent. of nitrogen. It contained 20 per cent. of water, and consisted mainly of gypsum and some cheap organic refuse, impregnated with sulphuric acid, and is not worth more 30s. to 35s. per ton as a manure.

Mr. Bacon informs me that he bought the manure from a Mr. Ralph Potts at £4 10s. per ton, and invoiced at £4, and that it was guaranteed to be bone manure, prepared by Mr. George Birch, manufacturer of all kinds of bone and special manures for every crop, Woodcock Street Works, No. 1, Henneage Street, Birmingham.

II. A second sample of bone-dust was sent for analysis by Mr. J. Borlase Tibbets, Barton Seagrave, Kettering, who bought it at £7 7s. from Messrs. Ellis and Everard, Leicester, as $\frac{1}{2}$ inch bones.

The following is the composition of this bone-dust:—

Moisture	9.94
*Organic matter	7.74
Tribasic phosphate of lime	40.19
Carbonate of lime	17.66
Oxide of iron and alumina, magnesia, &c.	6.35
Insoluble siliceous matter (sand)	18.23

100.00

*Containing nitrogen66
Equal to ammonia80

It will be noticed that these bones were very poor in nitrogenous organic matter, and contaminated with a good deal of carbonate of lime and fine sand. Their real value does not exceed £5 per ton.

III. The following is the analysis of another sample of bone-dust sent to me by Mr. E. D. Broughton, Wialaston Hall, Nantwich, who bought it from Messrs. Bradburn and Co., of Wednesfield, near Wolverhampton, through Mr. Thos. Wittingham, their agent at Nantwich, at £7 per ton:

Moisture	13.53
*Organic matter	22.03
Phosphate of lime	41.49
Sulphate of lime	13.75
Carbonate of lime	2.42
Alkaline salts and magnesia	3.47
Sand	3.32

100.00

*Containing nitrogen	2.71
Equal to ammonia	3.29

Genuine bone-dust contains about 48 per cent. of phosphate of lime, and yields about $\frac{1}{4}$ per cent. of ammonia, and no appreciable amount of sulphate of lime. Good bone-dust at present, I believe, cannot be bought for less than £8 8s. per ton. The bone-dust sent to me by Mr. Broughton was mixed with boiled bones, to which frequently sulphuric acid is added for the purpose of arresting decomposition.

The committee recommended that the foregoing reports

be published in the minutes of the Council meeting. They also recommended that the usual annual grants for experiments be awarded to Dr. Voelcker. This report was adopted.

VETERINARY.—Major-General Viscount Bridport (Chairman) reported that, in the opinion of the committee, the portion of the grant to the Royal Veterinary College (£50), which, by the resolutions of 1863, was to be appropriated for researches into the diseases of cattle, sheep, and pigs, has not hitherto been sufficiently set apart for that purpose. They therefore recommend that for the future the annual veterinary grant of £200 be divided under two heads: (1) That £150 shall be paid to the Royal Veterinary College for the general advancement of veterinary science in reference to cattle, sheep, and pigs, as heretofore; and (2) That £50 be retained under the control of the Council for the purpose of being applied to experiments on the diseases of cattle, sheep, and pigs. They further recommend, that in consideration of the general grant from the Society the Governors of the Royal Veterinary College shall undertake that the Professor of Cattle Pathology shall carry out such experiments at the College as the Council shall require, the cost not to exceed the above-named amount; that the result be communicated to the Council immediately on the conclusion of the experiments; and that a detailed account of the expenditure of the £50 shall be furnished each year with the annual report. This report was adopted.

GENERAL OXFORD.—Lord Walsingham reported the recommendation of the Committee that advertisements be issued inviting tenders for the supply of refreshments to the showyard at Oxford. This report was adopted.

It was moved by Col. Challoner, seconded by Lord Walsingham, and carried unanimously, after some conversation respecting the exceptional nature of the circumstances which led to the proposition:

"That a sum of £500 be given to the Manchester Local Committee, in aid of the extra and exceptional expense occasioned by the compensation awarded to the tenant of the trial ground."

Col. Kingacote, C.B., M.P., having called attention to the incomplete state of the Society's library, suggested the desirability of a grant of money for the purpose of bringing its contents up to the present time, and of an annual grant for the purchase of books from time to time being placed at the disposal of the Journal Committee. Lord Walsingham thereupon drew attention to the absence of accommodation for a large library in the Society's house, and Lord Bridport suggested the desirability of building a reading-room. Ultimately, at the instance of Mr. Torr, supported by Colonel Kingacote, the whole question was referred to a joint committee, to consist of the House and Journal Committees.

It was moved by Mr. Jacob Wilson, seconded by Lord Chesham, and supported by Mr. Milward:

"That the committee for the recommendation of judges be appointed at the March Council, that this committee shall sit in April, and that the absolute appointment of judges shall take place at the May Council."

This resolution having been carried unanimously, a committee was appointed for the selection of judges, consisting of the Implement and Stock Prizes Committees.

Mr. Torr gave notice that at the next monthly Council he should move "that judges of live stock be provided with catalogues in the same manner as judges of implements now are."

It was proposed by Mr. Milward, seconded by Mr. Torr, and carried unanimously, that Mr. W. J. Edmonds, of Southrop, Lechlade, be nominated as steward elect of implements.

A letter from Messrs. Holt and Glazier, on the utilisation of town sewage, was referred to the Journal Committee.

THE USE AND ABUSE OF TOWN SEWAGE.

At a weekly meeting of the Society of Arts, Mr. WILLIAM HORS, V.C., read a paper on this subject. He said :

When a man reads a paper on sewage, he generally thinks it necessary to commence with the camp regulations issued by Moses in the Wilderness, just as—with equal justice—old-fashioned books on gunpowder always began with an account of the imaginary invention of gunnery by Roger Bacon and Schwartz. Moses did not invent sewage. It is quite clear that the "Sewage Question" must have begun long before his day, and, in fact, must have first cropped up in the Garden of Eden itself. This is, perhaps, a somewhat prosaic view to take of Paradise; but the practical man is necessarily prosaic, and a careful investigation of this question dispels many prejudices and many illusions, and forces one to admit that, as Adam received a special permission to "eat freely" of every fruit in the garden except one, he must, as a physiological necessity, have been perplexed by the very same question which we are met here, some six thousand years later, to discuss. But no candid man, who is not committed to some sewage-precipitation or earth-closet heresy, can doubt that Adam utilised his sewage and grew his vegetables in the Garden of Eden by means of the same system of irrigation that I practise myself. I do not propose, therefore, to adduce any further proof of the antiquity of sewage irrigation, but rather to confine myself to the agricultural and economical desirability of its practice at the present day. As, however, no man can conveniently preach a sermon without a text, I will, if you will allow me, read, as texts, two short extracts from the *Times* newspaper. The first is taken from the *Times* of the 7th day of January last, and occurs in the letter of the Special Correspondent in Egypt. It is as follows: "The other day, at Sakhara, I saw nine camels passing down from the mummy pits to the banks of the river, laden with nets in which were femora, tibia, and other bony bits of the human form, some two hundred-weight in each net, on each side of the camel. Among the pits were people busily engaged in searching out, sifting, and sorting the bones which almost crust the ground. On inquiry, I learnt that the cargoes with which the camels were laden, would be sent down to Alexandria, and thence be shipped to English manure manufacturers. They make excellent manure, I was told, particularly for swedes and other turnips. The trade is brisk, and has been going on for years, and may go on for many more." The second text is taken from the *Times* of Thursday, the 10th instant, and is as follows: "According to returns furnished by the engineers of the Metropolitan Board of Works, the daily average quantity of sewage pumped into the river Thames, at Crossness, was 214,973 cubic metres, and at Barking, 157,091 cubic metres, equivalent to about as many tons by weight." Truly these two texts teach a startling lesson, and the modern philosopher may say with Shakespeare's philosopher Duke, that he

"Finds books in the running brooks."

To be ground into powder, or dissolved in sulphuric acid, as manure, to grow turnips, with which to fatten oxen for an unborn race of sacrilegious beefeaters, would probably have been considered by Pharaoh and his haughty captains a far greater indignity than to be swallowed up by the Red Sea.

"To what base uses we may return, Horatio!"

Probably no one would be found now to assert, as Liebig did, when he wrote his celebrated letters to the Lord Mayor in opposition to my proposals for utilising the sewage of London, north of the Thames, that no land plant could come to maturity, if grown in a medium of insoluble silica, and manured with liquid manure only. The proofs since obtained of the soundness of the principles I then advocated have been so overwhelming, that not even their most obstructive opponents any longer attempt to deny that liquid sewage, in its normal state, has a great and a practical value. By the admission, therefore, of even the most sceptical, the "running brooks, or rather small rivers, described above in the second extract

from the *Times*, as being injected into the Thames at Barking and Crossness daily, represent so much hard money wasted. Add to this the interest, at 3½ per cent. on the five millions laid out in the injecting apparatus, together with the tremendous annual expense of working it, and it must be confessed that this arrangement is the most extravagantly wasteful of which history furnishes any record. We profess to be a hard-headed practical people, and yet, whilst we ransack every other corner of the globe for animal refuse and remains with which to enrich our land, we go to an enormous expense to throw away the quotidian supply with which nature provides us at home—and this with a constantly increasing surplus of population and deficiency of food staring us in the face. This flagrant defiance of those very principles of political economy which we all profess to be guided by, is probably one of the chief causes of that flood of pauperism which all the machinery of government, even when in the most earnest and energetic hands, seems quite unable to stem. To remedy this state of things I have now laboured actively, and I hope, practically, for nearly nine years. During this time I have become painfully aware of the apathy with which this subject is regarded by most people, but I was not aware until lately how little the subject was understood. I had studied it so much myself that I forgot that others had not. Many still talk as if there were some room for doubt as to the value inherent in sewage. But this is susceptible of exact determination, and can be demonstrated as conclusively as a mathematical problem. It is a fact in chemistry that every human being, at a given age, produces yearly a certain average amount of ammonia, phosphoric acid, &c. Further observations are still required to enable us to fix the extreme limit of these productions, but existing knowledge enables us to fix a minimum value, below which, under any ordinary conditions, they cannot fall. There is an unknown, because a variable quantity in the margin of soapends, kitchen waste, liquid manure from stables, offal from slaughter-houses, street-washings, and many other matters which find their way into the sewers. But this is a margin which has to be added, not deducted, and therefore does not affect the minimum, but only the maximum, possible cost of the waste now going on in London and most other towns. Many of the most eminent chemists have conducted lengthened observations and experiments from many different points of view, in order to determine the value of the manurial constituents of this refuse. Anderson, Berzelius, Frankland, Gilbert, Hofmann, Lawes, Letheby, Liebig, Miller, Odling, Thudichum, Voelcker, Way, Wesarg, and Witt, are only a few of those who have investigated this part of the subject; and, not to weary you with technical details, I may mention that, as the result of an immense amount of work, a rough formula has been pretty well agreed upon among chemists, that the total value of all the constituents of sewage is about one farthing per ton of the liquid for every grain of ammonia per gallon, because it has been found that the value of the other constituents taken together is about one-third of that of the ammonia. Hence the important point in practice is to determine the quantity of ammonia, which gives the unit of value, and the engineer must then come to the aid of the chemist, and furnish him with the total number of tons of sewage in the year, with which to multiply his unit. Probably, if this unit were ascertained during one month in winter, and during another in summer, or during one month in spring or autumn, a sufficiently accurate result would be arrived at for most practical purposes; but it is evident that complete scientific accuracy could only be attained by analyses extending over several years. It was, therefore, a great disappointment to many besides myself, when a series of samplings and gaugings, intended to be exhaustive, of the sewage of the high and middle level sewers of London, which, at the suggestion of Mr. Way, I had caused to be commenced in 1865, before the formation of the Metropolis Sewage Company, were summarily stopped by the company: The results obtained were nevertheless, very instructive and reliable. The samples were taken every half,

hour, night and day continuously, for a period of 203 days; they were mixed together at regular intervals, and repeated analyses were made by Mr. Way and Dr. Odling. The result

was, to show an average of about 8 grains of ammonia to the gallon of dry weather sewage, and the following tables show the quantities passing the station during that period, the first

METROPOLITAN HIGH AND MIDDLE LEVEL SEWERS.

FINE WEATHER SEWAGE FLOW FROM 19TH MARCH TO 7TH OCTOBER, 1865 (INCLUSIVE).—WICK-LANE, OLD FORD.

	No. of days.	Gallons.	Average per day, in gallons.	
Sundays	25	442,628,000	17,705,000	} Daily average for fine weather, 27,431,000 gallons.
Mondays	24	669,057,000	27,877,000	
Tuesdays	24	708,335,000	29,514,000	
Wednesdays	25	754,949,000	30,197,000	
Thursdays	20	589,757,000	29,487,000

Saturdays	24	766,632,000	31,943,000	

FLOW OF SEWAGE FROM 19TH MARCH TO 7TH OCTOBER, 1865 (INCLUSIVE).—WICK-LANE, OLD FORD.

	No. of days.	High level.	Middle level.	Total high and middle level.	Average for each day.	Flow increased by rain.
		gallons.	gallons.	gallons.	gallons.	
Sundays	29	208,484,000	350,032,000	558,516,000	19,259,000	Four days.
Mondays	29	334,826,000	569,521,000	904,347,000	31,184,000	Five days.
Tuesdays	29	357,749,000	634,942,000	992,691,000	34,230,000	Five days.
Wednesdays	29	383,901,000	675,067,000	1,058,968,000	36,516,000	Four days.
Thursdays	29	405,064,000	713,244,000	1,118,308,000	38,562,000	Nine days.
Fridays	29	423,744,000	739,872,000	1,163,616,000	40,124,000	Seven days.
Saturdays	29	341,688,000	619,204,000	960,892,000	33,134,000	Five days.
Totals	203	2,455,456,000	4,301,882,000	6,757,338,000

Average flow per day during the above period, 33,288,000 gallons.

showing the dry weather only, the second showing the total. Unfortunately, there is considerable doubt as to the population represented by this flow, and there are also one or two disturbing causes to be taken into account whose magnitude cannot be defined; but this is certainly a higher per-centage of ammonia, and, therefore, a more favourable analysis than previous observations led one to expect, and it must be remembered that, when the low level sewer is completed, an analysis of its contents may be expected to show a very perceptibly higher per-centage of ammonia, owing to the denser population, and the great throng of business men of all classes in the lower parts of the metropolis during the day, many of whom represent a temporary addition to even the total population estimated for, as they reside beyond the metropolitan boundary altogether. Now, the estimated "dry weather" sewage of London north of the Thames is 120,000,000 tons per annum, while that portion of the rainfall which does not escape into the Thames and Lee higher up by the "storm overflows," but reaches Barking, can hardly be less than another sixty to eighty millions of tons. It appears impossible, therefore, to place the manurial value of the stream with which, at a cost of £100,000 or £150,000 a-year, the Thames is polluted at Barking at less than £1,000,000 per annum, equal to about 8s. 8d. per head of the population. And this we may take as a pretty near approach to the unit of value in estimating the yearly worth of the sewage of a given population. The amount of water in which this is conveyed can only affect in a very minor degree its value as a manure. This should therefore be reckoned per head of the population, irrespective of the water supply. To regard this chemical value as the practical value of the manure if applied to the land, was stated in a scientific journal the other day, by an eminent chemist, to be a great mistake, and likely to prove a very ruinous one. In the mouth of a chemist who, in the ordinary routine of his daily business, is perpetually called upon to put a practical money-value, by means of chemical analysis, upon all kinds of artificial manures, this is indeed a strange paradox, and I was at first considerably puzzled by it, but the key to the paradox was in the reasons he gave for the statement. In considering so very wide a question, he had been led, by the fascinating process of

deduction, to travel beyond the sphere of his own personal knowledge, and so had fallen into a very natural mistake. One distinguishing peculiarity of sewage as a manure is the ease and convenience with which it can be applied to growing crops. This is, of course, an enormous practical advantage. Instead of waiting until the land had been manured between two crops, it may at once be ploughed up, and another crop put in—a saving of time which will frequently pay the farmer's rent for him. It is only natural that this peculiarity should be widely taken advantage of; hence sewage is more frequently applied to growing crops than to fallow land. The chemist alluded to had probably always seen it so applied, and regarded it solely from that point of view. Consequently, he said that the obligation of applying water to crops at all times of the year, whether they required it or not, would be so onerous to the farmer, that the practical value of the manure contained in the water would be very largely reduced. This I at once admit; but I altogether deny that, where sewage irrigation is properly carried out, there exists any such obligation. In spring and summer there are always some growing crops which will benefit instead of suffering from the application of the water in which the manure is conveyed; it must be at once admitted, therefore, that during half the year the farmer must get the full chemical value of the sewage—and something more, for the power of watering his land whenever he pleases has a very practical additional value. In the other half of the year it is quite true that the water in which it is contained might often do as much harm to some plants as the manure could do good. But why suppose that a shrewd practical farmer is to be such a fool as to apply sewage to growing crops under such conditions? Clearly, he would turn it over his meadows or fallow land. The vastly greater part of the manure of all kinds throughout the country is applied precisely at that time of the year, and to fallow land. It would be obvious, therefore, to the very slowest bodied intellect in the country that this is the proper course to follow with sewage, under the conditions stated. Of course where sewage irrigation is not properly carried out, and where the area of the land irrigated does not bear a proper proportion to the population manuring it, the full chemical value will not be obtained, because the supply of food will be in excess of the

demand of the crops; just as a market-gardening neighbour of mine, who, last autumn, put 40 tons of the farm-yard manure, 10 cwt. of guano, and 10 cwt. of bones per acre on to one of his fields, will be disappointed with his results; but the accidental topographical exigencies of particular localities, and the accidental manurial eccentricities of particular market-gardeners, are disturbing causes which in no way require to be taken into account in such calculations. Would my friend, the chemist, say that because my neighbour will most assuredly not get the full value of his guano and bones, therefore any farmer who sends to his laboratory to ascertain the practical money value of any particular manure from its chemical analysis will be grievously misled? What would the chemist say if I assumed that farm-yard manure could only be applied to growing crops, and then asserted that the damage done to the land and crops in carting on the manure was so great that it counterbalanced the benefit conferred? Surely no test of the practical money value of any manure can be as conclusive and reliable as an accurate analysis of its constituents. As a matter of actual practice, I am just about to sow 10 acres of onions, which will not receive a drop of sewage while they are growing, the land having been manured quite sufficiently by irrigation while fallow. But in refutation of the fallacious conclusion deduced from a partial view of the question, and an imperfect knowledge of a branch of it which is not strictly within the province of the chemist, I can fortunately adduce a very high authority, namely, Dumas, who is not only one of the greatest, perhaps the greatest of living chemists, but is a man eminently distinguished for practical good sense. When he paid his visit to this country, in the early part of last summer, to deliver the inaugural Faraday lecture, he gave up a day to the inspection of the sewage irrigation at Barking and of the Barking outfall, accompanied by the President of the Chemical Society, and several other distinguished members of the profession. He expressed himself as being as much gratified by what he saw of the irrigation as he was shocked by what he saw of the outfall, and he repeated several times over "Oui, l'eau doit être la charrette de l'engrais" which may be translated freely, "water is the best dung-cart." With such an authority to support me in the "water-carriage" system, I am not afraid of a little adverse criticism. There is another objection which is sometimes urged to the utilization of sewage by irrigation, although it is, perhaps, the most groundless of all. I have heard it asserted that it was an utter mistake to convey manure in water, because in the course of a very short journey all the ammonia escaped by evaporation. Such a fallacy is, of course, never advanced by a chemist, as it is chemically impossible; but it is worth a passing notice, because it is clung to with such fond tenacity by some dogmatic laymen. In the first place, in fresh sewage, there is no ammonia present in a free state; and when chemists talk of the amount of ammonia in a gallon of sewage, they mean the amount that can be chemically evolved by analysis. But supposing an artificial ammoniacal liquor were substituted for sewage, and distributed over the fields by irrigation, and that this liquor were really a solution of free ammonia, these dogmatists would still be mistaken, for water has a greater affinity for ammonia than the atmosphere. If some ammonia is set free at one end of a room, and a basin of water placed at the other end, after a time all, or very nearly all, of the ammonia may be recovered from the water. It is chemically impossible therefore that, even to please the most dogmatic of sewage heretics, the process can be inverted, unless the laws of nature are suspended. Dumas would not recommend a leaking dung-cart, and the ammonia is very securely imprisoned in the one that he recommends. This being so, there is still, however, the question whether some of those processes to which I have alluded as "sewage-precipitation and earth-closet heresies" are not cheaper and more effectual than irrigation. In reply to this question, I can only say that no other process which I have ever been able to hear of approaches irrigation, either in economy or efficiency. I am quite prepared to admit that some of the precipitation processes may, perhaps, be sufficiently practical for use in places where irrigation is impossible, if, indeed, there are any such places; but the annual cost of the best of them amounts to not less than 30 or 40 per cent. of the total yearly value of the sewage, whereas the annual cost of irrigation works, properly carried out, would not, on an average, exceed 10 to 12 per cent. of such value.

While quite ready to admit the possibility of some of these processes proving practically efficient, I wish however, to guard myself against being supposed to approve of any of them. It is evidently an operation of maximum difficulty, on a large scale, and at a cheap rate, to extract the ammonia and phosphoric acid from the sewage in a form sufficiently insoluble to remain behind when the water is driven off, and yet sufficiently soluble to dissolve as soon as put on the land as manure. As a chemist well said, in the chemical section of the British Association, at the meeting at Exeter, it is worse than if he were asked to extract a grain of wheat from a sack of chaff—it is as if he were asked to extract a cell of yeast from a trough of dough. And I confess that the advocates of the various precipitation processes, with many of whom I have had repeated and lengthened interviews, have always failed to inspire me with much confidence in their systems, for I have invariably found that they were quite unable to answer any of the fundamental questions I put to them, that they displayed an entire absence of exactness in their knowledge of their subject, lost themselves in vague generalities, were unable to explain the chemical action which they believed was set up by their own process, and invariably believed that their patent manures had, in some mysterious way, a fictitious value beyond that indicated by chemical analysis. At the same meeting of the British Association, I was asked to join the committee appointed the previous year to inquire into the "treatment and utilisation of town sewage," and, though avowedly a partisan of irrigation, I agreed to join, because I knew I could bring some practical experience to the aid of the committee; just as an extreme ritualist and an extreme evangelical were considered useful members of the ritual commission. I at once proposed to enlarge the scope of the inquiry and to increase the committee so as to include a representative of each branch of physical science to which any part of the entire question belongs. In order to procure the funds necessary for so extended an inquiry, the committee appealed to the various towns throughout the country for subscriptions, and their application has met with a favourable response from a large number of towns. It is their desire to inquire into every process having a semblance of practicability, and in this way, if any of these processes are indeed perfected, the fact will be authoritatively ascertained. Should the committee continue in existence for several years, and sufficient funds be available, it is indeed by no means impossible that the combined researches of so many men, assisting one another with their special knowledge, may throw considerable light on the origin and nature of diseases, and on the much vexed question of protoplasm, or the physical basis of life. Professor Tyndall's recent instructive experiment, following those of Mr. Crookes, go far to confirm the views of those who have devoted most time to the study of the spread of infectious diseases, but there is still much to learn as to their origin, while an attentive study of the organisms generated by the fermentation and decomposition of sewage, as well as of the abnormal developments induced in some plants by excessive stimulation with liquid sewage, cannot fail to reveal some further secrets of nature in that mysterious neutral territory where the animal protoplasm (if indeed this be an admissible term for an unknown and undefined principle) is for ever changing into the vegetable, and the vegetable changing back again into the animal. But to return to the more immediate subject in hand, there is still a third principle of sewage utilisation which is advocated very warmly by many persons—I mean the earth system. This is no doubt perfectly efficient within certain limits, and I have myself advised its adoption in several cases where I thought the circumstances admitted of its successful application. So far as a certain portion of sewage matter is concerned, there can be no question as to its complete efficiency, and as even a clumsy attempt to prevent waste is better than no attempt at all, I give Mr. Moule the greatest credit for the persistency with which he has warred against the present reign of waste; but his system is only that of Moses inverted. Moses told his countrymen to carry their sewage out of the camp and bury it in the land. Mr. Moule tells his countrymen first to carry the land into the town to be mixed with the sewage, and then to carry them both out to be finally buried. In both cases the sewage has to be carried out, but in the last the earth has to be carried out as well, in addition to being previously carried in. I think, therefore, that Moses was the better sanitary engineer

of the two; and irrigation is only the plan of the earlier engineer developed by modern appliances. Dumas said that water is the best dung-cart. It is the best spade also, for it buries the manure instantaneously, and is automatic in its action. The dispensation of sewage by irrigation is therefore strictly Mosaic. I have said, however, that I have occasionally approved of the use of Mr. Moule's system, and I should explain that I limit such approval to cases where there is a deficient water-supply, or where there is a rigid discipline, as in workhouses or barracks. For the service of an ordinary private house, much more of a village or a town, I consider the system utterly impracticable. Unless the amount of earth used in each house were enormous, it would of course be impossible that the soapens, kitchen refuse, and so forth, should be got rid of in that manner; yet nothing is more offensive in its decomposition than such stuff as this, although I am ready to admit that it may not be so dangerous to health as sewage matter proper. What, then, is to be done with this liquid? If it is allowed to go into the nearest river, the water will be hopelessly polluted for the purposes of drinking and cooking. Some system of precipitation or irrigation would, therefore, appear to be necessary, for this part of the sewage at all events, and is admitted to be so by Mr. Moule; but what a complication this admission implies. Supposing for a moment, however, that all the expense of sewers had been gone to, as in the ordinary water-carriage system, and that we were prepared to consent to the nuisance of long strings of carts bringing fresh earth into our towns, and longer strings of carts carrying away the used earth and sewage, accompanied by their own peculiar set of harpies, disturbing our families at unseemly hours, and "making night hideous" by their uncouth sounds and imperious demands for beer, would the system even then work for a single week without a hopeless breakdown? I think not, and I will give a very plain reason for my opinion. On this system all the bedroom "slopes" would have to be divided into two kinds; one, the bath water and soapens, to be emptied down the sewers; the other to be mixed with the earth. This would necessitate a double set of slop pails, one with a bright crimson "E" for earth, the other with a black "S" for sewer. But how long does Mr. Moule imagine that the ideal British housemaid would condescend to carry about these two different pails, containing two different liquors for disposal in two different receptacles? I cannot claim any special knowledge of the natural history of the housemaid, but I greatly fear that her organisation is not yet sufficiently delicate to enable her to appreciate this cloacal refinement. Surface irrigation is, in my judgment, both the simplest, the most efficient, and the most economical means of disposing of the miscellaneous waste and refuse from human habitations. The chance of anything going seriously wrong with the arrangements for getting rid of this noxious matter are reduced to a minimum, and the system is as beneficial to agriculture as to health. Of course, irrigation may be bungled just as any other kind of farming or manufacture may be bungled. But if the proportion of population to land is not excessive, and if the land is properly laid out at first, there is no reasonable probability of any sewage ever escaping into the stream unpurified; because, if it did, it would represent a loss of so much manure which the farmer has to pay for; therefore, it is his interest to apply it in such a way as to extract from it the greatest possible amount of organic impurity, and, if possible, to prevent Dr. Frankland from finding any traces of "previous sewage contamination" even in the third place of decimals. In point of fact, the sanitary and agricultural results will always go hand-in-hand; and the better the one, the better also will be the other. I do not yet go quite so far as my friend, Dr. Alfred Carpenter, however, who considers that sewage irrigation, by producing an abnormally rapid and vigorous vegetation, promotes the rapid disengagement of oxygen, in which he states that ozone is distinctly present. This is a most encouraging theory for an advocate of sewage irrigation, and, if he had been conducting his observations on my own land, I should probably have accepted Dr. Carpenter's theory, and started a hospital for diseases of the chest in the middle of one of my sewage fields, guaranteeing to the patients a certain number of irrigations in the month with genuine, unadulterated sewage, as received direct from London or Romford, as the case might be. The suggestion has a very considerable charm for a plain farmer; and I confess that I have given up, with no little reluctance, the idea of a copropathic

establishment on my farm, where London beauties might come out to recruit their wasted energies at the close of the season, and, attired in a *costume de circonstance*, with coquettish jack-boots, would perhaps at times listen to a lecture on agriculture from the farmer himself, while drinking his cream and luxuriating in the health-restoring breeze. But, as I said before, I am a plain farmer, and I felt instinctively that this was too pretty a picture to be realised on this earth; and then I remember that, however faultless I might consider my own irrigation to be, yet that I did not approve of the method in which it is carried out at Croydon, where the proportion of population to land is so excessive that it is chemically impossible for the crops to exhaust the organic matter continuously supplied to them, and that, therefore, there must be a dangerous accumulation or escape of impurity somewhere. I also reflected that at least one of the effects observed by Dr. Carpenter, and attributed by him to the action of pure oxygen, might just as well have been produced by ammonia or by moisture and carbonic acid, and I resolved to postpone the building of the hospital, so as to allow time for further observations. The first thing that the authorities of a town ought to consider, in purchasing land on which to utilise their sewage by irrigation, is whether their population is an increasing or a stationary one. If the former, they ought to secure as much as one acre for every 20 or 25 persons; and, if the latter, not less than one acre to every 40 or 45 persons, for this latter proportion represents as much sewage as land can either utilise or purify over a term of years. The land chosen should, if possible, be a light loam, because this is more easily cultivated, and better suited to the rapid growth of market-garden vegetables, not from its chemical composition—for with plenty of sewage this may be disregarded altogether—but from its physical condition, which admits of the delicate roots of young plants striking out more rapidly. The land chosen should, if possible, either be flat, or should consist of wide gentle slopes. Frequent and rapid slopes should, where practicable, be avoided. I have, on a former occasion, pointed out that the utilisation of sewage by irrigation, to be properly understood, must be divided into three parts, each of which must be considered separately; and it is useful to keep these distinctly in view. They are:—1st. Conveyance from the town to the country. 2nd. Distribution among the different farms or fields in the district to be irrigated. 3rd. Application to the soil or crops. The first is the province of the engineer, the second of the surveyor, and third of the chemist and farmer. With regard to the first, I will only say that I greatly prefer concrete, as now used so much in France, to either brickwork or earthenware pipes. Well made, it is absolutely water-tight and practically imperishable, two advantages which cannot be overrated. However, on this point I will not further enlarge, as I am already regarded by the engineers as a heretic, my doxy being different from their doxy. The second division of the question, or distribution, is one which presents very considerable difficulty. The expense of iron pipes is prohibitory, earthenware pipes are always going wrong, while earth ditches raised any height on embankment are very wasteful of ground, as their bases spread out to such a width. Wooden troughs have been used in some places where the sewage is required to be raised some height above the ground, but their perishable character renders them inadmissible. The only thing left to try was sheet iron troughs, and these are perfectly successful, and very convenient and cheap. The best form for strength and capacity, combined with convenience of working with sluices and openings, is what you see here. It has straight sides, which act as girders to carry the weight of the liquid, with flanges at the top to give lateral stiffness, and the bottom may either be semicircular, or flat, with rounded corners. Each form presents some advantages. Sheet-iron troughs of this size can be erected on legs of, say four feet from the ground, painted and finished for 6s. 8d. per yard forward, or fitted with these very ingenious openings, the invention of Mr. Edwin Maw, at every 10 yards, for 7s. 2d. per yard forward, completed in all respects. For efficiency, durability, and economy, nothing can approach troughs of this description, and they will distribute sewage over land reasonably well adapted for it, but where the levels will not admit of the use of earth ditches, at a cost of from £5 to £10 per acre. Yet I was recently shown a letter from a disconsolate mayor of a town not far from London, addressed to the president of the Institution of

Surveyors, in which he told the following piteous tale: Under the strong pressure of the Court of Chancery, his town had been compelled to cease poisoning their neighbours, had purchased 50 acres of land, had conveyed their sewage to the land, which he said was well situated for its reception, and in an evil hour they applied to a certain eminent engineer, who fancied himself a great agriculturist, to lay out their little bit of land for them. This gentleman positively sent them in an estimate for this little job amounting to the astounding figure of £5,000. Now, this is a fact; I saw the letter in the mayor's own handwriting. The third division, or the application of the sewage to the soil and crops, is a very simple process. The farm to be laid out having been carefully surveyed, the levels accurately taken, and the general scheme of the distribution settled upon by the surveyor, the lines of the main distributing channels should be marked on the map, being taken as much at right angles to each other as possible. Then the intervening spaces should be divided into "beds" or "lands" about 30 feet wide, and from 100 to 300 or 400 yards in length, according to the fall of the land, and handed over to the farmer. Then he should obliterate the marks of the old cultivation by a little shallow ploughing and cross-harrowing, when one deep ploughing will often suffice to throw up the land into ridges, as marked on the map by the surveyor. The irrigating channels are then taken out by plough or hand along the ridges. As I am not addressing agriculturists, I do not propose to trouble you with the details of the cropping; I will merely say that, with the allowance of sewage per acre I have indicated, the farmer or market-gardener will get far finer crops than with any other kind of manure, because, being already in solution, the manure can be more rapidly assimilated by the plants, and in larger quantities. As to the price that should be paid for the sewage, I have indicated what is its *bona fide* value, but it is evident that the actual price obtained by the town must, like every similar transaction, be a matter of bargain, into which many local circumstances may enter slightly to increase or diminish the figure agreed upon, and it must also depend of course on whether the town has paid for the conveyance of the sewage, or whether the purchasers have done this. Surely this little occurrence mentioned above, of the £5,000 estimate is, however, a bitter satire upon the relations at present subsisting between the central government and the local authorities. In the provincial papers there are perpetually to be seen eloquent and heartrending cries for help from perplexed vestrymen, who see Seylla, in the form of the Court of Chancery, on one side of them, and Charybdis, in the shape of the engineer, with his hundred pounds worth an acre of gimcracks, on the other. What are the poor people to do? They have duly polluted their river according to one Act of Parliament, and in many cases under considerable pressure from the Home Office; and now the Court of Chancery steps in and says that they must take their sewage out again, in accordance with another Act of Parliament, and they get neither pity nor assistance from the Home Office. This state of things had become so intolerable and anomalous that, a year ago, with a great flourish of trumpets, a "Royal Sanitary Commission" was appointed specially to devise a remedy. Many a despondent member of a local board has looked forward with the eye of expectant faith to the way of escape, to be indicated by the report of that august body, from the terrors of the Court of Chancery. To publish such glad tidings to trembling vestrymen was the final cause which brought the commission into existence, yet the president stated in the House of Commons, on the evening of Tuesday, the 16th instant, according to the *Times* report, "that scientific inquiry as to the best modes of carrying out various sanitary works they (the commission) postpone for the present, and entertain doubts whether public opinion is yet ripe for legislative prescription in such detail." That is to say they doubt the necessity for their own existence. But nevertheless we were informed on the same occasion that they were about to recommend a "plan of complete sanitary administration for all England and Wales, except the metropolis." The metropolis is no man's land, and therefore is left out, as a matter of course; but, in the present instance, the inhabitants of the metropolis may have reason to congratulate themselves on this strange exception, for what a terrible fate it will be for the other towns to be included in a "plan of complete sanitary administration," confessedly framed in a entire and absolute ignorance of all "sanitary works." This

is tentative legislation with a vengeance. What would be thought of a doctor who physicked his patient first and inquired into his symptoms afterwards? The Royal Sanitary Commission consider that public opinion is not yet ripe for inquiry, but that it is ripe for legislation. How a body of men, who are so sane individually, can be so insane collectively, is a psychological paradox that I will leave to the metaphysician; but it is quite clear that nothing but a vigorous expression of public opinion in an opposite sense can drive such a delusion out of their minds. Now it has occurred to me that, as the present Home Secretary was such an active member of the Committee of this Society on Food, the Society might usefully draw his attention—first, to the delusion under which the Sanitary Commission are suffering; secondly, to the great hardship of the position of these poor little country towns, floundering along in the dark; and, thirdly, to the enormous waste going on at present throughout the country of a manure which ought to be turned into food, and which represents, on the very lowest possible computation, four hundred millions of quatern loaves of bread, or their equivalent, in some other kind of food, lost to the country every year. To utilize this manure would provide work for very many hands now idle, and would provide food for more than five times the total number of paupers in the three kingdoms. As a case in point, the Romford sewage farm, which is now in my occupation, formerly provided work, so I have been informed, for three horses, two men, and a boy, with a little extra labour once a-year. But the increased production obtained from land under sewage necessitates increased labour, and I have already got thirteen horses upon it, a dozen men, and shall very shortly have to increase the number of horses, and to more than double the number of hands, while the production of food will be augmented in a still greater ratio. The utilization of sewage is, then, the true statesman-like remedy for the evil of pauperism. It would, so far as it is acted, be a radical cure, whereas emigration, so far as it acts, is only a Malthusian palliative. The one is creative—the other destructive. The one reproductive—the other exhaustive. The one increases the national wealth, directly and with certainty; the other decreases the national wealth, directly and with certainty, while it only offers a contingent prospect of an indirect benefit through possible future trade. Surely, this is a question which is even more imperatively urgent than the Irish land question, yet Government neglects it, or it is relegated to subordinate officials who have no power of initiation, and session after session passes, and nothing is done. Things drift on from bad to worse, the waste increases, the pollution of rivers increases, and pauperism increases, but the subject is dull, unattractive, by no means sensational, not altogether quite "proper," cannot be made a "cry" of, and so is voted a bore and shelved, and is not allowed by our politicians to come "betwixt the wind and their nobility." But there are some things which cannot and will not be shelved, because they are "irrepressible"—the negro was one, the pauper is another, and the sewage is a third. There is a Nemesis for the punishment of all waste and all reckless extravagance; and even if we ship off all our present crop of paupers, yet, if we continue to waste our sewage, in another 25 years, when all the guano islands and mummy pits are exhausted, another crop of paupers will have sprung up, and there will be less to feed them with than ever. If Mr. Gladstone will spend a day on my farm, as Dumas did, he will find that the waste of sewage is the reason why—in the words of his great speech on the Irish Land Bill—"we have not yet solved the problem, or got to the heart of the secret of how to relieve the destitution which is so rife among us." If his attention can only be attracted to this subject, the waste will be stopped; and if this Society can attract his attention to it, they will confer on the nation a great and a lasting benefit.

Mr. BALDWIN LATHAM said he fully agreed with many of the views put forward by Mr. Hope, though he differed with him on some points. With regard to the general question of the utilisation of sewage, there could be no doubt of its being one of the most important of the present day, particularly when looked at in reference to the general condition of the water-courses of this country, and to the enormous waste of fertilising matter which was going on in every direction under the present sewage system, and, therefore, any suggestions made by Mr. Hope, and gentlemen of his class, would

be eagerly welcomed, he believed, by members of the engineering profession. He differed with Mr. Hope, however, not as to the value of sewage matter, but as to the mode in which it should be applied to land, for he believed that by the system advocated in the paper it was quite possible to apply sewage to land, and yet to speedily exhaust the most fertile fields. It was quite clear that if no manure were applied, the land would sooner or later become impoverished, and it was equally clear that even if sufficiently manured it would equally become exhausted, although the process would take longer; and he was convinced that by applying only the limited quantity recommended by Mr. Hope sooner or later there would be a failure. Taking an analysis of the Rugby sewage, which had been well ascertained, he found that its component parts represented for every 100 parts of nitrogen 27 of phosphoric acid and 42 of potash. It was, therefore, manifest that sewage was a manure poor in phosphoric acid and in potash, and consequently if sufficient were supplied to grow a good crop, it would be necessary to apply such a quantity as afforded the requisite supply of the poorest element. It was, therefore, impossible to get the full value out of the sewage without exhausting the fields, unless a sufficient volume were supplied. Very careful experiments had been made for the purpose of determining the proper quantity, and he believed that an acre of land ought to receive the sewage from 100 persons. And it must be borne in mind that, although particular crops would not require the whole of this, yet no loss would occur, because the affinity of soils for fertilising matter was such that nature would not allow the surplus to be wasted, but would store it up for future requirements. From an experiment of Liebig in a field near Munich, not of very great power of assimilating fertilising matter, it appeared that a stratum of soil, only four inches in depth, would absorb 2,076 lbs. of ammonia, 1,110 of potash, and 1,888 of phosphoric acid per acre; and if a crop of Italian rye grass were grown upon such land—that being the largest crop which could be grown—there would still remain behind much fertilising matter, which would remain stored up there for nine years before it passed away. But, in addition to that, Italian rye grass was a plant which died out in a limited number of years, and, therefore, it became necessary to substitute other crops, which would utilise the remaining valuable constituents, and thus no waste would occur. Mr. Hope also said that sewage contained matter in solution; but there could be no greater mistake. In dry weather sewers frequently brought down a large quantity of fecal matter in a solid state, and if that were put on the land, it would not only be destructive to vegetation, but would create an intolerable nuisance. It was therefore necessary that these solid matters, which were held in suspension, not in solution, should be removed before the sewage was applied in irrigation. Reference had been made to Croydon, and fault had been found with the quantity of sewage matter which was there applied to the land per acre; but it must not be forgotten that, Croydon being almost the first town to adopt this system, and that not with a view to realise a profit, but really to get out of the clutches of the Vice-Chancellor, it could not be expected that the most perfect arrangements would be adopted all at once; and as soon as the present contract was terminated, a different course would be pursued, for he had already been instructed by the Local Board to procure a much larger area of land upon which the sewage might be deposited; in fact, it would be about four times the area at present in use for that purpose. Croydon had borne the burden and heat of the day in this matter; and therefore he did not think reflections should be thrown out at her expense, without knowing what her present intentions were, for she was just as ready to go forward now as she was eight or nine years ago. He was sorry to say that much discredit had been thrown upon this system of sewage irrigation by the analyses put forward by Dr. Voelcker, to show how utterly impossible it was to purify a chemical solution when presented in a diluted form to the land. These results had been published in one of the agricultural journals; and he was sure that when the error which must have occurred in the experiments was pointed out, he would repeat them. As he was possibly the engineer pointed at in the paper, knowing pretty well what works were alluded to, he might say that the estimate of £5,000 included not only laying out and enclosing 70 acres of land, but the cost of construction of the whole outfall works, the filtering works, and all the apparatus for inter-

cepting the solid matter. In the whole of the irrigation works which he had in hand, and he was now laying out upwards of 400,000 acres in England and on the Continent, the cost would not exceed £10 per acre for all purposes.

Mr. B. RAWLINSON, C.B., said he knew Mr. Hope would not wish an erroneous statement to go forth, and therefore he might correct one observation in the paper by saying that the Sanitary Commission was not appointed for any executive purposes, as would be evident upon looking to the members composing it. It was simply a Commission appointed to inquire into and consolidate the present sanitary laws, one Act having been passed after another until confusion had become worse confounded. The chairman was Sir Charles Adderly, and he thought that fact was sufficient to justify his remark that the Commission did not intend to touch on the scientific part of the subject, and he hoped that as long as he lived, no Commission in this country would undertake to deal with such matters, so as to make teaching a Government department, as was the case on the Continent. Indeed, he feared they were already going a little too far in the appointment of inspectors; but he hoped they would not at any rate begin to teach English engineers how to lay out a sewage farm so as to make the most of it. With regard to the practical part of the question, there were other differences than those mentioned by Mr. Hope. There were differences of position in many cases, and he differed with him as to the kind of land most appropriate for the application of sewage, being of opinion (having had some experience in the matter) that the most difficult land to irrigate would be a large area of comparatively flat land. He believed the most favourable was that having a limited contour elevation, and he should not even object to rather steep gradients in some instances, provided that the sewage at the commencement was sufficient for gravity, even if they had to go to some expense for pumping. His reason was this, that in irrigating land having a considerable fall, the engineer could pass his sewage by contour grips and lines over the upper areas, could then get it over the intervening portions into a second line of carriers, and as it was almost impossible to take out all the fertilizing qualities of sewage by once passing it over and through any table-land area, he could pass it over twice, thrice, or even four times beneficially, and he could then discharge the water from the last carriers as pure as ordinary spring water. He did not say they would ever arrive at that pitch of perfection when it would be safe to recommend the clarified water from subsoil drains for culinary and drinking purposes, although he knew at that moment of an instance in which the strongest sewage he ever heard or knew of was used by the adjoining residents in this way as it flowed from the subsoil drains, and that was at the farm at Aldershot, and as this was the most perfect system of sewage irrigation that had come under his observation, a word or two in description of it might be allowed. It was perfect in every respect, not only because the difficulties overcome were the greatest, and the sewage by far the strongest, but because the results were by far the best. The Aldershot Camp Sewage Farm consisted of about ninety-eight acres of land, which was, as an old north country farmer once said, worth "nowt" an acre. It was absolutely worthless, consisting of 90 per cent. of sand, with a mixture of peroxide of iron, which was absolutely poisonous. Mr. Blackburn, the engineer who had charge of the works, and who fortunately, had had some experience in agriculture, broke up the subsoil, washed out the peroxide of iron, drained it, and laid it under a sewage irrigation of from 200,000 to 400,000 gallons per day, the sewage coming from the camp, and containing 20 grains of ammonia in the gallon; and an analysis showed that, while it had 20 grains of strong phosphoric acid to the gallon as it flowed on the land, the water from the subsoil drains only had half a grain. Mr. Blackburn said it was no use to irrigate land with sewage on the surface, or to plough it in the ordinary way; he invented a plough for the special purpose, and broke up the subsoil to a depth of 20 inches, and having irrigated that well with sewage, he got a crop of Italian rye-grass of from 70 to 80 tons to the acre. After two years, he laid down a breadth in potatoes, which he sold on the ground at £25 per acre, the purchaser being at the cost of digging and taking them away, and leaving the tops behind as a solid dressing for the land of considerable value. In the same autumn the land was broken up, prepared and sown with Italian rye grass, which he himself saw showing two inches above the

surface. If, however, a good profit was to be made out of land irrigated with sewage in the vicinity of a town, it should be made to produce every kind of garden produce used in the community, all kinds of grain crops being avoided, as entailing only waste of labour, land, and money. Italian rye grass, mangolds, potatoes, cabbages, French beans, and lettuces, could all be grown with advantage, but they required special knowledge and special care; for some must not be irrigated at all while the crop was in the ground, whilst others required quite a different treatment. In this way as much as from £100 to £200 per acre of gross receipts might be obtained, for he had seen a return made by persons on whom he could place implicit confidence, showing with a crop of cabbages and cabbage plants a gross return equal to £200 per acre. Between this and the ordinary produce of £5 to £10 per acre was a wide margin, quite sufficient to induce efforts in this direction. They were on the threshold of this question, and only just beginning to understand it; and as there had been so much joint-stock enterprises of late, he would suggest to any gentleman who wished to make their fortunes that they could not do better than form an honest company and go to some of the distressed towns which had been described as in the clutches of the Vice-Chancellor, and treat with them for their sewage and the land necessary to utilise it. He knew many towns which would receive them with open arms, and let them have the land at a fair agricultural price, and let them have the sewage in for nothing, and if there was any truth in chemistry, this could hardly be a bad bargain. But at the same time, it must be conducted with knowledge and care, for he himself was concerned in a speculation of that kind where both the sewage and the land was as good as any in England, and the climate propitious, but, owing to defective management in some way, they only got a dividend of $\frac{1}{4}$ per cent., whereas, by letting it in the ordinary way, having bought it on good terms, they could have realized 5 per cent. There were, therefore, two sides to the sewage shield, as to most others, but he believed, nevertheless, that in the proper application of this system there was a mine of wealth, by bringing common sense to bear, and avoiding blunders which had already been committed. On the other hand, in many places it had become a sheer necessity to do something of this sort, in order to avoid poisoning the rivers, and would be more and more so every day. Before sitting down, he would say that the man who could solidify sewage and make it a portable manure, could invent perpetual motion and square the circle. The most perfect chemical researches had yet failed to do more than take out one-seventh of the valuable properties of sewage in solid form; and taking a ton of sewage as being worth 17s. 6d., and treating it in any possible way—and he spoke from having been associated on the commission with some of the first chemists of the day—the result would be to take out solid matter to the value of 2s. 2d., and leave 15s. 4d. worth to go away with the effluent water, which might nevertheless appear perfectly pure and bright. On the other hand, when liquid sewage was passed through twenty inches of soil, it had but the barest trace of these valuable salts left in it. This, therefore, was the only true and profitable chemistry.

Dr. VORLCKER said Mr. Hope was such a zealous advocate for sewage irrigation that he could but regret his having put his pet child into such doubtful company as that of the negro and the pauper. Perhaps he had done so from a feeling that sewage was a nuisance which must be got rid of; but though this had been the prevalent idea for many years, he was convinced that the time was coming when it would no longer be looked upon in that light. It appeared to him that they had not sufficiently considered the difficulties in the way of the successful application of sewage to land, and had taken too one-sided a view of it, as if it were only useful for particular crops, such as Italian rye-grass. Few experiments, if any, had been made as to the effect of applying it to fallow land, and he should like it tried in that way on an extensive scale, applying, say, 10,000 tons per acre, which he believed would much increase its fertility for a succession of years, during which a regular rotation of crops might be obtained; and he feared that if it were the fact that the sewage of not more than 25 to 40 persons could be applied to an acre, there would be a very serious impediment thrown in the way of its adoption. He should rather agree with Mr. Latham, that an acre would take, at least, the sewage from 100 persons, and if it were applied to fallow land no doubt that quantity might be much increased. Mr. Latham's

criticisms on his experiments had only been brought to his attention that evening, and he was hardly aware to what he referred. Probably that gentleman was of opinion that land was capable of absorbing every particle of ammonia, phosphoric acid, and potash, but if so he was in error. With regard to any special exception he had made as to the power of absorption and retention of ammonia and other fertilising matters, he had been corroborated by other chemists, who had gone very carefully into the matter, and who had found that although soils of every description had the power of fixing and retaining for a length of time immense stores of these bodies, yet they did not retain them in a very diluted, watery solution; and it was fortunate they did not, or how would the plants receive it? In these results he had been corroborated by Dr. Wolff, Dr. Knops, Professor Sonnenschein, Warg, Stohmann, and other chemists, who had laboured in the same direction. In conclusion, he could not but agree with the general principles laid down by Mr. Hope, and trusted that before long they would be generally carried out in practice.

Mr. MECHER said he felt much indebted to Mr. Hope for his interesting paper, in the main points of which he fully concurred. London had a population of about $3\frac{1}{2}$ millions, which consumed daily the average annual available produce of 20,000 acres of English land, in addition to innumerable cargoes of wine, sugar, coffee, and many other things, which must be added to the total; and every farmer would agree that the results of that consumption must be highly valuable when restored to the soil. The only question was the application of it. He had applied sewage for the last 20 years, both in a solid and liquid state, the details of which he would not go into further than to say that, so far from spending £100 per acre, even with the use of iron pipes and gutta percha tubing, the cost had not exceeded £2 an acre. The great difficulty appeared to be this—everyone was anxious to get rid of sewage, but there did not seem a corresponding demand on the part of farmers to make use of it. One would have thought that the farmers and landowners would have taken a deep interest in this question, and, after all, there was no real difficulty in applying it; it was only a question of pipes and pumping; and two of the most eminent hydraulic engineers had stated in evidence before the House of Commons that 1,000 tons of sewage, as it came from the sewer, could be raised 300 feet at a cost of from 13s. to 14s., and then with a fall of 5 feet per mile, it would flow 60 miles. Water was, in fact, brought to Glasgow from Loch Katrine, a distance of 40 miles, with only a fall of 200 feet on the whole distance. To go back to his first illustration, he might say that the only difference in the consumption of 3,500,000 of human beings and the same number of sheep, considered in reference to the value of the proceeds for manure, was that the sheep consumed the bone earth in the food which they ate, whilst human beings did not; therefore town sewage was deficient in that most valuable constituent, which, however, Liebig had shown could be supplied at a very small cost indeed. To throw away therefore the daily produce of 20,000 acres was a sinful neglect, and was as bad as throwing gold into the Thames. The great point was to get landowners to feel an interest in the question, and to appreciate the value of what was being now wasted.

Sir WILLIAM DENISON said that, as chairman of the Rivers Commission, he had listened with a great deal of attention and interest to what had been said. The Commission had just sent in their report upon the application of sewage to the Mersey and Irwell. The difference of opinion seemed to be not at all as to the fact of sewage being highly valuable as manure, but as to the quantity and mode of applying it, the character and amount of its action on different soils, and a variety of other minor matters. The truth was, what was really wanted was a series of experiments, on a large scale, which would set many of these questions at rest. The business of the Rivers Commission was not to enter into the question of the application of sewage, but to see to the cleansing of the water of rivers, and it became a question, therefore, of practical importance over what amount of surface town sewage must pass before it was in such a state that it might be allowed to flow into the rivers without injury, and experiments had been conducted with that end in view. These were carried on at Woking, because there the sewage from the prison was at their disposal, and there was also convict labour which could be made use of; but the soil was not of such a character that any general deductions could safely be drawn from the results

obtained. He hoped, therefore, that next year a more extensive series of experiments of this character would be carried on, and the results made known as speedily as possible. As far as his experience went, he agreed with Mr. Latham that the sewage from 100 people might be distributed over an acre of land; but he thought that after passing over this acre of land, though it would be sufficiently pure to be allowed to flow into a river, yet it would still contain matter which would be useful as manure. He believed, therefore, that the sewage from 100 people would irrigate profitably nearly six acres, and therefore the expense of pumping, which in many cases would be enormous if applied to one acre only, would be so distributed as not to be excessive. All these questions, however, were matters to be decided by experience alone, and would depend in a great degree on the character of the soil.

Mr. TARGET said he had a plan to bring forward, by which he claimed to be able to thoroughly deodorise human excreta in an easy and simple manner, which he would describe. In the first place, he begged leave to hand to the Chairman a bottle containing the result, which was perfectly inodorous and innocuous. His plan was to deodorise the excreta when first evacuated, by means of elements which were at hand in every household. Moulé's system had failed, not because it was a bad system, but because of the inconvenience of having to introduce a constant supply of earth; but he mixed simply the contents of the dust-bin, ashes, rags, dry refuse of all kinds which accumulated in every house, which had to be removed by the scavenger, and which he proposed should still be removed by the same agency, *plus* the sewage matter. This system was now in successful work in Salford, one of the most populous towns in the north, and also in Oldham, Rochdale, and other places. The plan consisted simply in lining a tub with zinc, into which the ashes, refuse, &c., were put, and mixed with a small quantity of sulphate of iron. The whole being mixed up, a mould was put into the tub, leaving a space of about three inches all round, into which the mixture was rammed, and the mould being removed, a cavity remained into which the dejections were received, when it was found that the urine was immediately absorbed, and the solid fæces were left almost dry and totally inodorous. These tubs could be removed periodically, say once a week, and there would be no more pollution of rivers from this excrementitious matter finding its way down the sewers, and the Sanitary Commissioners and Acts of Parliament would be no longer feared. There was only one difficulty—viz., that no water must be admitted to the closet; but that had been got over by a slight modification of the apparatus, by which the water used in cleansing the pan of a water-closet was sent away to the sewers, whilst the dejections, and even the urine, were received into the tub below. They had thus got rid of the only difficulty in the way of the full success of what was called the "Gould absorption system." The patentees were so thoroughly convinced of the entire success of this adaptation, that they offered to carry out the system in any town, large or small, free of expense, relying for their remuneration simply on the sale of the manure, and this showed some confidence in the value of the invention. The cost of the materials was nothing, and therefore there was no expense in working it out.

Dr. WYLD said he could not agree with Dumas, that water was the best dung cart. By using it as the vehicle of sewage, there were exhalations constantly rising up into the streets and creating diseases. He had recently had a case of typhoid fever in his own house. A very bad smell had been experienced, the cause of which was found to have been rats eating a hole into the sewer, and had every reason to believe that this was the cause of the fever. Turning excrement into the sewers was, he believed, the cause of a great deal of disease. The great merit of Mr. Target's system was that all the materials necessary were at hand in every house. He could speak from experience as to its perfect success; and, in fact, a friend of Mr. Target kept one of them in his bedroom and never experienced the slightest ill odour or bad effect, and he thought it might be carried out practically without much difficulty. In Salford a speculator had purchased from the corporation the privilege of removing the sewage, which had hitherto cost the town £3,000 a year. This gentleman had come forward, and given the corporation £3,000 a year to be allowed to do it, so that the thing was practically demonstrative, and not only was this the case, but the ratepayers were now up in arms, and asserting that the corporation had sold it too cheaply.

Sir WM. DENTON said he had seen the operation of this system in Lancashire, and he believed it to be efficient in getting rid of a portion of the excrement, but that did not get rid of sewage. All the slops from the kitchen of every variety had still to go down the sewers, and the portion removed in this way was but trifling compared with the whole of that which polluted the rivers.

Mr. RAWLINSON said that when he referred to solidifying the sewage he had only intended his remarks to apply to dealing with the liquid sewage at the outfall of drains, and to converting that into portable manure, but still he perfectly agreed with Sir William Denton, that removing human excreta was but a small part of the work required to be done in cleansing a town. There were the washings from the surface of the roads, which must be taken away by the sewers, and many other varieties of liquid refuse, which no such system as that referred to could get rid of. With regard to the effluvia which had been spoken of by Dr. Wyld, he would say that was simply the consequence of bad drainage. No drains should ever ramify beneath the basement of any house or any building, however large. They should end at the outside wall. In dealing with separate manipulative processes there would always be difficulties. He had three closets in his house, and some persons had a great many more, and he did not think they would ever get servants to pack these things and carry them backwards and forwards.

Dr. BURN said he had spent the greater part of his life in India, and there the system of dry manipulation of sewage matter was universally practised, and appeared to him quite successful.

Captain SELWYN, R.N., desired to call the attention of the meeting to the two tables showing the constant flow of sewage at Stratford, which really had nothing whatever to do with the question of human excreta, and therefore it was abundantly evident that any system of dry deodorisation, such as had been described, would be totally inefficacious for dealing with town sewage. It was a misapprehension of the whole question. They had to deal with sewers as they were.

Dr. PAUL suggested that the discussion of systems of dry deodorisation of solid sewage matter was one foreign to the subject of the paper. It was well worthy of consideration of itself, but he did not think it was desirable to mix the two things together. There were some cases in which it would be useful, and others where it would be quite out of the question; as, for instance, in London and other large towns, where water systems had been already adopted. In all these cases, the point to consider was, how to dispose of the liquid sewage, but in other parts, and particularly in some of the populous towns in the north, he was aware there was a strong feeling against the use of water as a means of carrying off the town refuse. If, however, the subject were brought forward separately, it would be likely to receive more attention and more justice.

Mr. HOPK, in replying to the observations which had been made, said he had been slightly misunderstood in some respects, in consequence of having omitted several points in his paper, in order to keep it within reasonable length. For instance, Mr. Latham had misunderstood him with regard to the number of persons per acre which he had mentioned. He did not mean to say that he would never, under any circumstances, apply sewage from more than 40 or 45 persons to one acre in a year, but that was about the amount which, on an average of a number of years, could be profitably applied. Latham said that there would be no loss in putting an extra quantity of sewage on the land, because what was not exhausted would be stored up in the soil, but if they continued this year after year it must come to an end some time; and where the land had stored up as much as it could hold, it was a necessary consequence that pollution would follow. With regard to irrigating with solid matter, that was another point which he had not enlarged upon, but he certainly should never propose to float down matter of that sort in its crude state over the surface of the land. It would be worse than useless from an agricultural point of view, and would, no doubt, create a great nuisance. All this solid matter must therefore be got rid of, either by mixing, which he believed was the best system, or by some process of intercepting it, which was not so effective, because it had then to be carried over the land instead of carrying itself. He did not agree with Mr. Rawlinson that land with steep slopes was the best

for irrigation purposes. No doubt Mr. Rawlinson was right as an engineer, but he was wrong as a farmer, because it was impossible to cultivate such land properly and comfortably, so to say, if the sewage were applied by contour lines. Every time that land was ploughed it was moved either upwards or downwards, which would interfere with its contour lines, unless you used nothing but a turn-wrest plough, which formed the furrow the same both ways, and these were both more expensive and less durable than those of the ordinary construction. He had had experience on both flat and steep lands, and his opinion was that the convenience of the farmer was the great point to be looked at, and this was too often neglected by engineers, who were rather disposed to force their systems upon farmers, instead of ascertaining how they could meet their requirements. Mr. Target's plan had, he believed, all the defects of Mr. Moule's, and one more, because he did not see how these things were to be arranged in villages and small towns where there were no scavengers. He should be very loth to ask his housemaid to operate on one of these affairs, and if he did, he did not think she would remain in his service after that day month.

Professor JOHN MARSHALL, F.R.S., the chairman, in proposing a vote of thanks to Mr. Hope, said the result of the discussion showed that this was a very fit subject to be brought forward by the Society of Arts, and he hoped they would press it forward in every possible way. There was, first, that admixture of scientific and practical work to be done which required the ventilation which all such questions received at their meetings, and he had no doubt that good results would follow from that evening's consideration of it. Mr. Hope was evidently armed at all points on this question. There might here and there be a weak place in his armour, through which an adversary might thrust a lance, but he was, in the first place, thoroughly acquainted with the subject, and, in the second place, he had had practical experience upon the very point now at issue. The time was now passed when it was doubted whether sewage was offensive and noxious, and they had also passed the time when it was necessary to inquire whether they could substitute any other mode of treating town sewage in a great number of instances, for out of ninety-six towns which were thoroughly sewered, there were only fifteen where the sewage was made use of upon the land. This, therefore, was a question vitally affecting all these towns, and also the metropolis, and it ought to be argued to the full. He was therefore of opinion that the introduction of the question of earth closets and other systems of dry deodorization was rather out of place, but he had not thought it right to put a stop to the discussion, because he felt it was a question which, in many cases, had great practical value. The great defect of any such system must always be that it left behind a vast amount of fluid matter of a noxious character undisposed of. Nor was it at all certain that typhoid fever resulted from the decomposition of human excreta; on the other hand, there seemed rather reason to believe that it might be the result of the decomposition of vegetable matter; and a great quantity of this must always be passed down the sewer with the kitchen slops, whilst fungi would also vegetate in the drains themselves, so that typhoid fever might still occur, even if all solid human excreta were prevented from entering. The meeting seemed all of one mind as to the value of sewage matter, but the point on which difficulty arose was the application. The engineering difficulties were admitted not to be great, but still they required experimental inquiries into the best mode of delivering the sewage upon the land, and utilizing it when it was there, and also to the best kind of land, the proportion of land to a certain number of persons whose sewage was to be applied, the character of the irrigation, the crops which might best be treated with it, and the proper seasons for its application. All these were points of detail, and as the object of the paper had been to raise a discussion upon them, no one could have brought it forward with better effect than Mr. Hope, who had had such favourable opportunities for forming an opinion, he having arranged for the exclusive use of the sewage from the small town of Romford, where he knew the number of inhabitants, and number of water-closets, and could easily gauge the quantity of sewage that flowed from day to day and hour to hour; analyse it as often as was desired, and distribute it in a certain order and on certain principles. In conclusion, he would say that Mr. Hope deserved the most

hearty thanks of the meeting for having brought this subject forward, and he hoped he would continue his experiments and make known the results. If he might say so without being considered fanciful, he would suggest that they might all take as their motto the name of the author of the paper, and might hope that in a short time sewage would be utilised instead of being wasted, and used instead of being abused.

The vote of thanks was carried unanimously.

Mr. HYDE CLARKE writes: "The valuation of sewage manure is to be taken in food and not in money. The sewage of London, valued at £1,000,000 would grow corn for at least 2,000,000 people, and this food-producing substance is now thrown into the Thames. It is worthy of inquiry, what is the quantity of corn imported into Belgium, which has a population of nearly 8,000,000 on a very limited surface. The production of food in Belgium is chiefly dependent on the economical application of manure, and particularly of human manure, and that to inferior land, the soil of Flanders being a sand, with a thin layer of humus. The increase of the population in Belgium actually contributes to the increase of food, while here these resources are annihilated by the novel legislation of the last few years. It is most desirable to have the experience of Belgium made known, a country within sight of us and in the same climate, where town manure is applied to a variety of crops—grain, cabbages, roots, potatoes, flax, tobacco, &c., and where the rent on light land is very high."

EXEMPTION OF DUTY ON FARM CARTS.

TO THE EDITOR OF THE WEST BRITON.

SIR,—I send you a communication I have received from the Board of Inland Revenue, who have, with great kindness, answered three letters I wrote them on the subject.

I do think that if the Legislature would omit the word "farm" and also the words "in the course of trade," that it would be a great improvement in the Act; and as it is a ridiculous piece of law-making to subject the owner of a cart or of a waggon to a fine of twenty pounds besides the amount of the duty on the same as a carriage, because on it the name, &c., is not duly inscribed, I think it would be a further improvement if the clause requiring the christian and surname, &c., of the owner were struck out.

And if, in addition to these suggested improvements, in the exemptions to licence for horses, in the clause No. 3, for the words "and not used for riding," was inserted "or not used for riding," I think that the Chancellor of the Exchequer would give us something that we could not much grumble at as a tax on carriages and horses.

Tregony, Feb. 23.

J. P. PETERS.

The following is the communication above referred to:—

Inland Revenue, Somerset House, London, W.C.,

22nd February, 1870.

SIR,—With reference to your letter of the 11th instant, I am desired by the Board of Inland Revenue to acquaint you that, upon further consideration of the general subject, they have now decided that the use of a duly-inscribed farm cart for the conveyance of goods or burdens in the course of the trade of any person, whether the owner or the hirer of such cart, shall not be treated as rendering a licence necessary for the cart.

On your putting yourself into communication with the collector of this revenue at Truro, steps will be taken to repay you, in due course, the duty which has been charged for your cart, if properly exempt, under the present order.

I am, sir, your obedient servant,

W. M. ROSSETTI, Assistant Secretary.

Mr. J. P. Peters.

DORCHESTER FARMERS' CLUB.—Mr. Homer in the chair. The vice-president, Mr. Genge, read a paper on "Irrigation," showing that a great loss accrues to farmers through proper attention not being paid to this important subject. In the discussion which followed several leading farmers of Dorset took part, all agreeing that the watering of meadows is not at present sufficiently attended to, and the water mills should be abolished, steam mills taking their place. The days of water mills were, it was thought, numbered.

THE BIRMINGHAM SHOW AND SALE OF SHORTHORNS.

The entries at this exhibition, held on Thursday, March 3, dropped from 137 of last year to 102; and the quality was as inferior as the number was reduced. Breeders were put upon their honour not to buy an animal in over the twenty guineas reserve; but as the seller was in nowise protected from the collusion of buyers, it could hardly be thought that first-class animals would be sent. Good animals will never be exhibited for show when compulsory sale is enforced; for, as a rule, the owner or breeder of a fine animal generally values him considerably higher than the public does, and the chances may possibly happen that he obtains his price—but more often he does not. The nineteen animals consequently entered for the £50 prize were a very inferior class, one of them was not sent, and three were passed away without a bid; indeed the show was only redeemed from mediocrity by the entries of Mr. Willoughby Wood and Mr. Wakefield. A finer lot of animals may often be seen at Pearith great fair, or at Darlington on the first Monday in March. The £50 prize was awarded to Mr. Willoughby Wood's Duke of Lancaster, a young fat bull of Bates' blood, possessing a few good but no extraordinary points, and lacking hair; had he been exhibited in a lean state there is no doubt that he would have come out a very inferior animal. The competition for him when he entered the ring was far from keen, and he was all but sold for 80 gs.; still he lingered on, and went to Messrs. Perry, of Acton Pigott, for 96 gs. The second prize went to an uneven red bull, of Mr. Bayes', and he was sold to Mr. Wodehouse for 54 gs. A red bull, of Bates' blood, highly commended, bred by Mr. Willoughby Wood and exhibited by Mr. Wakefield, was considered by many superior to this animal; and his price seemed to bear this out, for he was sold to Mr. Smith, of Wick, for 81 gs. The third prize fell to a lean white bull, of Mr. Swingle's, which went for 46 gs. Mr. Curtler, of Bever, had a few entries, one of which was unsold. In this class, his blood-red hairy Worcester Knight was remarkably low on the leg and very thick, quite of the Scotch bullock stamp, for which no doubt Mr. Rowland Wood fancied him at 45 gs.

The calf class between six and twelve months old went up to 37 entries, and one of the best, a young roan bull bred by Mr. J. C. Adkins was unnoticed; he had, however, the satisfaction of breeding the grandam of the first-prize bull, a thick hairless calf exhibited by Mr. Ambrose Robotham, that was fancied by a gentleman from Cornwall, and sold for 50 gs. A commended bull of Mr. Wakefield's made the best price, and was well sold to Mr. Robbins for 60 gs.; whilst the second-prize calf, also exhibited by Mr. Wakefield, made 47 gs. Mr. Crispin gave 44 gs. for a flat-sided roan, the third prize, sent by Messrs. Garue. A nice calf of Mr. Bowly's was highly commended, and sold for 46 gs.; but the other from Siddington was passed without a bid. Earl Beauchamp and Mr. Thos. Harris were also exhibitors of some useful calves. A very lean one of Mr. Curtler's, with two crosses of Captain Gunter's Duchess bulls, from one of Mr. Bowly's cows, only made 22 gs.—3 guineas less than the fee at which his sire and grandsire stand!

Mr. Wakefield sent nine heifers out of the fifteen cows and heifers exhibited, and a very creditable lot of animals they were. Lord Beauchamp, however, took the £10 prize and had the reserve number with the two he ex-

hibited—the former selling at 47 gs. to Mr. N. Catchpole, and the latter at 43 gs. Mr. Wakefield's lot were generally commended; 46 gs. was however the highest price that could be got, and this was given by Mr. Beale for Lady Geneva, a fine roan heifer; the nine averaging just 31 gs.

The nine aged bulls had Monk (24,616), the first-prize bull at the Bath and West of England Meeting last year, at their head; but the beef trade was useful here, and scarcely one went over butcher's value. The extra stock comprised three of Mr. Thos. Robinson's bulls, and five of Mr. Woodward's, some of which were passed unsold. The judges, Messrs. Sanday and Savidge, had no very difficult work, and their labours were soon over; out of the bull calves seventeen went at a first draft, and six followed them soon after. Taken as a whole the show was about as good as could be expected under the conditions. One feature however distinguished the meeting this year—there appeared no complaint about any lots being bought in, and a general impression prevailed that they were all sold, but how sold?—frequently under butcher's price, and after the expenses of railway carriage, entrance fee, man fare, and time had been expended. Not a few grumbled sorely at the one shilling admission fee and sixpenny charge for the catalogue, but so strict were the council rules, that one of the greatest exhibitors could only get one catalogue gratis, and the rest at sixpence a-piece, to circulate among his probable customers. Mr. Lythall's delicate health was sorely tried in the rostrum, and Mr. Thornton being present was requested to sell the cows and heifers. The Shorthorn business seems to open very flatly this year, but considering the general depression of trade, and the price of corn, this is not to be at all wondered at. The only surprise seemed to be at Birmingham, how so many inferior animals were sold; pedigree was of no value, anything of a blood-red colour with a little hair went up at once, but plain colours and white animals were passed time after time without a bid. The company was much smaller than last year, and consisted principally of farmers who had ordinary stock, dairymen, and the exhibitors, with very few of what may be termed Shorthorn notoriety; but they evidently most of them came for business, and there was no lack of customers, and if this sale may be taken as a fair sample there will be no difficulty in disposing of stock of a similar character.

JUDGES.—Mr. W. Sanday, Ratcliffe-on-Trent; Mr. R. Savidge, Chipping Norton.

CLASS 1.—Bulls exceeding twelve and not exceeding twenty months old.—First prize, £50, Willoughby Wood, Holly Bush, Burton-on-Trent (Duke of Lancaster); second prize £15, Chas. Bayes, Kettering (Vulcan); third prize £5, T. Swingle, Langham, Oakham (White Satin); reserve and highly commended, W. T. Wakefield, Fletchamptead Hall, Coventry (Lord Oxford Wild Eyes); commended, Robert Emmerson, jun., Over Dinsdale, Darlington (Royal Charlie); and Earl Beauchamp, Madresfield Court (Young Monarch).

CLASS 2.—Bull calves exceeding six and not exceeding twelve months old.—First prize, £20, Ambrose Robotham, Drayton Bassett (Bruce); second prize, £10, W. T. Wakefield, Fletchamptead Hall (Marquis); third prize £5, Thomas Garue and Son, Broadmoor, Northleach (Blondin); reserve and commended, Edward Bowly, Cirencester (Fourth Lord Waterloo); commended, W. T. Wakefield, Fletchamptead (Martyr); and T. Morris, Madismore Court, Gloucester (Socrates).

CLASS 3.—Best cow, heifer, or heifer calf.—Price £10, Earl Beauchamp (Coronet); reserve and highly commended,

Earl Beauchamp (Emblem); highly commended, W. T. Wakefield, Fletcherstead (Lady Geneva); commended, W. T. Wakefield (Queen of the Ocean), and W. T. Wakefield (Factory Girl).

Class 4.—Best bull exceeding twenty months old.—Prize, £10. T. Garne and Son, Broadmoor (Monk); reserve and highly commended, Colonel Loyd-Lindsay, M.P., Lockinge Park, Wantage, Berks (Governor Eyre).

The following is a list of the animals sold, the names of the purchasers, and the prices realised:

BULLS exceeding 12 and not exceeding 30 months old.

Duke of Lancaster.—Messrs. Perry, Acton Pigot, Salop, 96 gs.
Young Waterloo.—Mr. H. Harding, Gillingham, Bath, 33 gs.
Vulcan.—Mr. Wodehouse, Woolmer's Park, Hertford, 54 gs.
Patrician.—Mr. Cowley, Kilsby Grange, Rugby, 27 gs.
Lord Oxford Wild Eyes.—Mr. J. B. Smith, Wick, 81 gs.
Royal Charlie.—Mr. Wilson, Wroxall, Warwick, 46 gs.
Young Monarch.—Mr. Ashlin, Firaby, Spilsby, 45 gs.
Gay Laddie.—Mr. J. Newbould, Bagington, 25 gs.
White Satin.—Mr. Bradburne, Wedgefield, Wolverhampton, 46 gs.

Cherry Prince.—Mr. Anslow, Eyton, Salop, 25 gs.
The Worcester Knight.—Mr. R. Wood, Clapton, Northamptonshire, 45 gs.

Monarch.—Mr. Hamilton, Princethorpe, Rugby, 36 gs.
Worcester Archduke.—Mr. Lockhart, Culmington, Salop, 40 gs.

Master of Arts.—Mr. Tomlinson, Ashbourne, Derby, 27 gs.
Prince Regent.—Mr. C. S. Lindsell, Holme, Biggleswade, 30 gs.

BULL CALVES, above 6 and not exceeding 12 months old.

Matadore.—Mr. Simon, Fernhill, Market Drayton, 25 gs.
Donald.—Mr. Betty, Madresfield Court Farm, Malvern, 26 gs.
Marquis.—Mr. Attwater, Britford, Salisbury, 47 gs.
Saltan.—Mr. Mullins, East Penward, Shepton Mallet, 23 gs.
Red Duke.—Mr. Allen, Blaby, Leicester, 25 gs.
Blondin.—Mr. P. Crispin, Barnstaple, 44 gs.
Miracle.—Mr. Palmer, Hampton-in-Arden, 36 gs.
Champion.—Mr. Watson, Whitacre, 33 gs.
Martyr.—Mr. R. Robins, Stoneleigh, 60 gs.
King Cole.—Mr. Martin, Madeley, Salop, 39 gs.
Barnster.—Mr. Dodds, Wakefield, 28 gs.
Newton.—Mr. Hazelwood, Accleiton, Northamptonshire, 36 gs.
Progress.—Mr. Ogle, Kinnersley, Salop, 21 gs.
The Colonel.—Mr. King, Rowington, 24 gs.
Baron Hasforth.—Mr. Tomlinson, Ashbourne, 26 gs.
The Polar Bear.—Mr. Robotham, Drayton Bassett, 28 gs.
Bruce.—Mr. T. M. Cardel, Cosworth, 50 gs.
2nd Achievement.—Mr. Thompson, Appleby, Atherstone, 39 gs.
The Colonel.—Mr. Swinnerton, Thorpe, Tamworth, 31 gs.
Red Rover.—Mr. Clare, Twycross, 30 gs.

Solitude.—Mr. Lane, Stratford-on-Avon, 42 gs.
Carlo's Grand Duke.—Mr. Tunncliffe, Ecclehall, 22 gs.
Star of Hope.—Mr. Davis, Kidderminster, 21 gs.
Fourth Lord Waterloo.—Lady Emily Foley, Stoke Edith Park, 46 gs.

Rustic Chief.—Mr. Heatley, Patahull, 24 gs.
Socrates.—Mr. Kinghorn, Thorpe, Tamworth, 43 gs.
Excelsior.—Mr. Thornton, Strassham, 29 gs.
Julius.—Mr. Loxley, Stoulton, Worcester, 32 gs.
Lord Hawkeaworth.—Mr. Bickford, Oxley, Staffs., 29 gs.
Towcester.—Mr. Tins, Atherstone, 38 gs.
Blucher.—Mr. Martin, Madeley, 21 gs.

COWS AND HEIFERS.

Crocus.—Mr. F. Lythall, Banbury, 25 gs.
Iris 2nd.—Mr. Tunncliffe, Ecclehall, 23 gs.
Commemoration 3rd.—Mr. Harding, Gillingham, 32 gs.
Emblem.—Mr. P. Crispin, Barnstaple, 43 gs.
Coronet.—Mr. Catchpole, Ipswich, 47 gs.
Queen of the Ocean.—Mr. P. Crispin, Barnstaple, 38 gs.
Factory Girl.—Mr. Robins, Stoneleigh, 32 gs.
Lady Geneva.—Mr. J. Beale, Brockhurst, 46 gs.
Miss Oxford.—Mr. H. Burt, Grantham, 21 gs.
Wild Flower.—Mr. Robins, Stoneleigh, 29 gs.
Nightingale.—Mr. Martin, Madeley, 37 gs.
Milkmaid.—Mr. J. Beale, Brockhurst, 24 gs.
British Queen.—Mr. Martin, Madeley, 31 gs.
Moss Rose.—Mr. Bradburne, Wedgefield, 21 gs.

BULLS exceeding 20 months old.

Monk.—Mr. Upton, Rivenhall, Essex, 45 gs.
Knight of Wetherby.—Mr. Davenport, Ashby-de-la-Zouch, 43 gs.
Duke of Jamaica.—Mr. Davenport, Ashby-de-la-Zouch, 37 gs.
Fashion.—Mr. F. Lythall, Banbury, 31 gs.
Twelfth Baron Wetherby.—Mr. J. Foster, Coventry, 26 gs.
Governor Eyre.—Mr. Simon, Fernhill, Market Drayton, 32 gs.
Prince Pearl.—Mr. Morey, Market Drayton, 34 gs.
Oliver.—Mr. Chamberlain, Sharesill, 28 gs.

EXTRA STOCK—BULLS.

President Lincoln.—Mr. Arthur, Birmingham, 21 gs.
Sir Thomas Bates.—Mr. Upton, Rivenhall, 21 gs.
Saccharometer.—Mr. Davenport, Ashby-de-la-Zouch, 24 gs.
Duke of Darlington.—Mr. Morris, Kempsey, Worcester, 31 gs.
Rocket.—Mr. Beale, Brockhurst, 37 gs.
Tribune.—Mr. Davies, Minshull, Cheshire, 26 gs.
Boreas.—Mr. Welch, Evercreech, Bath, 25 gs.
Buoyant.—Mr. Brown, Wigginton, Tamworth, 21 gs.
Duke of Catton.—Mr. Geary, Daddington, 38 gs.
Emperor.—Mr. Watson, Sowe, Coventry, 33 gs.
Royal Towneley.—Mr. Horley, The Fosse, Leamington, 23 gs.
Pontiff.—Mr. Wilkinson, Madeley, 28 gs.

SALE OF THE LATE MR. MANN'S SHORTHORNS.

At the ASFS, Warwick, on March 1, by Mr. JOHN THORNTON.

The stock was brought out in very low condition, which had a great effect in reducing the prices. A large company assembled, and the animals were most extensively dispersed. Mr. Dalzell and Mr. Haslam took several lots into Cumberland and Lancashire, Mr. White and Mr. Cross bought some to go into Kent and Sussex, whilst others went into Gloucester, Northampton, Derby, Nottingham, Middlesex, and Buckinghamshire. The county people, although not keen bidders, kept many of the lots, Lord Leigh, Lord Willoughby de Broke, Sir G. B. Phillips, Mr. J. C. Adkins, Mr. J. Lane, Mr. W. Canning, and Mr. F. Cobb being the principal buyers. Some of the Didos made 40 gs. and upwards, the calves and yearlings selling well, but the great number of bulls and calves pulled down the prices, and on the whole, although a dull, it was considered a good sale for the animals in the condition in which they were offered. The 59 cows and heifers averaged nearly £25 each.

Lady Fairbairn, calved Feb. 20, 1858, by Fifth Duke of Oxford (12762), out of Fanchette by Plausible (11908).—Mr. Biggs, 19 gs.
Sylphide, calved May 8, 1858, by Sarawak (15238), out of Pintail by Janizary (8175).—Mr. J. K. Fowler, 42 gs.
Dahlia, calved April 20, 1859, by Londonderry (13169), out of Darling by Meteor (10526).—Mr. J. C. Hutton, 36 gs.
Amy, calved June, 1859, by Amiens (14095), out of Delight by Rubens (15209).—Mr. Bolton, 19 gs.
Oxford Lassie, calved July 18, 1859, by Fourth Duke of Oxford (11387), out of Elsie by Economist (11425).—Mr. Biggs, Cubbington, Buckinghamshire, 18 gs.
Daffodil, calved April, 1860, by Londonderry (13169), out of Darling by Meteor (10520).—Sir George Phillips, 34 guineas.
Crocus, calved 1861, by Amiens (14095), out of Cherry Blossom by Rebec (16132).—Mr. Biggs, 18 gs.

- Ada, calved June 9, 1861, by Earl of Derby (21637), out of Accident by Amiens (14095).—Lord Leigh, 19 gs.
- Cocoa, calved 1862, by Earl of Derby (21637), out of Cherry by Amiens (14095).—Mr. Meekin, 18 gs.
- Dorothy, calved April 11, 1862, by Oberon (15016), out of Darling by Meteor (10526).—Lord Leigh, 38 gs.
- Duenna, calved June 6, 1862, by Earl of Derby (21637), out of Dairymaid by Rubens (15209).—Mr. Haslem, 31 gs.
- Doubtful, calved July, 1862, by Earl of Derby (21637), out of Titmouse by Craven (14350).—Mr. Cobb, 37 gs.
- Alice, calved 1864, by Greville (19907), out of Ada by Earl of Derby (21637).—Mr. Bolton, 20 gs.
- Dulcimer, calved 1864, by Greville (19907), out of Duenna by Earl of Derby (21637).—Mr. Dalzell, Cumberland, 21 gs.
- Duchess, calved Aug. 9, 1864, by Oberon (15016), out of Dairymaid by Rubens (15209).—Mr. Hodges, 31 gs.
- Pearl, calved Aug. 17, 1864, by Royal Prince (20743), out of Prim by Fitz-Clarence (14552).—Mr. Arkell, 40 gs.
- Celia, calved 1865, by Baron Fleda (21221), out of Clopton by Mameluke (13289).—Mr. Wynn, 23 gs.
- Dinorah, calved 1865, by Baron Fleda (21221), out of Dew drop by Earl of Derby (21637).—Mr. Webster, 24 gs.
- Dorcas, calved June, 1865, by Falstaff, out of Damsel by Oberon (15016).—Mr. Cross, Sussex, 17 gs.
- Dowager, calved Aug. 21, 1865, by Oberon (15016), out of Dairymaid by Rubens (15209).—Mr. Brown, Clifton, Northamptonshire.
- Andalusian, calved April 9, 1866, by Baron Fleda (21221), out of Amy by Amiens (14095).—Mr. Webster, 22 gs.
- Attraction, calved April 10, 1866, by Baron Fleda (21221), out of Ada by Earl of Derby (21637).—Mr. Baker White, 19½ gs.
- Diamede, calved April 14, 1866, by Baron Fleda (21221), out of Dolby by Killie Crankie (18129).—Mr. Lane, 43 gs.
- Dairymple, calved April 22, 1866, by Baron Fleda (21221), out of Doubtful by Earl of Derby (21637).—Mr. Biggs, 23 gs.
- Deadmona, calved June 22, 1866, by Touchstone (20986), out of Dulcimer by Greville (19907).—Mr. Webster, 21 gs.
- Abbess, calved April 1, 1867, by Touchstone (20986), out of Ada by Earl of Derby (21637).—Mr. Wynn, 21 gs.
- Diadem, calved April 13, 1867, by Touchstone (20986), out of Dewdrop by Earl of Derby (21637).—Mr. Dunn, 26 gs.
- Custard, calved May 23, 1867, by Bull's Bay (23490), out of Cocoa by Earl of Derby (21637).—Mr. W. Canning, 28 gs.
- Delight, calved July 22, 1867, by Bull's Bay (23490), out of Duenna by Earl of Derby (21637).—Mr. Haslam, 29 gs.
- Kitty Clyde, calved Aug. 3, 1867, by Bull's Bay (23490), out of Celia by Baron Fleda (21221).—Mr. W. Canning, 24 gs.
- Dapple, calved Feb. 8, 1868, by Bibury Buttery (25631), out of Dorcas by Falstaff. —Mr. Harris, 23 gs.
- Constance, calved Feb. 15, 1868, by Bull's Bay (23490), out of Killie Crankie (18129).—Mr. Ratcliffe, 20 gs.
- Cornelian, calved Feb. 28, 1868, by Bull's Bay (23490), out of Crocus by Amiens (14095).—Mr. Ratcliffe, 27 gs.
- Audrey, calved March 19, 1868, by Bull's Bay (23490), out of Amy by Amiens (14095).—Mr. Robbins, Stoneleigh, 20 gs.
- MacKenzie 6th, calved April 12, 1868, by Bull's Bay (23490), out of MacKenzie 4th by Amiens (14095).—Mr. Lane, 16 gs.
- Duplicity, calved May 8, 1868, by Bull's Bay (23490), out of Deceitful by Killie Crankie (18129).—Mr. Cooke, 21 gs.
- Deodora, calved June 22, 1868, by Bull's Bay (23490), out of Dinorah by Baron Fleda (21221).—Mr. Thompson, 22 gs.
- Allegre, calved June 28, 1868, by Bull's Bay (23490), out of Andalusian by Baron Fleda (21221).—Mr. Lane, 20 gs.
- Ariel, calved July 2, 1868, by Bull's Bay (23490), out of Alice by Greville (19907).—Mr. Ratcliffe, 21 gs.
- Chloe, calved July 12, 1868, by Bull's Bay (23490), out of Celia by Baron Fleda (21221).—Mr. Robbins, Stoneleigh, 16 gs.
- Diana, calved July 20, 1868, by Bull's Bay (23490), out of Deadmona by Touchstone (20986).—Mr. Dalzell, 23 gs.
- Atlanta, calved Sept. 6, 1868, by Bull's Bay (23490), out of Attraction by Baron Fleda (21221).—Mr. Lane, 21 gs.
- Dimple, calved Dec. 20, 1868, by Bull's Bay (23490), out of Dorcas by Falstaff. —Mr. Oldham, 15 gs.
- Dandelion, calved Jan. 10, 1869, by Bull's Bay (23490), out of Dewdrop by Earl of Derby (21637).—Mr. Dalzell, Cumberland, 22 gs.
- Drama, calved Jan. 18, 1869, by Bull's Bay (23490), out of Diamede by Baron Fleda (21221).—Mr. Lane, 20 gs.
- Cora, calved Feb. 1, 1869, by Bull's Bay (23490), out of Crocus by Amiens (14097).—Mr. Bourne, Wiltshire, 18 gs.
- Dimity, calved Feb. 25, 1869, by Bull's Bay (23490), out of Doubtful by Earl of Derby (21637).—Mr. Hawkes, 23 gs.
- Dulce, calved March 1, 1869, by Bull's Bay (23490), out of Dulcimer by Greville (19907).—Mr. Hudson, Pershire, 20 gs.
- Annie 3rd, calved March 18, 1869, by Bull's Bay (23490), out of Annie 2nd by Nottingham (15014).—Mr. W. H. Browne, 12½ gs.
- Dabious, calved April 5, 1869, by Bull's Bay (23490), out of Deceitful by Killie Crankie (18129).—Mr. Hawkes, 19 gs.
- Damsel, calved June 16, 1869, by Bibury Buttery (25631), out of Dorothy by Oberon (15016).—Mr. Hudson, 22 gs.
- Adamanta, calved Oct. 10, 1869, by Bull's Bay (23490), out of Andalusian by Baron Fleda (21221).—Mr. Hatton, 13 gs.
- Sabrina, calved Oct. 12, 1869, by Bull's Bay (23490), out of Sylphide by Sarawak (15938).—Mr. J. King Fowler, Buckinghamshire, 56 gs.
- Achievement, calved Oct. 11, 1869, by Bull's Bay (23490), out of Attraction by Baron Fleda (21221).—Mr. Robbins, 15 gs.
- Lady Feversham, calved Oct. 15, 1869, by Bull's Bay (23490), out of Lady Fairbairn by the 5th Duke of Oxford (12762).—Mr. Thompson, 18 gs.
- Daphne, calved Nov. 12, 1869, by Bull's Bay (23490), out of Dorcas by Falstaff. —Mr. Brown, 10 gs.
- Drusilla, calved Nov. 14, 1869, by Bull's Bay (23490), out of Dinorah by Baron Fleda (21221).—Mr. B. White, 13½ gs.
- Columbine, calved Dec. 24, 1869, by Bull's Bay (23490), out of Crocus by Amiens (14095).—Mr. Brown, 14 gs.

THE SALE OF SHORTHORNS at Oldwhat, New Deer, the property of Mr. Chalmers. There was a large attendance of farmers and others, and the sale was very successful. The following are the lots sold, with their buyers and prices:—

BULLS.—Duke of Kent, calved June 3, 1866; Mr. Ironside, 32 gs. Jock o' Drumblair, calved March 8, 1868; Mr. Chalmers, 20 gs. White Duke, calved May 15, 1868; Mr. Hay, 30 gs. Neptune, calved October 11, 1868; Mr. Milne, 16 gs. Gladiator, calved October 29, 1868; Mr. Hamilton, 25 gs. Squire of Cobham, calved November 19, 1868; Mr. Davidson, 19 gs. Columbus, calved February 16, 1869; Mr. Taylor, 18 gs. Nobility, calved March 7, 1869; Mr. Williamson, 31. Free-Trade, calved March 8, 1869; Mr. Murray, 31 gs. Amaranthus, calved March 8, 1869; Mr. Chesor, 27 gs. Baron Bunsen, calved March 16, 1869; Mr. Black, 20 gs. Scarlet Lustre, calved March 26, 1869; Mr. Langster, 21 gs. Scarlet Jacket, calved March 28, 1869; Mr. Beattie, 14 gs. Beau Ideal, calved April 6, 1869; Mr. Leslie, 20 gs. Bounce, calved April 8, 1869; Mr. Morrison, 22 gs. Viceroy, calved April 7, 1869; Mr. Forgie, 17 gs. Floral Scarlet, calved April 20, 1869; Mr. Anderson, 16 gs. Scarlet Nasturtium, calved July 6, 1869; Mr. Watson, 16 gs. Gentleman, calved July 17, 1869; Mr. Minto, 17 gs.

COWS IN CALF.—Flora, calved in March, 1860, Mr. Taylor, 23 gs.; Peer o' Day, calved in February, 1862, Mr. Robb, 26 gs.; Utopia, calved May 25, 1862, Mr. Milne, 25 gs.; Miss Butterfly 3rd, calved March 29, 1863, Mr. Watson, 23 gs.; Brenda, calved in March, 1864, Mr. Murdoch, 25 gs.; Roan Laurel, calved April 27, 1864, Mr. Marr, 27 gs.; Rosanna 2nd, calved April 9, 1865, Mr. Watson, 36 gs.; Lady Exmouth, calved March 22, 1866, Mr. Milne, 24 gs.; Verjuice, calved March 31, 1866, Mr. Ingram, 23 gs.

HEIFERS IN CALF.—Gentle Emma, calved March 5, 1867, Mr. Gordon, 36 gs.; Grace Darling, calved April 24, 1867, Mr. Robertson, 27 gs.; Laureate, calved May 22, 1867, Mr. Ironside, 27 gs.; Rarity, calved June 4, 1867, Mr. Duthie, 30 gs.; Lady Cobham, calved June 9, 1867, Mr. Gibbon, 26 gs.; Alix, calved in January, 1868, Mr. Robertson, 25 gs.; Miss Cobham, calved January 29, 1868, Mr. Stewart, 27 gs.; Verbena, calved April 11, 1868, Mr. Stewart, 20 gs.

LADY THORNDALE BATES 2ND.—Lord Dunmore, not Mr. Dunmore, was the purchaser of this cow, for 300 gs., at Mr. Slye's sale; and his lordship has just purchased of the Duke of Devonshire a bull calf, out of Lady Oxford 5th, for 500 gs. at a day old!

AUSTRALIAN VIEW OF THE ENGLISH WHEAT MARKET.

The probability that the markets of the neighbouring colonies will be virtually closed to our breadstuffs during the coming year renders the prospects of the home trade unusually interesting. It is quite clear that if we have even a moderate harvest we must find an outlet for our surplus elsewhere than in Australia, and the place to which we now naturally turn in

our perplexity is Great Britain. It has been demonstrated that with wheat at a certain figure exportation to the mother-country cannot be carried on without loss. Two or three years ago the discovery of this fact proved a substantial consolation to dealers and producers; and it is not at all unlikely that we shall have to take advantage of it once more during the twelvemonth before us, should it offer us the least encouragement. Prices have gradually receded to within a trifle of the amount represented as the minimum below which they need not fall, and there is no immediate ground for expecting a rise. The nominal condition of the English market at the present time is certainly not very encouraging to speculators. Rates have fallen lower and lower for weeks past, until our late telegram, bringing news to about the middle of November, quotes foreign samples at 47s. a quarter. This points to a fall in a little more than a month of close upon 10s. In the beginning of October, Dantzic, the head-quarters of the fine wheat supply, refused to abate anything of 58s. or 59s. a quarter, whilst the Continental markets generally exhibited a firmness which, though not reflected very strongly at Mark-lane, had a sustaining tendency upon prices there. By October 11 the continuous depression in trade had forced down quotations to the extent of 1s. or 2s. a quarter, although then best Dantzic found sale in London at 51s. to 53s., Australian being reported 2s. lower. Next week holders had to submit to a further reduction of from 1s. to 2s., owing to the overwhelming quantity of foreign grain under offer. A general impression, however, prevailed that wheat had reached its lowest point, and little anxiety to deal was manifested by sellers. On October 25 the published accounts show that a better feeling had prevailed, and that rates had been restored to the level of the previous fortnight's transactions. Unfortunately this reaction was but of short duration, for before the close of the month dulness had resumed its influence, and business could not be done except at a decline. The confidence of holders was not greatly shaken, and, whilst Australian was *pro forma* set down at 51s. to 52s., Dantzic best took rank at 52s. to 54s. Later accounts show that these prices could not be upheld. It is an ominous fact that the depression in prices realized for wheat in London during the month of October, 1869, find no parallel without a reference back to 1865. In 1867 they amounted to close upon 70s. a quarter, in 1868 to 53s., whilst for the present year they stand at a little over 46s. The reason for these very broad discrepancies has occupied the attention of statisticians and agricultural writers, and they are unable to reconcile them with the facts of the case. The harvest this year throughout England has yielded less than was expected, and less even than the average. The imports have been very large, but advices do not justify the belief that they will be maintained at the rates peculiar to the few weeks preceding the departure of last mail. But for the large quantities brought in from foreign markets during that time, the stocks of foreign grain in hand cannot be excessive. The Board of Trade returns show that the importation up till September 18 of 1868 totalled 6,210,410 quarters against 6,142,588 quarters in 1869. The monthly average, according to that return, would be 682,000 quarters a month, or less than 8,200,000 quarters for the year, an aggregate that falls below the mean of the last seven years. The question becomes a serious one whether the supply from the countries in closer connection with Great Britain than Australia is will shut out our producer from a chance of competing profitably in the London market. To a great extent the reply to this depends upon the exportable surplus of the United States, which this year appears unusually large. During the eight months ending with August, 1868, America contributed to English stocks 1,197,681 quarters; whilst for the same period of the present year she has furnished 1,755,142 quarters. This is a very tangible increase, materially affecting the prospects of other producers to meet with a cheering reception at Mark Lane. As things now stand, shippers will probably deem it unsafe to send cereals to the old country, but there is reason to believe that the present state of affairs is abnormal. The spirit of speculation, so rudely checked by the disasters of 1867, has not resumed its wonted vigour, and the quiet demand for immediate consumption cannot make any great impression upon prices. We must wait for another mail with more cheering news of the home market before we can put much reliance upon that market as a stand-by when other customers fail us.—*Adelaide Observer*, Dec. 26, 1869.

THE STOCKELD PARK SHORTHORN SALE.

BY MESSRS. WAITE AND CROUCH, ON FRIDAY, FEBRUARY 25TH.

There was a large gathering of agriculturists from the immediate neighbourhood, and of Shorthorn men from all parts of England. The first lot was Shuttlecock, a three years old bull by Mr. Fawkes' Lord Cobham (20164), d. Blue Bell by Reformer (18687), tracing back through Bridegroom and The Stuart to Norfolk, Ambo, Memnon, Pilot, and Agamemnon. This plan of commencing the sales with the bulls, contrary to the usual polite practice of giving precedence to the ladies, was a bold innovation. Nevertheless it was successful, making another illustration of the truism that there is no rule without an exception. The reason assigned for this was that by so doing the public would have an opportunity of seeing the value of the sire of all the young stock (with the exception of one young bull, Lord Cobham the 2nd, by Mr. Fawkes' Lord Cobham) tested by public auction before they competed for the progeny in the same ring. Had Shuttlecock been anything but a first-class animal, the policy adopted would have been more than doubtful, and would have depreciated the selling prices of the young animals to a serious extent; but it was otherwise. He stepped into the ring a noble animal—grand in his shape, rich in colour, of great frame, filled up in every point, yet full of style and gaiety, and looked every inch what one of the highest authorities of the day called him—"One of the very best, if not the best, of the bulls now out." And thus, after a slight hesitation, before the first hundred was telegraphed, the bidding ran up quickly to 240 guineas, at which he was knocked down to take up his residence in Surrey, within sight of the great city, where we are happy to learn he arrived safe and sound.

The competition displayed for the bull, and the figure he reached explain the spirited bidding for nearly all the young animals, and the satisfactory prices which some of them made. Shuttlecock 3rd, a beautiful roan, under a year old, straight in his lines, and of capital quality, was a good purchase for the Marquis of Ailesbury, at 46 gs. He is out of Miss Fawkes by 22nd Duke of Oxford, and goes through Fair Maid of Wetherby, Fair Maid of Perth by Lord Marquis (10469), and Buchan Hero (3283), Sir Thomas Fairfax (5196) to Lawnsleeve (365); a mixture of "all the bloods," including the popular Gunter. Shuttlecock 4th, a red roan, under a year old, is another gem worth "setting" in any casket of good-bred animals. He is full of substance, long, low, and level, out of Maid of the Glen by Harry of the Wynd, and is of the favourite Favourite (252) strain, through Punch (531) to Hubback (319). He goes to the classic region of Yorkshire Shorthorns, where the Studley White Bull in early days held sway, and is a good purchase for the Earl de Grey and Ripon, at 44 gs. Another yearling, Lord Cobham 2nd, white, by Mr. Fawkes' Lord Cobham, d. Miss Pyrgo by Clement Cleveland, who goes back through Fair Maid of Wetherby to Lawnsleeves, in the same line as the Marquis of Ailesbury's purchase, was knocked down at the very moderate figure of 30 gs. to Mr. Keyworth. How this should be no one could tell; yet everyone saw that it was a great bargain! Hair, frame, quality, and breeding are in this animal combined; and he will fetch three figures the next time he changes hands, should his purchaser be willing to leave hold of him. Lord Willoughby de Broke took away some capital young animals. The calf Battledore, roan, five months old, d. Miss Pyrgo 3rd by 23rd Duke of Oxford by Shuttlecock, of the same family as the Marquis's Shuttlecock 3rd, and the Lord Cobham 2nd, mentioned above, was worthy of the merry competition he excited. His price, 45 gs., does not make him a dear one to his lordship; for as a calf, he is as full of promise as he possibly can be, and if ancestry and beauty can make an aristocratic Shorthorn he will grow into one. We must certainly congratulate his lordship on the whole team which his commissioner drove away at the close of the sale. The Stockeld cows were a creditable lot, only in store condition, but in full profit. Of course many of them were well up in years. The prices fetched were nothing particular. Lord de Broke got a good cow, 7 years old, in Haxby's Last by 7th Duke of Oxford, at 40 gs.; Mr. Botterill secured a beauty in Miss Pyrgo, 10 years old, dam of Lord Cobham 2nd, at 40 gs.; and Earl de Grey got a cheap animal

of the fashionable lineage in Archduchess 3rd by 20th Duke of Oxford, dam Archduchess by Archduke (14099), at 35 guineas. He was also a lucky buyer in securing Archduchess 4th, a roan heifer, 1 year 11 months, by Shuttlecock, dam Archduchess 2nd, for 32 guineas. Archduchess 5th, by Shuttlecock, dam Archduchess 3rd, a roan calf, 11 months old, went to Mr. Baker, Gamston, Retford, at a nominal figure according to her merits, viz., 21 guineas; while Mr. Tomlinson, Cowthorpe, Wetherby, bought a sweet heifer "very cheap", at 28 guineas, in Nicolina 2nd, a roan heifer calf, 10 months old, dam Nicolina by 7th Duke of Oxford, grandam Lady of Avenal by Harry of the Wynd (12992). Nedora, a two-year-old roan heifer, by 26th Duke of Oxford, dam Lady of Avenal, bought by Mr. Mellor, at 38 guineas, will also make a fine cow. Several other of the young heifers and calves will be found after many days, now that they are dispersed, holding high and honourable position in the scale of Shorthorn society. On the whole, whatever may be thought of the prices, there can only be one opinion entertained by the breeders present, that it was impossible to imagine a whole tribe of young animals in which the characteristic merits of the sire were more clearly developed, for the young stock by Shuttlecock one and all father themselves.

BULLS.

Shuttlecock—Mr. Crosse, Blackwell, Surrey	240
Shuttlecock 2nd—Mr. Tinker, Thirsk	14
Lord Cobham 2nd—Mr. Keyworth, Wellingley, Doncaster	30
Shuttlecock 3rd—Marquis of Ailesbury, Marlborough, Wiltshire	46
Shuttlecock 4th—Earl de Grey, Ripon	44
Frank—Mr. J. Hepworth, Rogerthorpe Hall, Pontefract	25
Red Deer—Lord Willoughby de Broke, Compton, Verney, Warwick	16
Battledore—Lord Willoughby de Broke	45
Shuttlecock 5th—Mr. Knowles, Wetherby	30
Shuttlecock 6th—Lord Willoughby de Broke	33
Shuttlecock 7th—Mr. Dickenson, Partridge Hill	24
Bull calf—Mr. Sharpley, Melstrop, Louth	8

COWS AND HEIFERS.

Haxby's Last—Lord Willoughby de Broke	40
Maid of the Glen—Mr. Cook, Thixendale	35
White Hind—Mr. Loy, Aislaby, Pickering	27
Miss Pyrgo—Mr. Botterill, Driffield	40
Last Fawkes—Mr. H. Crossley, Halifax	31

Tilla 2nd—Mr. Tennant, Selby	9
Miss Pyrgo 5th—Mr. Botterill, Driffield	9
Heifer calf, by Shuttlecock, 3 days old—Mr. Tennant, Selby	5

The total amount realised was £1,331 8s. on 41 animals; showing an average of £32 8s. 9d. per head, including young calves. Taking the animals above six months old, the bulls average £69 13s. 4d. each, and the cows £29 8s. each. The young bull-calves between two and four months old averaged £26 17s. each.

THE BERKELEY CASTLE SALE OF SHORTHORNS.

On Friday, March 11th, by Mr. JOHN THORNTON.

This was inaugurated by Mr. Thornton as the first of a series of periodical sales. Many of the young bulls were the produce of cows from the herds of Messrs. Bowly, Rich, and Holland, their sires being of the Bates' blood. The cows and heifers were principally bred from Yorkshire dairy cows, purchased some years ago in Darlington, and since crossed with pure-bred bulls. Some few of the lots were the property of Lord Ducie and Sir John Rolt. The prices were altogether better than had been expected.

BULLS.

Artern (25531), white, calved May 10, 1867, by Lord Jersey (20185), out of Rose of Dumbleton by Duke of Cleveland (15924).—Mr. Cooke, 36 gs.

THE GAME LAWS.

A meeting as called by Mr. McGeachy, was held in Birmingham, at which Mr. T. Prime, the mayor, presided. Amongst those present were many tenant farmers.

Mr. McGEACHY, in an able address, put the following resolutions:

1. "That the existing Game Laws are detrimental to the community at large, and in a high degree injurious to the social and moral well-being of the nation."

2. "That they greatly lessen the productions of the land, and are at present the greatest existing obstacle to the development of agriculture."

3. "That, as the grievance is a national one, it is the duty of the nation, through its representatives in Parliament, to devise, in their wisdom, a sufficient and lasting remedy."

Mr. JAMES BALDWIN seconded the motion, which was carried with only one dissentient.

A committee was appointed to carry out the views of the meeting.

THE RABBIT PLAGUE.—It would be superfluous to dilate on the nuisance which rabbits must needs be to the tenant-farmer, eating up his young blades of grass, and his corn as it appears above the surface. If he be a hop-grower, he is doomed to feel their devastating influence in his hop-yard, or hop-garden also; and, in short, the tenant who could look calmly and complacently, we do not say upon a rabbit-warren in his immediate neighbourhood, but upon the toleration and keeping up of rabbits in his hedge-rows and the adjoining coverts, might be safely set down as a thriftless and insensate dullard. There is every excuse, therefore, for the almost unanimous clamour which the tenant-farmers are raising—not a whit too soon—against this fertile source of loss and disappointment. In whatever light a landlord may regard them, in the tenant's eye rabbits are and must be vermin. And the speedy recognition by landlords of the tenant's view upon this matter might not improbably avail to stay or stave off, indefinitely, a further agitation about the Game-laws.—*The Saturday Review.*

MESSRS HOWARD'S WORKS AT BEDFORD.—Some time since Messrs. Howard determined to devote the present large foundry to the fitting and wrought-iron department, and to erect a new foundry on a much larger scale by the side of the old one. Some competent judges have pronounced this to be the most complete, the best planned, if not the largest foundry in the United Kingdom. There are no less than 35,000 square feet on the ground floor. There are four huge cupolas or furnaces capable of melting 300 tons per week, which are expected to be very shortly in full work. The arrangements were planned by Mr. James Howard, M.P., the erection being under the direction of Mr. Usher, architect, of Bedford.

THE CENTRAL CHAMBER OF AGRICULTURE.

A meeting of the Council of the Chamber of Agriculture was held on Tuesday, March 8, at the Salisbury Hotel, Colonel TOMLINE, M.P., in the chair.

Sir MASSEY LOPES, M.P., as Chairman of the Local Taxation Committee, presented the following Report, which was adopted:—

"The Local Taxation Committee, in presenting their report, have much pleasure in stating that the prize essay has now been published and is in circulation. More than 5,800 copies have been disposed of, of which number 2,000 copies have been sent gratuitously to the members of both Houses of the Legislature, to the editors of the principal London and Provincial journals, to the Chairman and secretaries of every Chamber of Agriculture in the country, to every member of the Local Taxation Committee, and to every gentleman attending this day the Council of the Central Chamber of Agriculture. The committee venture to express a hope that the essay may be attentively read, as they feel assured that much useful information may be gained from it upon a subject which is at present attracting very great interest and attention. It should be clearly understood that the great object of the Committee is to obtain a reform in the present system of levying local taxation exclusively upon income derived from real property, whilst that derived from personal property entirely escapes. It is erroneously asserted that this exemption is balanced by charges on personal property for imperial objects. Mr. Gladstone has adopted this line of argument in the debate of the 21st February on Mr. Goschen's motion for a select committee to inquire into the subject of rating. He is reported to have said, "Real property enjoys exemption which it would not be possible to maintain for a single moment after you removed the exemption of personal property from local taxation. And again, 'Real property in various forms has borne the main part of local taxation, and personality the main part of Imperial taxation.' The accuracy of these statements the committee deny, and they challenge the fullest and most impartial investigation into the real facts of the case. The committee would particularly direct attention to Chapter III. of the Prize Essay, in which this fallacy is fully treated. It appears from Mr. Goschen's speech that the Government have no intention to remove this injustice. All that it is proposed to do is to rate some real property now exempt, such as Government property, metallic mines and woods, and to divide the payment of the rates between owners and occupiers. This will give little or no satisfaction to the large class of freeholders who occupy their own property, more especially those residing in towns. The committee cannot accept these proposals as an equitable and permanent settlement of the question; for the real question at issue is not touched. Some of the Government proposals tend in the right direction, but no prospect is held out of a removal of the great grievance that income derived from personal property should be exempt from local taxation, and this is the question which the Committee consider to be of first and paramount importance. The petition adopted by the Council of the Central Chamber of Agriculture at their last meeting has been printed and circulated, and it is hoped that members of the Council will use their utmost exertions to get it numerously signed in their respective districts. The Local Taxation Committee herewith present their finance account up to the present date, which shows that the funds placed at their disposal are quite exhausted, and that if their operations are to be continued, it is absolutely necessary that they should receive further assistance from the provincial Chambers, as well as from landholders and householders, who are more particularly interested in the object they have in view. The amount that the Council of the Central Chamber at their last meeting resolved to start the subscription list with for the new year, was £50, while two gentlemen (Colonel Tomline, the chairman of the Central Chamber, and the chairman of the Local Taxation Committee) have each offered similar amounts, trusting to be met in like manner by other landowners. The committee have much pleasure in making this announcement,

and take this opportunity to offer their thanks. A financial statement of the expenditure of some £200 was given here.

"The proposal of the Government to add to the already-increasing burden of local taxation by a new rate for national education is one to which the committee would specially direct the attention of the Council. Should this scheme be adopted, it would impose a novel and very serious addition to the grievances which at present exist. The committee consider themselves fortunate in being able to announce that they have secured the services of Mr. Gardner, the writer of the prize essay, as secretary."

A long and desultory discussion ensued with regard to the points to be submitted by the malt-tax deputation to the Chancellor of the Exchequer, the result being the adoption of a memorial, as prepared by the Business Committee, that will be found in another column. It was also resolved that the following should address the Chancellor—an arrangement, however, that was not adhered to: Mr. James Hudson, Mr. Jasper More, Mr. John Helmaley, Mr. May, Mr. H. Biddell, Mr. Isaac Seaman, Mr. J. Whitley, and Mr. Rowley.

Professor LEONE LEVI then proceeded, at the request of the Chairman, to make a communication from the International Decimal Association on the question of weights and measures. The Association had laboured for many years for the purpose of securing if possible an assimilation of the weights and measures of different countries, including those used throughout this kingdom. In 1863 a Committee of the House of Commons resolved unanimously that the best mode of attaining that object was the introduction of what was called the metric system, which obtained to a very large extent on the continent of Europe, and had been recently adopted in India. The Act of 1864 made the adoption of that system in this country permissive, and not compulsory; but very recently the Standard Commissioners had made a Report in which they recommended the further legislation of the system, and there now seemed a fair prospect that sooner or later it would be established in this country. The sale of corn in England, Scotland, and Ireland varied very considerably in different markets and places; and only the other day a return was obtained by Mr. Sheridan of the reports of the inspectors of corn in various markets, and from which it appeared that a large number of different weights and measures are still in existence. The Decimal Association had received from farmers' clubs and local chambers of agriculture communications which showed that they have had this question under their consideration, and those bodies had asked them for, and had received, information with regard to the metric system, which in their opinion was the best system that could be established in lieu of the present variations. At present there were great and most inconvenient differences in weights and measures, not merely between different counties, but even between different parts of the same county; and the importance of the subject could no longer be disputed. His purpose in coming before the Council was to ask it to appoint a select committee to consider this question. The Association thought that the subject should be brought before Parliament as soon as was practicable. Sir Charles Adderley, Mr. J. B. Smith, and other members of the House of Commons would be very happy to introduce it, but it was considered far better that it should be brought forward by members who were connected with the Chamber of Agriculture, and who would therefore be able to express the feelings of the agricultural community in respect to any change. He trusted that the Council would concur in an appeal for the appointment of a Committee of the Lower House to inquire into the whole question, of course without binding itself to any specific course of subsequent action.

A vote of thanks was passed to the Association represented by Professor Leone Levi for the communication which he had made; and the matter was referred to the Business Committee.

The Rev. E. LACON WILLES, of the Leicestershire Chamber, moved the following resolutions: "That the Elementary Education Bill merits the support of this Council, inasmuch

as it aims to secure a sufficient amount of public school accommodation throughout the kingdom and to maintain a good standard of efficiency in schools; but this Council considers that adequate opportunities for instruction may be secured by regular attendance at school up to the age of ten years, supplemented by partial attendance after that age, and that compulsory attendance of children up to the age of twelve years would prove a great hardship to the labouring classes." The other day he performed a similar task in the Leicestershire Chamber, and the following resolution was adopted: "This meeting is of opinion that the Education Bill now before Parliament is a just and liberal measure, and that, subject to certain modifications which it is hoped will be introduced, it is likely to conduce to the best interests of education and the welfare of the country." That resolution exactly expressed the opinion which he held himself. It was perhaps unfortunate that the Business Committee entrusted that question to one who belonged to the somewhat-maligned body called parsons; but he must say, notwithstanding anything which might have been stated to the contrary, that the clergy, especially in the country districts, accepted with the greatest thankfulness the bill proposed by Mr. Forster. They considered it a just and liberal measure, and for this reason, that it had regard to the past. He did not know where the country would be now if the clergy had not put their shoulders to the wheel in reference to education. He felt great respect for the two associations which were agitating the country on that subject, and believed that they had done much good to the cause of education; but he could not help thinking that it would be rather hard if the labours of the last thirty years were cast aside. £14,000,000 had been spent on education during that period, almost in spite of the Government and the Legislature. Nothing could be more niggardly than the public grants made to schools; but, notwithstanding that, the clergy had, with the assistance of many of the laity, built up a great work, and it would have been a reckless waste of force to have destroyed that work, or to have alienated those who were engaged in it. A far larger proportion of the children of the country had been educated or were being educated in the schools to which he alluded than many persons seemed to suppose. Now, there were many things in the Bill which must come home to the minds of those whom he addressed. He would first allude to what he believed to be the objections to Mr. Forster's measure—objections which he thought should be strongly urged upon the Government at the present time. The chief point which concerned the agricultural interest was that by this Bill the Government were throwing upon the occupiers of land a prospective burden of no ordinary character. As he understood the matter, the bill provided that if at the end of this year schools should be found wanting in suitability for the object, or not sufficient to secure it, then, under certain restrictions, the burden of providing proper schools might be thrown upon the rateable property of the neighbourhood. Did they as occupiers of land consider it fair that those burdens which ought to fall in a large proportion upon the owners of land should in future be thrown upon occupiers? For his own part, he could not conceive what had induced so wise and just a man as Mr. Forster to propose such a thing as that, unless it were that this would be the last straw that would break the camel's back, and that such an arrangement must inevitably lead to a revision of the whole system of local burdens. Then, again, there was the question of compulsion. That was a point on which, no doubt, many persons present felt very strongly. There was one part of the bill, relating to that matter, which seemed to him utterly inexplicable; he meant that part of it which provided for what he might call an optional compulsion. Let him give a case by way of illustration. "A" was a country parish, which had been found on inspection to have sufficient school provision, and was therefore left alone; while "B" was a neighbouring parish where the provision had been pronounced inadequate, and where in consequence attendance at school was made compulsory up to 13 years of age. How would it be possible for the two systems to stand side by side? He asked them as practical men whether such a state of things could continue. He, for one, would rather see absolute compulsion put in force in every parish, than a half and half system which would produce heart-burnings through the length and breadth of the land. Of course any system of compulsion must tread, as it were, on many people's toes, and he confessed

he did not see how any great comprehensive measure was to be carried out without compulsion. It was not just to the hard-working labourer, who made sacrifices in order to send his children regularly to school, that his dissolute neighbour should be allowed to leave his children to grow up in the gutter. Parliament must interfere to remove a great moral pest, and he thought agriculturists would be ten times better off under absolute than under partial compulsion. He believed that a solution of this difficult question was to be found in the Report of the Commission on agricultural labour, which was issued last year, showing, as it did, how due provision for education might be combined with a proper regard for the earnings of children after a certain age—in other words, how children might be protected against the selfishness or cruelty of their parents. He thought there should be established in the country districts a kind of indirect compulsion in accordance with the resolution which he was proposing, that up to 10 years of age children should be prevented from being employed in agriculture, and that after that they should be compelled to receive a certain additional amount of schooling, unless a Government inspector had certified that that was unnecessary. If a child of 10 years of age came up to the fourth standard, there could not be much use in his continuing at school any longer, and he would then have got the means of improving himself; and after all, the proper object of education was not to educate the child completely, but to place in his power self-instruction in after-life. Three months' teaching in the slack time of the year, between the ages of 10 and 13, would in country districts prove in most cases very useful, and he should be very glad to see provisions made for that purpose. As to the great towns, there was no blinking the fact that there was nothing for it but absolute compulsion; but on the other hand, he did not see how any distinction could be made between town and country as regarded the means of supporting schools. As to the religious question, he thought the Government had dealt with it fairly and liberally. There seemed to him to have been just and liberal consideration for the case of those who differed from the Church of England. It was computed that 75 per cent. of the existing schools belonged to that church; and, if that were so, it was far from being a reproach to the Church, though it had been treated as one. These schools were already in existence, and it was but just to regard the past labours of those who started them. As regarded those who differed from the Church, it was surely sufficient to provide that no child should be called upon to learn any doctrine or dogma if the parent had expressed his objection in writing. It was well known that, practically, the religious question hardly ever raised any difficulty in the working of schools. He had held a living in a large parish where the non-conformists formed a majority, and he had also held one in a parish where the Church was predominant, and in neither case had the religious difficulty cropped up. People said that it must do so, but it did not, and he believed it would not do so in future. He did not mean to say that it was not possible for it to do so, for there were silly men among the clergy as well as among other classes of society; but, though he had sometimes heard of foolish clerical intolerance, yet he believed the great body of the clergy had treated and wished to treat their non-conformist brethren with the greatest liberality in regard to education. He was glad that the Government had held their own with respect to the non-establishment of free schools; for he firmly believed that to establish such schools throughout the length and breadth of the land would be one of the most unwise things that could be done. A free school was almost always a bad school. Moreover for the Government to establish such schools would be a great injury to the small industrious rate-payers, inasmuch as a heavy burden would be laid upon him for the schooling of children, while a labourer, who perhaps received a larger sum of money for his support, entirely escaped.

Mr. BUND (Worcestershire Chamber), in seconding the resolution, said that as regarded the question raised by Mr. Willes upon whom the rate should fall, the owner or the occupier, he doubted whether there should be any rate at all. As to the question of compulsion, they all knew that in many parts of the country the children of agricultural labourers were able at ten years of age to contribute a little towards the support of the family, and of course that source of help would be lost if all children were compelled to attend

school daily up to 12. He felt that it was absolutely necessary that some comprehensive education bill should be passed by the Legislature; and he therefore should deprecate a bill like that before Parliament being entirely rejected.

The CHAIRMAN here observed that as the resolution stood, it appeared rather inconsistent with one which was to follow. Mr. Neild suggested that that objection might be met by substituting "as far as" for "inasmuch" at the commencement, and with consent of the mover the resolution was altered accordingly.

Sir MASSEY LOPES, M.P., regretted that the introducer of the subject had referred to the religious difficulty. The Chamber had, in fact, nothing to do with that difficulty; the question before it being simply how education was to be secured, and whether attendance should be made compulsory or not. If they discussed the religious difficulty they were not very likely to agree. He felt strongly upon it himself, but would not enter into it then.

Mr. YOUNGMAN (Essex), did not think the religious question should be burked. Many persons in the agricultural districts were strongly opposed to denominational schools being supported out of rates. To his mind it seemed a terrible fact that many dissenting parents having sent their children to schools belonging to the Established Church, those children had been taught to say there that by baptism they were made members (Cries of order).

The CHAIRMAN observed that such remarks were not within the terms of the resolution.

Mr. RIDLEY, M.P. (Northumberland), said that the North of England Chamber which he represented on that occasion had passed a resolution expressing a general approval of the Government Bill. As to the religious difficulty it was not known in Northumberland. One good advantage, he thought, of the Bill was the elasticity of its provisions. In Northumberland they would protest most indignantly against being called upon to establish school boards in districts where they were not required; but that would not be the case under this Bill. In this district they courted investigation into the state of the schools, but they would strongly object to an establishment of the maintaining of a school board without proved necessity. The definition in the Bill of a parish as a place where a separate poor rate was levied would introduce great confusion in Northumberland. In many cases it might have the effect of making one man a school board in himself. In that county they also entirely objected to there being any restriction as regarded age; thinking that if a child had attained a certain standard of education he should not afterwards be obliged to attend school (Hear, hear).

The Rev. E. SMYTHIES said he could not join in the general chorus of praise with regard to Mr. Forster's Bill. He admitted that in many respects it was a good Bill, but there were serious defects. Existing schools which had deserved well of their country were to be left alone, and were to continue to be supported as to one-third by the children's pence, another third school grants, and the remaining third by voluntary subscriptions. But what was to be done in parishes where there were no voluntary subscriptions, or almost none? Supposing the total annual expense to be £200 and £300 to be supplied by the children's pence and £30 more by the Government, how was the difference to be made up? There were many parishes in that position in which the burden fell almost entirely on one individual, that individual being the clergyman. For many years he had had a school in his parish where there had been carried out from the first a most stringent conscience clause, and yet there has been scarcely any voluntary subscriptions. He could corroborate from observation what Mr. Willes said about the inferiority of free schools. He believed that, as a rule, the worst attended schools were those which were free. As to the religious difficulty, it was the greatest sham ever palmed off on the country.

Colonel BRISK, M.P., expressed his regret that any restriction had been put on the discussion of the education question. In his opinion, it was far better that gentlemen who differed should have an opportunity of expressing their differences.

The Rev. Mr. JACKSON (Wisebeach) agreed with previous speakers in expressing gratitude to the Government for their Bill. He would like to know, however, how a compulsory rate would bear on the poorer class of rate-payers. As the manager of a school, he found that it was materially supported by that class. Many of them paid not merely a penny or two-

pence, but fourpence or even sixpence a head, and if they were compelled to pay a 3d. rate in addition, for the benefit of others, there might be a difficulty in making the two ends meet. Were such men to be fleeced when they were doing so much for their children? Again, he objected to a 5s. fine being imposed on the labourer. If a fine was to be inflicted at all, yet it should be on the occupier who employed the labourer's child; but he doubted the policy of fining any one. He also objected to the giving tickets to the indigent poor. It would be impossible for a school manager to draw the line between those who were and those who were not indigent. There would no doubt be numerous applicants for free tickets, and he feared that what the labourer did not pay for he would not value. Another blot in the bill was that it did not try to stimulate education by rewards, being altogether penal. In the middle-class and public schools there were scholarships which opened a path to the University, and he wanted to see the labourer's children stimulated in a similar manner. He should be glad to see the bill passed if it was properly amended.

The resolution was then put, and carried unanimously.

Mr. ARTHUR STARTIN (Warwickshire Chamber) then moved the following: "That, giving school boards power to borrow money to be repaid out of local rates, and power to levy a rate of threepence in the pound, would be increasing an injustice already inflicted upon the owners and occupiers of rateable property; and this council considers that, as the education of the people is a national object, the whole of the public contribution should come out of the general taxation until there has been a complete revision of the present system of rating." He said, it being now universally admitted that education was a national benefit, it followed that the funds for promoting it should come from a fund to which all contributed. The amount charged to the poor-rate was only about one-sixth of the total income of the country; and could it be just to impose an additional burden on such a limited area? He thought the time had come when a strong resistance should be offered to these continual additions to local taxation under the head of poor-rate. Mr. Gladstone said that the rating system was so exceedingly convenient that it would be unwise to touch it; but that was done by these additions to it. He (Mr. Startin) would say, therefore, let them not be contented with scotching the snake, but let them kill it. It was no more the duty of a particular parish to provide a school out of rates than to provide a barracks or the defence of the country. Public duties of that kind should be performed by a Minister of the Crown responsible to Parliament.

Mr. GENCE ANDREWS, in seconding the resolution, said they had before them in that case not merely a charge for education, but the threatened introduction of the thin end of the wedge, which would be afterwards extended in other directions. He did not know exactly what 3d. in the pound would amount to, but he would put it down at £1,000,000, and that would be in addition to £12,000,000 already raised under the name of poor rate. Altogether, with the contemplated abolition of tolls the charges on the land would amount to about £17,000,000 upon an annual income of £100,000,000. This proposal to levy an education rate was directly in the teeth of resolutions of that Chamber, which had declared over and over again that it would oppose to the utmost any attempt to impose addition to the burdens under the head of poor-rate assessment. After all, primary education was only a means to an end. Efforts must afterwards be made to educate the boy until he became an adult; otherwise the labourers would be under the influence of the conductors of the cheap press, who taught that there was a necessary antagonism between capital and labour, between master and man (Cries of "Question").

Mr. T. ARKELL, of the Swindon Chamber, in supporting the resolution, read a resolution of his own chamber, to the effect that the Government Bill unduly interfered with the existing system, and that it would destroy voluntary school management.

The Rev. E. LACON WILLES said that, if the Chamber sanctioned that resolution, it would do what tended to shut up every voluntary school in the country; for the resolution declared that education should be supported entirely out of the "general taxation." Was the Council prepared to endorse the principle that they should forego all local effort and management, and have a central board directing the course of action throughout the length and breadth of the land?

Mr. HUSON (Worcestershire Chamber) supported the resolution. The real property of this country was already taxed to an abominable extent; and every Chamber of Agriculture ought to resist any attempt to increase its burdens until every kind of property bore its fair proportion.

Mr. MARTIN (Cambridgeshire Chamber) read a resolution of his Chamber in accordance with that before the meeting.

After some further discussion, in which Mr. Youngman, Sir George Jenkinson, M.P., and Major Paget, M.P., took part, the latter observing that he thought the objection raised against the bill was not directed against voluntary subscriptions, but against the levying of any additional rate until there has been

a complete revision of the present system of rating, the resolution was adopted.

On the motion of Capt. Cragie, seconded by Mr. C. Bramley (Lincolnshire), the further discussion of the subject was adjourned to the Council meeting on April 5; the mover having explained generally that the object of the adjournment was to watch the progress of the Bill and take steps accordingly, it was suggested that copies of the resolutions just passed should be forwarded to the Government, and this suggestion it was understood would be carried out.

A vote of thanks was given to the Chairman, and the meeting then separated.

IRRIGATION.

At a meeting of the Dorchester Farmer's Club, Mr. John Homer in the chair, Mr. RICHARD GENGE, the vice-chairman, read the following paper on Irrigation:

You are probably aware that a few months ago one of our county gentlemen notified to his tenants that he would offer prizes, to be competed for by watermen on his estates, to be awarded to the men (if I remember rightly) who had their weirs, hatches, mairs, drains, and meadows generally in the best condition. Whether any entries have been made for these prizes, I am not aware. Practically there may be some difficulty in making the competition fair to all, as some meadows may possess more natural advantages than others. But I think the offer on the part of the landlord showed that he was well aware of the great value of water meadows, and was anxious, as far as he was concerned, to encourage the greatest amount of skill and attention in their management. This gentleman's proposal gave me the idea that we may, perhaps, not unprofitably devote an evening to the subject of irrigation; and although it may be a dry one to those present who are not fortunate enough to possess water meadows, still even they may ask themselves the question whether they make the most of the fertilising properties of the water they happen to have at their command? Irrigation, derived from the Latin *irripo* (to water), has been aptly described as a method of probing or increasing fertility in soils by an artificial supply of water. It was probably first resorted to in countries where much of the land must have otherwise remained barren from drought, as in Egypt, where it was extensively practised 2,000 years before Christ, and where great systems of canals and artificial lakes were formed for the purpose. Extensive works, intended for the irrigation of large districts, existed ages ago in Mesopotamia, Persia, India, China, and some other parts of the East; and in such of those countries as have not entirely lost their ancient prosperity, such works still remain. In many parts of the world the necessity of irrigation is so strongly felt, at least at some seasons of the year, that the agriculture of even comparatively rude tribes depends on the facility with which it can be accomplished. Some plants also require a very abundant supply of water, and irrigation has become general where their cultivation prevails. This is particularly the case with rice, the principal grain of great part of Asia. Irrigation is supposed to have been introduced into Britain by the Romans. In Europe it prevails chiefly in the south, and is most extensively practised in Lombardy, in some parts of Spain, and of the south of France. The extent of irrigated land in the valley of the Po is estimated at 1,600,000 acres, and the increase of rental thus caused at £830,000. In our own country, and in most parts of Europe except Lombardy, irrigation is principally employed for the purpose of increasing the produce of grass, by converting the land into water meadows; but it is far from being so largely practised as seems desirable. Poor heaths, by water alone, have been changed into luxuriant meadows. The extent of water meadows in England is stated to be not more than 100,000 acres. The irrigation of land with the sewage water of towns is, under another name, the application of liquid manure; but it is not my intention to dwell this evening on that branch of the subject, although it is most interesting. The utilisation of sewage is a great, I may truly say, a national question. It has been most successfully adopted near Edinburgh, where an extensive tract of meadows yields a rent of £20 to £40 per

acre. The grass is cut from three to five times a year, and as much as 10 tons an acre have been obtained at a cutting. It is practised in various parts of England; amongst others in Nottinghamshire, Staffordshire, at Bedford, Croydon, and also at the Lodge Farm, Barking. A report of the sewage culture at the latter place has lately been published by the Hon. W. Petre. Fifty-three acres have been sown with Italian ryegrass, and between September 1st, 1868, and September 1st, 1869, it yielded more than 1,800 tons. One plot, a little less than two acres, gave in three cuttings 45½ tons; one and three quarters acres of white onions have realized over £67 for the plot. The crop of winter oats has produced 11 qrs. to the acre by the application of 1,000 to 1,200 tons of sewage. During the year 360,000 tons of sewage have been sufficient to render highly productive 120 acres of the Lodge Farm. The value of the crop, in the gross, grown with 360,000 tons of sewage, is over £3,200. In no small degree the water of rivers and of springs depends on its organic and mineral constituents for its fertilising properties, so that the application of it is not in principle different from that of liquid manure, but it must be borne in mind that the mere abundance of water itself is of great importance, as the most nutritious substances brought in contact with the roots of plants are of no use to them unless in a state of solution. Water, you are aware, consists of one part by weight of hydrogen, united to eight of oxygen; but Professor Johnston says, "In nature water never occurs in a pure state; it generally contains both gaseous and saline substances in a state of solution; and this, no doubt, is a wise provision by which the food of plants is constantly renewed and brought within their reach." The water that is used for irrigation should be free from mud and such impurities as mechanically clog the pores of leaves, or cover up the hearts of plants, and interfere with their growth. It is a commonly received opinion that the elementary food of plants is contained in a state of solution in water, and that no plant can exist without a supply of it in a greater or lesser degree. Without some degree of moisture the roots of grass become withered and perish, and too great a depth of it over them is equally fatal to their existence. Stagnant water on grass land encourages the worst, and kills or discourages the best, kinds; water in motion, whatever the depth may be, is less injurious than if quite at rest, and the shallower the current and quicker its motion over the turf the more the grass is excited to luxuriant growth. It may be observed that heat, air, and light are indispensable agents in the development of plants. If they be kept in a low temperature, secluded from fresh air or in darkness, they are inactive or languish and die. Applying these facts, whilst considering the effects of irrigation, we may safely conclude that the energies of the plants are excited by being defended from the chilling night air, whilst they enjoy a higher degree of heat generated by the motion of the current, and at the same time are not excluded from the direct action and benefit of the light of the sun; nor can the thin covering of agitated and rippling water be said to deprive the grass of the necessary portion of air. Before proceeding to the more practical part of my subject I will, with your permission, make use of an extract from a most interesting paper by Mr. James Howard, M.P., on "Farming and Peasantry on the Continent." He says: "Some four years ago I spent a few weeks in Egypt. I was so impressed with the astonishing results obtained by the simple application of water to land, in

the valley of the Nile, that I came home under a strong conviction that in England, notwithstanding the difference between the two climates, we do not reap half the advantages we might do from the water which a beneficent Providence sends us. By the aid of very primitive pumps, worked by a mule, or a bullock, or a couple of donkeys, sufficient water is often raised by the Egyptian farmer to irrigate 30, 40, or 50 acres of land, which fields produce prodigious crops of a kind of clover called 'burseem.' My recent visit to Italy and Switzerland has confirmed me in this opinion. I am aware that water meadows in England are almost as old as the hills. The practice of irrigation is, however, confined to very few localities—not one farmer in 500 in England, I venture to say, knows anything of the subject, or has ever given the matter serious consideration; and I believe there are reasons which have produced the indifference for which I think the State is in great measure answerable. The practice of irrigation in Europe is carried out on the greatest scale, with probably the best results, in the plains of Lombardy and Piedmont. In Lombardy, out of an area of 6,000,000 acres, upwards of 1,000,000 are artificially irrigated; upwards of 3,000 miles of main or minor canals have been cut in the province, besides a vast extent of small arteries in the hands of private individuals. Although some of the main canals are used for purposes of navigation, they are mainly constructed with a view to a comprehensive plan of irrigating the country. The Grand Canal, which brings the water of the Ticino to Milan, has been in existence some 700 years, and for this long period has the practice of irrigation been carried on. I would also remark in passing that for almost a longer period a portion of the sewage of Milan has been utilised—I believe the credit is due to the monks of the monastery of Chiaravalle. I visited some of the fields that had been irrigated for centuries, and, although not furnished with all the modern appliances to be seen in the irrigated fields at Bedford, the results are most satisfactory. I may mention that at Bedford the growth of Italian ryegrass, by town sewage, is a most complete success; as many as six crops have been raised this year (1869). I visited an irrigated farm of 90 acres near Milan, rented by a M. Antonio Monti, at which the water is used eleven times over from the point at which it reaches his farm to where he parts with it to his neighbour. The rent of the farm is about 64s. per acre, which is considered low. The grass I saw growing was twenty-four days old, and was fit to cut. Seven crops had been previously mown since the commencement of the year. A good deal of the arable land is susceptible of irrigation. After a wheat crop cabbages are planted. The wheat in one field I saw was cut on June 24. On July 7 the cabbages were planted, and on 24th August (the day I was there) the ground was completely covered. The land was irrigated once before the cabbages were planted, and once after. M. Chizzoline, who is an engineer by profession, and also a landed proprietor and farmer in the neighbourhood, employs a centrifugal pump, driven by a portable engine, for pumping back the water when it has reached the lowest part of his farm—a plan with which he is well satisfied. The watered plains of Lombardy present a most rich and luxuriant appearance. In Switzerland, Mr. Howard says, "Everywhere along the hillside are to be seen devices for catching and spreading the water on the grass slopes; then again it is arrested on its way to the valley and turned over the meadows and fields of maize; indeed, as the fertility of the country depends on the utilization of the water, every little stream is turned to the best account." He afterwards observes, "I believe no gentleman present will differ from me in the opinion that if upon a given portion of land, especially if friable soil, he could always command a supply of water for irrigation, a larger quantity of green food could be raised, and, if so, it would furnish the means of keeping a greater number of animals. Along one valley, where water is to be obtained at a few feet from the surface, a centrifugal or chain pump, worked by a horse or an engine, would supply water for scores of acres." Gentlemen, I owe you an apology for having quoted so much from Mr. Howard, but his paper is so exceedingly interesting that I would recommend any one who has not read it to take an opportunity of doing so. Whether his deduction with regard to irrigation are practical we may well inquire. To a certain extent in some localities they undoubtedly are; but in parts of this district, depending, as many of us do for our water supply on springs, which become so exhausted after a dry summer that I have

once known them not overflow till the month of February following, I do not think it would pay to erect even a donkey engine to pump water to the higher parts of our farms, although it would be most delightful to be able to give our parched soils a supply of moisture during the hot weather; but we could not afford the water. Gentlemen living on the banks of the Frome may be tempted with advantage to help themselves more freely to its waters; but then, perhaps, some unhappy miller would feel himself aggrieved; and this is a point which is well worthy of a passing notice. Water-mills on a stream are frequently a great nuisance, and I question whether the rent they pay is not often more than balanced by the injury they do the meadows both above and below them—in the one case by penning the water, and causing it to be stagnant on the land, and in the other by preventing its being used freely and advantageously for purposes of irrigation. I have been advised that £500 per annum would pay the rent of all the water-mills between Maiden Newton and Wareham. Could not the beneficial results of their removal be reckoned by thousands? And where, let me ask, can landed proprietors find a better or more paying investment for money than in the improvement of water meadows? I agree with Mr. Howard, that hundreds of acres of extra water meadow could be made by a judicious outlay of capital, whilst much of what is now imperfectly irrigated or badly drained might be made doubly productive. Are the Fordington meadows, which we sometimes see so productive of docks, &c., rather than grass, in a creditable state? And another fine tract of land, not many miles away, which unfortunately happens to be "common meadow," would well pay at least 7½ per cent. for capital invested were it enclosed, and the old, and probably doubtful if not obsolete, rights to which it is subject bought up or annihilated. Gentlemen, I need not detain you by detailing the advantages arising from the possession of good water meadows. Water is now abundant, and the crop of grass will probably be good; and, should the severe frost we have lately experienced injure the swedes and turnips, it will be more than usually valuable for early feed. In making a water meadow, two things require the greatest consideration—first, how to get the water on; secondly, how to get it off your land. The size of your ridges or panes must depend on the supply of water, which should be caused to flow gently and evenly over the surface when turned on, and when out the drainage should be sufficiently good to leave the land as dry as possible. With an adequate supply of water, and beds laid out in an uniform manner, there is little trouble in making the whole water well; but with small streams, and where the ridges are irregular in shape and size, considerable care and attention is required to give all the surface an equal share. In such cases the water should be kept together, and not more land irrigated at a time than can be done effectually. Drains and floats or flows should be well scoured, or "taken up," as it is termed, every season where required, by which means the work of irrigation is greatly facilitated. The first flood in the autumn should be taken advantage of. The water may then be allowed to remain two or three weeks on one place, taking care not to shift it when there is a probability of frost. In severe weather all should be flooded that it is possible to get water for. In the spring of the year the water must be frequently shifted. If allowed to remain too long a scum settles on the grass, which prevents its growth, and is very undesirable at any time. The appearance of scum on the grass is a proof that it has had water enough for the time. Gentlemen, I fear that I have intruded too long on your forbearance. Many points of interest in connection with the subject of irrigation will, I trust, be brought out in the discussion. I now beg to thank you for the kind attention you have paid me.

Mr. LOCK: He had always felt that the proper watering of meadows was of the greatest value and importance; indeed that no other branch of farming was more important. Nothing afforded him greater pleasure than the opportunity of improving the irrigation of a piece of land. They would perhaps remember that he had the management of the Fordington meadows, where docks grew a considerable number of years, and that when he left them they were in no slight degree improved. He thought there was much to be done in improving land this side of Wareham; if deep draining were carried out, the landlords joining together to get a good fall, no doubt the land might be rendered very valuable. He concurred with all the observations made by Mr. Genge in the course of his lec-

ture. He should like to see further improvement in the meadows of Wareham neighbourhood; he was satisfied that wherever the irrigation of meadows was properly carried out a good percentage on the amount laid out was yielded. This was a landlord's question, one calling for the utmost attention.

Mr. R. DAMEN had had a little experience in the irrigation of the meadows near Wareham, of which Mr. Lock had just spoken. He could not but think that after water had run through heath country it was deteriorated in quality; he thought that meadows were best when near the spring-head. Water used eight or ten times over was evidently deteriorated, and there must be the greatest advantage in land being near the spring. The water mills were the greatest possible nuisances. He contended that the water used at the mills might be made much more valuable for the purposes of irrigation. The water mills would, he thought, in the course of time, be dispensed with, and steam mills would take their place. Legislation would doubtless before long effect a material change in this respect. Mr. Genge had indeed given them a very nice lecture on a subject which was of the greatest possible importance. Everybody could see that it would be of the greatest possible advantage to abolish the miserable mills; his own experience was not great, but he had had forty or fifty acres of meadow for many years, and during that period he had found those mills to be of the greatest disadvantage; they were sometimes of disadvantage in penning up the water.

Mr. LOCK suggested that the water was of value at the spring-head on account of the fall.

Mr. DAMEN: Something more than that.

Mr. JOHN FOOT spoke on the importance of the proper drainage of land; it was useless, he thought, to attempt to irrigate land unless it was fairly drained where required.

Mr. CHAPMAN SAUNDERS referred to the use of under drainage in taking away poisonous water which was injurious to plants, and he also alluded to the fact that water running through poor land increased in quantity, but was not improved in quality. The subject had, he thought, been very ably introduced. He quite agreed with Mr. Genge regarding the water mills. He at once recognised the desirability of getting rid of them; they were great nuisances. The Legislature would, he thought, take action in the matter before long. The fact that sewage was not utilized as many suggested it should be, demanded, he considered, serious attention. Mr. Chapman Saunders embraced the opportunity of reading the following remarks made by Mr. J. Howard, M.P., as chairman at a recent meeting of the Central Farmers' Club: "Mr. Cadle referred to the important question of the evils which river mills inflicted on a large breadth of land in this country. He thought that in days when steam power was so much cheapened, and when the prices of beef and mutton were so high, it might fairly be said that the time had arrived when the Legislature should deal with that question. Thousands and thousands of acres in this country were water-logged through miserable bits of mills which barely yield a living to the occupiers, and if he continued of the same mind as he was at present he would call the attention of the House of Commons to that subject in the approaching session."

Mr. FOOT suggested that the mills were equally injurious to underground and surface drainage.

Mr. SAUNDERS: If we did away with the mills the land would absorb all the water used there.

Dr. ALDRIDGE said no branch of agriculture was so much neglected as the irrigation of the meadows. It was evident to all that the meadows formed the most valuable part of a farm. The rental was from £4 to £6 per acre, against 30s. per acre for the rest of the farm. It was palpable, then, that the meadows formed the most important part of a holding. To this subject of irrigation greater attention should be paid; if more attention were paid to it he was sure that the land would be very soon doubled in value—instead of realizing £6 per acre it would realize £12. Respecting the sewage question it was still in its infancy; considerable progress had yet to be made. He hoped that ultimately some plan would be adopted by which many valuable manures now comparatively useless would be used for agricultural purposes. He concurred with Mr. Genge respecting the mills. From what little experience he had had himself he must say that there was no greater nuisance, no greater obstacle to the cultivation of the meadows than these mills. Dr.

Aldridge pointed out that in many instances by some inscrutable law the rights of the millowner override those of the landlord and the tenant, the water being turned off at his convenience, whatever the requirements of the landlord or the tenant. Steam being more economical than water for the grinding of corn, it would doubtless be generally adopted before long in all cases where applicable. Water mills would inevitably, he thought, give way in the end to the superior power of steam. He must express his thanks personally to Mr. Genge for the able manner in which he had brought forward this very interesting and important subject. He hoped it would receive the due attention of the club. Before sitting down he would remind them of the danger of putting too much water on the land. They often saw land for days under water; that surely could not be right; it could not promote the growth, or at all events the nutrition of plants. This excessive watering arose probably from a spirit of covetousness.

Mr. LOCK could not fall in with this objection raised by Dr. Aldridge. When he began to drain his meadows he liked to keep it on a fortnight or three weeks without taking it off.

Mr. SAUNDERS: Your meadows have a good under drainage, I suppose.

Mr. LOUX: Yes; I never found any ill effect to arise from the system of retaining the water the time stated.

Mr. SHORTO said previous speakers had set forth the advantages which land derived from being irrigated, and refer once had been made to the mills. Regarding the latter, he had some knowledge of the effect of the mills in the valley of the Avon and the valley of the Frome; he knew that they consumed the greater portion of the water. In order to get rid of the evil pointed out by Mr. Genge he suggested the purchasing of the interest of the mills and the application of the water consumed by them to the meadows. This would be something practical; it was a point to which he desired respectfully to direct their attention. He reminded them that steam was preferable, the action being much more regular than that at water-mills. Regarding the effect of water a friend of his who had some meadows in the neighbourhood of Tisbury, in Wiltshire, told him that they were valuable because close to the spring-head; he said a certain degree of warmth came from the spring-head, and therefore the meadows near there were worth more than the others, the grass being earlier and richer. He paid a visit to the Isle of Man some 35 years ago. He lodged at an hotel at the foot of a certain mountain there, from the top of which issued a little spring. A clever woman—an Irish woman he thought—who kept the hotel, had three or four acres of ground there, and he was surprised one morning to see a great pile of shutes. Before he had been there a month he saw all of them in operation, and he was truly surprised at the effect produced; they were used for watering a garden and an orchard. The shutes were paid for over and over again by the produce. They were shifted day by day, and the effect upon the growth of the plants was really marvellous.

Mr. LOCK could not see that any Act of Parliament was required to do away with these mills. There were only two on the stream between Maiden Newton and Wareham to be purchased; the rest were in the landlords' hands.

The CHAIRMAN desired to offer a few words in closing the discussion. To water-meadows he had been very little accustomed; still he had paid some attention to the subject, and he knew well that they formed an important part of a farm. He knew that they were most valuable in a country such as this, where a great number of sheep were kept. Water-meadows, from what he had seen, were not made the most of. Mr. Homer strongly advocated the laying out of money in improving the irrigation of land, urging that the investment would be amply repaid, landlords and tenants alike reaping the benefit. The outlay would, he thought, be repaid over and over again. With regard to the mills, he quite agreed with what Mr. Genge had so well said. He mentioned the case of a gentleman offering £20 a-year extra rent for the land he occupied provided a mill a mile distant was done away with. The mills, observed Mr. Homer, not only took away the water at certain seasons, but were the means of penning it upon the meadows. There could, he thought be no question about the mills; the meadows would really be worth double their present value if the mills were abolished. The mills were a great nuisance. As for steam-power being used, that was, of course, a separate question; there might be some

little difficulty in applying it in every case. But there could be no doubt that if the mills were done away with, agriculture would be greatly benefited.

Mr. GENGE said: Respecting the quality of the water he thought it a subject of very interesting inquiry; it was one which he should be very glad to hear properly elucidated. He quite thought that water must be considerably affected by the subsoil from which it springs. Having enlarged on the importance of pure water for the purposes of irrigation, Mr. Genge reverted to the question of water mills, mentioning the

case of a miller erecting steam mills close to a railway station and giving up a water mill three miles from the station. Respecting sewage he could not think that in a liquid state it would ever be conveyed to the land in a general way. They had heard of sewage being used on the Edinburgh meadows, but it must be remembered that the very air there was impregnated. The solid matter should, he thought, be extracted, and put in a portable form as was done at Leamington.

A vote of thanks was given to Mr. Genge, and this ended the proceedings.

MARKET-GARDENING FOR FARMERS.

BY A PRACTICAL FARMER.

London, the wonder of the world, contains an immense population, all concentrated within a rather limited area, and looking for their daily supplies from the surrounding country. Many other large populations are contained in our great cities and towns throughout the kingdom. The additional wonder is how they are all fed from day to day. The supplies of bread and meat are generally sufficient, if not abundant; grain and flour are articles of large import, and always forthcoming. Live stock, the producers of our meat supplies, are not so largely imported; but these, together with our home meat aids, are generally found sufficient, and therefore the main requirement of our large populations are provided for. Animal food, however, is too often so dear as to be far beyond the pecuniary means of the industrial population to become a prime article of daily food for their families. They are therefore compelled to resort to vegetables, and to vegetable diets in broths, soups, porridge, and like cookeries. Hence it would appear desirable that more attention should be given upon every suitable farm to the culture of vegetables and edible plants. That these crops are gradually on the increase we readily admit. The growth of potatoes, for instance, as shown by our satisfactory statistical returns, has increased to 43,000 acres over 1868, and 93,000 acres over 1867; and yet this area is only a little more than one-half of the acreage annually grown in Ireland. Carrots continue to be about an average growth, but not by any means sufficiently large in extent, owing, no doubt, to the expensive culture. The cabbage tribe show an increase of 30,000 acres over 1868. Turnips also show an increase; but these are chiefly for stock food, a very small portion being brought into consumption as human food. Of the increase of garden produce we have no separate account, but it is no doubt advancing. There are two or three considerations to be named which ought to induce more attention to the culture of roots and edibles for human consumption—first, the chief monopoly which the home cultivator would enjoy in edibles, and the partial monopoly he would have in the production of roots, as the importations of potatoes and other equally bulky cargo cannot profitably take place unless prices are high in this country; another is, that the industrial population require a far greater general supply of vegetables and edible plants, in order that their prepared foods may be better, cheaper, and more varied; and a third consideration is, the facilities given by railway communication to every market, and the readiness by which all produce is there sold under commission. The farmer's only business, therefore, is to produce the crops and transmit them to market, the commission agent doing all the remaining. It is not every farmer that is qualified to undertake the growth of the many varieties of garden produce in large quantity. It requires a tolerable acquaintance with garden cultivation and garden productions to make much way. There are, however, the common vegetables and edibles which may be grown without difficulty, *i.e.*, potatoes, carrots, turnips, and cabbage in variety, and peas and beans sold green. These may be extensively grown, and will always command a sale. But the smaller kinds, and such as are generally termed garden stuff, require a more intimate knowledge, not only of their habits of growth, but also of garden management. I would enumerate some of the most useful of garden produce which I would propose to cultivate more extensively in the field, in addition to those named above, and where suitable sites can be found on the farm

for their culture, such as asparagus, celery, cress, cucumber, leek, lettuce, onion, parsley, parsnip, radish, rhubarb, spinach. It may appear preposterous to recommend the growth of these many varieties on any given farm, and I think would, in fact, be so; and it is only for the farmer to make his own selection according to his taste and the suitability of his soil and site and the climate in his locality. The best results would most probably arise by the adoption of this course: far better to produce a few things well than aim at doing too much. In making this selection, the farmer must have an eye to the greatest returns. Suppose he commences with an area of early potatoes, he may sow upon them seed for a crop of radishes. These will be marketable almost before the potato plants are above ground. After the potatoes are gone to market, he may plant the same land with cabbage or celery for winter service. This course is not unusual, and if the season is favourable, cannot fail to be profitable. The area in this commencement must be limited so far as the radish crop is concerned, but I know of scarcely any limit to a cabbage or celery crop—the demand is always abundant; and the celery crop, although expensive in management, is a truly profitable one if well got up, good "sticks" making 1½d. to 3d. each. I will just state its culture. Sow a large bed of the best giant celery seed early in the spring. Prepare trenches fifteen inches deep, and three to four feet apart—the further the better for the growth of large "sticks;" these to be well manured with good rotten dung immediately prior to planting. When the plants are ready for lifting, *i.e.*, from four to eight inches in height, take a common garden trowel and lift each plant with a small portion of earth to it, and thus transplant it into the bottom of the trench, and give it and the trench a slight watering, to be repeated as required, and that freely if the season is dry. As the plants attain a fair growth, *i.e.*, from a foot to fifteen inches, they must be gently and carefully moulded up by hand to near the top, taking care the earth does not fall in amongst the stalks to its injury, by causing decay, this moulding to be repeated frequently as the plants grow, all by hand, till near their full growth, when the hoe may be used, if sufficient care is observed. In this way, very fine celery of exquisite quality may be secured, and of great weight per acre. The cabbage should be of the best early garden sorts, and in variety. Every farmer should grow his own plants, so as to be in readiness whenever required. The culture and planting of cabbage is so universally known as to need no repetition here. The varieties are so many, it is superfluous to enumerate. Any respectable gardener seedman will supply the seed correctly to order, and cheaper than they can be grown by the farmer. The preparation of this crop for market is of the simplest kind. They merely require cutting from the top of the stalk, and the trimming off of the outer or large leaves, and packing in the trucks. The celery requires carefully digging from the trenches, so as not to break the stalks. One or two of the loose outer stalks may be taken off, the fibrous roots cut off, and then it is ready for packing in railway trucks, as the cabbage. This is all. We will now take asparagus. This crop requires more care and attention than most ordinary farmers would choose to bestow upon it; therefore none but cautious, careful men should attempt to grow it. It is a profitable crop under good management, and always saleable. The seed should be sown in the spring in nicely prepared soil; in the following spring it will

be ready for planting out. The land should be a fine deep loam, well pulverized and manured. Beds of convenient width should be laid out; and the planting may be done in suitable weather, beginning about the middle of March. As this crop will not yield a return till the second year after planting, a crop of onions may be taken upon the surface in the first year, or lettuces, or radishes, or leeks. It will require cleanly management and every encouragement to bring it into early profit. The cutting in the second year must be limited, but afterwards it will yield abundantly. In preparing it for market, it is desirable to cut it low into the ground, tie it up in bunches, and pack in oblong baskets for the railway trucks. The culture of carrots and parsnips is the same. The land must be perfectly clean, or the seedling plants will soon be choked with weeds, being slow in their early growth. The soil should be a good loam of considerable depth, as these tap-rooted plants drive their roots down a long way for food. The chief management after the plant is up consists in careful hand-weeding. The harvesting is expensive. Strong two-tined forks are usually employed to dig up the roots; and all has to be done by hand—hence the expense. They are usually gaved down till required for market, when they are taken and thrown loose into the railway-trucks. The weight grown in

often very great: hence the profit. These roots are the great competitors with potatoes in the market, but they by no means command the same popularity. It is a pity they do not obtain a higher value with consumers; they are very nutritious and valuable as human food, and ought to be extensively patronized. Rhubarb is a very prolific plant, and is well worth attention on loamy soils. Its culture is the simplest imaginable. It requires a good soil, highly manured; and the planting is generally from off-shoots or divided roots of old plants. The produce is very great; and as it is the earliest plant of the spring, the stalks are in great demand. Lettuce and spinach are well worth a moderate share of attention by farmers, particularly those farming in the vicinity of large towns. The soil requires nicely preparing. The lettuce may be sown broadcast; the spinach is best in rows. These crops may be sent to market advantageously in baskets. The drawing of the lettuce and the cutting of the spinach must be done with judgment as to maturity. The growth of the cucumber can only be profitable on hot soils and warm situations, and such may be found on many farms. As a general farm crop it cannot be grown; but it is worthy attention, and very profitable, where it can be favourably produced.

THE NEW FOREST.—A CHALLENGE.

TO THE EDITOR.

SIR,—The discussion upon the Royal Forests in the House of Commons, brought from Mr. C. S. Read a remark upon the amount of rent I pay the Crown for 430 acres of land—£316 per annum—that is, for rent and interest upon capital expended in improvements by the Crown, at my request. But as the object of the discussion was whether sixty thousand acres of land should be cultivated or not, I am anxious to add a few important facts to his statement, which he could not be in possession of. The staple of many thousand acres round the two farms I hold, four miles apart (mostly planted with fir trees), is as fine for agricultural purposes as is usually found in any county, very superior to that round London, and the climate superior to any I have hitherto met with in any other part of England. The land wants nothing but simple honest farming, by resident farmers. I say resident farmers, because both farms I hold were farmed by the Crown up to the time I took them, and produced, I am told, very little indeed. They now produce heavy crops of the finest grain of all kinds, the finest roots; and growing grass 2 feet 9 inches high was shown at the fat cattle show at Christmas at Mr. Geo. Gibbs' stand dug up from the open field and sent there. I have no objection to show the last year's produce of the New Forest Farms (swedes only excepted, they are eaten), white wheat, red April wheat, barley, oats, both kinds of mangolds and carrots, against the produce of any farm in England, not for a money wager, but for the benefit of the public. The highest quotation for last year's wheat in the London market, on the 21st ult., was 48s. per qr. or £12 per load (being five qrs.); the highest price at Southampton was £11 5s. per load; my last sale-return from Guildford on the 21st was £13 15s. per load. My barley is equally good, but has not yet been offered for sale. My red and yellow mangolds both got second prizes at Birmingham, and my carrots were commended.

The public good I allude to is the poor people scattered about the Forest, who with great difficulty earn a living, and find some resource in the produce of the Forest. They may be driven by hunger—perhaps they are; but there is no doubt cattle and pigs are taken without respect of persons. I have been favoured with the interest they take in my cattle and pigs. I now send out heifers in-calf, instead of Scotch bullocks, and never send out my pigs without a person to stay

with them during the day and bring them home at night. My newly-made hay was taken away with a horse and cart from the field during the night, before it was to be carried to the stack; my wheat was taken from two fields, one at each end of the farm, in the night after it was cut; and there are occasionally prosecutions by the Crown for taking rabbits and pheasants' eggs, and children are prosecuted for damaging trees for firewood. Is it not a scandal, is it not a sin, is it not grievous to see children driven into the forest, to pick up what they can for food and firing, and men half starved for want of work in a country of 60,000 acres of land, capable of growing the finest grain and the finest roots in England, uncultivated; and that because it belongs to the Crown? Had not the Crown better sell the 60,000 acres to be cultivated, employ the increasing population honestly, grow food for them, as well as for the country at large? The Forest, after paying off the common rights in land or money, would realize to the Crown between one and two millions of money, one million of which invested in Consols would produce £32,500 per annum, instead of £1,700 as at present. I feel sure that her Majesty would approve this, and that it only need be placed before her to receive her consent.

What would be about the produce of the 60,000 acres, farmed by individuals who would purchase them? In all probability it would be farmed after this manner: 20,000 acres might be in pasture, 10,000 in wheat, 10,000 in barley, 10,000 in oats, and 10,000 in roots. Ten thousand acres in wheat, 3 qrs. to the acre, would be 30,000 qrs.; 10,000 acres in barley, 5 qrs. to the acre, would be 50,000 qrs.; 10,000 acres of oats, 7 qrs. to the acre, would be 70,000 qrs.; 10,000 acres of roots, 25 tons to the acre, would be 250,000 tons; 20,000 acres of pasture for sheep, etc., produce—to be added by a more competent judge than I am. One sheep an acre for the roots and one sheep an acre for the pasture, would produce annually 30,000 sheep.

If you think these remarks worthy a place in your paper, I shall be obliged by your giving them insertion in my own name and address: I never publish under a feigned one.

Yours truly,

WILLIAM DICKINSON.

New Park, Lymington, March 4th, 1870.

ON THE APPLICATION OF FARM-YARD DUNG.

It has been shown by experience in a majority of similar results, which are very sufficient to establish a fact for practical use, that farm yard dung in a fresh condition from the cattle yards and the doors of the cow sheds is fully equal, if not superior, in effect to the same quantity of straws and feces that has been fermented in a heap, and passed the half putrescent state of decomposition. Placed in the turnip drills in the usual quantity of application, the fresh feces have shown a superiority in effect to the fermented heap, and served in the required change of soils and climates to establish a fact. In order to secure a complete covering of the fresh dung in the drills, it is necessary to cut all the straws that are used for litter into short lengths by the power of the steam thrashing machinery, which will confer an intimate mixture of the straws and feces, with a thorough impregnation of the earthy matters with the urinary fluids. A very moist condition must be maintained, completely saturated, without very large droppings of moisture.

It has been incontestably proved that rough strawy dung from the cattle yards and stable doors is the best manure for wheat, after the fresh and wholly unfermented matters have lain on the fallow lands, exposed to the alternations of rain and dry weather, heat and cold, sun and wind, only half covered by the ploughings, lying on the surface during winter, torn into fragments by the grass seed harrows, and the last remains pressed into the ground by the heavy rolling that finishes the process of sowing the seed in the spring. The application of rough strawy dung on fallow lands for wheat has been long observed to be the best use of the matters to that vegetable, and the subsequent reduction by the ploughings and harrowings of the land, and atmospheric agencies, is more effectual than the fermentation and decay in the heaps of preparation. These facts are attested by many results of experience, which wholly exploded the doctrine that has been long entertained of the damage and loss sustained by dung being exposed to the changes of climate in the usual vicissitudes. Fresh bodies will contain the specific caloric or lateral heat, which, in a greater or less quantity, accompanies every formation of existence, and this provision may be more favourable to vegetable life than the artificial productions of heat from fermentation and artificial regulations. Less expense is incurred by the application of fresh dung than by the preparation in heaps or pies, and a different use can be adopted, and at various seasons of the year. The certain fact of experience will be attended with important alterations in practice.

Manures are applied to the ground in two ways—dung is spread over the surface, or placed underground in the depth of a plough-furrow. In the first method the action is exerted by the shelter the covering affords to the roots of plants, and the consequent warmth that is conferred. Some benefit will accrue from the contact of the terrestrial and atmospheric agency, and from the liquid oozings that will descend into the ground from the substances that have been applied. The action of manures in the ground will arise from the caloric that proceeds from the mutual action of the applied matters with the soil, and of the substances with each other, all tending to produce warmth for the use of vegetable life. The application of farmyard dung is done at the wrong time of the year in the autumn; the winter soon follows, of which the cold is very inimical to chemical action, and must be hurtful to the future value of the manures. The action will be rendered of much less efficacy, if not, in many cases, altogether destroyed; and when the warmth of spring arrives, the matters are in a dormant state from a starved condition, and wholly unfit for energy in beneficial purposes. It is the great object to place the ultimate elements of matters in the closest contact, and to induce the combinations of moisture and caloric in the peculiar forms that are conducive to vegetable life. These forms may never be under human control, and wholly escape observation from being placed beyond any research that can be made, but every means must be used to effect that object by performing the modes of applica-

tion that may be most reasonably supposed to favour the attempt from theory and practice. It is the certain combinations of moisture and caloric that produce the immenses and largely varied numbers of organized life—that maintain and support the existence, and engender the diseases which terminate the existence of mortal endurance. Life and death are produced by the materials of agency under different forms and qualities.

The use of them as a motive power is not yet half developed nor applied to the purposes of which it is capable. The fixed objects in which the impelling power can be conveniently applied and commanded are daily increasing, both in number and utility; in these cases the application is under an easy control. In the propelling of moveable adaptations which require the use of trimmings and details, much difficulty happens in controlling the power and using it in minuteness. But it is very evident from the known use of steam that a large increase of the power is very possible, and that it is capable of being modified and reduced into many shapes and forms to adapt the convenience of purposes. The private roads of farms of land may be provided with a railway on the side of the common paths of traffic, running from a central point at the farmery, and branching into each gateway of the fields. From this point of ending a moveable railway can be laid over the field to suit the purposes of carrying dung, or the harvest of hay and grain crops, and the same provision will be made from the central depot at the farm, even to the dung-courts and to the rick-yards. The moveable railway is placed along the headland of the field, and at right angles with it, the lines of rail are placed at 10 or 12 yards distant with turntables, on which main and branch lines an engine of two to four horse power drags light iron waggons loaded with dung from which a man throws the manure right and left in the quantity, as allowed. In February or March the farm yard dung in a fresh condition from the yards, and short cut straws, mixed with feces, and impregnated with urine, is applied as a top-dressing to wheat sown on clay fallows, and spread most carefully over the ground, broken into fragments, and placed in a close covering of the surface. The quantity of moveable railway may be sufficient for one or two days' work, and then lifted and replaced for a continuance to finish the field. In this condition the top-dressing remains into April, when the grass seeds are sown, and then the harrows will tear the fragments into shreds, and mix the dug with the fine alluvium that has been produced by the winter's rains and thaws, and dried by the suns of spring. A heavy rolling will press into the ground the dung and fine earth, along with the seeds, which will find a matrix of growth never yet granted to any germination of plants in point of quality and a minute commingling. The dung and the soil are very finely commingled to suit the small seeds of the grasses, as the size of any seeds always need a soil of the same bulk in which to germinate and thrive. In this mode of application the fresh dung in unexposed feces, impregnated straws, and urinary liquids, will find a ready convenience to produce caloric warmth, from the contact of atmospheric elements that are fast increasing into power with the returning sun. This combination of favourable circumstances for the production of aliment to plants forms the grand secret to be discovered, and the great object to be attained.

After the wheat is sown in autumn, straw may be placed on the land in a quantity to cover the surface wholly and entirely, and secured in its position by placing clods of the land on the straw in places, to keep the covering from being moved by the winds. On fine soils of land, clods may be wanting, when branches and light timbers will preserve the straw in the position, till the covering is flattened and partially decayed by the weather. In northern climates the decay will soon be effected by the rains, frosts, snows, and thaws, which alternately prevail, and a short provision will be required to fix the straws in position; but in southern climates, the dry weather will longer delay the rotting of the straw, and a longer provision will be required. The covering of the straw on the ground will protect the wheat from cold, and provide warmth to the

young plants, which will be further promoted by the decay of the earthy straws forming a manure, and very especially to the seeds of grasses in the spring, after being torn into shreds by the harrows, mixed with the pulverized soil, and pressed into the ground by the roll. The result is much the same as by laying the dung on the surface in February or March, as before detailed.

Farm-yard dung in a state of decomposition on the surface of the ground, or partly covered in the soil, is placed in a very

favourable situation for the purpose of affording shelter and warmth to the plants and to the ground, and of provoking the combinations of terrestrial and atmospheric elements to produce aeriform matters, which are very justly supposed to constitute a large portion of the food of plants. When dung is wholly covered in the ground, its agency is much restricted from want of the necessary adjuncts to promote the effect.

J. D.

THE MALT-TAX.

DEPUTATION TO THE CHANCELLOR OF THE EXCHEQUER.

On Tuesday, March 8, a numerous deputation from the Chambers of Agriculture had an interview with the Chancellor of the Exchequer, in Downing-street, on the subject of the malt-tax. The deputation was introduced by Colonel Tomline, M.P.; and among the members of Parliament who accompanied it were the following:—Earl Percy, Mr. J. Howard, Major Paget, Mr. Neville-Grenville, Mr. M. W. Ridley, Mr. E. Turner, Mr. M. E. Welby, Colonel Co bett, Mr. C. Sykes, Lord Claud John Hamilton, Mr. Sewell Read, Sir Montague Cholmondeley, Colonel Wilmot, Colonel Gilpin, Lieut.-Colonel C. Amcotts, Lieut.-Colonel Parker, Mr. J. Figgins, Sir George Jenkinson, Bart., Mr. R. Paul Amphlett, Sir W. Buller, the Hon. F. Wapole, Sir Edmund Lacon, Colonel Barttelot, the Hon. E. Miller, Viscount Holmesdale, Mr. T. Mitford, Mr. Ormsby Gore, Sir Percy Herbert, Mr. Rowland Winn, Mr. H. C. Wise, the Hon. Henniker-Major, Mr. Benyon, Mr. Beach, Mr. Hildyard, Mr. W. Baker, Mr. J. Floyer, and Mr. G. B. Gregory.

Colonel TOMLINE, said: Sir, I have the pleasure of introducing to you a deputation from the Central Chamber of Agriculture, composed of delegates from seventy-two Chambers throughout England. Of course I shall say nothing to you on this subject, because you understand it as well as I do.

The CHANCELLOR OF THE EXCHEQUER: Oh, no (laughter).

Colonel TOMLINE: You understand it, though you don't feel as we do. I will only say one thing. A former President of the Board of Trade (Mr. Milner Gibson) said that the incidence of the malt-tax was only 12½ per cent.; and Mr. Gladstone, in a very intelligible speech, also gave us to understand that that was his idea of the matter. Now, I have barley which I should be happy to sell at 21s. 8d. per quarter. If I wished to malt it, I must pay 21s. 8d. duty, and that is more than 12½ per cent. (Hear, hear). I observe that Lord de Grey, in speaking the other day to a deputation which waited upon him in reference to the education question, remarked that at this moment political economy is being taught in schools which are maintained out of the taxes, adding that when such schools are maintained out of the rates, political economy will no doubt be taught more extensively than it is now. From what I know of the gentlemen in the provinces I feel sure that they will be reluctant to pay rates for such political economy as consists in taxing one of the three paying crops, under the four-course system of agriculture, 100 per cent. The secretary will now read the memorial, sir, and hand to you a list of the names of the gentlemen who have to speak.

The SECRETARY then read as follows:—

TO THE RIGHT HONOURABLE THE CHANCELLOR OF THE EXCHEQUER.

SIR,—At a meeting, this day, of the Central Chamber of Agriculture, representing seventy-two Chambers of Agriculture in forty counties of England and Wales, with a total constituency of seventeen thousand members, the present deputation was instructed to lay before you the following points with reference to the Excise duty on malt.

(1) The malt tax is prejudicial to the agricultural interest, because it interferes with the most remunerative relations of crops, and hinders the growth of barley. In particular, the operation of the duty discourages the growth of second-class

and medium quality barleys. Taking high class barley as worth 40s. per quarter, barley that will produce one-fifth less strength and quality in beer should be worth 32s. per quarter, but owing to the payment of a heavy duty, which is not on an *ad valorem* scale, the maltster cannot afford to give for that barley anything like so much. The better barley at 40s., together with the duty, 21s. 8d., costs 61s. 8d. per quarter as malt, and the lower class barley, being of one-fifth less merit, is worth as malt 40s. 4d. per quarter. Of this sum 21s. 8d. goes for duty, leaving, therefore, only 27s. 8d. as the price given to the farmer for barley worth, according to its intrinsic value, 4s. 4d. more.

This virtual bounty upon first quality barleys operates as a fine upon high farming, for the production of very heavy and prolific crops is incompatible with the preservation of the most superior quality for malting purposes.

(2) *By the Excise restrictions farmers are deprived of source of profit in their business from the use of malt and sprouted grain as food for animals.*

By the simple and inexpensive process of germinating, farmers could convert their medium and inferior barleys into a valuable food containing 20 per cent. more of flesh-forming constituents and 100 per cent. more of sugar than the raw grain; while it is calculated that this most nutritious food would cost the farmer only one-half as much as the same barley made into malt and charged with duty.

The farmer is prohibited from using his own germinated grain, and thus protecting himself to a large extent against the adulterated feeding-stuffs which now victimise him in the market. The English farmer is placed at a disadvantage as compared with the foreign farmer, who is free to use germinated grain without payment of duty, and to compete in our meat markets against home produce, which the English farmer may not rear and fatten by the same means. *Mr. Gladstone's Malt for Cattle Act is inoperative*, because of the expensive and wasteful character of the feeding mixtures which alone it permits to be used, and because of the obstructive and vexatious conditions which it imposes.

(3) The incidence of the tax falls with peculiar pressure upon the labouring classes, artificially enhancing the price of the national beverage, thereby encouraging the use of unwholesome and deleterious compounds, and interfering with cottage brewing, and with the comforts, habits, and morals of the poorer families. It is respectfully submitted that the heavy apportionment of this tax upon the labouring classes is apparent from a comparison with the duties on tea and coffee.

According to the inquiries of the Board of Inland Revenue in 1857, and the recent statistics of Mr. Dudley Baxter, the annual consumption by the working classes is—of the tea 5lb. per head, and of coffee 1lb. per head, the average selling prices of these articles being 2d. 8d. and 1s. 5d. per pound respectively, and the annual expenditure upon them, therefore, 9s. 5d. per head. If a repeal of the 6d. per pound duty on tea, and of the 3½d. per pound duty on roasted coffee, were to lower the average retail prices possibly to 2s. and 1s. respectively, there would be a saving of 2s. 5d. per head in the annual expenditure of the working classes.

Of beer, the 'temperate consumption' by the working classes appears, from the investigations of Mr. Dudley Baxter, to average twenty gallons per head per annum, which is less than half a pint per head per day; and taking the average

retail price at 1s. 4d. per gallon, the annual expenditure is 26s. 8d. per head. If, as Mr. Gladstone admitted in the year 1865, the price of beer is raised by the malt duty 20 per cent. above the natural price, a repeal of the duty would save the working classes 4s. 5d. per head per annum. Hence, a repeal of the £3,000,000 of tea and coffee duties, or a reduction of £3,000,000 in the malt duty (which would be about half the impost), would alike relieve the working classes to about the same amount per head. And if the tea and coffee duties are specially oppressive upon the poorer classes of the community, so, therefore, must be the malt tax.

This is arguing from Mr. Gladstone's estimate that the operation of the malt duty raises the price of beer only 20 per cent. But in another part of this paper are stated reasons for believing that the natural price is raised by the tax very much more than 20 per cent.

(4). In the opinion of this deputation the question of freeing malt liquors from taxation should be entirely dissociated from that of lightening the taxation upon spirituous liquors.

(5). In the absence of an important reduction or total repeal of the malt-tax, great relief would be afforded to agriculturists by transferring the incidence of the burden from malt to beer.

(6). *It is submitted that any supposed difficulty of levying £6,500,000 directly upon beer, by brewers' licences or otherwise, is not to be compared with the great loss to consumers arising from the cumulative incidence of the malt duty.*

From the evidence of Mr. Carling, of the Board of Inland Revenue, before the Select Committee of the House of Commons, it appears that the cost of the barley and hops for producing beer of the strength of four barrels to the imperial quarter averages about 4½d. upon each gallon of beer, that the cost of converting the barley into malt is 0½d. upon each gallon of beer, and that the duty, if levied directly upon the manufactured product, would average 1½d. per gallon, making a total cost for materials, malting, and duty of 6½d. per gallon. The selling price of such beer is 1s. per gallon, and as the difference between this and the sum of 6½d. per gallon—amounting to 5½d. out of the shilling—cannot be accounted for as the cost of brewing and as profits, a considerable proportion of this difference must represent an absolute loss occasioned by the operation of the duty.

It further appears, from a calculation of Mr. Joshua Fielden, M.P.—which the Select Committee reported to be, in their opinion, based upon a correct principle—that the pressure of the duty increases at every stage of the trade and manufacture in about the following proportions: The maltster, paying the tax of 21s. 8., requires 5 per cent. interest and 10 per cent. profit for this portion of his capital invested, and charges the brewer 2s. 11d.; the brewer, requiring also 15 per cent. upon this expenditure, charges the retailer 28s. 8d.; and the retailer recovers from the consumer this amount with 10 per cent. added for his profit, making the total tax paid by the consumer 31s. 6d., for 21s. 8d. actually accruing to the revenue. Thus, according to this estimate, the amount of malt duty paid by consumers is £9,425,000, for £6,500,000 received by the revenue, showing an absolute loss of £2,925,000, or 45 per cent. upon the duty collected.

It appears, moreover, that the payment of the malt duty by brewers in the same way that the commuted hop duty is now charged, namely, by a licence duty, calculated according to the quantity of malt or the equivalent of malt used, would be a positive gain to the brewer; for, according to these figures, which are approximately, though not strictly correct, they would buy malt 2s. 11d. per qr. cheaper, owing to the abolition of the malt duty and of the maltster's interest and profit upon it, and would pay 21s. 8d. per qr. in licence duty, showing a saving of 3s. 3d. per qr.

The gain to the consumer is made apparent by following out Mr. Fielden's illustration of the principle upon which the malt-tax operates. The retailer, having henceforth to repay the brewers' interest and profit upon 21s. 8d., instead of upon the larger sum, would charge his 10 per cent. profit upon 24s. 11d., instead of upon 28s. 8d., making the total tax paid by the consumer 27s. 5d., instead of 31s. 6d. This is a gain to the consumer of 4s. 1d. per qr. of malt, from transferring the incidence of the taxation from the stage of malting to that of brewing, while still leaving the amount of revenue from this source at its present heavy figure.

In support of the opinion that an equivalent for the malt-tax could be readily collected as licences on public and private brewing, the Select Committee of the House of Commons adduce the evidence of Sir Charles Presby, formerly Chairman of the Board of Inland Revenue, and the evidence of Mr. C. B. Forey, Surveying General Examiner of Excise, reporting that 'the former witness stated distinctly that there would be no difficulty in raising a tax from private brewers; while the latter "could point out no insuperable difficulty in substituting a brewers' licence in lieu of the malt-tax."

Mr. ROWLEY (Cheshire) said: Sir, I believe the duty which I have to perform is that of showing the injury which the malt-tax inflicts upon the farmer in the cultivation of the soil by preventing him from making the largest quantity of beef, mutton, and long wool that he can out of his occupation. I have paid attention to this subject during the last twenty years, and I may remark that the malt-tax bears particularly upon the case of Ireland. The Irish cultivators cannot, with the climate they have to deal with, grow wheat in competition with foreign countries under free importations; hence they are compelled to fall back upon the cultivation of oats and barley. The barley produced in Ireland is not of the first quality, and does not go to the maltster. Official returns show that a large proportion of the Irish land which was under cultivation twenty years ago has since gone out of cultivation; and it must continue in that position if the malt-tax be not repealed or reduced. The Irish soil is very good, but it cannot withstand this difficulty. I may state that friends of mine, who went over to Ireland some years ago with the idea of leasing large farms and of purchasing small properties, came back and said they felt perfectly certain that if the malt-tax were not repealed the land of Ireland must go out of cultivation, and great numbers of the people leave the country. This was stated twenty years ago, and it has been borne out by what has occurred since. A Yorkshire gentleman, a friend of mine, purchased 800 acres of land in Ireland to cultivate in the Norfolk fashion. That was ten years ago; and he has since told me that he could not grow wheat, that his barley was not good enough for the maltster, and he had now laid down the land for grass, and would be glad to sell it. He said he felt perfectly certain that the Irish soil could never be cultivated with the malt-tax. Since then the whiskey duty has been increased; and the grain of Ireland which should be used in the manufacture of a second quality of beer cannot be so employed.

THE CHANCELLOR of the EXCHEQUER: I understand your point to be that the tax limits the barley that is used for malting to the first quality?

Mr. ROWLEY: Yes, it does, sir. Some years ago we were advised as farmers to grow less corn and produce more beef and mutton; but the less corn we grow the less beef and mutton is produced. The quantity of turnips grown in Ireland is gradually becoming less, and it is a singular fact that an acre of turnips will produce as much money value in meat and wool as the best acre of grass in the kingdom (cries of "More"). The turnips produced in Ireland are an inferior class. Grass land which produces 20 stones of meat per acre—it must be very good land indeed to do that—will let for £3 an acre; while turnip land which produces the same money value in mutton and wool averages from 25s. to 30s. an acre. A good crop of turnips will feed eight sheep per acre, and they will lay half-a-stone per quarter upon themselves; making altogether 16 stones. You have eight good fleeces at 10s. apiece, and all this makes more money than the best grass land. I have no doubt that the result of the present state of things, if it continue, will be that Irish land will almost go out of cultivation, simply because the corn crops do not pay.

THE CHANCELLOR of the EXCHEQUER: Let me understand you; I am not very clever about these things. What you mean is that the land would produce an inferior kind of barley, but that it does not pay to grow it because of the malt tax—that in the rotation that would, but for the malt tax, have been the best crop?

Mr. ROWLEY: Yes.

Mr. MAY (Staffordshire): The gentleman who has preceded me comes from the North of England; I come from the Midland Counties, and can fully bear out all that he has said with regard to the irregularity of the cropping which this tax causes to us. It is well known that the price of wheat is degen-

rating. The removal of the last shilling of tax on corn imports has made England one vast granary; and the probability is that in future we shall always have a stock of wheat at our ports, as we have at this moment, to be pushed into our markets whenever there is an advance sufficient to pay the importer. In consequence of that the men who have been disturbed in growing barley, as in the case of the hop, will not be able to grow wheat. If wheat is to be at the present price, or anything like it, even with a fair crop, we shall not know what to do with our land. And there is this anomaly in the present year that, with a very small produce, something like 20 per cent. less than the average, we have very low prices. It seems to me, then, but right that every facility should be given to us to make the best of a single crop, which is barley, and limited in its growth. Wheat, oats, beans, and peas are imported freely from all parts of the world; whereas barley has only a limited area; and, that being so, why should we not be allowed to grow the crop that we can grow best?

THE CHANCELLOR of the EXCHEQUER: You mean that no country can compete with us in barley; and that English barley is the best in the world?

MR. MAY: It is so. Supposing our barley not to be of a good colour it will not be sold for malting; the maltster will not touch such barley, and in our neighbourhood it is seldom that we get the whole crop good. I have been a farmer for 25 years, and only in 5 years have I sold the whole of my crop of barley for malting purposes. Two of those 5 years were the last two, both of which were very hot; and it appears to be only an act of justice to place us at least in the same position as the foreigner. The time has arrived, we think, when we ought to have our hands loosened from these trammels, and be allowed to do what we like with our own produce.

THE CHANCELLOR of the EXCHEQUER: How do you consider that you are worse off than the foreigner?

MR. MAY: Because we cannot grow what he can. Wheat is the main produce of our heavy soils—clay and marl.

THE CHANCELLOR of the EXCHEQUER: Do you think, then, that barley ought to be set free in order to enable you to compete with those foreign countries where wheat is grown?

MR. MAY: Yes, and I think we might export malt. For why should we not send it abroad, if we can grow better than they?

THE CHANCELLOR of the EXCHEQUER: Is there anything that prevents you from doing so now?

MR. MAY: Yes; the malt tax.

THE CHANCELLOR of the EXCHEQUER: But you get the drawback.

MR. MAY: True; but the great difficulty is with the maltster. He turns away from it, if we show a stained sample. Mr. Bass, I see, recommends the growth of barley after wheat, but good farmers will tell you that two white crops in succession are not good farming. So that we are placed in this dilemma; that we cannot do what we wish with our own produce, and if you would take off this tax I am convinced that it would not only confer upon us as agriculturists a decided advantage but be a benefit to the whole country.

MR. SEAMAN (Essex): Experience has taught me, sir, that grain in a state of germination just previously to being carried to the malt kiln is by far the most nutritious and the quickest fat-former of any substance, whether single or combined food, whatever. During the past 15 years I have conducted experiments on a considerable scale. For the first 5 years of that period my experiments were confined to horses, and they brought me to the conclusion that if ever Englishmen became hippophagists I should have no difficulty in producing an abundance of horseflesh. In 1861 I turned to feeding sheep with this grain.

THE CHANCELLOR of the EXCHEQUER: What grain?

MR. SEAMAN: This (producing a sample bottle of germinated barley). I used it for a number of ewes and lambs, my success was very great indeed. For there was not a single death during the whole of the lambing season, although I had something like three hundred ewes, and it is a very common thing for people to lose 10 per cent. of their ewes, and not an uncommon thing to lose 20 per cent. of their lambs, especially in seasons when they have not a supply of suitable food. From 1861 the consumption of germinated barley increased in my neighbourhood, until in the year 1865 there were something like a thousand sheep feeding upon it,

within an area of ten miles of my residence. This was in the summer of 1865, when there was scarcely a blade of grass to be seen; when our grass fields were like ploughed fields, and nothing could be obtained so suitable for the sheep as this; for they fattened very fast upon it, and produced an immense quantity of meat. In the month of June, 1865, mutton chops were worth 15d. a pound, and there were scarcely any grasses and roots to be had of any kind; whilst linseed cake was £12 10s. per ton, and barley was worth only £8 per ton. This immense quantity of meat was being produced in that neighbourhood when its price was 15d. a pound, and the *Times* wrote that, so far as meat was concerned, famine was at our doors; at that critical juncture I received an order from the Excise not to feed any more sheep upon this grain. About the same time the result of Mr. Lawes's experiments came before the world, and its effect was to lead to the belief that raw grain was superior to malt; but I must tell you that amongst all Mr. Lawes's experiments there was not one in which malt or barley was used alone, for if there had been Mr. Lawes would have been obliged to insert an extra column in his report for the sheep which had died from the use of raw grain, because raw grain is a deadly poison for sheep if they are permitted to consume it *ad libitum*.

THE CHANCELLOR of the EXCHEQUER: Any sort of grain?

MR. SEAMAN: Wheat and barley. Many farmers said, "Well, if raw grain is as good as malted, it must be as harmless;" so they began to use raw grain on the faith of Mr. Lawes's experiments on the feeding of sheep, and the result was in many cases a loss of fifty per cent. This germinated grain undergoes a change before it enters the body of the animal.

THE CHANCELLOR of the EXCHEQUER: By fermentation?

MR. SEAMAN: Yes; and the noxious element being destroyed, the sheep can feed upon it, as I said, *ad libitum*, and produce an immense quantity of meat. For example, two lbs. of germinated barley will produce three lbs. of mutton per week on each sheep, and that without mixing linseed cake with it. In fact, no other food is required to be mixed with it, and now that we have such enormous importations of maize, wheat, and barley, I have no hesitation in saying, should an almighty fiat go forth to take away from us our green crops, our peas and our beans, there would be enough maize, wheat and barley supplied to prevent meat from being dearer than it is now.

MR. GARDNER (Essex): I am able to support what my friend says on every point; and have to hand you a sample of germinated barley cooked and prepared for food.

THE CHANCELLOR of the EXCHEQUER: Is that pure?

MR. GARDNER: Yes; and now I hand you another, which you see is composed of leather, rags, fibres, and hair. It shows you how we are victimised in our cake.

THE CHANCELLOR of the EXCHEQUER (holding up what appeared to be a strip of leather about six inches in length): Is this what you are supposed to give your beasts as cake to eat?

MR. GARDNER: Yes, and we should not be in that position if we had the opportunity of making our own food.

THE CHANCELLOR of the EXCHEQUER: What is this first sample?

MR. GARDNER: That is germinated barley cooked on the malt-kiln.

THE CHANCELLOR of the EXCHEQUER: Without linseed?

MR. GARDNER: Yes, or anything else. This is malt, so called; but it would not suit the purpose of the brewers to buy it.

THE CHANCELLOR of the EXCHEQUER: It is made from an inferior kind of barley?

MR. GARDNER: Yes, and the tax on that barley is not less than £6 1s. per ton.

THE CHANCELLOR of the EXCHEQUER: The tax on the malt that a ton will produce?

MR. GARDNER: The barley this malt is made from I can purchase in the market at £6 1s. a ton, and if I convert it into cattle food at the duty of 21s. 8d. per quarter, the tax brings up the price of this valuable cattle food to £13 15s. a ton. What the malt tax does is to prevent me and all my brother farmers from making use of the grain which we grow for the purpose of producing meat.

MR. WHITWELL (Peterborough): I wish to say a few words on behalf of the labourers. At present they may as a class be said

to have no beer. I have seen many of them with their bread and bit of cold meat, and nothing but water or a little weak tea or coffee to wash it down; and if anybody supposes that they drink that from choice, he has only to take a bottle containing a pint or so of beer for each labourer before him to see that he is delighted at the prospect of having something which he does not very often get. I must say that if the malt-tax were repealed, the labourer who cultivates a small quantity of land would be able to turn the little produce of his garden or allotment, which is often barley in the rotation, into malt. If there were no restrictions he could easily get it malted, and he and his family, instead of having no beer from one week's end to another, might have a quart a day. Thus the labourer would be kept at home, and the public-house would be compelled to sell a better article in order to attract customers. I consider that the position of the agricultural labourers has not occupied sufficient attention in reference to the malt tax. It should be remembered that the labourer has very few articles of food. As a rule he has only bread, cheese, and a little meat to eat, and the everlasting tea or cold water to assuage his thirst in summer. If beer were added to the list he would bless the Chancellor of the Exchequer.

The CHANCELLOR of the EXCHEQUER: I should like to ask a question. Supposing it were possible to transfer the collection of the tax from the maltster to the brewer, do I understand that that would be considered—of course it would not be as good as taking it off altogether—a great relief? (Several voices: "Yes.")

Sir G. JENKINSON, M.P.: It would set free the farmers to use his produce for feeding his animals.

The CHANCELLOR of the EXCHEQUER: Do the gentlemen here present think that the inferior kinds of barley would then be more available for that purpose?

Exclamations of "Decidedly."

Mr. BIDDLE (Suffolk): The malt-tax bears most oppressively upon the labourer who brews for himself and his family. I know that the practice of cottage brewing at the time of harvest has been denied; but I have gone round among the homes of a number of labourers in my employment, and have found them engaged in brewing. For the last twenty years cottage brewing has in fact been the rule in my neighbourhood. Independently of the malt which, as employers, we give at the time of harvest, every labouring man brews two bushels of malt in the year, which would cost at the present time 18s., or 9s. a bushel. The other day I sold barley in Ipswich market at 4s. a bushel, which would have made as good malt as the labourers use, and from the evidence given years ago before the committee which sat on the subject 1s. a bushel would be ample for the malting. And yet with these two bushels of malt the labourer would brew 288 pints of beer—that is something like three-quarters of a pint a pint on the average. I ask you, then, sir, to consider the labourer's case and to deal with it. It appears to me that it is not fair or consistent with commercial principles that he should be required to pay cent. per cent. in the form of a tax on malt if he brews at his own home.

Mr. LEMAN said that if the tax were placed upon beer instead of malt, that would give the same amount of revenue, while the farmer would thus be relieved from the great inconvenience under which he now suffers through the restrictions with regard to malt.

Mr. JASPER MORE: I wish to observe, sir, with regard to this question, that the deputation seem to me to be placed rather in a difficulty. You are no doubt aware that previous Chancellors of the Exchequer have asked similar deputations to the present one, what substitute they could suggest for the malt tax, and when they have proposed one they have been twitted with being amateur Chancellors of the Exchequer.

The CHANCELLOR of the EXCHEQUER: That is a common fault on these occasions.

Mr. J. MORE: We have felt, sir, that as there might be a division of opinion on that point, the wisest course on this occasion is to leave the question of providing a substitute for the malt tax to you (cheers). As a member of the Malt Tax Committee I beg to draw your attention to the evidence given by the excise authorities who were examined before that committee.

The CHANCELLOR of the EXCHEQUER: You allude to Mr. Forsey and Sir Charles Presby, I have read the evidence.

Mr. J. MOORE: Yes, they said that they regarded it as pos-

sible to draw the same amount of rent from other sources. I believe it would be a relief to the farmers if the tax were transferred from the maltster to the brewer; and I am prepared to say that the farmers would consent to a tax being levied on private brewing.

Mr. LATIMORE: Allow me, sir, to say a few words as an old advocate of this cause. As far back as the year 1847 I formed part of a deputation to Lord John Russell, when he was Prime Minister, on this question. In 1849 a number of leading manufacturers invited a deputation of farmers to discuss this question with them in London. I had the honour of taking part in the discussion, and the result was that the conference declared that something was due to farmers, that their movements were fettered, and that they had not then that fair play to enable them to contend with the unrestricted competition of the world to which they were entitled. But these manufacturers mentioned one condition, they said: "If you will help us to get rid of the agitation for the revival of protection, we will help to free you from the fetters to which your industry and occupation are subject." I am sorry to say that a portion of the agriculturists did not at that period see their interests so clearly as they do now; but, the pressure of circumstances, the competition of prices, the increase of wages, the vicissitudes of seasons, and the introduction of disease by foreign cattle, have devastated their property, if not emptied their purses; and I feel humiliated to think that 24 years after the deputation to Lord John Russell, to which I have just alluded, when he declared that he could not answer the arguments advanced in favour of the total repeal of the malt-tax, there should be a necessity, sir, of appealing to you to do what, in my opinion, ought to have been done by your predecessors. I want to say one word about the tax if I have not wearied you already.

The CHANCELLOR of the EXCHEQUER: Oh, no.

Mr. LATIMORE: The other day Mr. Bass remarked as a member of a deputation which waited upon you, that he considered that a duty of 3d. a barrel on beer was so infinitesimally small a tax, that he could not recoup himself for it from his customers, and that a tax of 3s. or 4s. a barrel would be required, that being something tangible.

The CHANCELLOR of the EXCHEQUER: Mr. Bass said the other day, if you put the tax on beer, you may leave me alone to get it out of my customers.

Mr. LATIMORE: I hope, sir, that this is the last occasion on which any deputation will wait on a Chancellor of the Exchequer to bait him on this subject. It seems to me exceedingly desirable that this tax should be entirely abolished, because it fetters industry and impedes cultivation, because of the evil effects which are seen in the wan and discontented faces of the labourers, and the manifest tendency of the tax to increase drunkenness and adulteration. The temptation to adulteration is greatly strengthened by such an impost. Beer is the natural beverage of the agricultural labourer, and if malt were free the result would be to do away with the incitement to adulteration, and at the same time to diminish the temptations to excessive drinking. Something has been said to-day respecting Mr. Lawes's experiments on the feeding of cattle with malt and barley. I hold in my hand a copy of some comments of my own on that subject. I went over Mr. Lawes's farm, and I pointed out at once animals which had been fed on malt and others which had been fed on barley. I must say that I cannot regard Mr. Lawes as a good authority on the question of using malt for feeding purposes. In the very year in which his experiments were made he lost one-third of his lambs and sheep for want of malt. His own shepherd admitted to me with tears in his eyes that his master had lost a large proportion of his flock for want of that very article which his master persuaded the Government was not necessary for feeding. While he was thus misleading the Government he had himself just lost one-third of his flock for want of malt. Arguments on this subject seem to me to have been exhausted. What I rely upon is the imperishable principle of justice. It is indisputable that agriculturists have suffered in this matter partly from their own mistakes and partly for want of honesty on the part of landowners who have not been true to the tenants in reference to the malt-tax. There would have been no opposition scarcely to repeal on the part of governments if the county members had all acted up to their duty and determined that this question should be settled for ever; and I need hardly say, sir, that in-

perishable honour will attach to the name of the minister who shall remove the malt tax.

The CHANCELLOR of the EXCHEQUER: Well, gentlemen, I will make one admission to you very cheerfully, and that is that it is quite impossible to levy a revenue approaching £7,000,000 upon a single article of agricultural produce without very much interfering with the cultivation of the land and with the business of those who are engaged in it. It would be useless to attempt to conceal that state of things. It is absolutely impossible that the tax should not have a very great and very embarrassing effect. That cannot be doubted for a moment. I will make another admission: I think it is exceeding undesirable—perhaps in taking this view I am influenced a little by early prepossessions and associations—that a large, most important, most respectable, and respected class like yourselves should live in a state of chronic discontent, thinking itself ill-treated; and, therefore, nothing would give me greater pleasure than to hit upon anything which might be in the least degree gratifying or satisfactory to you in this matter, and which would not only be of service to you, but also beneficial to the country at large. I do not wish a great class like that to which you belong, to think that it is not well treated, because, although the feelings which you entertain may be exaggerated, yet I believe you entertain them honestly and truly. I do not wish any large class like yours to consider that it is passed by, or neglected, or not treated as fairly as anybody else. Of course, as to taking off the malt-tax, I must tell you frankly, that the thing is simply impossible; and for this reason, that all our duties on fermented and spirituous liquors hang together. Even supposing it were in my power, supposing, that is, I had the means of doing it pecuniarily, still I could not recommend it, because that would immediately shake the whole foundation, upon which rest some £15,000,000, raised upon spirits. We cannot look at these things separately, we must look at them as a whole; and, therefore, it would be vain for me to hold out any hope of that kind. Whether we may be able to reduce the duty is another question. Do not imagine that I should look

upon reduction unfavourably; on the contrary, I should be very glad if it were in my power to reduce it. As to the views which you have placed before me to-day, they shall be most carefully considered; and I do not say that as a mere matter of courtesy, by way of sending the deputation away from this room in a good humour. We shall look into the thing as minutely and carefully as we can; and I am bound to say that if we can find any means of putting whatever duty we collect upon a later stage of the manufacture, upon beer instead of malt, nothing would give me greater gratification than to propose that. Of course there are great difficulties in the way, and one difficulty is the question of the private brewers, and how to deal with them (Several Voices: "Licences"). But I could not take a licence-duty from a labourer.

The Rev. E. SMYTHIES: You take one for dogs.

The CHANCELLOR of the EXCHEQUER: The next objection is, that you would be liable to fraud, inasmuch as people would make any excuse in order to undersell others (A Voice: "You might send them to gaol"). Well, the whole case is full of difficulty. I don't say that anything can be done. Don't go away with an impression that I make any promise to you. All I can say is that we are now looking, and we shall look, carefully into the question; and if we can hit upon any means by which we can set your industry more free, and redress the matters of which you complain—and it seems to me that your complaints are exceedingly fair and reasonable—it will afford us great pleasure to do it. On the other hand, if it cannot be done, I shall endeavour to give good reasons for not doing it; and it will not be for want of good-will, but because we find it impossible to do it. More than that I cannot say.

Col. TOMLINE: I am sure the deputation will agree with me that our thanks are due to the Chancellor of the Exchequer for the manner in which he has received it.

The interview, which occupied about three-quarters of an hour, then terminated.

THE IRISH LAND QUESTION.

The great fight of the Session has already ended in no fight at all. The wholesome influence of an Opposition has come in this matter to the Opposition exercising no influence whatever. Four evenings have been occupied in dull and almost unprofitable debate, and some dozen or so of members have declared themselves not satisfied with the Irish Land Bill. Most reasoning men had long since arrived at a directly different conclusion. The Premier, in fact, had in the very outset carried the country with him; and, if never Quixotic enough to expect to tranquilize all Ireland, those best qualified to judge will best know how well Mr. Gladstone has succeeded. As we said when he first made his statement, "of all the pamphlets, essays, letters, or reports we had met with, there was none to compare with that address." Nevertheless, the measure is essentially Irish in its tone, many of its provisions being thoroughly inapplicable to any other part of the United Kingdom, as no doubt for this very cause its value is the greater. It was a special case that required special treatment, and nothing probably would create more dismay than any attempt to establish so exceptional a remedy as a precedent in other places. Mr. Samuelson, a gentleman whose very name in some degree identifies him with Agriculture, said he "regarded the Bill as a most important step in a course of legislation which he believed would be both a benefit to Ireland and to the Empire at large." From the context here one would be inclined to gather that the Irish Land Bill might furnish the framework, or its principle be extended to other occupations where there has so far been no experience of such peculiar usages. Whereas, nothing would promise

to be more pernicious. The demarcation line between Ireland and rest of the United Kingdom, or even of the Continent, in the way of land tenure could scarcely be drawn more strongly than by the ocean itself. As we have previously endeavoured to show, there may have gradually grown some reason for the recognition of Good Will, for Security which almost amounts to Fixity of tenure, and so forth. There may be right and justice in maintaining a race of cottier farmers, or in allowing to tenants something of the position of proprietors; but all such Custom has come more as a matter of necessity or of expediency rather than of sound policy, and the lesson which we learn is that we cannot too carefully avoid the encouragement of these practices elsewhere.

So far, indeed, as England is concerned, the discussion might be forgotten forthwith, saving, perhaps, but for one speech of remarkable practical ability. It was only last year, if we remember aright, that Mr. Henry Chaplin, a new member of the Commons, fairly took the House by storm when touching on another phase of the Irish difficulty. There was not so much scope now; the subject was not one of so much general interest, but the honourable member for Lincolnshire has by no means disappointed his early promise, and it may be, possibly, because he is one of the members for Lincolnshire that he has on this occasion done so well. He is one of the few, one of the very few, who have essayed to compare the two systems of tenure with anything like success, and in doing so he has been able to speak with an air of singular authority. Mr. Chaplin is not only a

county member, but a country gentleman; a large landed proprietor in Lincolnshire, upon whose own estates the English Tenant Right principle has demonstrated its use and worth. That, if anything comes consequentially from the adjustment of the Irish land question, there will be the more general establishment and appreciation of the English Tenant-right Custom is already sufficiently evident. More and more attention is being called to this matter; people with a prejudice grounded in ignorance are beginning to educate themselves, very possibly on the incentive that it may be as well to know something of English as of Irish Customs. Men like Mr. Caird may have persistently ridiculed or confounded the English Tenant Right, and others, taking the cue, have more recently spoken to "that old offender," Custom of Country. But the time for this sort of thing is rapidly passing away, when every man who knows anything of English agriculture, when every man who reads him or heard him will testify to the excellence of Mr. Henry Chaplin's speech. And it was in this wise that he spoke: "In England especially in those parts of the country where agriculture was carried to the highest perfection, there was something which was entirely wanting in Ireland—namely, a marked, distinct, and accurate system, capable of being enforced at law, assuring the tenant that he would be amply repaid for everything that he had laid out in the cultivation of the soil in the event of his being ejected from his farm. He would take as an instance the Custom that prevailed in the county which he had the honour of representing—and he did not think he should be accused of undue partiality when he asserted that his county stood pre-eminent for the excellence of its cultivation. In no county was the science of farming carried to such perfection, or capital more liberally expended upon the soil, and nowhere was the identity of interest between landlord and tenant more fully recognised, or were more cordial and kindly feelings entertained between them. And yet this was a county where leases for a term of years were practically unknown, or, at all events, were very rare. It would merely weary the House were he to enter into details with respect to the various arrangements. They were many, and necessarily so, because in themselves the operations of farming were of a very multitudinous character. Under those arrangements compensation was amply provided for everything that could be laid out in fair farming, the amount of compensation to be paid being fixed by a valuer or valuers, and a third party being called in to act as umpire if necessary. So simple was that operation, and so well known its results, that an appeal to law or a dispute scarcely ever arose; and not the least advantage of the system was that it applied with equal effect to small or large farms. By this means security of tenure and its attendant beneficial results were attained; and although no man could more heartily acknowledge than he did the cordial and kindly feelings mutually entertained with respect to each other by the landlords and the tenants, yet in his judgment those feelings were mainly due to the uniform operation of the just and effectual system of Tenant Right to which he had referred."

Can anything be clearer than this? There are people who will tell you that a tenant who farms on a yearly agreement has nothing more than a blind confidence in his landlord, that he has to depend on good-feeling which may be destroyed in a moment, that this is not business, and so on. But Mr. Chaplin, on the contrary, shows us that this *is* business, and that nowhere do landlord and tenant do better than where such an arrangement is in force. It may be useful, in truth, to compare the clear, concise, and straightforward phrase in which Mr. Chaplin puts the advantages of his Tenant Right with the half-hot and half-cold air with which Mr. Sewell Read ap-

proaches the subject: "The custom as between landlord and tenant in Ireland was, as far as he could learn, precisely the same as in England, the difference, if any at all, being in favour of the Irish tenant. There were, for instance, more leases in Ireland, and when the Attorney-General talked about Derbyshire and Lincolnshire Tenant Right, he would merely observe in reply, that in the large majority of counties in England there was no Tenant Right at all, and that in Norfolk no shadow of a custom of that kind existed. Irish members might, however, say, 'You have covenants in Norfolk, which we look upon in the light of a compensation for unexhausted improvements.' Those, however, constituted simply a reservation which was made by the landlord for his own benefit and the benefit of the estate, so that the outgoing tenant should at the expiration of his tenancy leave the roots and hay and straw to be paid for at a certain valuation." It would be difficult to say from this whether Mr. Sewell Read would wish to see the Lincolnshire principle extended or not. As reported the honourable member would almost seem to imply that as they had not got Tenant Right in Norfolk they did not want to have it; especially as the custom is "precisely the same between landlord and tenant in Ireland as it is in England." That is, of course, precisely the same *with a difference*. There are some features or claims which no doubt resemble each other, but it is simply preposterous to assume that the Customs are anything like identical. Proportionately, indeed, as Mr. Chaplin is happy in distinguishing the two systems, does Mr. Sewell Read contrive to confound them. He talks of English and Irish in the same breath, with a kind of running accompaniment of indifference to either. "He did not mean to say that the English system was right and the Irish wrong," and so forth. In almost every respect Mr. Chaplin's is by far the more masterly disquisition of the two. He not merely defines the merits of the Lincolnshire Customs, but he proceeds to show in striking contrast the many objections which an Englishman must hold against the usages that have sprung up in Ireland. We can only repeat it would be advisable to keep the two systems as distinct as possible; with one we should have nothing to do, while with the other it is clear that we shall have more to do. In so long a discussion, however, some comparison between the two would naturally crop up; but until Mr. Chaplin spoke the English principle was never fairly represented. There are, indeed, so far as British agriculture elsewhere than in Ireland is concerned, but two speeches in the debate that are worth dwelling upon. If we may dismiss some other authorities with or rather without a word we must give Lord Elcho almost equal credit with Mr. Chaplin. If the one was the champion of improved farming in England, the other as ably spoke to any advancement in Scotland; while both arrived at the same conclusion from their several experiences as to the inevitable wretchedness which must arise from the cottier system of either tenure or proprietorship.

Within the last few years or months every reasonable right has been conceded to the Irish, and with the ground thus cleared, the one remaining duty of the Government must be to meet disaffection with as rigorous a rule as the necessity requires.

Mr. C. S. READ had never doubted, when once he had heard the principle on which the Bill was founded, that it would be his duty, as well as his desire, to support the second reading. He knew that under the Bill certain rights of the landlord were abrogated; but those rights had been so long in abeyance that they were of little pecuniary value, and if you could not enforce your rights it did not signify whether you possessed them or not. New rights, however, would be created, and the remedies of a good landlord against a bad tenant was

to simple that he believed, on the whole, landlords in Ireland would be gainers rather than losers by the Bill. As to the Ulster tenant-right, he thought the Government had used a merciful consideration in not extending it all over Ireland. As a tenant farmer, he knew no right so stupid and, at the same time, so unjust. It was stupid, because it professed to give a man an interest in the land, whereas it really made him bury his capital during the whole time of his occupation, and in all probability prevented him from cultivating the land as he should cultivate it. Then, too, in selling the goodwill of the farm he was selling that which he had no right to sell, and, therefore, the custom was unjust. It was wise, also, on the part of the Government not to attempt to define that which they really could not define. There were so many varieties of the custom, not only in the Province but in the same parishes, and even on the same estates, that it would have been impossible to define what Ulster tenant-right was. He supposed the Bill left things exactly as they were; but if leases had been given at a reasonable rent for the express purpose of abolishing the right, that stipulation should not be made void; and, again, if a landlord had bought out the tenant-right, a new tenant should not be able to claim a right of seven years' occupation as he would do, if ejected, under Clause 2. He hoped, also, that if a tenant had made a bad bargain, by giving twice or thrice as much for the tenant-right as it was worth, he would not be at liberty to turn round upon his landlord and so recoup himself. Cordially approving the definition of what was to be regarded as an improvement, he was glad that the presumption in favour of the landlord as to improvements should cease, and that there should be compensation for retrospective improvement; but there should be some limit of time as to these, and, even in the case of reclamation of land and buildings, 20 years back ought to be sufficient to recoup anyone for what had been done. Moreover, the tenant and not the landlord should be called upon to prove who were at the expense of retrospective improvements. His sympathies were, of course, with the Irish farmer; but he could not see the justice of the clause under which the Irish farmer was to be paid for interruption of tenancy. If the tenant had expended any money, and his prospects were interfered with, he should be paid to the full; but it was not easy to see why he should be paid for interruption of occupancy; and, admitting that he should, there was a chance, as the Bill stood, that he who lost most would get least. For example, if one man rented a cheap farm at £5 a-year, and another rented a similar farm at double the money, the one man would be paid £70 and the other only £35. As to a small farmer, he would receive much less injury than a large farmer. A holder of three or four acres of land would be all the better for being made an agricultural labourer, whereas there was no more miserable being than a broken-down farmer of 100 or 200 acres. In England, if you did not make him relieving officer, or surveyor to one of the new highway boards, or put him into some other office for which he was not at all fit, he speedily became a candidate for the Royal Agricultural Benevolent Institution. Under the Bill, the small holder, if ejected, would receive money with which he might emigrate or seek employment elsewhere; and as it was now the almost universal rule in Ireland to give money to an ejected tenant of this description, the Bill merely legalised a custom. The hon. member (Mr. Samuelson) had quoted from Dr. Voelcker as to small farmers in Belgium; but he should have quoted the conclusion of the writer, that their earnings were lower than those of an agricultural labourer. He (Mr. Read) was greatly in favour of agricultural leases, which ought to be given in all cases where you could find an enterprising and a wealthy tenant; but indiscriminate leases in small holdings would be an injury rather than a benefit. He was told that the Irish people repudiated the provision in the Bill that agricultural leases of thirty-one years were to stop litigation. If that were so, the Irish were the most unreasonable people in the world; and if a landlord said to a man, "I will give you a thirty years' lease, with compensation for unexhausted improvements, at a rent which cannot be extravagant, because it must be submitted to the court," and the tenant was still dissatisfied, he (Mr. Read) would not try to make him satisfied. Would it not be well that at the expiration of the thirty years those parties should be treated more as civilized beings, and should be allowed to contract themselves out of the provisions of the Bill? There was one

remark which he wished also to make on that portion of the measure which related to the creation of small freeholders. It would not, in his opinion, answer, because it could not be made to pay. Poets, politicians, and philosophers always looked on small freeholders as a very happy class of men; but he regarded them, as a rule, as most miserable; and it would not, he thought, do to try to bolster up a system which was gradually dying out merely because it did not pay. If a man happened to be the owner of 100 or 200 acres of land which he farmed himself, he invariably found that he could not make above three per cent. on the money which was invested in the fee-simple, whereas he could make eight or ten per cent. if he invested as a tenant. The result was that he sold his land when he could, and became a farmer on a larger scale. He might illustrate his argument by his own case. He was a little freeholder, and he had a small farm which he let, while he rented a large one. If it were not for the law of entail he should sell the little freehold; and he might observe, in passing, that when persons talked about the law of entail operating to keep large estates together, they should remember that several small estates were protected by that law from being snapped up by some large proprietor. He must express his most cordial concurrence with the right hon. and learned gentleman, the member for the University of Dublin, when he said that what Ireland wanted was not so much the creation of a peasant proprietary as a greater number of landed gentry. It struck him that in that country there was no middle class. There were the owners of very large estates and small squires; tremendous land-agents in Dublin, with their offices all over the country, and insignificant, miserable bailiffs who did the work for them. There were also great graziers occupying 2,000 or 3,000 acres of land and cottier farmers, but he looked in vain for those men with 200 or 300 acres of land who farmed and who constituted the bone and sinew of England. There were in Ireland large cattle dealers and little men who dealt in pigs and poultry, immense stores in the cities, and hardly anything between them and the little retail shops. What was wanted, therefore, in Ireland was, he believed, the creation of a middle class, which could never be created until life and property were more secure in that country. Now, when hon. and learned gentlemen differed about points of law it would be very presumptuous in a practical farmer to pronounce which side was right and which wrong, but he must nevertheless say that the custom as between landlord and tenant in Ireland was, as far as he could learn, precisely the same as in England, the difference, if any at all, being in favour of the Irish tenant. There were, for instance, more leases in Ireland, and when the Attorney-General talked about Derbyshire and Lincolnshire tenant-right, he would merely observe in reply, that in the large majority of counties in England there was no tenant-right at all, and that in Norfolk no shadow of a custom of that kind existed. Irish members might, however, say, "You have covenants in Norfolk, which we look upon in the light of a compensation for unexhausted improvements." Those, however, constituted simply a reservation which was made by the landlord for his own benefit and the benefit of the estate, so that the outgoing tenant should at the expiration of his tenancy leave the roots and hay and straw to be paid for at a certain valuation. But what did the Irish tenant do? He sold out everything at the full market price, whereas the English tenant was bound to leave those things which he had mentioned on the farm at the consuming price, which was only two-thirds of their value. He did not mean to say that the English system was right and the Irish wrong, but the Irish tenant, he thought, had the advantage at least in that respect. He should like, he might add, when leases were introduced into Ireland, that some little better definition should be given of the rotation of cropping, and that the tenants would be good enough after they had signed a lease to stick to it. There was one remark in the opening speech of the Prime Minister in which he could not concur, and that was when he showed the increase of rental in different parts of England to show how agriculture had prospered in recent years. In a great number of instances it would be found that in consequence of the development of minerals and manufactures the rental had increased, while in other parts of the country the liberal expenditure of capital in the first instance by the landlord, and in the second place by the tenant, had produced a similar result. That was no doubt the case both in England and Scotland, but looking at Ireland he found

land there was as cheaply rented as in any country in the South and West of Europe, and infinitely more cheaply than the land either in Scotland or in this country. He believed on the whole that the bill of the Government was calculated to do a great deal of good. He did not suppose it would satisfy the Irish tenant farmers as a class. He for one should not attempt to give them all or even half they asked, but he should be very happy to give them all they deserved, and the present bill would, in his opinion, do them ample justice.

Lord ELCHO: After listening last night to the speech of my right hon. friend the member for Lisakeard, and also this evening to the speech of the hon. gentleman who has just sat down, my memory goes back a few years, and a flood of varied recollections comes over me ("Hear," and a laugh). I congratulate my right hon. friend at the head of the Government on having obtained the hearty and ardent support of my right hon. friend the member for Lisakeard for this measure. My right hon. friend last night made, if I may so call it, his baptismal cry—it was his first speech in this House since he passed through the baptism of a dissolution; and when I heard him, without any criticism of any sort or kind, praise the Bill of the Government, the conclusion I came to was that his regeneration had been by total immersion (laughter). My hon. friend the member for Galway told us that he lately returned from the East, and that his path there had been marked by skeletons—not the skeletons, I hope, of his former sentiments (a laugh). I had read that in his pilgrimage he visited the residence of the ancient poet-king of Israel, and there renounced independence and all its works on his knees (laughter); but I am glad to find from his speech this evening that, after all his roving, he still retains this amount of independence, that, while giving his cordial support to the second reading of this Bill, he does not fail not only to criticise it, but to produce what is to some extent a rival scheme to that of the Government ("Hear," and a laugh). For myself, I am not an Irishman, or an Irish proprietor, and I cannot profess to speak as one conversant with Irish habits or ways. Therefore I do not attempt to discuss with my hon. friend (Mr. Gregory) the rival measure that he has laid before us. I should not have ventured to obtrude myself in this debate were it not that as a Scotch member I see in this Bill principles so novel, so sweeping, so revolutionary in their character, so totally opposed to anything we have ever seen in the shape of legislation up to this time in this House, that I feel bound to enter my independent protest (Hear, hear). Do not let it be supposed that I am hostile to legislation. I agree with my hon. friend (Mr. Gregory) in thinking it necessary that this question should be settled speedily, in the interest of both landlords and tenants. A measure on this subject became necessary when it was reported by the Devon Commission as being so; it became inevitable when Bill after Bill—the "skeletons" of which my hon. friend has spoken was brought into this House, and when my right hon. friend at the head of the Government said, with his enthusiasm and eloquence, on taking the reins of power, that this was one of the questions for the settlement of which he went into office. But for myself I will only further add that there is no man in this House who more heartily sympathizes with the concluding passage of my right hon. friend's speech, in which he expressed a hope that this Bill would produce blessings on Ireland. I am sure there is not a member of this House who, however he may criticise the provisions of this Bill, does not heartily wish that in this Session we may at last bridge over the Irish difficulty, and tie the Irish people to us by ties stronger than those of law and empire. But I think we should approach this question undeterred by agrarian outrages from going liberally into the subject of tenant-right, and uninfluenced by the exaggerated language or the confounding views of some of those who advocate the tenant's cause. On the other hand, we should not go into this question in any way scared by that Fenianism which has of recent years sprung up. The Secretary for Ireland has pointed to what was the state of things four years ago, and he said a great advance had since been made. Sir, I should like to go back four years—to the time when there was in this country a Minister as powerful and as able as my right hon. friend, who had besides the advantage of being an Irish proprietor with a well-managed estate. He epitomized this Irish question by saying that "tenant-right was landlord-wrong" (Hear, hear). We ought to look at this Bill from a landlord's as well as a tenant's point

of view, and we ought to see what there is in this Bill that comes under the head of landlord wrong, for there are in this Bill principles which to a certain extent do wrong to the landlord's of Ireland. I am told that the provisions of this Bill will lead to the growing up of tenant-right, under certain circumstances, after it has been bought out by the landlord. I know that view is taken by some of the Ulster landlords. The whole question of tenant-right must appear to persons on this side of St. George's Channel as being a matter which it would be very questionable policy to establish, especially when a person who is acknowledged to be one of the best Irish landlords (Lord Dufferin) has bought up the tenant-right on his estate, because he thought it inconsistent with the proper and beneficial management of the land (Hear, hear). I am told that the abuses of that system are carried to such an extent that on the estate of Lord Waterford, in the north of Ireland, forty or fifty years' purchase is given for the land. We may guess what a miserable existence must be that of the tenants, and how deeply indebted they must be to those of whom they borrow the money (Hear, hear). To a stranger looking at this question, it appears to be a landlord-wrong that, as to claims for compensation, you should throw upon the landlord the *onus probandi*; that he has not made the improvements. I can understand it being required that by one or the other the proof should be given, but I cannot understand that it should be thrown wholly on the landlord, especially when, as regards buildings and the reclamation of land, there is no limitation of time. As far as the provisions of the Bill go, there is no much limit, and you might go back to the Deluge, which was, I presume, the time when land began to be reclaimed (laughter). Again, the provisions as to cottiers appear to me to be a landlord-wrong, because the Bill enables tenants, but not landlords, to give land to cottiers. With regard to purchase, if the House wishes to lend money to enable tenants to buy estates, I should be the last person to object. Parliament has lent money to landlords to enable them to drain their property, and on the same principle money might be lent to tenants to enable them to purchase estates when they can do so. But I am told that if an Irish proprietor has a mortgage on his property, the mortgage or bond-holder can force him to sell in the Encumbered Estates Court, and if the tenants choose to combine they can force him to sell at any price which they may offer, for no one else dare step in and bid more money (Hear, hear). These are points which appear to me to be deserving of consideration in Committee on this Bill. But there is another point. What will be the effect of this Bill not only upon Irish, but also upon English and Scotch landlords? (Hear, hear). It will affect property of all kinds, whether funded or landed, and it will affect employers of labour. Again, it interferes with contracts and gives compensation for what is called "disturbance" (Hear, hear); and to these two points I wish to direct the attention of the House. The question of contracts divides itself into two parts—you forbid contracts and you regulate them. To forbid contracts appears to me to be a novel principle, and one which goes directly in the teeth not only of recent legislation, but of legislation which we are promised this Session. In coming here to-night I passed the house where for two years I sat on a Commission for inquiring into Trades Unions, and that Commission unanimously came to the conclusion that in these days of free-trade and free contract, it was not right that any class of men should be prevented from combining to get what they could, and to make their bargain with their employer, and a Bill embodying, I presume, the views of that Committee is to be brought forward in this House. How can my right hon. friend reconcile the principle of forbidding agreements in this Bill with the principle of free contract in the other Bill which is to come before the House? The Secretary for Ireland gave us a gauge upon this question; he said that four years ago there was not any such proposition, but we have made a very great advance. Again, as to the regulation of contracts. The Bill proposes to regulate the length and the terms of leases and the rent, and, adding to that the clauses relating to disturbance and to ten-acre holdings, the Bill really gives what the extreme party in Ireland want—fixity of tenure, with rents regulated by the Government. I believe that no Scotchman except myself has spoken in this debate, and I am, therefore, curious to know what the Scotch members who support the Government think of the regulation of contracts. In what does that regulation consist?

You regulate the length of leases, and say that in some cases they are to be for 31 years, in others for 21 years. A 31 years' lease is to cover this, but not to cover that, yet a 21 years' lease is to cover almost everything (Hear, hear). Among the matters which a 31 years' lease is not to cover is the reclamation of land; and I should like to know what my Scotch friends can say of that. In the first place I think they would not like 31 years' leases by way of trying to raise in Ireland a condition of land tenure similar to the conditions in England and Scotland. But if they do not like 31 years' leases, how do they like leases that do not cover the reclamation of land? Every Scotchman, and almost every man who has ever crossed the Tweed, well knows the prosperous state of agriculture in Scotland, where the heather is being reclaimed, and giving way to turnip crops, oats, and wheat. The extension of cultivation in that country is due entirely to the system under which 19 years' leases cover all such improvements (Hear, hear). I hope this matter will come home to the Scotch members when we go into Committee. The hon. member for Liskeard said he could not conceive, either on the ground of expediency or on any other ground, that the effect of the clause under similar circumstances could be different in the two countries. But you may have similar results with totally different circumstances. Upon what does the limitation of agreement in Ireland rest? Upon the poverty of the tenant, upon the impossibility, from his hunger for land, of his making a proper bargain with his landlord. I remember that last year a Bill on the subject of the Game Laws was brought into this House, and that Bill interfered with contracts between landlords and tenants. I heard the argument used by an officer of the Crown that the competition for land in Scotland was so great among the agriculturists, who can farm thousands of acres, and pay thousands of pounds in rent, that the law of hypothec (or the law of distress) and the Game Laws ought to be altered, because the parties were not in a fair position, owing to that competition, to make a bargain (Hear, hear). You may have in the two countries circumstances which are materially different, but lead to precisely the same results. If you apply the principle of regulating contracts in Ireland between man and man, and thus interfere with political economy, there is no earthly reason why you should not have the same principle applied elsewhere, and only yesterday I congratulated my hon. friend who brought in that Bill on the Government having adopted his principle, and applied it in their Irish land measures. It is another of those questions which did not exist four years ago in the Bill, which, according to my right hon. friend the Chief Secretary for Ireland, was drawn up by the firm friends of Ireland in that day. But, sir, we have made a great advance. The other point to which I will refer as objectionable in principle in this Bill is what is called compensation for disturbance. Now, in the legislation of this country this principle is as novel as the principle of the State interfering with agreements between landlord and tenant. The extent to which this principle goes has been pitifully described by my right hon. friend when he said, "This Bill will prevent a man from doing what he will with his own." It may be a right principle, but it is at least a new one. For what you propose is this: If a man, for any reason, with a view to the improvement of agriculture, with a view to adding to his own farm, or to his grounds, or for any other purpose, wants his property, he has to buy it back at seven years' purchase (Hear, hear). I heard a discussion at my house the other night between two gentlemen, both of them in favour of this clause on the whole, but one of them doubted whether it would work well, because a rich tenant might go and offer the landlord seven years' compensation for the farm which a poor man possessed. And what was the answer? It was this—supposing a small farm of ten acres at a pound an acre; the person who wished to get it would have to pay £70 in the first place for disturbance; there would, perhaps, be £30 more as compensation for improvements, and then to my surprise I heard that it would take from £30 to £40 more to clear away the fences (a laugh). What a state of agriculture that must be where on ten acres it would take £30 or £40 to clear away the fences! And that is the state of agriculture which you wish to stereotype and perpetuate (Hear, hear). I heard last night, in a speech of my right hon. friend, a very graphic description of two contracting parties, in which the one went about with double-barrelled guns, while the other crept behind a hedge to shoot him. What must have struck

every person when he heard that account was, what a shame that such a scandal should be suffered to exist (Hear). If you have not maintained law and order in Ireland, if you have not given that security to life and property which is the prime cause why Government exists, and therefore you say the whole law of contracts, and of the relations between landlord and tenant, is to be interfered with, it seems to me the most monstrous argument I ever heard uttered in the House of Commons (Hear, hear). With reference to this compensation for disturbance, I want to know where it is to stop? There has been a great deal of "disturbance" proposed by the Secretary of State for War the other day (cheers). He is disturbing the officers of the army, and yet he did not seem inclined to give them seven years' compensation (renewed cheers). But there is another class. As to the rich class of officers, like the landlords, my right hon. friend may come down on them; but there is a poorer class, a class somewhat in an analogous position to that of the tenants in Ireland, and that is the soldiers (Hear, hear). How did the soldiers that you are dismissing now enlist? For 12 years, with the power of going on for nine years more, and at the end of the 21 they were to be entitled to a pension. But they are liable to be dismissed at any moment if the army is reduced (cheers). And now my right hon. friend, with the view of helping the Chancellor of the Exchequer to a surplus of £5,000,000, strikes off 12,000 men at a time when there is great distress in the country (Hear, hear), at a time when the papers are full of various schemes of emigration which have found their way into this House (cheers). These men had a prospect after 21 years' service of 8d. or 1s. a day, but my right hon. friend strikes them off without any compensation (Hear, hear). But if you give compensation in the one case why not in the other, more especially when there is this stronger claim in favour of the soldier, that the soldier whom you send away uncompensated is a shootee (much laughter), while the tenant in Ireland whom you are going to compensate is a shooter (renewed laughter and cheers). I say these are very wild doctrines which have found their way into this Bill, and again I apply the gauge of the right hon. gentleman the Secretary for Ireland—"They were not in the Irish Land Bill four years ago, but we have made a great advance since then." And why? I can attribute it only to two things. I look upon these features in the Bill as the product of what I may call sentiment with saltpetre—that is to say, I believe that my right hon. friend, with his warm heart, kindly feelings, and impulsive nature, has been carried away by the wild deeds that have been done in Ireland from the sound views of political economy which he imbibed under Sir R. Peel, and that he thinks he is doing a kindly act to those men by establishing principles for their sake which ought never to have been mentioned in this House, and which I hope will not be found in this Bill when it is read a third time (Hear, hear). Now, any views of my own I naturally felt would require corroboration, and, therefore, I did this, and I think my right hon. friend will admit that the opinions I have got are sound. I sent one copy of the Bill to a well-known, first-class Edinburgh lawyer, quite conversant with the management of estates. I sent another to a country solicitor—what we call a writer—in one of the most agricultural counties in Scotland, who does more business with farmers, perhaps, than anybody else, and who is thoroughly conversant with everything connected with land. And lastly, I sent a copy to a gentleman, a Scotch proprietor, conversant with the management of land in Scotland, and who has also had the management of land in England. I said to these gentlemen, "Look at this Bill, at the principles you find in it, and give an opinion as to what you think." If the House wishes I will read the opinions I have received, because I think them the most valuable that can be got (Hear, hear). The Edinburgh lawyer says:

"There is danger of legislation for the exceptional state of things in Ireland, that it should familiarize men's minds with a state of things between landlord and tenant that would be destructive in England or Scotland. The landlord is not to be left really proprietor of the land, but the 'Court' is to take the part of proprietor. The bondholder is ignored. Rules issued by the Privy Council may protect him, but the Bill does not; landlord and tenant and Court agree upon a price which may be insufficient to meet the claim of the mortgagee. The preference given to the charge of

annuity of £6. 10s. per cent. on the land for money advanced by the Board of Works for improvements, &c., is an unjust provision for mortgagees."

(Hear, hear.) The country solicitor says:

"May be land has been let at a low rent in consideration of the tenant making improvements, or other such cases, but this is a compulsory power on the owner to make compensation without usage or contract, or without it ever having been contemplated by either party during the contract—it is a violation of the law of contracts; an entirely new principle in jurisprudence. This legislation for the future, according to certain fixed details only, is a violation of the rights of property, of the rights of the public, and a direct interference with the principles of free trade (Hear). The results would be injurious in a general sense. Altogether, the subjects for which compensation are allowed are too varied and undefined; rights of free trade are violated, contracts treated as waste, and the law upset."

The Scotch proprietor, who has also had the management of land in England, says:

"The first consequence would be to sow broadcast over the land the seeds of universal litigation, embittering instead of smoothing over the hostilities between landlord and tenant; hostilities which it is the direct interest of the lawyers and priests to keep awake. The machinery will probably be found inadequate for the vast mass of disputes that will come before it, and at the end of a few years we shall find the Courts choked with work, discontent as ripe as ever, fresh litigation necessary. The case being desperate, the remedy must be extraordinary, but any direct violation of the rights of property in land must in the end intensify the evil. My prescription would be contract. Coerce, if you cannot persuade, all who have to do with land to make their bargains by written agreement, by putting at a legal disadvantage whoever neglects doing so. And provide proper means for enforcing such agreements, and for teaching the Irish, if we can, the meaning and value of legal obligation. Their perverted views on this subject are at the bottom, not of the land difficulty only, but of all the other disorders in the country."

There is one more voice from Scotland to which I think my right hon. friend will listen with some deference. Among the many Scotch proprietors I bethought me of one who had property analogous to that of Irish proprietors—I mean Lord Lovat. I have been often on his estates, and there in Inverness-shire you see cultivation of the richest kind between some of the wildest parts of Scotland. Lord Lovat says: "I think, on the whole, the Irish Land Bill is a good one for that country under its present circumstances" (Cheers from the Ministerial benches). I don't say otherwise. I vote for the second reading (A laugh). I said so. I object only to two of its principles, and those principles I shall take every opportunity of voting against. You might as well give compensation for a disturbance from the Treasury bench (laughter). Indeed, I am not quite sure that my right hon. friend had not that in view, because he has fixed for the compensation to be paid to a certain class of tenants "a sum not exceeding two years' rent," and in recent times two years has been the length of time after which my right hon. friend has been disturbed from the Treasury bench (renewed laughter). Lord Lovat says:

"I think, on the whole, the Irish Land Bill is a good one for that country under its present circumstances, but there are some points on which it might be amended. I approve tenant-right being paid by the landlord where the tenant has paid it on entry to his farm, and there it should end. A 31 years' lease should cover all improvements on land, building, &c. I think 30 years is too long a period to go back for improvements—ten years would be quite enough. Unexhausted manures, if allowed for at all, should not exceed three years, and be very distinctly defined, otherwise it is only opening the door for the rogue to take advantage of the honest man. I do not approve agricultural leases being longer than 15 or 19 years. In my experience, both on my own estates and elsewhere, I have always found more improvement made on 15 or 19 than on 31 years' leases. Improvements are always made in the first five or seven years of the lease. In all leases made after the passing of this Act landlords and tenants should be allowed to contract together."

I thank the House for having listened to these extracts; I think they are of value considering the sources whence they

come; and perhaps the most valuable is that of Lord Lovat, who is a practical owner of land (Hear, hear). But these are only the opinions of practical men who are engaged in dealing with land, and I should wish, if the House will bear with me for a moment longer, to fortify my objection to certain principles of the Bill as contrary to sound legislation by the opinions of some greater authority than Lord Lovat whom I have quoted. I would present to the House one or two passages from speeches of a philosopher, sage, and orator, which, I think, bear out the view I am taking, and to which I would desire the attention of the House, and particularly of Her Majesty's Government (Hear, hear). I find it stated as follows in a speech made in this House in the year 1866:

"I hold it is a retrograde notion of jurisprudence to pass laws to limit the power of contract between landlord and tenant. I hold this introduction of a compulsory term into voluntary contracts to be a blunder, a solecism. All these attempts against nature, against the laws of political economy, and against that natural law which binds men by the contracts they make, must in the nature of things recoil, and the person whom you mean to benefit is injured by them. I have no doubt myself that in Ireland, more than anywhere else, it is necessary our legislation should be founded on principles perfectly broad, perfectly well ascertained, perfectly defensible upon the most abstruse philosophical grounds. You cannot give up principle without encouraging those dreams of reconquering land which has been taken from them. You must take your stand upon something; that something ought to be truth, honesty, and sound principle. If it is necessary to maintain them in England, it is ten times more necessary to adhere to them with punctilious accuracy in Ireland."

That, as I have said, was spoken in 1866, but in 1868 another speech was made, and I look to see if any change has come over the views which in 1866 I looked upon as being wise to a degree. In this latter speech, then, I find these words:

"As regards the laws of political economy, I believe they are the same on both sides of the Channel. As far as the right of private property goes, I would be no party to do anything in Ireland I would not do in England. There is an oasis in the desert of politics upon which we may safely rest, and that is afforded us by the principles of political economy."

I need hardly tell the House that the speeches from which I have quoted extracts were delivered by the present Chancellor of the Exchequer (Hear, hear, and laughter). They were two very remarkable orations, and when delivered had a remarkable effect upon the House, for it was, indeed, refreshing to be drenched with so much common sense, sound reason, and political economy (Hear, hear). I would particularly call the attention of the House to the last passage, in which the right hon. gentleman says: "There is an oasis in the desert of politics upon which we may safely rest, and that is afforded us by the principles of political economy." I regret that my right hon. friend has left that oasis. I regret it on his account personally, for I have a great friendship for my right hon. friend, but I should have regretted it on the nation's account less if he had left this oasis and gone out into the desert alone with all the sins of *Hansard* on his head (a laugh). But he has not done this. He has gone into the desert in goodly company, for the strongest Cabinet we have had for some years in this country has gone out into the desert under the guidance of my right hon. friend—and where will that guidance lead them to? (Opposition cheers). If we are to judge by the passage I have quoted, it can only lead to legislation for England and in Scotland similar to that which is proposed for Ireland (Hear, hear), and it is to this that I wish the attention of the landed proprietors, whether from England or from Scotland, who sit behind my right hon. friend; for the Chancellor of the Exchequer is a man who, I am certain, from his determination, his logical faculty, and his courage, would not have left the oasis and gone out into the desert unless he saw it would lead directly to similar legislation in England and in Scotland—for he says, "I will be no party to do anything in Ireland I would not do in England" (Hear, hear). I thank the House for having listened to me with patience (Hear). I have thought it my duty to speak out straightforwardly on this question, because I hold it to be more important at the present moment than it has been at any other time in the history of this country, that we should be careful how we deal with property

(Hear, hear). Ideas germinate fast in the present time in this country. Those who last year maintained that the way in which the House was dealing with the Irish Church Establishment would react upon England and Scotland were laughed at by the supporters of the Bill, who wished, supporting it, to dull their consciences and hide their heads in the sand in the hope of thereby warding off, or, at any rate, of not seeing, the coming danger (Hear). But what have we this year. A motion has already been laid upon the table of the House by an hon. gentleman from Wales, proposing to deal with the Welsh Church as the Irish Church was already being dealt with; and last Wednesday the House rejected a Bill for practically knocking on the head the Scotch Church under the specious pretence of dealing with church-rates, there being no such thing in Scotland (Hear, hear and a laugh). During the debate on the Irish Church Bill it was said by some that if the House sanctioned the mode of dealing with corporate property proposed in the Bill it would not be long before private property would be similarly dealt with. The statement was combed by the supporters of the Bill; out now, after so short a time has elapsed, a measure is introduced proposing to deal with the property of individuals in a manner such as has never yet been brought before Parliament (Hear, hear). Shall I give another reason why at this time we should be careful how we deal with property? (Hear, hear). In this country there is at this time a class agitation getting up on this question of the land. It is called the Land and Labour League. The members call themselves, I believe, the L.L.L.'s; but, in my opinion, they ought to be styled the "Lack-Land Looters" (laughter); for what is it that they propose? It is simply that the State should acquire land, paying in State Bonds, which are subsequently to be cancelled (Hear, hear, and laughter). That is, I believe, the programme of the "Lack-Land Looters" (laughter). Now, supposing you gentlemen from manufacturing districts were to admit this principle, what would be the result? (Hear, hear). Take the case of you moneyed men (laughter)—you who lend money, the bankers in this House (Hear, hear). I want to know whether, if I borrowed money from you at 4 per cent.—and it is very difficult to get it at that sum—and you, finding you could obtain 5 per cent. elsewhere, called it in, I am to have any compensation for disturbance (laughter), and, if not, why not? (renewed laughter). But perhaps hon. gentlemen may think that landed property and property which exists in the shape of money ought to be dealt with on a totally different principle. Should this be the case, I would ask the House to consider whether the time is the most fitting one at which to commence experiments *in corpore vili* upon the landlords (Hear, hear). What I wish very much is that my right hon. friend opposite (Mr. Gladstone), who has an influence with the people which nobody can deny, would by his influence and his eloquence effectually stamp out all this pestilent stuff (cheers). Let it be known that there are certain rules with regard to property which must be maintained, for the ultimate result of such action as I have referred to would be that communism would rise up in this country as it has risen up in France, and as it would rise still farther in that country, but for the fact that they have there a man who says, "*L'ordre j'en réponds*" (cheers). I want, sir, my right hon. friend to do in this House and in this country what across the Channel is done by bayonets (Hear, hear). There was a time when he was silent on the Reform question, and as a result heads were smashed, illegal meetings were held, and all order and law were shaken in this country (Hear, hear). Upon this Irish question he was adjured last year in both Houses not to say what he would do, but what he would not do; and why did we make the appeal? (Hear). Because we knew full well that in dealing with a highly imaginative and excitable race like the Irish they would run riot if they thought they were not to be treated in a spirit of perfect fairness (Hear, hear). A very similar state of things prevails at the present moment. I appeal to my right hon. friend to look into this question of the land, and to stamp the very beginnings of Communism under his heel. It is because I see the principles of Communism in this Bill in the way in which it deals with property, in contracts, and in compensation for disturbance that I condemn its provisions in the way I have done. Why should you depart from sound and just principles? What do you gain by doing so? What has been the result of all that you have done? Those whom you hoped to conciliate, peaking through their accredited organs in this House, the

mover and seconder of this amendment, and the hon. member for the city of Kilkenny, throw the Bill back into your faces; your sacrifices have been in vain; they have not pacified the unruly; they have not satisfied the unreasonable. But you will say, if we strike out of the Bill what you object to, and if we do not give compensation for disturbance, you leave nothing whatever in the Bill. I deny that. Go back to the gauge of my right hon. friend the Secretary of State for Ireland, and you will find that you still leave in the Bill more than was contained in the Bill of the Irish members (Hear). What will you leave? You will leave the legislative recognition of usage, and the power of enforcing payment for goodwill, whether goodwill or custom has prevailed throughout the length and breadth of the land. You will give compensation for improvements, past, present, and future; you will give simplification of remedies, encouragement of contracts by forcing these to a certain extent; and you will establish courts of equity and arbitration. Therefore, I say, when you have struck out of the Bill all that is objectionable in principle, as applying to England and Scotland, you will still leave in it, as applicable to Ireland, all that ought to satisfy reason and justice; and those whom it will fail to satisfy are those by whom confiscation is demanded, and who will not be satisfied with anything less (Hear, hear). In conclusion, I have only to say that if, as my right hon. friend told us in his opening speech, the Irish are, of all the people upon the earth the people that love justice most, I say do justly and fear not; trust to their sense of justice, be just to all—to the landlord as well as the tenant (Hear, hear). In endeavouring to conciliate Ireland do not break through principles which you know to be economically sound, but have the courage to prove your title to the government of this country and to the confidence of Parliament by the firm, unswerving maintenance of right (loud cheers).

Mr. CHAPLIN agreed with his noble friend the member for Haddingtonshire (Lord Elcho) that few measures of greater importance, and few that more affected the interests of the empire, than the Bill now before the House, had ever been submitted to Parliament. He thought, therefore, that in the discussion of the measure it was desirable to avoid anything like party warmth or party feeling. He should consider the Bill under two heads—namely, on that of its own merits, and that of the particular wants of the country for which it was intended. He thought that security of tenure was what every tenant in England or in Ireland or elsewhere was entitled to; but, as many persons differed on the question how that security could be best attained, it would not be out of place to consider how it was secured in this country and in Scotland. The right hon. gentleman at the head of the Government, comparing the increase of rents in England and Scotland as compared with the increase of rents in Ireland, referred to the system of granting leases in Scotland. Now, among the best authorities there was a difference of opinion as to the effects of that system. The right hon. gentleman was mistaken when he attributed the state of things to the difference between the feelings that existed in England as compared with Ireland. No one would deny that there existed in England, as a rule, a feeling of a kind and cordial nature between landlords and their tenants, and he should be sorry to think that those kindly and cordial feelings did not exist in Ireland also, and he could say that, with his limited experience of that country, he had known thousands of cases where it existed. But in England there was something beyond that, especially in those parts of the country where agriculture was carried to the highest perfection, which was entirely wanting in Ireland—namely, a marked, distinct, and accurate system, capable of being enforced at law, assuring the tenant that he would be amply repaid for everything that he had laid out in the cultivation of the soil in the event of his being ejected from his farm. He would take as an instance the custom that prevailed in the county which he had the honour of representing—and he did not think he should be accused of undue partiality when he asserted that his county stood pre-eminent for the excellence of its cultivation. In no county was the science of farming carried to such perfection, or capital more liberally expended upon the soil, and nowhere was the identity of interest between landlord and tenant more fully recognised, or were more cordial and kindly feelings entertained between them. And yet this was a county where leases for a term of years were practically unknown, or, at all events, were very rare. It would merely weary the House were he

to enter into details with respect to the various arrangements. They were many, and necessarily so, because in themselves the operations of farming were of a very multitudinous character. Under those arrangements compensation was amply provided for, everything that could be laid out in fair farming, the amount of compensation to be paid being fixed by a valuer or valuers, and a third party being called in to act as umpire if necessary. So simple was that operation, and so well known its results, that an appeal to law or a dispute scarcely ever arose; and not the least advantage of the system was that it applied with equal effect to large or small farms. By this means security of tenure and its attendant beneficial results were attained; and although no man could more heartily acknowledge than he did the cordial and kindly feelings mutually entertained with respect to each other by the landlords and the tenants, yet in his judgment those feelings were mainly due to the uniform operation of the just and effectual system of tenant-right to which he had referred (Hear). Under the operation of that system perfect freedom of contract and perfect security of tenure were obtained without any interference whatever on the part of the Legislature. He confessed he should have greatly rejoiced had it been found possible to apply some system of a similar nature to Ireland. But when the right hon. and learned gentleman the Attorney-General told them that was exactly what this Bill proposed to do—namely to recognise custom in Ireland as it was recognised in England—he must venture to point out that there was this very important distinction, that while on the one hand the custom in England was admitted to be good, the custom in Ulster was admitted to be as bad as a custom could be. With the permission of the House he should wish to compare for a moment the means by which the Bill proposed to give security of tenure to the tenants of Ireland; and here he should be met at once with the reply that the circumstances of the two countries were so different that no comparison could be instituted between them. He was fully aware that there was a marked difference between the amount of competition for land in England and in Ireland, but that was a point with which he would deal presently, and he should for the present deal with this measure as one only for giving the tenant security of tenure. In the first place he regarded this Bill as being an interference on the part of the Legislature for the benefit of one class and against the interests of another—in fact it was a distinct instance of class legislation carried out in the most undeniable manner. Young as he was in political experience, he could not believe that such a proceeding could be otherwise than dangerous in the highest degree (Hear, hear). Based, as it was said, upon the principle of interfering as little as possible with the freedom of contract, the Bill proceeded to inflict most severe blows at the freedom of contract of, at all events, one of the parties. The very terms of the leases and agreements, and the very rent itself, were to be settled, not between the two contracting parties, but by the tenant on the one hand and some third intervening party on the other, and that without any regard to what might happen to be the wishes of the landlord upon the subject (Hear). And here, as he was upon the subject of rent, he might be permitted to point out one of not the least defects in the Bill. One of its provisions was that the rent was to be settled by a Court of Arbitration. Well, the moment Parliament had by its Court of Arbitration fixed the amount of rent and had selected the tenant, the tenant ceased to be the landlord's and it became their duty to guarantee him the punctual payment of the rent so fixed. Now, competition for land in Ireland was great, and excessive competition meant high rent, and the Courts of Arbitration will be bound to take the best offer, because they would be dealing with property which did not belong to them, but to somebody else. If they were to compel a landlord to take the worse of two offers, they would simply be taking money out of his pocket to put it into that of somebody else who had no right to it whatever. And what happened then? The tenant fell into arrears, and was ejected for non-payment of rent. But ejection for non-payment of rent under the Bill was not a disturbance except where the rent was excessive, and the plea that the rent was excessive could not be put forward in the case he assumed, because Parliament had fixed it themselves. So far, therefore, it appeared to him that either the Bill was worthless, or else that the Government would be compelled to do that under it which would be simply destroying the landlord altogether, and to proclaim to the world that free trade in land in Ireland was

to be scattered to the winds, and to renounce in that country at once and for ever the principles which hon. members opposite had been advocating during the whole of their political life (Hear, hear); and when the Solicitor-General for Ireland bantered the hon. members sitting on the Opposition side of the House with their new-found attachment for Free Trade and its principles, it was much more worthy of remark that he should so suddenly have abandoned those principles (Hear). He trusted the joviality of the hon. and learned gentleman was not combined with sickness ("Hear," and a laugh). Then there was the scale of damages inserted in the Bill, which included compensation for disturbance of occupancy as well as for improvements. Compensation for loss of improvements was an intelligible proposition, but he confessed that when he heard so much of loss of occupancy he scarcely knew what it meant, because if the tenant lost so greatly by the cessation of his occupancy, he must have correspondingly gained when his landlord first permitted him to commence it, and, therefore, if the tenant were to be compensated for loss of occupancy the landlord ought to be compensated when the tenant comes in—what was sauce for the goose was sauce for the gander (Hear, and a laugh). Another main objection to the provisions of the Bill altering the relations between the landlord and tenant was, that it would take from the landlord the power of making any distinction between the idle and the negligent and the good and the industrious farmers, who would henceforth be placed upon exactly the same footing in every respect (Hear). Then, again, the Bill placed obstructions in the way of a good landlord making improvement, and, in fact, the promoters of the Bill appeared to be under the impression that a good and generous landlord did not exist in Ireland (Hear, hear). That such was the case he did not believe, and it was not even asserted by those inveterate spouters who clamoured for that which they knew could never be given to them, namely: the transference of property, its rights, its privileges, and, moreover, that, its duties from one class to another, which was the real meaning of fixity of tenure (Hear, hear). As regards the question of giving compensation for permanent improvements he asked whether it was fair that the Act should be retrospective. Those who had purchased under a Parliamentary or any other sound title had bought land having upon it certain buildings, and he had calculated the value of these buildings in the price he had paid; but if the Bill became law, these buildings would be taken away from him, and given to another without any sort of compensation—a proceeding which would be nothing short of confiscation (Hear, hear). In considering the whole of this question, he had often put to himself the question, "Why is there a land question at all in Ireland?" because until this question was properly answered it was impossible to decide upon any effectual remedy. One striking difference between England and Ireland was that while in England the farms were large and the improvements were made by the landlords, in Ireland the holdings were small and the improvements were made by the tenants. And this was necessarily so, because if an Irish landlord were obliged to build homesteads for every tenant, he would have to spend as much upon farm buildings as the value of the fee-simple. The existence of small farms was unquestionably an evil, and it would be better both for landlord and peasant if they were consolidated; for the peasant especially, because a large piece of land held by a farmer having capital would be better worked, and the poor tenant-farmer who now earns a precarious and scanty living would be able to command continual and remunerative employment. A tract of two or three hundred acres divided into three and five-acre farms by high banks, which, true to the Irish character, were called dykes ("No, no!"), would be occupied by a large number of tenants utterly incapable of improving them from want of knowledge, energy, or skill; the farming upon these small holdings was worse than anyone could possibly conceive who had not seen it; indeed, a friend of his, after travelling over a considerable portion of the land, had come to the conclusion that the dock and thistle were sacred weeds in Ireland (laughter, and "He was a Scotch farmer"). Possibly the view was opposed to the prejudices of the Irish people, but he firmly believed that very many of the Irish would prefer to remain in comparative discomfort, provided they were also allowed to remain idle; for when it was recollected that the ordinary English labourer cultivates not less than 25 acres

of land each it was evident that small farms of 15 acres and less in Ireland were maintained only to allow small Irish farmers to live in idleness. Was this the end which the hon. member for Kilkenny, and those who thought with him, had been endeavouring to accomplish for so long a time? His answer to the hon. member was that to require the land of Ireland to be cut up and subdivided and cultivated in the worst and most inconvenient manner for the purpose of giving a fictitious means of support to the surplus population was just as reasonable as to demand the banishment of science and machinery from English manufactories in order to give more occupation to those who were in want of employment. He would put a case to show the absurdity of the hon. member's argument. Let the House, for instance, take the case of an English farm of 1,000 acres, and apply to it the standard of Irish labour and work in connexion with a three-acre farm. Why, it would require something like 330 labourers for the due cultivation of the soil; and he certainly fancied that his hon. friends the members for Norfolk and Leicestershire, who might be supposed to have a practical acquaintance with agriculture, would agree with him that if 330 labourers were employed at 15s. a-week on 1,000 acres it would require a tenant of singular skill and capacity, to say nothing of rent, to make much profit out of his farm (Hear, hear). Ought we to refrain from doing that which it was clearly our duty to do in the way of making improvements out of regard either to their love of sloth and ignorance, or to their attachment to the mud cabins and farms where their forefathers had existed for generations before them and in a similar state of discomfort? He believed that no people on the face of the earth had so passionate an attachment for home as was developed in the Irish nation, and he should not presume to say a word in disparagement of so good and so natural a feeling; but he was compelled to remark that to be brought up and to continue to live in the homes of their ancestors was a privilege which in all countries and among all classes of society was denied to all except a favoured few. Why should Ireland be made an exception to this very general rule? (Hear, hear). He would now come to what he regarded as the very germ and root of this Irish question—viz., the difference between the two countries arising from the fact that while in England there were many and various means of employment, in Ireland it was to the soil alone that the people had been accustomed to look for their means of support (Hear, hear). It was, in his judgment, impossible for any one who had listened with attention to the remarkable speech delivered by the Prime Minister on the introduction of the Bill to avoid coming to the conclusion that all the difficulties encountered at every turn were mainly referrible to the great competition for land in Ireland and the dire necessity of obtaining it which destroyed all practical freedom of contract between landlord and tenant in that country. To this must be attributed so many of the evils of which Ireland justly complained. This was, indeed, the incubus which weighed so heavily on Ireland, and, to quote the words of the right hon. gentleman the First Lord of the Treasury, this was "the dark star which was for ever brooding over that unfortunate country." This was the substantial grievance, in the absence of which, as the right hon. member for Liskeard (Mr. Horsman) had pointed out, agitation in Ireland could no longer exist. It was the fruitful source of all the evils and miseries connected with land in Ireland. Now he had always believed that when a disease was known to exist the wise physician was he who, after first ascertaining its cause, proceeded to apply the remedy which appeared to him the most efficacious and the most likely to go straight to the root of the complaint (Hear, hear). Therefore, he asked, in what sentence, in what line, in what syllable of this Bill was this overpowering Irish evil attempted to be dealt with at all? (Hear). He objected to the Bill as a measure of policy, because it left the chief evils of the country altogether untouched. If then, he were asked how it happened that with these opinions he did not intend to oppose the second reading of the Bill, he would at once answer that he should offer no opposition to it because he believed it to be essentially a measure of detail, which he hoped might be sweeping changed in Committee, because he recognized to the full the need of something being immediately done with regard to Ireland—a need so dire as almost to appal the heart of the bravest—and because he was in dread lest he should

see the blood of her Majesty's subjects in Ireland flowing like water. Let it not be supposed that this was the language of undue exaggeration on his part, for he believed that no man could foresee what might be the effect of even appearing to thwart without reason the reason and temper of the Irish people (Hear). As to whose unpardonable silence that necessity for immediate action in the first place arose, and daily and almost hourly increased, he would not now state his opinion; but he must express his firm conviction that all the perennial attempts at legislation for Ireland—more baleful when they succeeded, as was the case last year, than when they proved signal failures—had done immense harm by raising the expectations of a restless and an excitable people, expectations which could in no event be fulfilled. Her Majesty's Government, long after having made up their minds as to what their policy would be, had culpably concealed it from the Irish people, and had thus increased the excitement which prevailed. Indeed, they had by this reticence done more to retard the civilization and progress of the country than 1,000 Fenian outrages or all the Riband societies in Ireland (Hear, hear). At the present moment Ireland was in a state that was scarcely ever known before. Agrarian outrages were of constant occurrence; the demon of murder was stalking unchecked through the land, and no species of property, nor even life itself, was secure ("Oh, oh!" and "Hear, hear"). Open rebellion was at our doors because open sedition was allowed to be everywhere openly taught; and he sincerely believed these to be the immediate results—deny it who could—of the unhappy, ill-fated, and deplorable policy adopted by Her Majesty's Government towards Ireland (cheers).

HEREFORDSHIRE AGRICULTURAL SOCIETY.

The adjourned meeting of the Herefordshire Agricultural Society, in reference to an amalgamation with the Worcestershire, Gloucestershire, or other Agricultural Societies, was held at Hereford, the Rev. Archer Clive in the chair.

The Worcestershire Society held a general meeting on Saturday last, to which the following report was presented from a committee appointed to consider the question: "The committee have had under their consideration the question of an amalgamation of the Society with those of adjoining counties, and have been in communication with Hereford and Gloucester, and believe that great advantages would be derived from a union with those counties. They have at present received no definite expression of opinion on the subject from Hereford or Gloucester, but will continue to give the matter their attention, and trust they may shortly be able to report favourably. They would, however, add that in their opinion it would not be desirable to join either county separately."

In reference to the amalgamation of the smaller Societies with the county Society, it appeared that efforts had been made to effect such amalgamation but had failed.

Having counted the letters—including some received at the former meeting—in which a positive opinion was expressed, aye or nay, the Secretary said there were 11 for amalgamation and 10 against it.

The CHAIRMAN: What is the position of the Worcestershire Society?

Mr. TAYLOR (Showle): It is much worse off than ours.

The CHAIRMAN thought he might take the sense of the meeting. He would therefore ask, Shall we appoint a committee to consider the expediency of conferring with the counties of Worcestershire and Gloucestershire with a view to amalgamation? Those gentlemen who are in favour of our taking that course will hold up their right hands.

Four hands only were held up, and the negative was then put, and carried by a very large majority.

LINCOLNSHIRE AGRICULTURAL SOCIETY.—

Professor Voelcker has been engaged as consulting chemist of this society, to analyze manures, &c., for the members on terms similar to those charged to members of the Royal Agricultural Society of England. Dr. Voelcker, who has also undertaken to deliver a lecture when called upon to do so, will receive a fee of £25 for his services for the current year.

THE CENTRAL FARMERS' CLUB.

SEWAGE FARMING.

The monthly meeting of the Club was held on Monday evening, March 7, in the Club Rooms, at the Salisbury Hotel, Fleet-street, the subject for consideration, standing in the name of Mr. J. Bailey Denton, being "On Sewage Farming, and the position of sewer authorities in relation to lands to which sewage is applied." There was a very full attendance.

The Chairman, Mr. J. HOWARD, M.P., said: The subject for discussion was sewage farming—a question of very great importance, and one which grew in importance from year to year. He should not anticipate what Mr. Bailey Denton was about to say, but would simply observe that the farmers of England had been twitted by the press and by Mr. Meehi with indifference and apathy upon the question. If there ever was a case of putting the saddle upon the wrong horse it was this (Hear, hear). The question of town sewage was one for municipalities and corporations to deal with first; the farmer could not apply the sewage until the towns brought it to him. With these observations he would only further congratulate the Club that the paper was to be read by a gentleman who was so conversant with the subject, and who had taken so much pains to master its details (cheers).

Mr. J. BAILEY DENTON read the following paper:—

Being a member of the Committee of the British Association for inquiring into the treatment and utilization of sewage, I shall be careful to avoid all controversial points upon which I may, with the rest of the committee, be required to report; my present object being to elicit the views of others rather than to pronounce opinions of my own. I propose to confine my observations this evening to the practice of sewage^{*} farming, where it may be called into existence by circumstances which render it the best mode of dealing with town refuse. I may premise that, having entered this Club at its opening in 1843, and being therefore well acquainted with the high practical character of its members, I shall avoid dwelling upon those general agricultural laws which rule in sewage as in ordinary farming, and shall address myself at once to the particular object of my paper, which as a new branch of farming, demands special treatment. In sewage farming special treatment, or, in other words, "technical knowledge," is admitted by all persons to be essential to success, and when endorsing this general opinion I do not wish to imply that in ordinary farming technical education is unnecessary, simply because it has been an art in which this country has excelled from the time of the aborigines with a sort of delusion pervading the popular mind that any one may become a farmer when he pleases, and that the practice itself consists only of the enjoyable action of the limbs without any exercise of the brain. I have been led into this little digression, while professing an intention to go direct to my subject, by observing in a recent address to the members of the Edinburgh Philosophical Institution by Dr. Lyon Playfair—who you will remember was some 20 years back consulting chemist to the Royal Agricultural Society of England, and is now one of its honorary members—an expression to the effect that, if improvement is to be effected in Ireland it must not stop at agriculture, but must extend to the secondary education of the people in *practical subjects*, conveying the impression, if his words are rightly reported, that he considered the art of agriculture an occupation requiring no special education. It is curious, however, to observe that, when impressing upon the manufacturing workmen the advantage of mixing brains with manual labour, he borrowed from agriculture itself an illustration to support his argument—an illustration which is very pertinent to my subject of this evening. He likened science to a perennial stream with a bountiful supply of fertil-

izing waters, and its application in the handicraft of trade to the work of irrigation, though, as the metaphor was somewhat poetically expressed, the Professor doubtless had in his mind the bright moving waters of rippling brooks rather than the dirty fluid of sewage with which I am about to deal. Strange though it be, it is nevertheless a fact, that although the learned Professor so naturally and pleasantly applied the metaphor, and made himself understood in doing so, there is not one in a hundred of the teachers in our national and infant schools who could explain in popular terms of simple English the scientific principles involved in the operation of ordinary irrigation, let alone the complex operation involved when water is mixed with human excreta and trade refuse with which we shall presently have to deal. Still, I believe it is the failure to inculcate upon the young rural labourers' minds such information as this, that is keeping agriculture behind the other arts. I could not resist the opportunity of expressing this opinion when about to speak on a branch of farming in which every one admits the value of technical teaching; for I believe that education in the common things of the farm is just as much required in ordinary as in sewage farming, and would advance the position of rural labourers, by enabling them to understand the reasons for what they do, and so improve the quality of their labour, more than all the talk of philanthropy, and all the threats of introducing among them the practices of trades' unions.

But to address myself to sewage farming; I will endeavour at the outset to show why it is an object especially worthy your attention. I think you will agree with me that, whatever may be the future result of chemical discovery in the treatment of sewage by deodorization and precipitation, or by any other means of separating from the water "the ingredients which do not belong to it," with a view to render it innocuous when it reaches the rivers, it is very improbable that those large cities and towns in which the comfort of water as a means of transporting sewage has been experienced will abandon the advantage, and you will most probably agree with me too in believing that many of those towns will resort to sewage irrigation as the most ready and the least objectionable mode of disposing of their discharged refuse. I say "the most ready and the least objectionable mode" in consequence of the large quantity of water which the sewers discharge. To realise the actual quantity, it would only be necessary to point out that in a town of which the water supply and influx of subsoil water into the sewers together reach 50 gallons a head of the population, there will be sufficient fluid from 100,000 people to cover 10 acres of land 23 inches deep every day of 24 hours, and this mass of water, weighing 2,232 tons, must be purified before it reaches the rivers. Fifty gallons of water weighs 500 lbs., while the excreta of each average individual weighs only 3 lbs., and though it would be easy enough to deal by chemical processes with the excreta alone, it is quite another matter when dealing with water nearly 167 times heavier. The difficulty is much reduced where the number of persons in a community does not exceed a few hundreds, and where, as in villages, the quantity of water used is comparatively small, owing to the absence of a public supply. In such cases, much is to be said in favour of the use of earth as a means of transporting excretal matter. In villages where a system of scavenging for the provision and removal of the necessary earth can be readily organised, the dry earth system of sewerage may possibly be better than that of water, though even in such cases the difficulty of getting rid of the slops of dwellings must stand in the way of its general adoption. While upon this point, I may usefully quote the

* Sewage is described by Professor Way in his report on the Deodorization of Sewage appended to the second report of the Sewage Commission, to be "water holding in solution and suspension ingredients which do not belong to it as water, and which render it objectionable to the senses of

sight and smell, injurious to health, and unfit for drinking and domestic purposes." By the Sewage Committee of the British Association it was decided to interpret the word "sewage," as "meaning any refuse from human habitations that may affect the public health."

opinion of the Rivers Pollution Commissioners expressed in their last report, just issued. They say, after describing what has been done with dry earth in certain places, that "In all these cases, however, the chamber slope are kept separate; and independently of that the success depends, not upon the people using the privies, but upon an officer whose duty it is to look after them and keep them clean. Even at Hallow (in Buckinghamshire) one man is set apart for this work. Elsewhere we have known earth closets introduced for the use of cottagers accustomed to the old privy seat and cesspool, and, requiring special service and attention which the average man or woman will not give, they soon become filthy and offensive. Add to these circumstances the enormous aggravation of all the difficulties of the plan when not fifty, but fifty thousand households have to be provided with the necessary appliances, and induced to work them properly, and we can have no hesitation in pronouncing the dry earth system, however suitable for institutions, villages, and camps, where personal or official regulations can be enforced, entirely unfitted to the circumstances of large towns." The Rivers Pollution Commissioners evidently consider, therefore, that the dry earth system of sewerage is not likely to interfere very greatly with the prospects of sewage farming. With respect to the various chemical processes of deodorization and precipitation which have been proposed, the Commissioners say, "The operations of the chemist have been directed chiefly to the soluble constituents of sewage, and have had for their object either the precipitation in a solid form of the valuable but offensive ingredients, so as to convert them into portable manure; or, secondly, the rendering them inoffensive by the action of disinfectants. Although these operations have not been altogether unsuccessful, they have hitherto entirely failed in purifying average sewage to such an extent as to render it admissible into running water. We have formed this opinion both from observations of the polluting effect of such chemically purified sewage upon the streams into which it was admitted, and from the amount of putrescible organic matter revealed by the chemical analysis of the sewage after treatment." These being the last official opinions formed and promulgated, they are worth attention, but at the same time we must not forget that such are the inexhaustible resources of chemistry, that the impossibility of to-day may be the realisation of to-morrow. Most interesting information on the chemical question is published in this last report of the Rivers Pollution Commission to which I have just referred, and the same may be said of a previous publication of the details of experiments carried out for the Sewage Commission in 1861, under the direction of Professor Way, entitled, "Deodorization of Sewage." They are appended to the second report of that Commission. The opinions expressed in both these reports cannot fail to remove any latent belief that sewage irrigation is to be very readily superseded by other modes of disposing of town refuse.

To appreciate the extent which sewage farming may extend in this country, I may mention that there are in England alone 12 towns, excluding the metropolis, with populations above 100,000, 18 towns between 100,000 and 50,000, 137 towns between 50,000 and 10,000, and 360 between 10,000 and 2,000. Now assuming, for our present purpose, that half these towns ultimately determine to utilize their refuse by irrigation, then the number of acres of land that will be withdrawn from ordinary farming and applied to sewage farming will swell into a considerable area. It is true that authorities differ upon the number of acres required to purify sewage, and turn it to the most profitable account. My own opinion is that a much more extended experience than we have yet had must be gained before we can draw the line between the necessary sanitary demands for purification, possibly requiring only a few acres, and the expediences of profitable farming rendering it wise to spread the sewage over a wide area. What has been already done, however, affords a variety of examples not very conclusive in result, but very suggestive for future guidance.

At Bedford, for instance, where the surface soil and subsoil are free and open, the sewage of upwards of 18,000 persons is at present applied to 55 acres of land only, which is after the rate of 300 persons to the acre. No fluid passes off the surface: it is all absorbed. Our Chairman will tell us, however, that it is the intention of the town authorities to extend the area of utilization to 200 acres, not perhaps so

much because the sewage is not at present sufficiently purified by the vegetation and filtration due to this limited area, but because the sewer authorities of the town believe a much greater profit may be obtained from a greater number of acres. It is not improbable, too, that there exists at Bedford the natural belief that a narrow area of surface, and limited means of filtration such as quoted may in time render the effluent water from the subsoil extremely polluted. At present it appears, from the published analyses, that vegetation and filtration together are "sufficient as a sanitary agency," though limited to the extent mentioned.

At Carlisle, where the soil is also very open in character, the sewage of 22,000 people, is distributed over about 100 acres of land devoted to permanent pasture. This is after the rate of 220 persons to an acre. The whole of the sewage is absorbed and percolates down to the level of the springs which help to maintain the rivers Calder and Eden.

At Croydon the sewage from about 35,000 persons is applied to 260 acres of free, open soil at Beddington, giving a proportion of 134 persons to the acre; the sewage from about another 4,000 persons is utilised on about 30 acres of low-lying clay land at South Norwood, giving a proportion of 133 persons to the acre. The comparative effects of the two operations upon the purification of the sewage is very intelligibly shown by the following analyses of the Rivers Pollution Commissioners. They are intended to show the influence of season upon the purification of sewage by irrigation, on the light soils of Beddington (Croydon), and the clay of Norwood.

RESULTS OF ANALYSES EXPRESSED IN PARTS PER 100,000.

Average composition of effluent Sewage Water.	Total solid matters in solution.	Organic Carbon.	Organic Nitrogen.	Ammonia.	Nitrogen as Nitrate and Nitrites.	Total combined Nitrogen.	Chlorine.
Spring—							
Norwood	88.1	1.500	.303	.816	.230	1.194	8.37
Croydon	35.4	.594	.104	.072	.225	.388	2.32
Summer—							
Norwood	88.6	1.883	.312	.462	.657	1.361	11.03
Croydon	35.4	.607	.128	.069	.155	.300	2.57
Autumn—							
Norwood	87.0	1.349	.203	.635	.734	1.629	8.94
Croydon	45.1	.680	.138	.185	.589	.702	3.20
Winter—							
Norwood	87.0	1.271	.273	.676	.813	1.255	7.71
Croydon	40.6	.612	.145	.204	.533	.846	2.72
After 7 days' frost—							
Norwood	88.8	1.356	.413	1.145	.156	1.534	8.84
Croydon	45.6	.591	.239	.371	.448	.992	2.89

The Commissioners, in speaking of the clay land at Norwood, say that the results of analyses "show that the effluent sewage was, except in a few instances, so far cleansed even upon this heavy clay soil, as to be admissible into running water without nuisance."

At Aldershot (where the sewage is all derived from the camp, consisting of adults) the sewage of 7,000 persons is distributed over 80 acres of poor sandy soil, in which peroxide of iron pervails, or 88 soldiers supply the sewage for an acre of land, which is equal to a much larger proportion of an average population consisting of men, women, and children.

At Tavistock, where the soil is a loam with a subsoil of pebbles, the population is 9,000, and the number of acres irrigated 90, or exactly one acre to 100 persons.

At Worthing, where the soil is also of a free description, 8,000 persons supply the sewage for 95 acres of land, of which 53 are cultivated and 42 are permanent grass. This is after the rate of 85 persons to the acre.

At Malvern, where the soil is partly a gravel and partly a clay, the sewage from about 5,000 persons is applied to 84 acres of land, of which 54 are permanent pasture and 30 arable. This is after the rate of 60 persons to an acre.

At Banbury, where the soil is clay, the number of acres under irrigation is 120, and the population being 11,000 the proportion is 1 acre to 92 persons. The condition of the effluent water here is not so satisfactory as in other cases, but this is no doubt owing to the fact that the under-drainage of the land is imperfect, and allows the sewage only partially filtered to descend into the drain, and so pass into the rivers.

At Rugby, where the soil is of a mixed character, partaking of gravel on a clay sub-soil, 65 acres of land have been taken on lease as sufficient to satisfy upwards of 8,000 inhabitants; and as this town has long been under treatment for sewage irrigation, past experience has probably had influence in deciding the quantity of land taken. The proportion is 125 persons to the acre.

There are about 30 towns in England where the sewage has been applied by irrigation, but the experiences of the before-named towns may be taken as the best examples at present existing by which to arrive at some idea of the quantity of land required, though, as I have stated before, we must trust to future experience to decide the question definitively. The *late* Rivers' Commissioners stated that the quantity of land required should not be less than one acre to every 150 inhabitants contributing the sewage, but the deduction from the instances given would be that 100 persons to the acre better represents the mean quantity required, putting light and heavy land together, and taking an average of populations consisting of men, women, and children. I have myself hitherto considered that one acre of free soil to 150 persons, and one acre of clay soil, if well drained, to 100 persons, would suffice; but to arrive at a general view of the matter, it would perhaps be better to reduce the latter proportion to 75 persons to the acre, and take 100 persons to the acre as the mean of various soils. To make sewage farming as profitable as it is capable of being made, it is necessary to have something like 33 per cent. of extra land beyond that used for irrigation—that is, one acre of unsewaged land to three acres sewaged—so as to allow of periodical rests to the sewaged portion by an alternation of cropping. To provide, also, for the gradual increase of population, additional land capable of receiving sewage should be provided. If, therefore, we take 50 per cent. in addition to the amount actually required to meet both these considerations, we arrive at the least extent of land which will sooner or later be abstracted from ordinary and devoted to sewage farming. Upon this data, and supposing that half the towns I have classified by their populations adopt irrigation as the mode of utilizing their sewage, the quantity of land required will amount to at least 100,000 acres. Up to the present moment, owing to the scarcity of sewage farmers, and the disinclination there exists to devote attention to a business about which so little is known, and about which so much doubt has been entertained, the sewer authorities in different towns resorting to irrigation have become farmers on behalf of the residents they represent. In such cases the duties have devolved principally on the surveyor of the Local Board, who, possibly knowing nothing of practical agriculture and receiving a fixed and probably not a very high salary for the performance of his duties, is hardly the person to develop the most profitable results. Sewage farming being a new thing too, the individual members of corporations or local boards of health have been led to take part in it; but, as gratuitous services are seldom very effective, it is likely that no greater profit will attend such superintendence than that of the local surveyor, and, consequently, the time cannot be very distant when sewage farms will be offered for hire in the same way as ordinary farms. As present there are very few ordinary farms to be let for which there are not always many applicants, even where the prospect of profit is very limited; and I think, therefore, you will agree with me that it will not be inopportune for this Club to consider at once whether the sons of the present generation of farmers can give their attention to better objects than sewage farming and the technical information required for it, particularly as the extension of this new branch of agriculture must reduce the chances of obtaining ordinary farms by withdrawing land from one purpose to apply it to another.

THE RENTING VALUE OF SEWAGE FARMS.—But if sewage farming is to become the occupation of a special class of men who prepare themselves for it, it is clearly desirable to come to some definite understanding as to the basis upon which the renting value of sewage-irrigated land should be calculated, for rent is always the first item of consideration with all farmers, and at the present moment there is much confusion prevailing upon the point. This arises from the supposition which prevails in some places that the return from the sewage farm should cover the cost of conveying the sewage from the sewer mouth to the land, forgetting that the obligation lies with the town to dispose of its own refuse in

an unobjectionable manner, irrespective of the cost. It may be a stroke of good policy to adopt a mode of disposal which will afford some return, though it is obviously a fallacy to connect the cost of the work with the rent of the land. Indeed so manifest is this view that it seems hardly necessary to remind you that the sewage in some cases may be applied to land lying below a town by simple gravitation at a trifling cost limited to the delivering conduit; while in others it may have to be lifted to a considerable height above the town, when there will not only be the cost of the necessary machinery but the current outlay of pumping and maintenance. And this may be the case when the productive capability of the land and the quality of the sewage may be the same in both instances. The true basis of rent consists of three elements—the productive value of the land with reference to the sewage to be applied to it; the proximity of the farm to the market for the sale of its produce; and the quality of the sewage delivered to it. The two first elements should be considered together and the last independently.

As far as experience has yet gone, the soil most suitable for the production of sewage crops is a light, free soil, though I am disposed to believe that when we have had more practice we shall find the clays equally available. Upon this point, I believe, our friend Dr. Voelcker, the farmer's chemist *par excellence*, is of opinion that clays, deeply cultivated and properly drained, may be more productive under sewage treatment than free soils; though we know as a fact that the poor, sandy soils to which the sewage of Edinburgh has been already applied have produced herbage which was sold last year at a price ranging from £1 17s. 6d. to £19 per acre; while in the more repulsive soils of the Bagshot Sands at Aldershot, which are mixed with peroxide of iron, Mr. Blackburn has let land for garden purposes at £5 an acre, while before the sewage was taken to it the same land was literally not worth half-a-crown. These sandy soils were naturally so sterile that it would appear it matters not what is the quality of the soil which becomes the matrix for the sewage so long as it is easily penetrated by the roots of vegetation. This is an important point where suburban land is very expensive and poor land is within reach. Another consideration will have its influence too, when determining the description of soil to be utilized, an opinion having recently gained ground that a poor free soil operates as an oxidiser of sewage at least as well as a rich loam or clay, even though the latter may be as completely disintegrated as it is capable of becoming by effective under-drainage.

If free soils naturally drained, and clays pulverized by under-drainage, are equally available, the proximity of the sewage farm to a ready market becomes the first desideratum. It so happens that the vegetation best produced by the use of sewage is that which will find customers in the town from whence the sewage is obtained if within easy reach. Italian rye-grass, roots, and market-garden produce can be sold as soon as they are fit for use to the townspeople; and it is for this reason that the land devoted to sewage in the vicinity of towns must rank as accommodation land, and the price if purchased, or the rent if leased, rise accordingly. And although the late Rivers Commission laid it down as a rule that sewaged farms should not exist within a mile of towns, it is not likely that this limit will appreciably reduce the price if valley lands of high quality are compulsorily taken. If therefore by raising the sewage to a height above the town it can be applied to poor and cheap land, it may be well worth the attention and consideration of sewer authorities, whether they may not spend less money in raising the sewage to such land than in the purchase of valuable valley land which may be reached by simple gravitation. Thus, for instance, a town requiring 150 acres for a sewage farm can afford to spend without loss £16,000 in pumping arrangements to raise its sewage to a height above (including the capitalization of current expense) if the cost of the high-lying land does not exceed £50 an acre and the price of the valley land is as much as £150 an acre. This question may be looked at in another light by comparing land to be leased instead of purchased under the two conditions supposed. The land in the valley may be worth from £3 to £5 an acre, while land above may be obtainable at £1 an acre. The difference of rent in these two cases would be at least £500 a-year, which if capitalized at 30 years' purchase would be £15,000; and the advantage of raising the sewage above the town would not be limited to the saving in the first cost or rent of land, for it is more than probable that the effect would,

in most cases, be to avoid all objections of a residential character.

On these grounds it appears reasonable that the rent of the land, irrespective of the sewage, and independent of buildings and the special preparation of the land constituting the sewage farm, should be the same as that of accommodation land in the vicinity of the town furnishing the sewage, which will vary from £2 10s. to £5 an acre.

VALUE OF SEWAGE.—The value of sewage depends in the first place upon the extent to which the excretal matter voided by the population is diluted by the water supplied to the town for domestic purposes and by influx of surface and subsoil water into the sewers; next, by the nature of the trades and occupations of the inhabitants; and lastly by the capability of the land to assimilate the fertilizing matter and to benefit by the quantity of fluid with which it is mixed.

Whilst the quantity of excretal matter per head is constant, the quantity of water supplied to different towns varies very considerably. For instance, at Bedford the daily supply is 15 gallons per head, at Carlisle 40 gallons, at Croydon 45 gallons, at Malvern 5 gallons, at Banbury 21 gallons, at Worthing 45 gallons, and at Rugby 25 gallons. The influx of subsoil water varies in different towns, even in a much greater degree than the water supply, and though it varies at different seasons according to the subterranean water pervading the district, it does not change like that entering the sewers from the surface which is directly dependent upon the rainfall, and sometimes over-loads the sewers, while at other times there is no influx at all. The great increase due to subsoil water alone is proved by the fact that, while at Banbury, with a daily water supply amounting to 230,000 gallons, the dry-weather discharge from the sewers is only 300,000, at Bedford, where the water supply does not exceed 150,000 gallons, and where the surface and storm waters are excluded from the sewers, the daily discharge from the sewers amounts to at least 500,000, and has been reported to be as much as 797,350 gallons daily. The quantity and quality of town refuse, other than and in addition to human excreta, vary also considerably in different towns, almost as much as the quantity of water supplied to the inhabitants and the influx of subsoil water. For instance, in some large towns there may be one prevailing character of industry, such as the woollen, silk, and chemical works of the Lancashire towns, the tanneries of Stockport and Warrington, and the breweries of Burton and Romford. In small towns there may be an extensive brewery, or one special trade which may proportionately affect the discharged refuse quite as much as a general trade in larger towns. I do not propose to go very deeply into the chemical analyses and chemists' calculations that have been published from time to time showing the value of sewage discharged from different towns. I abstain for two reasons—first, because the details are rather too technical, being learnedly expressed in the dead languages, and next, because, although we are under obligation to chemical science for the fundamental data by which to arrive at the existence and comparative powers of fertilizing agents, we cannot altogether rely upon the estimates of value. It is for this reason, I presume, that we have got into the habit of speaking of chemists' estimates of fertilizing matter as "theoretical values" although they are based on the actual price of guano and other saleable manures.

You will perhaps remember that Messrs. Hofmann and Witt, in the evidence they gave before the referees appointed to inquire into the sewerage of the metropolis, estimated the annual total voidings of an adult male to be worth 11s. 9½d.* Dr. Thudichum more recently gave the value of the urine alone of adult males at 10s. 8½d.† Messrs. Lawes and Gilbert esti-

mated the amount of nitrogen in the food of an average individual, which was founded upon the calculation of 86 different dietaries arranged in 15 classes according to sex, age, activity, of mode of life, and other circumstances, to be equivalent to rather less than 12½lbs. of ammonia, from which of course a deduction had to be made for the nitrogen retained in the body and for loss in various ways. Messrs. Lawes and Way, after quoting this estimate, state in their report appended to the third report of the Sewage Commission, that "upon the whole, therefore, it is concluded that the amount of ammonia contributed to the sewer water by each individual of a mixed population of both sexes and all ages is pretty certainly more than 10lbs. per annum, as formerly assumed, but probably less than 12½lbs. But it is not the human excretal matters of the resident population that alone contribute to the value of the sewage; to these must be added the fractional part of the excretal matters of horses, cows, dogs, and other animals; of the refuse from slaughter houses, of soot and of the matters derived from the abrasion of the streets, and also the refuse matters from certain manufacturing processes. So far as existing information bears upon the point, it would appear probable that not more than 12½lbs. of ammonia are contributed annually to the sewers from all sources per head of the population." Mr. John Chalmers Morton, in his "Agricultural Experience of 300,000 tons of North London sewage," having brought forward the results of the chemical analyses of Messrs. Lawes and Gilbert, says, "These then are the leading points to which the attempt to estimate the value of the sewage of a town have led. 200 ounces of ammonia per annum pass through the water-closet of every individual of a population, the proportions of other ingredients, potash and phosphoric acid, corresponding fairly with that of its ammonia or nitrogen to the wants of most of our cultivated crops; that of potash, however, being generally deficient." To bring these analyses to bear practically upon the treatment and utilization of sewage, engineers and chemists have combined to shift their figures from one denomination to another. Instead of referring to ounces of ammonia and pounds of excretal matter voided by each average member of the population, the whole refuse has been brought into tons of sewage discharged from a town. Having arrived at 8s. 4d. (which is 100 pence) as the average value per head of the excretal matter voided by a population—i.e., the 12½lbs. of ammonia—Messrs. Lawes and Way assume that by one means or another—by the supply of water for domestic and trade purposes, by the influx of surface-waters, and by the accretion of subsoil waters—the maximum quantity of sewage discharged from a town may reach 100 tons per head per annum. Thus, as 100 pence is the value of the fertilizing matter due to each head of the population, 1d. is placed upon each ton of sewage as its value also. The simplicity of the calculation would be perfect if experience showed that the excrementitious matter diluted in the proportion of 333 of water to 1 of excretal matter was really worth the money. But it is obviously the fact that, beyond the extent of dilution, which renders the sewage most acceptable to vegetation,—say 20 gallons per head,—the sewage undergoes depreciation in proportion as it is farther diluted. It stands to reason that there must be a proper limit to the dilution appropriate to different soils, and no species of sophistry in science can make it otherwise, however anxious we may be to utilize the water with which we have to contend under the present sewerage systems. Mr. Hope, the very able pioneer in sewage utilization, having satisfied himself by the analysis of Professor Way that the sewage of the northern portion of the metropolis—high and mid-level sewers—was theoretically worth 2½d. per ton, there being 8.2 grains of ammonia to the gallon in it, states his own estimate of the actual value to be 1d. per ton, and he takes 50 tons as the average annual quantity of sewage from each person, thus making the actual value 4s. 2d. per head, or half that of Messrs. Lawes and Way. But though I am also disposed, for the sake of simplicity, to take 1d. per ton as the value of sewage, I stop at a much less amount of dilution as my datum. I think that a penny should only rule when the water supply is 20 gallons a day per person, or 32½ tons per annum, and only then when the accretion of subsoil water does not increase the discharge from the sewers more than 25 per cent., which raises the discharged sewage to 40½ tons, the money value being calculated

* ADULT MALES PER HEAD PER ANNUM.

Urine alone	47	15.9	10	3½

on the water supply (32½ tons), and not on the aggregate discharge (40½ tons); for we must always bear in mind that sewage is "the refuse of human habitations," and not the water of drainage or the water of rainfall, and that therefore the measure of "sewage" is the water supply. Upon this view, while Messrs. Lawes and Way's estimate of the theoretical value of sewage is 8s. 4d., and Mr. Hope's estimate of the actual value is 4s. 2d., that which I have ventured to give will stand at 2s. 8½d. In fixing this price, I have been guided by realized results and probabilities, and have regarded sewage simply as manure supplied by sewered towns to their tenants, and have separated the return due to it from that which would arise from the land without it. In the desire to support theoretical value, we have got into some confusion on this head. There is no reason why we should regard commercially the supply of liquid sewage from a town in a different light to so much solid manure from stables in a town, with the single and great advantage that the former not only distributes itself over the land without labour, but it reaches the roots of vegetation in a ready condition for assimilation, and is therefore worth more money. Mr. Mariage, at Croydon, has shown that the full produce from his 260 acres has yielded a return of £46d. per ton for the sewage, or a fraction less than a halfpenny per ton, which is equal to 2s. 5d. per head of population, and which, after deducting rent, rates, taxes, labour, interest on capital, &c., will represent the value of the sewage (which is much doubted) at less than a farthing per ton. At Aldershot, where there is a return of £1,200 from the waste of 7,000 adults, the return per head is 3s. 4d. per annum. It is difficult to arrive at what proportion of this is due to the sewage, independent of the land and expenses, and I leave you to draw your own deductions. At Norwood 3s. 9d. per head, per annum, represents the return derived from the whole produce, while only 9d. per head represents the profit! These instances alone are sufficient to show that a penny a ton on the reduced quantity of sewage, which I have taken as my datum, is quite as much as the sewage, *per se*, is worth in the present state of our knowledge, and that this sum should be divided equally between the landlord supplying the sewage and the tenant using it. If this is right, 1s. 4½d. per head may be considered as the payment due for the sewage, and in a town of 10,000 people it would amount to £677 1s. 8d. This is equal to £8 15s. 6d. per acre, and represents the payment of the farmer for the manure of the sewaged portion of his farm. In some soils, where water is valuable after the land has appropriated a sufficiency of manure, a larger charge may be made for the sewage; but in clay soils, the retentive properties of which cannot be altogether removed by any amount of under-drainage, an excess of water should be met by a reduced charge. This is one reason why both storm and subsoil waters should be kept out of the sewers.

THE PREPARATION OF THE LAND.—I stated early in my remarks that we could not charge the sewage farm with any cost of delivering the sewage from the town to the land, implying that the outlay chargeable to the farm for works should commence from the point at which the sewage is delivered to it. Before entering upon the preparation of land for the only mode of irrigation to be recommended, let me say a few words on the systems which have each had their advocates for the time. I think I may say, positively, that sufficient experience has already been gained to lead to the conclusion that the method of irrigating by iron pipes with hydrants and hose for distribution, fails in satisfactory results, although there are some recognised authorities who still continue the practice. My friend, Mr. Mechi, I believe, is one who does so; though, seeing that Lord Essex at Watford, the Duke of Northumberland at Alnwick, as well as several others have relinquished the practice, I hardly think he would lay out a new system on the same method he now follows. Subterranean irrigation, admitting the sewage into the drains and allowing the sewage to pass out of the drains into the subsoil, I believe to be erroneous in principle: first, because it takes the fertilizing matter away from those fibrils of the roots which are ready to appropriate it; and next, because it takes the water holding the fertilizing matter in solution and suspension down into the subsoil to rise upwards and so maintain evaporation, which lowers the temperature of the bed of vegetation. The application of sewage on the surface, on the contrary, not only feeds vegetation in the way it is best able to assimilate the food contained in the sewage, but the flow of sewage over the surface has the effect common to all irrigation of raising

the temperature of the ground higher than the air above its surface, instead of lowering it as must be the case where the sewage rises upwards.

Irrigation by means of channels on the surface, is therefore, the only method open for adoption. As the surface of each farm will vary in configuration, it would answer no good purpose to go particularly into the formation of the surface. It will suffice to say that the sewage, starting from the point at which it will be delivered, will be conducted over the whole farm by open or covered conduits, with leading and minor carriers dividing the land into proper areas for distribution. If the land be steep, then the catch-water system, which is common in the hilly grounds of the West of England, will apply. The name itself explains the system quite as well as a lengthy description, as any overflow from the first carrier is caught by the second, and reapplied until the whole of the sewage has fed vegetation on the surface, and been absorbed by the soil. If the surface of the land has only a moderate fall, then the system now called the "pane and gutter system," and adopted in the first instance by Mr. Baldwin Latham at Croydon, will be called into use. The size of the panes depend upon the natural fall of the ground and the nature of the soil. The system may be thus shortly described: The sewage having been brought to the head of the field by a main carrier, and conducted down the field in the direction of the greatest fall by minor carriers, passes therefrom over the sloping surface from the upper to the lower margin, the system being perfect when the whole of the vegetation has been covered with sewage, without any escape from the surface. Where the land is nearly level it is necessary to give an artificial fall, by raising it into ridges, and depressing it into furrows in the shape of the winter irrigated land of Italy, which is called "marcite." A marcite field in Lombardy is very much like a well-formed English ridge-and-furrow field, with this difference, that instead of exhibiting, as some of our "corduroy" fields do, the "curves of beauty and grace," they are made precisely straight. The breadth of each plane or side of the ridge in Italy, where the water has very little solid matter floating in it, varies from 25 to 30 feet. The most recent illustration of this formation in England is that being carried out on Mr. Hope's farm at Romford. He says: "The result of many careful observations and experiments was that the breadth which combined the most advantages was 15 feet from ridge to furrow, and two ploughings are amply sufficient to lay the land up to the necessary slope of 1 in 25." The more porous the land the steeper must be the fall from ridge to furrow, as the object to be aimed at is that no sewage at all shall ultimately pass from the surface into the rivers or watercourses. In Italy the effluent water of irrigation is frequently applied over and over again, and it becomes richer the more frequently it is passed over the surface. It gathers fertilizing matter as it flows, and more money is paid for the last application than for the first. In England the primary object being to free the fluid of impurities as completely as possible, irrigation and filtration should go hand in hand. The necessity of so forming the irrigating surface that, with the aid of natural or artificial under-drainage, every drop of sewage shall be absorbed by the soil at the time of feeding or after it has fed vegetation, leads me to state that I believe a very erroneous impression has hitherto prevailed as to the capability of vegetation alone to purify sewage. It has been over and over again asserted that vegetation even in the dormant period of winter has the power of abstracting and appropriating in some way or other the obnoxious and fertilising portions of sewage. That it does not do so profitably has been shown to be the case by Mr. Morton, who states, in his "Agricultural Experiences of 300,000 tons of North London Sewage" before referred to, that a very large quantity of the sewage applied at Lodge Farm in January and February before the season of growth had arrived had been nearly useless, having before stated that his experience had proved to him that "it is a wasteful process to attempt to overcome the natural tendency of things." These remarks are those of an honest agriculturist looking for a return in the growth of vegetation. If sewage has passed off the surface comparatively pure, as we know has been the case, while vegetation has been dormant, the purification has been due to the absorption of the sewage at the surface, and its lateral filtration through the soil, rather than to the influence of vegetation at such times. In fact, I believe that fallow land would be nearly as serviceable for purification during winter as land upon which a plant of

Italian ryegrass existed provided there was natural or artificial under drainage. I have heard it frequently said, and by high authorities too, that clay lands devoted to sewage irrigation do not require under drainage; and I remember once hearing the foreman in charge of a well-known irrigated clay farm state that the drains were an evil rather than a benefit, because a large quantity of the sewage passed from the surface down to the drains, and so escaped to the river with the fertilizing matter wanted to retain for vegetation. It is needless to point out that the passage of the sewage from the surface carrier to the drain below was due to the too near approach of the drain to the carrier. It has long been my opinion, from observations made in draining works during the last twenty years, that with a *sufficient* bed of any soil for the sewage to pass through, it may be purified independently of surface vegetation. The question is one of quantity of the filtering material. The Rivers' Pollution Commissioners state: "The process of filtration through sand, gravel, chalk, or certain kinds of soil, if properly carried out, is the most effective means for the purification of sewage to which reference has yet been made." They also say, "Indeed irrigation as now carried out owes no inconsiderable amount of its success to the contemporaneous effect of the filtration of the sewage through the soil of the irrigated fields, for it is precisely in those cases in which the sewage is absorbed and disappears in porous land that we have observed in the effluent water from drains the most complete purifying effect." The absence of all reference to clay soils in this passage would lead us to believe that although the commissioners experimented on the brown loam from the marl stone of the lower oolites near Dursley, in Gloucestershire, and the result showed that it surpassed all other soils experimented upon in its power of purifying sewage, they reserve for future investigation and consideration the special capabilities of clay lands. The great point to aim at in preparing the land for sewage is to acquire a sufficient depth of filtering bed by drainage where it does not naturally exist. In surcharged free soils there is no difficulty, because a few deep drains will serve the purpose; but in clays, where we have to combat with the natural retentive powers of the soil and where a number of underdrains are necessary to produce disintegration, it is a more difficult matter. This, however, is a question too special in character to dwell upon now; it will be sufficient to state that, whatever drains are adopted to render the soil capable of absorbing and filtering the sewage, their position must have special reference to the way in which the surface carriers are laid out, and that if miasma is to be avoided no land should be irrigated that is not perfectly drained. While upon this point I will only add that I concur in what I believe to be an opinion expressed by Dr. Voelcker, that clays will be found as suitable for sewage irrigation as other soils if they are properly subsoiled as well as drained, for the more that is done to open the subsoil so as to render it less necessary to put the drains near together the more perfect the purification will be. The cost of laying out land for irrigation will, of course, vary with the form of the surface and the crops intended to be grown. It varies from £2 to £15 per acre. Where under-drainage is necessary the two will probably average the larger sum. If house and buildings are erected in cases where the extent of land reaches 150 acres the outlay may be doubled, and then the rentcharge to repay the outlay in 30 years may reach £300 a year; but in an average of instances £200 a year would suffice. This brings me to the third and last point,

THE RETURN FROM SEWAGE FARMING.—The crop which up to this time has commanded the greatest attention is Italian rye grass, which has been generally sown in the autumn, and has lasted two years and more; but experience is beginning now to show that it is more productive if grown for one year only. Its value as a farmer's crop consists in the extraordinary rapidity of its growth. Mr. Morton has shown that 46 tons can be produced in the year by dressings, amounting to 5,520 tons per acre, which is equal to one ton of grass from every 120 tons of sewage; while Mr. Hope states that as much as 100 tons per acre can be produced in the year from nearly the same amount of dressings, which is equal to one ton of grass for 56 tons of sewage. The value of Italian rye grass as a means of purification consists in its rapacious appetite for liquid manurial matter, causing it to start into growth earlier in the spring, and remain active later in the autumn than any other known crop. The money value of Italian rye grass will, of course, depend upon the market at

hand. It has realised upwards of £1 a ton when fresh cut, but the average price will probably be 11s. a ton, and then only when there is a constant demand for fresh cut grass. But a constant sale of Italian rye grass is not by any means certain. In the small towns of Rugby, Bedford, Banbury, and Warwick, they have, I believe, already experienced considerable difficulty in disposing of it, and at Banbury last year they sold it by auction when ready to cut for hay, the price realised in the year for the two cuttings was £11 an acre, which is considerably less than half the amount realised from Mr. Morton's quantity of 46 tons an acre, at 11s. a ton (£25 6s.). At the Lodge Farm, last year, the Hon. Mr. Petre actually produced and sold 53 acres of rye grass for £1,350, which is £25 9s. 6d. to the acre; and he had amongst his customers Messrs. Pickford and Co., the well-known carriers, who had regular supplies for their stables, and who pronounced it to be excellent horse fodder. I understand Mr. Darby, of Rugby, the well-known horse dealer, has also found Italian rye-grass excellent food for horses. Hitherto there has been some doubt upon this point, and sewage-produced grass has been almost entirely devoted to feeding cows and neat cattle. I mention it, therefore, here, as it will go some way to satisfy you that the demand will increase as the production becomes better known. Mr. Marriage, of Croydon, has, I believe, contrived to sell his fresh cut grass for 23s. a ton when carried into town; but the ordinary price on his farm has been from 13s. to 14s., when taken from the ground ready cut and weighed. This, it must be remembered, however, is near the metropolis, and the grass was therefore more likely of sale than in ordinary instances. At Norwood, last year, the rye-grass from 28 acres of land was sold in five or six cuttings for £741 0s. 6d., which is more than Mr. Petre realised at Barking, being upwards of £26 per acre.

Now that it is pretty well understood that Italian rye-grass does not remain at full profit more than a year, and that it has not the effect which people believed in purifying sewage during the winter, its pre-eminence as the best sewage crop may cease to be acknowledged. Sewage suits all roots of a succulent character; potatoes, mangolds, swedes, turnips, carrots, parsnips, kohlrabi, and sugar beet are all equally fond of it. It also suits the leguminous vegetables; cabbages of every kind seem to luxuriate in it, and vegetables of a less gross habit, such as celery, lettuces, onions, radishes, &c., all seem to thrive. The superiority of liquid sewage over farm-yard, or any other dry manure, for the growth of roots and vegetables, is that it allows of transplanting, and thus making good any delay or accidental failure up to a late period of the year. Mangolds have been transplanted as late as the end of June, and have produced a heavy crop. In fact, such is the value of a command of water in sewage that mangolds and most other roots are looked upon as a certainty. It is not over estimating the average crop of mangolds produced from sewage farming to put it at 35 tons to the acre, which will realise at least £25 at 14s. a ton. We have not had sufficient experience in kohlrabi to arrive at any average weight of crop, but there is every reason to believe it will turn out to be a most suitable one. The same may be said of swedes and turnips. Carrots and parsnips, if grown in moderate quantities, so as not to overstock the market, will realise between £30 and £40 an acre, assuming the land to be suitable to their growth. The whole of these root crops appear to require very judicious treatment in the selection of time of application, and the quantity of sewage applied, for it is easy to overdo the dressing, and to apply it at the wrong stage of growth. So with potatoes, which will probably be found the most profitable of all roots. Already upwards of £30 an acre have been made, and, considering that it is hardly possible to overdo the market with potatoes, as you may with carrots and parsnips, the anticipation will not appear unreasonable. Cabbages of various sorts have realised from £20 to £30 an acre. Onions, though we are told by the Hon. Mr. Petre they are difficult to raise, well repay the efforts to produce them; for he states in his "Notes for the year ending 31st August, 1869," that "1½ acres of white onions sown early in March, which did not look well until June, realized over £67 for the plot." I desist from further details, being content to point out the fact that in many cases it is possible to take two crops in one year, and to assure you that the figures I have given are moderate. Early peas may be directly followed by mangold, and mangold by celery, the plants being insured by the aid of a suf-

iciency of water and manure. Moreover, there is a future for sugarbeet and mangolds, which renders them of extra value. It is hoped that the one may be made into sugar, and the latter into feeding cake for stock. I place on the table a cake made from dried mangold by Mr. Hugh Smith. The crops which do not satisfactorily respond to sewage treatment are cereals. These crops have seldom exceeded in quantity what has been obtained from ordinary farmed land dressed with yard manure. It will be a very different thing with cereals when they alternate with rye-grass and roots; then the sewage left in the soil after satisfying the grass or roots will suffice to produce the heaviest crops of wheat, oats, or beans, without additional manure; and it is not at all improbable that we shall have fallow lands used as filtering beds during the winter in preparation for cereal cropping during the following summer, thus securing a fair proportion of straw. I lay great stress on the growth of straw, as I believe it will ultimately be as highly valued on a sewage farm as any other production; inasmuch as it will only be by the most profitable home consumption of sewage produce, when it cannot be advantageously sold at the proper moment, that sewage farming will reach its full profit.

To bring these various prices of produce into account and put before you the balance-sheet, I will assume that for a town of 10,000 inhabitants a farm of 150 acres is established, on 100 acres of which the sewage will be utilized. Let us further assume that with good management at least one crop is produced every year from the whole farm, and that, for the sake of simplicity of calculation, the whole is sold as it is produced. We shall then have the following figures to deal with:

RECEIPTS.		£
40 acres Italian Rye-grass (30 acres sold green at £25 an acre, 20 acres sold for hay at £12 10s.).....		750
20 acres permanent grass (10 acres for winter irrigation), at £6 an acre average.....		120
20 acres mangolds at £24 10s. an acre average		490
10 " potatoes " £25 " "		250
5 " carrots " £32 " "		160
5 " parsnips..... " £32 " "		160
10 " cabbages..... " £25 " "		250
40 " cereals (with straw) " £16 " "		640
		<hr/> £2,820

OUTGOINGS.		£
Rent, with rates and taxes	600	
Charge for sewage.....	677	
Rent-charge for preparing and draining land ...	200	
Labour, horse and hand	500	
Seeds, repair of implements, &c.....	200	
Interest on capital.....	75	— 2,252

Tenant's profit.....£568

By this statement it would appear that the tenant farmer's profit and interest on capital would be £548 a year from 150 acres of land; while the sewer authorities of a town acting as their own tenants may realize the same amount in addition to the charge for sewage (£677), making together very nearly 2s. 8½d. a head on the 10,000 persons contributing the sewage, which you will remember was datum value.

But this, perhaps, is assuming a favourable view of things: it is supposing the produce all sold, and the money all realized. I will now claim your attention to the disadvantages and drawbacks of sewage farming. In the first place the sewage farmer will be under obligation to receive and dispose of the sewage at all times of the year, whether it be profitable or not to utilize it; and when you consider that, with a town of 10,000 inhabitants using 20 gallons of water a head, there will be delivered to the farmer every day, winter and summer, 9,000 tons of sewage which must be dealt with and discharged in a pure condition, the obligation assumes a very serious aspect. If, however, filtration through land in a fallow state will sufficiently purify sewage during winter when vegetation does not want it, this difficulty will be very much reduced, and we may regard sewage farming in a different aspect. Then it will become an object of the highest importance so to devise the system of filtration that it shall operate as the best means of placing and storing the manure required for future as well growing crops. The next drawback is that of being obliged to dispose of your free-growing grass directly it is fit to cut. If

cut for use while green, there must be the customer near at hand to purchase and remove it as soon as it is ready, or it suffers considerable damage, and causes injury to the succeeding crop as well. If there be no customer, the farmer must let it stand for hay; or he may provide stock to consume it in a green state, when he departs from the simple course of disposing of the crop as soon as it is ready for sale and alters the whole system of arrangement I have assumed in my calculations. He has the alternative of selling by auction the grass when fit to cut for hay, as is done at Banbury and other places, and transfer the risk of making it to the purchasers. These difficulties are very considerable, owing to the fact that the crop is too bulky to dry in the natural way by being spread upon the surface of the ground which has produced it; it must be either wholly or partially removed to an adjacent surface or it must be artificially dried. Against these drawbacks or difficulties, however, there is the set off of prospective advantages to be gained by the adoption of a system of cropping more nearly approaching that of market gardening than I have mentioned. If onions and spring peas, lettuces, and such like vegetables are produced, my figures will sink into insignificance; or if milk is produced and sold successfully, the business assumes a different character. This I leave for future consideration. My remarks have already been too lengthy; and I have only to hope that they have been kept sufficiently close to the point to secure a profitable discussion, and that you will give me credit for placing the details in an unvarnished manner before you.

The CHAIRMAN said there were present several distinguished gentlemen who might be considered as pioneers both in the practice and science of sewage utilisation, and he was sure the meeting would be but too pleased to waive the rule of the Club which confined the discussion to members (Hear, hear). Amongst those gentlemen was Mr. Hope, who had had large experience in the application of sewage to agricultural purposes. A member of the Club, Mr. Baldwin Latham, who had likewise gained large experience on the same subject, had written a letter, in the course of which he said: "As I have unexpectedly to proceed to Berlin to-day on professional business, and as I shall be absent for at least ten days, it will be impossible for me to attend the meeting of the Farmers' Club on Monday next as I had intended. I think the sewage question is one of vital importance to the agriculturists of this country. In the sewage of our towns will be found a mine of wealth which merely requires time for its development. Every day fresh experience convinces me that the time is not far distant when towns will net a good round sum for that matter which is now cast away as worthless, and which is a source not only of considerable anxiety but the means of bringing the rivers and streams of the country into the foulest possible condition. Experience at Beddington, Norwood, and Thornton Heath, in the district of the Croydon Local Board of Health, shows that sewage may be applied to almost every description of produce. Good wheat crops, mangel, potatoes, cabbages, strawberries, celery, and a variety of other crops, have been grown with the most perfect success. I do not think it would pay to grow wheat on a sewage farm in the ordinary course of agriculture, as there are other crops which will give much greater yield under sewage treatment; and therefore the land will be probably better occupied by growing crops that will give greater returns, instead of being occupied by cereal crops. The Croydon Local Board received last year for every acre under tillage at Norwood £24 14s. They have had an offer lately from an influential person to take their sewage farm at Beddington, 270 acres only of which are under sewage culture, and for which they have been offered a rental of £3,000 per annum. The agricultural land in the neighbourhood of Beddington is certainly not worth more than from 30s. to £2 per acre. The additional rent offered, therefore, may be taken as the value of the sewage. The Local Board would not accept this offer, as they think they will be able to realise a much larger sum by working the farm themselves. At the present time much difference in opinion exists as to the expense of fitting the land for the purposes of the application of the sewage. In my experience I have had land laid out at a cost not exceeding £3 per acre, and I have had land which has cost upwards of £20 per acre. I am now laying out about 5,000 acres for the purpose of sewage irriga-

tion; and the average cost will be much less than £10 per acre. We have lately tried on our irrigation farm at Beddington some new turnwrest or turnover ploughs, which leave the land level, without ridge or furrow; and we find they work extremely well; and with such an instrument in the hands of the agriculturists, the cost of preparing land for sewage irrigation purposes will be greatly reduced. I trust you will have a very successful meeting, and that much valuable information will be elicited. When I look back on the short space of time when Mr. Rawlinson and myself were found the only engineers who advocated the application of the sewage to land, as the means not only of realising the value of the fertilizing matter, but as the only means by which sewage can be purified before it is turned into the fresh watercourses of the country, and when I consider the vast number of persons that since that time have taken up this question, I take it as a criterion of the progress which has been made, and which augurs well for the future success of the system of applying sewage to land."

Mr. Horz said he rose with great diffidence to speak for the first time to the Farmers' Club, and should have hesitated to do so had not Mr. Bailey Denton called attention to his operations in connection with sewage farming. The first point he would notice in the most interesting paper which had been read, was the statement made as to the number of persons per acre. As a rule a great deal of misapprehension existed upon this subject. Persons frequently talked of the number of tons of sewage per acre, and the number of persons representing those tons, when they intended to speak of the particular acres under crop in a given season, leaving out of consideration those other acres which either were in crop the year before, or would come into rotation the following year. Mr. Denton had pointed out that a large addition must be made of not less than 50 per cent. to the acres actually under sewage, in estimating the number of acres proportioned to a town. His own experience was that a smaller number of persons should be applied to each acre, his average being not more than 40 or 45 persons per cent., including the land which perhaps received no sewage at all in the given year. Dr. Voelcker was perfectly right from the chemist's point of view in saying that clay land was the best of all for the reception of sewage; but unfortunately it was also the nastiest upon which to grow market-garden crops. Cabbages and other similar plants refused to grow at all, and flooding a piece of land in the face of a north wind, in the expectation of getting cauliflowers, was at the best a disheartening operation (laughter). Dilution he regarded with comparative indifference. Many persons thought town sewage was too diluted, and that in point of fact it was questionable whether it did not do more harm than good. The first thing he did when he took the sewage of the town of Romford was to stipulate for an additional dilution of something like 90 gallons per head per diem at his pleasure in summer. The sewage at Romford, although it had a regular water supply, was so strong and thick that it would injure all young plants, not chemically but physically. Thirty gallons per head per day represented 48 tons per annum, or in round numbers 50 tons. That was approximately the dilution to be expected from the London sewage when the whole system was completed. This was the most suitable quantity so far as he could discover. With regard to the estimates formed by chemists of the value of sewage per ton, or per head of the population, he was himself originally much misled by the chemists, who were themselves misled from want of farming experience. They were afraid to trust their own chemical knowledge, and they fancied that by the application of so much "washy stuff" as the farmers called it, they would injure many crops, and they did not see their way to applying it at all times of the year. The explanation was that at that time they had not had sufficient experience. They, therefore, halved their theoretical value, and put it at 1d. per ton. He himself had a little skirmishing with his friend Mr. Mechi, on the matter, and he had now very great pleasure in admitting that that gentleman's estimate of 2d. per ton was much nearer the mark. He (Mr. Hope) would repeat what he stated at the Society of Arts, and to the basis of his opinion upon this point. He had samples taken every half hour, night and day, for 203 days on the high and middle level sewers of London in 1865, from March to September, and the average analysis gave about eight grains of ammonia to the gallon, or 2d. per ton. It was quite clear that if you put a certain quantity of ammonia and other chemical manures into the ground, and did not somehow get them

out again with a proper proportion of profit, it must be the fault of the man who put them in. His experience was that there was nothing in nature to militate against such an operation. Land should be so arranged that with a proper proportion of Italian rye-grass common meadow land, and all descriptions of roots and market-garden produce, there was always a sufficient proportion of ground in a condition to receive sewage. He received all the sewage from Romford, and had of course to stand his chance of all suits in Chancery for nuisances, and he was not a bit afraid of the result, because he had long become convinced that he could not only apply it without injury or offence to the town's people, but also with a handsome profit out of every ton of sewage. He was sowing ten acres of onions which would not receive any sewage during their growth, the land having been enriched in its fallow state. He himself could see no reason for the belief amongst some chemists that the theoretical value could not be borne out by skilful management on the part of the farmer. He had gone into a number of very careful calculations as to the returns which might be expected from rye-grass, that being one crop which must always be used on every sewage farm, and he found that if cows were reasonably well purchased, of the right breed—large-framed Yorkshire or half-bred Short-horns—well tended and housed, and never allowed to waste their milk-producing energy; and if the milk was sold near a railway station at say 2d. per quart, which was the average price obtained by dairy farmers in the neighbourhood of all large towns, the return to the farmer for his grass consumed, after deducting interest on the cost of the cows and buildings, and allowing for everything in the most wasteful manner, would be, net, 15s. per ton. When it was remembered that 70 tons per acre had been got in one season from ten crops, the return to the farmer must be even beyond what Mr. Denton had held out. Large crops were always obtained if the grass was sown at the proper time. It should always be sown in the month of August, and lightly sewaged. One light crop would be obtained that year to pay for the cost of the sowing. There would then be another crop in the ground to come off in the spring. Last year grass-cutting began on the 24th of January. This year that was of course out of the question, but no doubt the price would be proportionately high when the cutting commenced, so that even if a farmer in a bad season got only nine or eight crops, he might realise quite as much money. With regard to mangold wurtzel and all other crops with similar appetite for manure (such as drumhead cabbages), 2,000 tons per acre of sewage—equal to forty persons—was enough to produce a maximum crop. Twenty-five to thirty tons was the ordinary yield; but with sewage 50, 60, or 70 tons might be counted upon with absolute certainty, irrespective of the season. The plant was pushed forward from the very earliest stages of growth, supposing the soil to be suitable and friable. Nothing seemed to check it; it never flagged in long periods of drought, as was the case in ordinary farming; and, above all, there were no gaps. Even if some of the seed failed, transplanting might be effected with certainty. A field of mangold produced in the ordinary way showed vacancies equal to a quarter of the whole. This was not the case with sewage, and, irrespective of this, the roots themselves were individually larger. Market-gardening was a trade which every sewage-farmer must learn. He would be almost always within easy reach of a good market for vegetables, and he could grow better vegetables than anybody else. The quality of vegetables depended upon rapidity of growth. Grown slowly, they are more generally hard and withered; if grown rapidly, they were succulent and crisp. The difference between the two kinds in sale was something extraordinary in the Borough or at Covent Garden. Last year he knew of an instance where 600 dozen of cabbages were sent up, grown by the old and the new method. They went up on the same day, when the top price for cabbages was a shilling a dozen. The 300 dozen of sewage-grown cabbages were bought up at once at 14d.; the others went off very slowly, first at 8d., then at 6d., and it took many hours to sell them. A few facts like these ought to convince everybody not only of the value of sewage, but of the necessity of combining market-gardening with farming (Hear, hear). It was the ambition of the ordinary farmer to spread his farming capital over a maximum number of acres, and perhaps in some parts of the country where rent and labour were cheap, that was right, but where the rent was

heavy and labour scarce the best policy was to concentrate capital upon a minimum number of acres. He would quadruple Mr. Denton's estimate for the above, and instead of making the sum £500 a year he would put it at £2,000 or £2,500, but at the same time he would multiply the returns at least by three. He had only further to add, that he paid £800 a year for sewage, representing 6,000 persons, or in round numbers 2s. a head, and as now it was worth 8s. per head of the result he was not afraid (cheers).

Mr. SMYTH (Herts) desired to make some observations on a plan of his own for utilizing mangold, looking at it with the view of utilizing sewage.

The CHAIRMAN suggested that Mr. Smyth's remarks would be foreign to the question under discussion.

Mr. SMYTH said he thought not. He would show that 8 tons of mangold would produce the same amount of feeding material as was to be found in a ton of barley. He took mangold pulped and kiln-dried and pressed it into a cake, and that was equal to a ton of the best barley, or equal in feeding value to a ton of oilcake. Many persons might laugh, but he was prepared to prove it analytically that it contained the same amount of feeding material.

The CHAIRMAN suggested that Mr. Smyth should confine his remarks to the question how far his process bore upon sewage.

Mr. SMYTH said he thought it was palpable that it bore upon the question if he could prove that this food was worth £10 a ton. Then came the question of the utilization of the raw mangold.

A MEMBER: The growth of the raw mangold.

Mr. SMYTH: Not the growth, but the utilization.

The CHAIRMAN: Your observations would apply equally to mangold grown in the ordinary way.

Mr. SMYTH: With all due deference the same thing may be said of the potato, but the object which you have is to show what is the best crop and what is the best way of utilizing it. (Cries of "No, no," and "Question.") Mr. Smyth finding the Club indisposed to hear him sat down.

Mr. MECHE (Tiptree Hall, Kelvedon, Essex) desired to express his thanks to Mr. Bailey Denton for his very able paper, and the great number of useful facts he had given, although he did not agree with everything he had said. He was rather an old sewage customer (laughter), it being now 27 years ago since he first wrote against the great folly and wickedness of throwing that away which would yield abundance of food for the people. He had practised it in his small way on his farm for 20 years. The manurial power of England taken by stock represented $2\frac{1}{2}$ sheep per acre; and he found that the same conclusion had been come to by the Rivers Pollution Commission; and $2\frac{1}{2}$ sheep, or $2\frac{1}{2}$ people were about the same in manurial value (laughter). It was a fact and no laughing question. If they took an Alderman's family he would give it in favour of man over sheep; but when they came to the same thing mixed with water they must estimate 50, 100, or 200 people to the acre, and if so the land in England must be very deficiently manured. The average rainfall in England was 2,600 tons per acre, and the manurial power of $2\frac{1}{2}$ sheep was mixed with 2,600 tons per acre. In towns, taking $2\frac{1}{2}$ individuals, the calculation of water was 60 tons per acre per head, making 150 instead of 2,600 tons, and yet no one grumbled. He hoped by and by they would arrive at a more reasonable calculation. He believed if they doubled the manurial power of England they would grow a great deal more of everything than they did now—at least that was his experience, and he was glad to see the result wherever the towns had begun to move in the matter. He could not give a better proof than Croydon, which had found out its error, and was about to apply only the same quantity of sewage to four times the quantity of land, and if they lived 20 years more the limitation of people to acres would go on increasing, and could they wonder at it when it took the annual average available produce of 20,000 acres of land to feed the people of London for a single day? Would any one tell him that the manure from that was not capable of greater diffusion than they had heard of yet? He agreed with Mr. Hope that if they were going to make market-gardens of the land they could hardly put too much sewage in reason upon it. They know that if an ordinary agricultural crop was consumed on the land, that land was considered sufficiently manured; and on that principle London ought to manure 20,000 acres a day; but according to

the principle now adopted London only manured a few acres. There was only one little difference between the sheep and the human being (laughter) in this matter of manure. The sheep consumed all the phosphate of lime that was contained in its food. Man in the consumption of meat did not consume the bones, and therefore in the important element of lime his manure was deficient. Baron Liebig asserted that the addition of a small quantity of superphosphate of lime would render the manure of individuals equal to that of animals that were fed on the land. He was exceedingly pleased to find the subject was now getting one of every day discussion. When he first mooted the question 27 years ago he was called a nasty fellow for hinting at it; but the subject had since been taken up in editorial articles, and he believed they would all now agree that the waste of that enormous amount of value was not only absurdly wrong with regard to the pollution of our rivers, but was wickedly wrong with respect to depriving the people of this country of a handsome profit, a large employment of labour, and a great increase of food. He recollected the time when there were no sewers in London—when they used to catch roach at Blackfriars Bridge at low water—but that time had gone by, and the river had been made a common sewer. The same thing had been done at Manchester, but now they would be compelled to do their duty. His friend the chairman, in introducing the subject, had rather charged him with twitting the farmers for not being anxious to receive liquid manure.

The CHAIRMAN: I said indifference and apathy.

Mr. MECHE said he adopted the word apathetic, and he thought it would be seen that he was right in drawing that conclusion, as he had heard it said by hundreds of farmers that they had put liquid manure on their land, but had never seen where it went, but, if so, the land could not have been drained. He believed now the time would come when the use of liquid manure would not be confined to near towns, but would be disposed over a larger area until it reached the land that had been exhausted in producing food to bring into the towns. He had used a good deal of sewage, and though he might differ with Mr. Bailey Denton as to the mode of putting it on, when it was in large quantities it would be desirable to convey it through open channels and diffuse it by means of hose pipes. He had not to spend £10 to put the land into form. When he had the jet at work he could put the hose on any part. He quite agreed that the land ought to be well drained. He had spent only £2 an acre for iron piping, and was thus enabled to dispose of a large quantity of sewage, and if it was of good quality it would pay to put it on in that way. Our growth of cereals could only be called half crops. The poverty of the land from want of manure was the great curse of the land in England.

Mr. CLARE SEWELL READ, M.P., said they were very much indebted to Mr. Bailey Denton for his paper, which was useful in consequence of its moderation. It was very much better to understate than to overstate the case. It was well known that to apply sewage at a certain period of the year, it would not produce the benefits to be expected from it. With regard to sewage farming, one point which had been hinted at he should like to refer to. Although there might be a considerably increased quantity of ground used for market gardens, he believed that for many years to come the principal produce would be Italian ryegrass, but the great drawback to growing it was the impossibility in some districts of disposing of it: therefore every sewage farm should have an apparatus for drying that article. Such an invention had been produced by Mr. Gibbs for drying corn, and was pretty successful. Hitherto all attempts at drying large quantities of grass by artificial means had failed; but he trusted that with the attention of scientific men would be more given to the subject, because until that was done they would never get the full value of their sewage produce.

Mr. THORNHILL HARRISON, C.E., said it struck him, after hearing the remarks that had been made, that the area of land required to utilize sewage upon was becoming more and more extensive. Mr. Mechi had pointed out that we wanted a more extended area, so as to bring about the condition of things existing previously to the introduction of the water-closet and sewage system. Previously to that period the night-soil of the country was collected and carried to an extended district over the country. Doubtless some of the Lincolnshire farmers could give some information as to the value of the night-soil of Man-

chester, which was carried across the island into Lincolnshire, and purchased at the rate of 3s. 6d. to 7s. per ton, giving as the maximum a return of about 2s. 7d. per head of the population. That was the sum that the farmer gave for the night-soil. Of course the farmer expected a considerable profit from using it, and the amount of agricultural produce was not at all represented by that sum. He found that at Stockholm the price given by the farmers for night-soil was 4s. 5d. per head of the population, and at the barracks at Carlshus, 2s. 4d. per head. One advantage of night-soil was that it could be distributed over a very large area. As regarded market-gardens as a system through which a maximum value of sewage might be obtained, of course there were near every town market-gardens at present, and by-and-by there might be difficulty in disposing of the sewage for that purpose. The question now was, what had been the experience of sewage farming up to the present time? Upon this point information of considerable importance was given in the report just issued by the Rivers Commission. First of all was given the total value of the crops, per head of the population, derived from sewage farming. At Edinburgh 260 acres of land returned, per head of the population, 1s. 5d. as the total value of the produce. It was fair to deduct from the total receipts something like 2s. 4d. as produce naturally to be expected from the land without any sewage irrigation, and deducting that in the case of Edinburgh, the amount of 1s. 5d. was reduced to 1s. 2d. per head. At the Lodge Farm at Barking the total value of produce per head 4s. 1d.; deducting 2s. 4d. as before, it was 1s. 9d. At Aldershot the total value 3s. 4d.—making no deduction for the crop without sewage, as the land being sand was worth nothing. At Rugby the return per head was 1s. 4d. (nearly the same as Edinburgh), but the deduction as before reduced the amount to 8d. The values respectively at Banbury were 2s. 4d. and 1s. 4d.; at Worthing 4s. 6d. and 3s. 8d.; at Bedford 10d. and 7d.; at Norwood 3s. 6d. and 3s. 1d.; at Croydon 4s. and 3s. 5d. That was the total value of the produce derived from the application of sewage, and compared to 8s. per head as the value of sewage it could not be considered satisfactory; but there was another point to be looked to, and that was the commercial result. At Rugby the net receipts, after deducting the expenses, only gave 28s. 8s., or 3d. per head of the population; and there was no allowance for the charge of interest upon £5,000, the cost of laying out the land. At Banbury the net receipts were 28s. 4s., or only 2d. per head, and there was no interest charged for £4,000 expended. At Worthing the amount was 27s. 18s., or 1s. 11d. per head of the population, and Mr. Rawlinson said it only returned an interest of 1½ per cent. At Bedford it was only 287 6s., or 1d. per head, with no allowance for interest. At Norwood it was 214s. 6s., or 9d. per head, and no allowance for interest. These facts he gathered from the Rivers Commissioners' Report; and the experience in England up to the present time was therefore not satisfactory to the farmer or to the country. We were by no means getting the maximum of benefits to the farmer; nor the benefit the whole country ought to receive. Probably the experience of market-gardening might mend the matter; but up to the present time the experience was very decidedly against sewage irrigation, as being either a beneficial application of the excrement of man, or a commercial success to the person who tried it.

Mr. EDMUNDS (Rugby) said: That after the glowing accounts they had heard, he was afraid there must be something wrong with them at Rugby. There they had no such results. Last season was an exceptional one—by this time they were cutting their first crop of grass (this year it had scarcely commenced growing), and then, though the ground was irrigated so soon as the crop was removed, they were only able to get six cuttings. Some difficulty was experienced in disposing of all the grass, and one piece was mowed for hay. This realized 247 from nine acres—three other crops were obtained, but they were inferior. He did not think sewage farming would be that very profitable occupation it had been represented. So much depended upon the nature of the land itself, its situation, &c., &c., that he was quite sure those great returns they had heard of were exceptional. No doubt enthusiasts had been the means of carrying out all our great improvements, but it required some one now and then to put the drag on to prevent others being carried too far. Now the balance sheet of their

surveyor was like another famous one. He had left out entirely a small matter of £5,000, which it took to prepare the land by levelling for the reception of the sewage, the making of roads, the erecting tanks, laying down pipes, &c., and no allowance at all was made for the sewage itself; so that instead of having a balance of £58 in their favour, there was an actual deficiency of £200; but he did not complain. The advantages gained were cheap at that cost. The land had been proved to be a thorough deodorizer. The pollution of the river was prevented, they had no complaints from their neighbours, and the sewage was no longer a nuisance injuring the health of the people. Mr. Bailey Denton had spoken of old pasture-land. At Rugby they had irrigated old turf, and the result was that it destroyed all the fine grasses, and the whole of the trefoils disappeared, and completely spoiled it for grazing. He was satisfied the system would not succeed with cereals—it might succeed for market gardens, but then they must be within reach of large populous towns, or they would not be able to dispose of the produce. Italian rye-grass had been proved to be the most valuable crop for two years, then it required to be renewed. One great drawback to the profitable use of sewage was, that they had to deal with it when they did not want it. No less than 84 acres out of 87 were taken for roads, tanks, &c. For these and other reasons he did not believe sewage farming would be generally a successful speculation. Where it would be profitable would be the exception.

The CHAIRMAN said this was the fifth time the Club had discussed the subject of town sewage. As early as 1848 Mr. Warren, of Horsley, brought it forward, and it was discussed on three other occasions by Mr. Mechi; so that, as far as the farmers of England were concerned, the Club could not be charged with being behindhand or indifferent to its importance. He had long taken a deep interest in the question, and some seven years ago he travelled half over England and Scotland to inform himself upon the subject before recommending any plan to be adopted in the borough of Bedford. He saw the necessity of separating rainfall from the sewage. This was a cardinal point where sewage had to be pumped; and he differed from Mr. Hope as to the amount of dilution. Then it must be remembered that vegetation, and not so much the earth itself, was the great deodorizer. If the rainfall was taken into the sewers, there was great difficulty in dealing with the sewage in winter when the supply was greatest, and when vegetation, being dormant, required least. As to the area required per 1,000 of the population, that depended upon circumstances, but mainly on the amount of filtration and screening which the sewage had to undergo. Last week he saw at Croydon an invention by Mr. Latham for screening sewage. A large perforated wheel placed in the sewage tank, in the course of its revolutions, threw out all the more solid matter before the sewage was put on the land; when sewage was so treated a very much smaller area was required for utilising it. When he told them that the land at Bedford had realised as much as £20 an acre, he thought it would be seen that Mr. Harrison's calculations were scarcely tenable. At Edinburgh, too, in open competition, the land had fetched as much as £28, and even £35 per acre.

Mr. HARRISON: I don't deny the immense produce from sewage application.

The CHAIRMAN said he did not base his remarks upon that; but he denied the statement of Mr. Harrison, that towns had hitherto failed to apply their sewage profitably. With respect to the soils best adapted to sewage, the towns had no choice, but must use the soil by which they were surrounded; but towns would do well to remember that the sewage should be applied eastwards of the town, where possible, as the prevalent winds being west, less effluvia, if any, would be carried to the town than if the sewage were applied on the west side. With regard to the drying machine of Mr. Gibbs, he thought its usefulness would be manifest in cases where towns had a difficulty in disposing of their rye grass. With regard to the dry earth system, it had been adopted in the middle-class schools at Bedford and at labourers' cottages he had recently built with marked success, but he did not think it could be adopted in large towns or places where carelessness existed. His experience led him to the conclusion that all sanitary arrangements in cities or towns must be as nearly self-acting as possible. He believed they had arrived at the solution of this difficult problem of town sewage. The plan adopted was not new. At Milan it had existed 500 or 600 years, at Edinburgh for

nearly 200 years; and therefore, as Solomon had said, there was nothing new under the sun.

Mr. BAILEY DENTON, in reply to the observations made, said as regarded Mr. Harrison's remarks they ought to look not so much to the past as to the future, which he hoped would be the case, as it was clearly not right to make the efforts of infancy the criterion of the future. His observations would certainly be very disheartening if they had any influence with the meeting. With regard to Mr. Hope's remarks, he believed the report of the Rivers Commission before referred to would show that an excess of dilution washed out the manurial matter through the soil, and if he (Mr. B. Denton) was right there was a mean to which they ought to direct their attention. He hoped some good would arise out of the variety of opinions that had been expressed on this point. With regard to another remark of Mr. Hope's as to quadrupling

the item of labour, the advantage of sewage irrigation was that the sewage was brought to the land and there distributed with a very great diminution of labour. With regard to Mr. Gibbs's machine, he happened to be one of the judges of it at Manchester, and he advised its application to the drying of sewage produce. As regarded the statement of Mr. Edmunds, of Rugby, that the finer grasses disappeared with sewage irrigation, it had been found at Carlisle to double the value of perennial grasses, land which was rented at £4 an acre now renting at £8 there. This was old grass land.

Mr. CROSSKILL (Beverley) proposed a vote of thanks to Mr. Bailey Denton for his paper.

Mr. CONGREVE, in seconding the vote, said his experience at Rugby was that sewage destroyed the finer grasses.

A vote of thanks to the chairman concluded the business.

THE GOVERNMENT EDUCATION BILL.

At a meeting of the East Suffolk Chamber of Agriculture at Ipswich.

Mr. H. BIDDILL moved that a general assent to the Bill be accorded, but that the attention of the House of Commons be called to certain clauses that require amendment.

Mr. T. HAWKINS seconded the motion.

Mr. C. HAWARD (Bramfield) moved as an amendment: That if compulsory national education be unavoidable, such education shall exclude the formal teaching of religion from such schools as shall be so supported, and also that such schools shall be supported from the national, as contrasted with the local, funds.

Mr. N. GARRETT seconded the amendment.

Mr. R. L. EVERETT suggested that the Government Bill contained many points on which they were all agreed, and it would be better to carry Mr. Biddell's motion and then point out in what respects the Bill could be amended.

This suggestion was adopted by Mr. Haward, the amendment withdrawn, and Mr. Biddell's resolution carried.

Mr. EVERETT then moved that the age up to which children should be required to attend school should be ten instead of twelve, and also that the distance from a school which should excuse a child should be two miles instead of one mile, as in rural parishes many more schools than were really required must be built if they were to be brought within a mile of every house.

Some conversation followed as to whether it would be in the power of a school board to excuse attendance for other reasons than those given in the Bill, and in the end Mr. Everett withdrew his resolution.

Mr. EVERETT then moved that at least half the school rate ought to be paid by owners of property, otherwise in many cases the tenant would have to pay in rate what the landlord now pays in the form of subscription. Wages, too, would be increased by the subtraction of juvenile labour from the market and that would fall on the tenant.

Mr. HAWARD said it was on that account that he moved that the cost of national schools should be thrown on national rather than local funds.

The CHAIRMAN suggested that as the question of local taxation was under consideration it would be rather premature to enter into the question of who should bear the burden of local rates. They would not object so much to an education rate as to some of the existing burdens, but as there did not seem much chance of getting existing burdens taken off, and as this was a national question, perhaps it was a matter in which more national assistance might be given.

Mr. HAWKINS thought as national education would be for the benefit of the whole community it should be maintained from the general taxation of the country. He also thought the chamber should express its opinion as to the time children should be kept at school, and moved that it should be up to ten years old instead of twelve.

This was seconded and carried. It was also resolved, on Mr. Hawkins' motion, that a child should not be excused if there was a school within two miles.

Mr. HAWARD moved as an amendment to Mr. Everett's proposition as to the incidence of rates, that national schools should be supported by national as distinct from local rates.

Mr. N. GARRETT seconded the motion, and it was carried by a large majority.

Mr. EVERETT then proposed

That school boards should be established in every district, and their proposed permissive power of enforcing the attendance of children at the schools should be made compulsory.

Col. TOMLINE, M.P., said: if he were inclined to use compulsion in any way upon the agricultural labourer he should insist on compulsory eating and drinking. He asked Mr. Everett what it was he meant practically by compulsory education—what was to be compulsion?

Mr. EVERETT said the Bill provided that the fine for not sending a child to school should not exceed 5s.

Col. TOMLINE: Suppose he does not possess 5s.?

Mr. EVERETT: The Bill makes no provision.

Mr. H. BIDDILL: There's lots of Bills that do.

Col. TOMLINE: The Bill is a sugar plum, and it does not present the alternative.

Mr. H. BIDDILL thought Col. Tomline would say that it would be far better that the *onus* of compulsion should rest on the government than on certain parishioners forming the school board.

Col. TOMLINE: Certainly.

Mr. BIDDILL said that was the idea of both Mr. Everett and himself.

The CHAIRMAN opposed the resolution on the ground that it was opposed to the principle of the Bill, which was to avoid interfering with the existing system in any way.

Mr. Henniker-Major and Col. Tomline were at this stage obliged to leave to take the 6 P.M. train to London to be present at the debate on the Education Bill, and the vice-chairman, Mr. M. Biddell, took the chair.

Mr. N. GARRETT then seconded Mr. Everett's resolution, which was carried.

Mr. EVERETT moved, "That in all schools receiving aid from local rates, the teaching of any creed, catechism, or tenet peculiar to any sect, be strictly forbidden. And that in all other schools receiving aid from Government grants, the religious teaching be either before or after the ordinary school business; provision to be made that attendance at such religious teaching be not compulsory, and that there be no disability for non-attendance."

Mr. W. BRACKETT seconded the resolution.

Rev. C. HODGSON defended the Church Catechism, and opposed the banishment of the Bible from schools.

The discussion was continued by Mr. H. Biddell, Mr. N. Garrett, Mr. Beckett, and Mr. E. Roe, but considering the lateness of the hour, Mr. Everett withdrew his motion without a division being taken.

At an adjourned meeting of the members of the West

Suffolk Chamber at Bury St. Edmund's, Mr. W. BIDDLE moved "That the Government Bill was generally worthy the approval of the Chamber."

This resolution was seconded by the Rev. G. F. TURNER.

Mr. FISH proposed an amendment, that the Chamber objected to the Government proposition of leaving to school-boards the power of determining the religious teaching to be given in schools supported by rates and parliamentary grants, as establishing or extending the irreligious principle of concurrent endowment and taxing minorities for the support of a religious teaching that they disapprove of or disbelieve.

Mr. CLOVER seconded Mr. Fish's proposition.

Mr. NUNN here proposed a resolution to the effect that the age up to which children should go to school should be reduced from 12 to 10, and under that age every inducement ought to be given to parents to send their children to school, but there should be no direct compulsion.

This was seconded by Mr. GAYFORD and carried.

Other resolutions were talked of, and eventually attention was redirected to Mr. Fish's, which Mr. Sparke believed was a covert attack upon the Established Church. Several gentlemen, including the chairman, agreed with part of Mr. Fish's resolution; and eventually he cut it in two, dropping what follows the word rates. This was, however, rejected by 10 to 4.

HOW THE AGRICULTURAL LABOURER WAS EDUCATED.

Fifty years ago I was seven years of age, and can well remember that my father's household consisted of two servant men, and six apprentices, viz., two stout lads, two small boys, and two girls. It was thought necessary in those days that persons should serve an apprenticeship to agriculture as well as to any other kind of business; but now the more enlightened part of the community think that any fool will do for a farmer or agricultural labourer, and that experience or training is quite unnecessary. The men in question never had more than six pounds a-year; they, however, lived with my father several years, and, on leaving his service, I have heard him say that out of his savings one of the men had left in his hands upwards of £13. But few apprentices on entering my father's house could read, but none of them ever left it without being able to read the Bible well, and most of them could write. All his household, except one boy and girl, went to church every Sunday morning, and previous to doing so the youngsters spent an hour in reading and teaching each other; after dinner two hours were spent in the same way, also after supper, when a circle would be formed and the Church Catechism, with numerous hymns and pieces would be repeated; small prizes would occasionally be offered for encouragement, and it was surprising that some of those *uneducated* children could repeat; one, I remember, would recite a very long chapter in the Testament without missing a word. Winter evenings, after supper, the men and stout lads would make spears for rick thatching, and the children would be employed reading, &c.

"Now I am one of the olden time and may be thought too slow,

But give to me the good old days of fifty years ago."

Agricultural labourers brought up in that way understood their work, and were not above doing it, but since the abolition of apprenticeship there has been a fearful falling off in their ability and manners; boys will not now submit to necessary restraint, but would rather work and live hard to enjoy liberty, and their parents generally encourage those feelings. During the last thirty-five years I have been a considerable employer of labour, and fearlessly assert that I have generally found those labourers who have had the least schooling the most valuable to me. These men having devoted their time and attention to their occupation have become masters of it, and, excelling, they take pleasure in it, and are contented in their station. "The cobbler should stick to his last." While these more highly-educated frequently become "book-worms," their attention being divided, they never excel, but are always "building castles in the air," anticipating that which they never realize; hence they become dissatisfied with their station, mere dregs of society, ready to do anything but that for which they were intended—work. I have had many such characters from time to time in my employment, whom I would rather pay to stay at home than mix them with other labourers, because they hinder more than they further by talking of what they read and hear. This knowledge frequently leads them to public-houses, where they "let their light shine before men," wasting their time and money, while their families are starving.

—Mr. T. OLIVER, of Penhallow, in *The Royal Cornwall Gazette*.

THE IMPROVIDENCE OF THE FARM LABOURER.—It was only yesterday that one of my men, who is the father of seven children, requested me to take the eldest, a boy barely ten, to act as scarecrow. I consented to do so, more with a view of helping the father than to serve any purpose of my own, as I

had rather be without the boy than otherwise. It will be a little help to the family income. I could not raise the parent's wages beyond those of my other men, on the ground of his having a large family. Such a course, even if I had, would have caused dissatisfaction among the rest of my hands, especially as the man is by no means a skilled workman. An intimate friend of mine has for the last two years employed two little boys—sons of one of his labourers—chiefly to work with their father when possible, solely to help the man, and the extra 5s. on Saturday night has been well appreciated. We farmers expect to pay for work according to its value, regardless whether it be done by Richard without a family or John with half a score, and I think rightly so. A man's family is his own private affair. Our labouring classes seem to think they were created chiefly for the purpose of bringing babies into the world. Argument and persuasion to the contrary are thrown away upon them. The man I have alluded to as in my employ must needs take a wife at the very ripe age of 19. Another, who has been in my service from childhood, and in whom I took a more than common interest, in spite of my entreaties, about two years ago did the same sort of thing. He is now 23, the second child has just come to light, and he promises to give a good deal of work to the registrar. I have a third, a nice lad of eighteen, and he is very sweet on a little girl, and I expect that before long the two will be made one flesh, with the usual consequences of course. I do all I can, by way of advice, to prevent this sort of thing, but they appear to consider their own feelings as the best guides, and they act accordingly. In every other class some regard is paid to the question of ways and means, and marriage is delayed until there appears a prospect of livelihood for the contracting parties, and provision for a family. Our agricultural labourers ignore these considerations altogether, and hence how can they expect to be anything but paupers? I differ with you entirely about little Woolven's death resting upon the community. If parents will persist in bringing heavy families into the world without having made the slightest provision for a rainy day, and are obliged to send their children to work at a tender age or submit to any other inconvenience, it is a consequence of their own act, and neither they nor any one else has a right to turn round and blame the community for that which is the natural result of individual folly and imprudence.—*A Farmer* in *The Daily News*.

ANOTHER AGRICULTURAL MOVEMENT.—The county papers are curiosities just now. In all parts of the country there are expressions of discontent and dissatisfaction at the public proceedings which have been carried on in the name of the tenant-farmers of England. In Suffolk, too, East Suffolk, and West Suffolk, Farmers' Clubs were formed last week, with a view to supersede the present injurious partizanship which has crept into the more local and declining institutions of that county. We are assured, too, that these Farmers' Clubs have been simultaneously formed in Suffolk, with a view to counteract in some measure, if not to smother completely, the evil consequences which are resulting from Chambers of Agriculture, in the Eastern Counties, being misguided and misled by the partizan zeal and activity of the Central Chamber and its Newspaper Company (Limited).—*The North of England Farmer*.

THE USE OF STEAM POWER IN AGRICULTURE.

In these days of educational development it may be a very pertinent question to ask how long is it since the agency of steam power was first directed to agricultural purposes? Very naturally one of the favourite arguments advanced for improving the mental condition of the labourer is the superior class of workmanship upon which he is engaged. The better the machinery the better should be the man to whom it is entrusted. Such an element, indeed, as fire is described in something like a proverb to be a good servant but a bad master, so that if we leave the ignorant dolt to deal with the consequences may be in every way unprofitable. But then the ignorance or erudition of the farmer's boy is worth distinguishing or defining. How proficient is it really requisite that he should be in "book learning," and how far might any such proficiency help him, as Falstaff says, "to labour in his vocation." Some thirty years or so since, any such points as these would have been scarcely worth replying to, for the business of Agriculture was still conducted very much as it had been. Four horses followed each other in one long halting line at plough; the wheat was sown broadcast, cut with a sickle, and thrashed with a flail. The establishment, however, of the Royal Agricultural Society quickly created a new order of things; one man made a fortune by drills, and another by engines, as a third spent a fortune in perfecting the design of the steam plough. The very stock of the farm may be now said to be fattened by machinery, for the lowing herd gets on a deal faster on clean cut chaff and pulped food than when winding o'er the lea; while the ploughman's whistle is fairly drowned in the busy hum of Fowler's eight-horse or Howard's patent. The hero of Bloomfield's Pastoral would, no doubt, be sadly out of place here, as we look rather for the smart mechanic or skilled artisan,

"Whose hair is crisp, and black, and long,
Whose face is like the tan."

But is it so? Is it within so comparatively recent a period that the farmer has only contrived to get so strong a power under his command? How long is it since, we repeat, that the aid of steam was first directed to agricultural purposes? According to the tradition of the engine which still stands just without the station at Darlington, it is, if we remember aright, some forty-three years back that George Stevenson started his iron horse on the Yorkshire tramway, and how much later shall we put it that the plodding farmer took up the idea? The first meeting of the Royal Society was held in Oxford in 1839, and by 1841 the Tuxfords of Boston had turned out a portable engine and thrashing-machine for Mr. Roslin, of Algarth. Let us say, then, that it is thirty years since the much-admiring Hodge first saw steam generated, and the corn knocked out after so comical a fashion. Strange as it may sound, it is much nearer sixty than thirty years since the labourer was called upon to educate himself up to the every-day use of such appliances. The railway engineer followed rather than set the example to the farmer: "The steam-engine was placed at Trewithin by Trevithick in 1812, and it cost £70. It is not equal to the engines now made, but it had done a great deal of work. We use it for thrashing, chaff-cutting, and bruising, but only for one purpose at a time." So writes Mr. Henry Trethewy, senior, at this time about the father of Cornish agriculturists, a position to which he has most deservedly attained. And we are told on all sides to educate the labourer to the

higher duties expected of him, mere physical force will have to give way to cultivated skill and mental power, and so on; when down in the far West the now worn-out grandseir can tell the little ones that he was educating himself in this way sixty years since, and without making much fuss about it, either. His "betters" even did not insist on sending him to school, and he was very probably feeding the engine, when he should have been studying the use of the globes.

There is something of a moral in such an incident as this, more especially in its application to the discussions going on throughout the country. How highly were the farming men educated in those times? How far was it necessary to elevate the minds of those who took charge of the engine at Trewithin, and in turn taught her to thrash the corn and cut the straw? Curiously enough, just within a week or so, Mr. Olver, of Penhallow, another well-known Cornish man, has been publishing his experiences of the last half-century, having been born in the very year that Mr. Trethewy started his steam engine. And this is one of the pictures presented to us: "Few apprentices on entering my father's house could read, but none of them ever left it without being able to read the Bible well, and most of them could write. All his household, except one boy and girl, went to church every Sunday morning, and previous to doing so the youngsters spent an hour in reading and teaching each other; after dinner two hours were spent in the same way, also after supper, when a circle would be formed and the Church Catechism, with numerous hymns and pieces would be repeated; small prizes would occasionally be offered for encouragement, and it was surprising what some of those uneducated children could repeat; one, I remember, would recite a very long chapter in the Testament without missing a word. Winter evenings, after supper, the men and stout lads would make spears for rick thatching, and the children would be employed reading." Some of Mr. Olver's neighbours, who do not give their names, and who, as we suspect, are not farmers, have been attempting to ridicule such reminiscences, but we can scarcely go with them, for these are surely suggestive and susceptible of some good purpose. A farm labourer who in the course of some years' service could put by his £13 may be not worth speaking of, although we fear there are but too many who never do as much, even in this advanced age. But Mr. Olver goes further, for he says, "Agricultural labourers brought up in that way, understood their work, and were not above doing it." And, again, "during the last thirty-five years I have generally found those labourers who have had the least schooling the most valuable;" whereas, "the more highly-educated frequently become 'book-worms,' their attention being divided, they never excel, but are always 'building castles in the air,' anticipating that which they never realize; hence they become dissatisfied with their station, mere dregs of society, ready to do anything but that for which they were intended—work. I have had many such characters from time to time in my employment, whom I would rather pay to stay at home than mix them with other labourers, because they hinder them more than they further." Is there any truth in this? Or should Mr. Olver become, as the other correspondents of some of the Cornish journals would make him, the mere laughing-stock of his fellows?

It was only the other evening that we were spending an

hour or two in company with a leading agriculturist, a member of the Council of the Royal Agricultural Society, a frequent judge of implements and stock, and a man of high standing in his own district. The experience of this gentleman was that some of the best labourers he had ever employed were the least educated; they were not only the best workmen but they were the most trustworthy. A carter or a cowman, moreover, would take three shillings a-week each for the services of his lads at an age when according to the new Bill they must have been at school. An addition of some six shillings to the father's own twelve or fourteen must be a matter of serious consideration, as it would tend further to keep the mother out of the field, and so afford those at work something of the sterling comforts of home. Turning to Cornwall, again, we find that at a meeting held only a few days since, Mr. Pollard, another agriculturist whose name is not unfamiliar to us, said, "twelve years was far too old for children to be kept at school, and, if insisted on, would result in a deal of pauperism, for if the parents were deprived of the half-crown or three shillings a week brought by children between ten years and twelve, they would have to go to the parish for assistance in the maintenance of their children." The education of the labourer must be considered *mainly* by his necessities, and there can be no possible doubt as to the mistake of the clause which would enact that a boy must go to school, and must not go to work until he has reached the age of twelve years. He would be very probably half-starved from the force of such a condition, and so set about the business of life at all points a worse instead of a better man. It is satisfactory to see that at most of the meetings held throughout the country this twelve years' limit has been very generally protested against; as we know of nothing that would threaten to be more injurious either to the employed or the employer in agriculture than that such a proviso should become law. In our improved schools a lad should learn at least to read or write by the time he is ten years of age, while if we ask for more, this can only be accomplished at some still more serious sacrifice.

THE EDUCATION QUESTION.—At a meeting of the Notts Chamber of Agriculture, Mr. Gilbert, Barnby, moved "That charging the cost of education out of the present poor rate would be partial and unequal; this Chamber is of opinion that the education of the people being a national object, public contributions should be paid out of the whole income of the country." Mr. Walker, Mattersey, seconded the resolution. Mr. Hemaley, Shelton, moved the following resolution:—"That we consider that compulsory education beyond the age of ten years will be injurious to the employers of labour, and a serious loss to the parents; it is calculated also to increase pauperism, and is detrimental to the children themselves as concerns their future usefulness." Mr. Butler, Ratcliffe, seconded the resolution. Mr. Walker thought they would be better without the last clause. Mr. Scott, Raddington, proposed as an amendment that "the time of compulsion be increased to thirteen years of age, and that it was desirable that children should be compelled to attend a certain number of days up to thirteen years." The amendment of Mr. Scott, finding no seconder, the original motions were put and carried. Mr. Godber proposed that a petition be sent to Parliament, embodying the resolutions passed, and praying for them to be considered. The motion was seconded, and carried.

LOCAL TAXATION AND THE GOVERNMENT PROPOSALS.—At a meeting of the Cambridgeshire and Isle of Ely Chamber of Agriculture, on Saturday last, under the presidency of Mr. Edw. Hicks, Mr. Oliver C. Pell made the following proposition: "That a petition be presented to Parliament praying that no further addition be made to the burdens already borne by the funds raised by local taxation for imperial purposes till further inquiry has been

made as to the incidence of taxation on real or personal property respectively." This was carried after some slight demonstration in favour of the Government movement.

MR. HENRY HALL DIXON.

The readers of the *Mark Lane Express* will learn with regret that the hand which penned those most interesting articles on the "Herds of Great Britain," written exclusively for this paper, is now still in death. The columns of this journal will no more contain the life-like sketches of character which was the peculiar feature in the writings of H. H. D. On Wednesday, the 18th of March, this talented writer died at his residence, in Kensington, and a gap has been left in the sphere in which he moved that cannot be easily filled up. He was as well known in the Sporting, as in the Agricultural world. The *Doncaster Gazette* says: "The racing interests of this town had always in him a most earnest and powerful supporter, and it is not too much to say that to the alterations which he from time to time suggested, Doncaster owes much of its present celebrity; and writing in reference to some further improvements only a short time ago, he said: 'I cluck over the meeting like an old hen, as I always did. Do get something done.'" The legal profession, to which Mr. Dixon was attached, he having been called to the Bar some fifteen years since, are indebted to him for a text-book compiled after great research, called "The Law of the Farm" (1858), which has already run through three editions. But it was in his sporting articles that he excelled: there was an ease, a piquancy, "quaint almost to oddity," as the writer in the *Field* has aptly expressed it, in all his articles. In his description of a race, we could almost fancy we saw what he described. The "Omibus," in the *Sporting Review*, has for the last ten years been from his prolific pen. And so was "Post and Paddock" (1858), "Silk and Scarlet" (1859), "Scott and Sebright" (1862), "Field and Fern" (1865), "Saddle and Sirloln" (1870); and, while the hand of death was poisoning over him, a companion volume to the latter work was being rapidly completed by him. His real sympathies could be traced in all he wrote, whether pastoral or personal: the owner and the animal were alike sketched with the pen of a master. Nor could it ever be said of him that he "set down aught in malice," as he abhorred all personalities. We knew him well and intimately. He was most upright and honourable in all his dealings with the world; and where he felt friendship extended towards him, he returned it tenfold in acts of everyday kindnesses. In the notice given of him in the *Sporting Life* it is truly said, "he was a most amiable, truthful, conscientious man, and perhaps no person connected with sports and pastimes more signally preserved the dignity of his private life. Quaint and plain in dress, he was himself one of the 'characters' he could so well have depicted; and as he strode along in his deerstalker, with his stick in hand, or hovered about the secluded portions of our racecourses, few would have imagined how thoroughly refined, reflective, and cultivated he was in all his tastes and predilections. His love for anecdote was a perfect passion with him, and he sifted the traits of his subjects so completely that he could set dead worthies before the reader's eye with marvellous fidelity. When in health, his mind was bright and his spirits especially vivacious, and he delighted in quiet satire and humorous sallies, with which he invariably set off his genial and chatty form of conversation with his friends." We again quote from the *Doncaster Gazette*: "On leaving Doncaster he became more especially identified with the *Mark Lane Express* and *Sporting Review*, and in the dedication of his last volume—'Saddle and Sirloln'—he gracefully acknowledges the substantial assistance which he had long received from Mr. George Parker Tuxford, the proprietor of these publications." We know that the proprietor to whom Mr. Dixon so generously referred feels that he has done no more than any other person similarly circumstanced should have done, and none more deeply feels the loss of one whom he always considered as his friend as well as his protégé. Truly may it be said of Henry Hall Dixon—"The Druid" as he loved to style himself—"We ne'er shall look upon his like again."

Mr. Dixon, who was in his 48th year, was educated at Rugby and Cambridge. He was subsequently, as we have said, called to the Bar, but his love of the literature of rural life prevented him following his profession.

THE HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

The monthly meeting of the directors of this Society was held on March 2, in the Chambers, No. 3, George IV. Bridge, Edinburgh, the Marquis of Tweeddale, K.T., president, in the chair.

The minute of the joint meeting of the agricultural education examiners and of the Forestry Committee held on the 9th of February, was read, from which it appeared that it had been resolved to hold the examinations for the society's agricultural certificate and diploma this year on Wednesday and Thursday, the 30th and 31st March, candidates being required to lodge intimation on or before the 23rd.

The SECRETARY submitted two letters from Mr. Gillon of Wallhouse, convener of the society's Veterinary Committee, who is at present abroad. In the first letter Mr. Gillon mentions that when in Paris he was introduced to M. Charlier and his son, and that he spent two hours in the forge with them. He saw the shoes of a horse removed and new ones put on, and he considers there is more novelty than difficulty in the manipulation. He then started with M. Charlier, jun., to visit some of the stables of the French noblesse which were in the neighbourhood, and where the system has been in use for some years. He saw all kinds of feet, large and small, shod in this manner. There are about 6,000 omnibus horses shod in Paris thus, but besides, there are hundreds of horses belonging to those who let for hire in carriages and for saddle. In the country, the nobility and gentry who care about sporting or driving are gradually coming to see the real advantages of the system. Mr. Gillon states that he is thoroughly convinced of the superiority of this mode of shoeing, and any objections he has heard urged are very easily and simply answered and explained.

It was resolved that, instead of a public banquet, a president's dinner should be held at the head-quarters of the Society in Dumfries as was done at Aberdeen in 1868.

The SECRETARY reported that during the past month premium-books and blank forms of reports had been sent to 229 conveners and secretaries of local agricultural and other associations in receipt of the society's money premiums and medals.

Copies of the detailed agricultural returns of Great Britain, with abstract returns for the United Kingdom, presented to the society by Government, were submitted, and were ordered to be placed in the society's library, where any member might consult them.

Mr. MENZIES submitted a letter from Lord Kinnaird sending a printed report on steam cultivation, being the result of a year's work. Subjoined to the report there are carefully prepared statements of the cost of the implements, the expense of working, and the amount of work done in twelve months—spring and autumn cultivation. The secretary was instructed to thank his lordship for the report, which was remitted to the Committee on Steam Cultivation.

A letter from Mr Prowett (Kent), addressed to the president, in regard to a new plan of a steam cultivator, was referred to the same committee.

EAST LOTHIAN AGRICULTURAL SOCIETY.

SPRING SHOW OF STOCK.

The annual spring show of stock took place on the East Haugh, Haddington, on Friday, March 11th. In consequence of the animals for service in the county having been previously selected by a committee of the Society, no stallions were exhibited. The following premiums were awarded in breeding and fat stock. Judges for the bulls: Messrs. Douglas, Athelstaneford, and Taylor, Carsebridge, Alloa. For the fat and graining stock: Messrs. J. Wilson, Edinburgh, and Gaff, Haddington.

Five best steers, under three years old.—First, A. C. Balfour, of Whittinghame; five second best, J. Christie, Westmains. Commended: J. Hope, Fentonbarns.

Five best heifers, under three years old.—Premium, J. Hope.

Five best yearling cattle, the property of a member.—First, J. Hope; second, A. C. Balfour.

Best Shorthorn bull, above one and under four years of age.—First, Binnie, Seton Mains. Commended: J. Hope.

Best Shorthorn yearling bull.—First, Sir David Baird, Bart. Highly commended: Tweedie, Deuchrie. Commended: Tweedie.

The show was above an average in point of quality.

MUCK FACTORIES.

TO THE EDITOR.

SIR,—A farmer said to me the other day, after a chat about artificial manures, "Give me farm-yard muck; then I know what I am putting on the land!" I replied, "Do you? Have you travelled on the London and South Western Railway, between Waterloo and Vauxhall, and made use of your eyes? If so, you must have observed right and left certain yards, where the manufacture of muck is carried on most vigorously; or rather a compound is made up and sold to farmers, which passes for farm-yard manure, but is very different to what farmers get from their own yards. There may be virtue in spent hops, tan bark, and sundry kinds of refuse from dust bins, mixed with straw and as much coloured dirty water as it will carry; and no doubt farmers are quite satisfied they are getting a dirt cheap bargain; but it is only another illustration that the reign of happy ignorance and blind trust is almost as universal as ever."

As an old subscriber, I have felt it a duty to seek admission for this, in order, if possible, to induce thought and inquiry.

I am, sir, obediently yours,

ORIENTAL.

THE JOURNAL OF THE BATH AND WEST OF ENGLAND AND SOUTHERN COUNTIES ASSOCIATION.—The second part of the first volume of the third series has just been published; but the appearance of this only tends to confirm our impression as to the impolicy of a Society of such calibre attempting to issue two numbers during the year. The original papers, so far as we have had an opportunity of looking through the conveniently-cut pages, are confined to a treatise of some length, by Professor Brown, V. S., on Sheep Scab; and briefer articles on Cabbage as a Field Crop, by Professor Buckman; the Management of Farm Buildings, by Mr. Scott Burn; the Meteorology of the Southern Counties, by Mr. Whitley; and Observations on Channel Island Cattle, by Mr. Henry Middleton. The last-named of these contributions should command some especial attention, as we never remember such "a row"—there is no other word for it—as there was over the Channel Islands awards, at Southampton, where Mr. Middleton was one of the Judges. He himself admits that "the Judges were placed in a very awkward and unpleasant position;" an opinion in which we thoroughly agree. The rest of the part is made up by the Note Book.

THE CLIMAX!—Seventy-nine tenants of a Scotch proprietor have presented a petition to Parliament stating amongst other things, "That each of your petitioners as were not prohibited in their leases from killing rabbits, commenced to trap and otherwise kill the rabbits, whereupon the landlord applied for Interdict against them, but after a protracted, and to them expensive lawsuit, he failed to get Interdict. That your petitioners, or some of them, still endeavour to protect their crops by killing the rabbits, but that it is impossible to put them down in consequence of the proximity of the landlord's coveys, in which they are carefully protected during the breeding season. That the crops of your petitioners continue to be every year very much and in some cases altogether destroyed by game and rabbits, and the extent of the damage may be inferred from the fact that during last summer and autumn more than 6,000 rabbits were killed on less than 800 acres of arable land. That your petitioners believe that the existing game laws are highly prejudicial to the general interests of the nation, besides ruinous to tenant farmers."

THE TOTAL ABOLITION OF THE GAME LAWS.—At a special meeting of the Hexham Farmers' Club, Mr. Dodds moved that a Petition be sent to Parliament from this Club in favour of Mr. Beaumont's amendment to Mr. Martin's bill, so that hares as well as rabbits might be excluded from the game list. Mr. Jobson seconded the res-

lution. Mr. Bunting Lee moved: "That this Club, whilst regarding as unsatisfactory any legislation on the game laws short of their total abolition, afforded its hearty support to Mr. W. Martin's bill, with Mr. Beaumont's amendment, as conducive to that end;" and Mr. Catchaide seconded this. Mr. Trotter moved that the Club petition Parliament for the total repeal of the game-laws, and Mr. Pattison seconded this. Mr. Joseph Lee, having merged his resolution with that of Mr. Drydon, moved the following resolution: "That this Club cordially approve of Mr. Beaumont's amendment to Mr. Martin's Bill, that hares and rabbits shall not be deemed to be game within the meaning of the Game-laws; the tenant to kill hares and rabbits on the lands occupied by him, any agreement or covenant to the contrary notwithstanding, but that existing leases for a term of years shall not be interfered with." Mr. Drydon seconded the motion. On the voting being taken the first time the numbers were—For Mr. Trotter's amendment, 11; Mr. Jos. Lee's, 6; Mr. J. Bunting Lee's, 4; Mr. Dods' original motion, 9. On the voting being again taken, the result was that there were 18 in favour of Mr. Trotter's amendment, and 14 in favour of Mr. Dods' motion. The amendment in favour of petitioning Parliament for the total abolition of the Game Laws was consequently carried, the result being greeted with applause.

THE SITTITON SALE OF SHORT-HORNS.

On March 17, at the farm of Sittiton, Straloch, Aberdeenshire, the Messrs. Cruickshank had their annual sale of about eighty yearling Shorthorn bulls and heifers. Forty-five bulls were catalogued, but several of them having in consequence of some being a little off they were withdrawn; and, in order to make up the number, four younger bulls, which were intended for private sale, were taken into the ring. The young bulls were chiefly descended from the famous Forth, bred by Sir William Stirling-Maxwell, Bart., of Keir (which was slaughtered the other week at the ripe old age of thirteen), either directly or indirectly, and the very prolific, if less famous, bull Champion of England, still in the herd and serviceable, though now eleven years old. Several highest-priced bulls on Thursday were by Allan, bred at Sittiton, and the winner of two Highland Society prizes.

The average realised was for the season fair, but below that of former years. The heifers, though creditable, did not sell nearly so well in proportion to the bulls. The bidding was a little slow on the whole, but the sale was probably the best that has taken place in Aberdeenshire this year. The attendance of people, as it always is at Sittiton, was very large. Mr. Mitchell, St. John's Wells, Fyvie, acted as auctioneer. The following is the result of the sale:

BULLS.

Emblem, white, calved June 4, 1868.—Mr. Bruce, Southfront, Skene, 21 ga.
County Clerk, red, calved May 27, 1868.—Mr. Troup, Tullo, Meldrum, 33 ga.
Lord North, red, calved June 11, 1868.—Mr. Gordon, of Parkhill, 50 ga.
Chorister, red and white, calved June 15, 1868.—Mr. Philip Boyd, Inverurie, 31 ga.
Recorder, red, calved Nov. 16, 1868.—Mr. Watson, Blackford, Auchterless, 23 ga.
Goldsmith, red, calved June 1, 1869.—Mr. J. Colvin Kesick, Inverness, 26 ga.
The Bishop, roan, calved Nov. 13, 1868.—Mr. Johnstone, Drumwhindle, Ellon, 29 ga.
Solicitor-General, red, calved Jan. 3, 1869.—Mr. Craig, Fin-gass, Daviot, 37 ga.
John Bright, red, calved March 19, 1869.—Mr. Bruce, Broadland, Huntly, 73 ga.
Duke of Sutherland, red, calved Feb. 11, 1869.—Mr. Still, Pittsike, New Deer, 33 ga.
Lord Lennox, roan, calved Feb. 27, 1869.—Mr. Hutchison, Cairngall, Longside, 40 ga.
Lord President, roan, calved March 3, 1869.—Mr. Milne, Maines of Leithers, 41 ga.
Alliance, roan, calved March 4, 1869.—Mr. Stewart, Sand-hole, Fraserburgh, 51 ga.

Peer of the Realm, red, calved Feb. 26, 1869.—Mr. Ross, Ankerville, Nigg, Ross-shire, 67 ga.
Augustine, red, calved March 9, 1869.—Mr. Leslie, of Warthill, 35 ga.
Archbishop, roan, calved March 20, 1869.—Major Ramsay, of Barra, 56 ga.
City Arab, roan, calved April 2, 1869.—Major Gordon Duff, of Drummur, Keith, 30 ga.
Bartholomew, roan, calved April 10, 1869.—Mr. Milne, Levenshall, Westmoreland, 44 ga.
Golden Cross, roan, calved March 14, 1869.—Mr. Thomson, Drumbeck, Udney, 55 ga.
Mathematician, roan, calved March 25, 1869.—Mr. Fraser, Faidlie, Inverness, 41 ga.
Crown Royal, red, calved March 26, 1869.—Mr. Ure, Mel-gonie, Cromar, 43 ga.
Forerunner, red, calved March 16, 1869.—Mr. Manson, banker, Oldmeldrum, 51 ga.
Lord Clarendon, red, calved April 1, 1869.—Mr. M'Clymont, Ballagart, Ayrshire, 23 ga.
Brunswick, red, calved March 15, 1869.—Mr. Fullerton, Upper Took, Stonehaven, 24 ga.
Provider, red, calved March 9, 1869.—Mr. Ruxton, So. Ar-troughy, Logie Buchan, 27 ga.
Colossal, red, calved Feb. 27, 1869.—Mr. Robertson, Carna-dally, Ellon, 25 ga.
Social Science, red, calved March 16, 1869.—Mr. Russell, Kininmonth, 32 ga.
Royal Britain, roan, calved May 13, 1869.—Mr. Marr, Upper-mill, Tarves, 59 ga.
Prince of York, roan, calved April 25, 1869.—Mr. Rannie, Mill of Cullie, Udney, 25 ga.
Victorious, roan, calved April 29, 1869.—Mr. Cruickshank, Altona, Keithhall, 26 ga.
Violoncello, red, calved April 29, 1869.—Mr. Black, Lum-head, Foveran, 20 ga.
Golden Prince, red and white, calved April 29, 1869.—Mr. Mains of Waterton, Ellon, 23 ga.
Vampyre, roan, calved April 25, 1869.—Mr. Lawson, Old-mills, Elgin, 30 ga.
Saxe-Coburg, red and white, calved April 30, 1869.—Mr. Marshall, Overtown, Ards, 21 ga.
Royal Commission, red, calved May 1, 1869.—Mr. Thomson, Tillecarrie, Fintray, 24 ga.
Benledi, roan, calved April 28, 1869.—Mr. Valentine, Effleck, Alford, 20 ga.
Vineyard, white, calved May 11, 1869.—Dr. Traill, Tombeg, Monymusk, 10 ga.
Duke of Montrose, roan, calved May 21, 1869.—Mr. Snell, Bridgend, Cruden, 21 ga.

HEIFERS.

Angelina, red and white, calved Dec. 3, 1868.—Mr. Hope, Fentonbarns, East-Lothian, 28 ga.
Woodbine, red, calved Jan. 24, 1869.—Mr. Valentines, Affleck, Skene, 24 ga.
Challenge, red, calved Feb. 13, 1869.—Mr. Chalmers, Old-wharf, New Deer, 26 ga.
Anna Buckingham, red, calved March 2, 1869.—Mr. May, Haddo, Crimond, 19 ga.
Butterfly 30th, red, calved Feb. 23, 1869.—Mr. Cruickshank, Comisty, Forgue, 23 ga.
Spangle, red, calved March 26, 1869.—Mr. Davidson, Mains of Cairnbridge, 27 ga.
Aroma 4th, red, calved Jan. 27, 1869.—Mr. White, Clinterty, 31 ga.
Surprise, roan, calved Feb. 12, 1869.—Mr. Phillip, Softhillcock, Keithhall, 35 ga.
Kilmenny 10th, white, calved March 19, 1869.—Mr. Still, Pit-foskie, 16 ga.
Butterfly 29, red, calved March 3, 1869.—Mr. Thomson, Dumbreck, 21 ga.
Matchless 14th, roan, calved Feb. 6, 1869.—Sir William Forbes of Fintray, 37 ga.
Red Rose, red, calved April 15, 1869.—Mr. Philip, Boydne, 18 ga.
Golden Eye, roan, calved April 15, 1869.—Mr. Godsmen, New Deer, 30 ga.
Lily Buckingham, red, calved Feb. 11, 1869.—Mr. Hope, Fen-tonbarns, 18 ga.

Golden Rose, red, calved April 1, 1869.—Mr. Valentine, Affleck, 19 gs.
 Rosette, red, calved April 19, 1869.—Mr. Stewart, Laurence-kirk, 20 gs.
 Butterfly 28th, roan, calved April 24, 1869.—Mr. Bruce, Fornet, 11 gs.
 Eva Buckingham, roan, calved April 12, 1869.—Mr. Russell of Aden, 18 gs.
 Mysie 31st, roan, calved April 27, 1869.—Mr. Philip, Boynds, 21 gs.
 Sunshade, roan, calved April 29, 1869, Mr. James Moggie, Kinnellar, 10 gs.
 Broadhooks 10th, red and white, calved April 10, 1869.—Mr. Godaman, New Deer, 12 gs.
 Venilia, red, calved April 25, 1869.—Mr. Cruickshank, Comisty, 19 gs.
 Mysie 30th, red, calved April 27, 1869.—Mr. Mortimer, 15 gs.
 Golden Lily, roan, calved June 4, 1869, Mr. Godaman, New Deer, 15 gs.
 Garnet, red, calved June 13, 1869.—Mr. Philip, Boynds, 20 gs.

SALE OF SCOTCH SHORTHORNS.

On Thursday, March 24, Mr. Bruce and Mr. Scott, Glendronach, joined in offering for sale by public auction, at Iluntly market, their yearling Shorthorn bulls and heifers, hitherto disposed of separately. Mr. Raeburn, Banff, was auctioneer.

BULLS.

Miltiades, roan, calved 7th Jan., 1869.—Mr. Swanson, Golspie, 36 gs.
 Darius, roan, calved 23rd Jan., 1869.—Mr. John Sinclair, Ulbester, 46 gs.
 Marshal Ney, dark roan, calved 12th Feb., 1869.—Mr. Morrison, Braevail, Nairnshire, 26 gs.
 Hastings, red and white, calved 20th Feb., 1869.—Mr. Abel, Pitmeddan, 19 gs.
 Mazeppa, roan, calved 23rd Feb., 1869.—Mr. Allan, Portsoy, 19 gs.
 Great Seal II., roan, calved 24th Feb., 1869.—Mr. Watt, Garslity, Morayshire, 51 gs.
 Duke of Guise, red, with white marks, calved 24th Feb., 1869.—Captain Cameron, Petty, Aberdeenshire, 35 gs.
 Lord Clive, roan, calved 6th March, 1869.—Colonel Fraser Tytler, Aldourie, 31 gs.
 Lord o'Gowrie, roan, calved 29th May, 1869.—Mr. Gill, Tillydown, Marnoch, 26 gs.
 Massy, roan, calved 23rd May, 1869.—Mr. Grant, Pitgaveny, Elgin, 30 gs.
 Emperor (26096), red, calved 24th June, 1868.—Reserved at 70 gs.
 The Banker, red and white, calved 26th June, 1868.—Mr. Bruce, Clova, 26 gs.
 Amateur III., red, with white mark, calved 1st Jan., 1869.—Miss Macpherson Grant, Aberlour, 38 gs.
 The Bridegroom, red, with white mark, calved 8th Feb., 1869.—Mr. Scott, Norse, Caithness, 23 gs.
 The Admiral, red, with white mark, calved 14th Feb., 1869.—Mr. Longmore, Keith, 37 gs.
 The Favourite, dark roan, calved 17th Feb., 1869.—Mr. Alexander, Balncon, 46 gs.
 Duke of Edinburgh, red, calved 17th March, 1869.—Mr. Laing, Northumberland, 27 gs.
 Prince Arthur, red, calved 25th March, 1869.—Mr. Watt, Kirkton, Fyvie, 18 gs.
 Lord Ythan III., rich roan, calved 3rd April, 1869.—Mr. Joss, Cruichie, 36 gs.
 The Marquis, red, calved 18th April, 1869.—Mr. Smith, Inverkerty, 36 gs.

HEIFERS.

Venus, red and white, calved 6th May, 1869.—Mr. Bruce, Newton, Forres, 28 gs.
 Lady Scott, red, with white marks, calved 2nd June, 1868.—Mr. Watt, Crombie, 25 gs.
 Kitty, white, calved 3rd Jan., 1869.—Mr. Bruce, Burnside, 19 gs.
 Snowdrop, white, calved 17 March, 1869.—Mr. Mortimer, Dumkennan, 22 gs.

BURGHLEY PARK SALE OF SHORTHORNS.

By MR. STRAFFORD, ON THURSDAY, MARCH 17.

This sale was a renewal of the periodical auctions of the Shorthorns that have been held for many years at the Dairy Farm during the life of the late Marquis of Exeter; as Mr. Stafford in his remarks before the sale said, "it was an old feature under a new face." The stock was brought out in better condition than on former occasions, and, under Mr. Walton's management, who has of late been very successful with the Burghley animals in the show yard, it is expected the herd will assume a more leading position than it has hitherto done. About a couple of hundred partook of luncheon, and after the stock bulls, Nestor and Telemachus, had been inspected, the company adjourned to the ring, where, with occasionally keen competition, the following prices were realised:

COWS.

Bee, 12 years old.—Mr. Sturgeon, 23 gs.
 Queen Mary, 10 yrs.—Mr. Brown, 29 gs.
 Cecil, 7 yrs.—Mr. Stokes, 40 gs.
 Louisa 8th, 6 yrs.—Mr. Bayes, 30 gs.
 Faith, 5 yrs.—Mr. Whitwell, 25 gs.
 Fairy, 4 yrs.—Mr. Sturgeon, 24 gs.
 Lady Olivia, 4 yrs.—Mr. Stubbs, 19 gs.
 Fair Mattie, 3 yrs.—Mr. Paleman, 21 gs.
 Louisa 10th, 3 yrs.—Mr. Wood, 25 gs.
 Hope, 2 yrs.—Lord Berners, 17 gs.
 Chance Gwynne, 2 yrs.—Mr. Lawrence, 17 gs.
 Louisa 11th, 2 yrs.—Mr. Wood, 17 gs.
 Lady Cambridge, 1 yr.—Mr. Wood, 22 gs.
 Miss Martin and calf, 6 yrs.—Mr. Scott, 30 gs.
 Betty Martin, 1 yr.—Mr. Whincup, 13½ gs.

BULLS.

Royal Oxford (27380), 3 yrs.—Mr. Brown 40 gs.
 Grand Seneschal (26309), 2 yrs.—Sir G. Margrave, 46 gs.
 Grecian Saye (26318), 2 yrs.—Mr. Whitwell, 47 gs.
 Lord Treasurer, 13 months.—Mr. Bonser, 17 gs.
 William of Orange, 10 months.—Mr. Tindall, 32 gs.
 Ulysses, 12 months.—Mr. Bardett, 16 gs.
 Duke Robert, 11 months.—Mr. Fellowes, 42 gs.
 Osprey, 10 months.—Mr. Thurlby, 31 gs.
 Royalist, 10 months.—Mr. Sewell, 35 gs.
 Pembroke, 5 months.—Mr. Hack, 10 gs.
 Grand Vizier, 4 months.—Mr. Nidd, 14 gs.
 Lord Lieutenant, 3 months.—Mr. Sewell, 11 gs.
 Average of 15 cows and heifers... £24 13 6
 Average of 12 bulls £29 15 0

Some few of the company afterwards visited the stables, where the two thorough-bred stallions Knight of St. Patrick and Knight of the Thistle were shown. Old Pocahontas, the famous brood mare, is still alive, and in her 34th year.

SALE OF LORD HILL'S SHORTHORNS.—In consequence of Lord Hill entirely relinquishing his agricultural pursuits, sales have been held last month at the Hawkstone Farm in Shropshire, of the whole of the farming effects, including his famous Shorthorns, a herd of fifty-five bulls, cows, heifers, and calves. The sale of these took place on Tuesday last. There was a very large attendance from all parts of England of very influential men, the biddings were very spirited, and we believe the sale realised upwards of 1,500 guineas, or an average of about 30 guineas for all kinds and ages. 19 cows averaged 29 gs. each, 4 three-year-old heifers 31½ gs. each, 5 two years old 25 gs. each, 4 year-olds 34 gs. each, and 5 small calves 9 gs. each. The first bull, Prodgal, 3½ years old, brought 52 gs., 5 two years old bulls averaged 32 gs. each, and 11 young bulls (including bull calves) averaged 24 guineas each. The sale was under the conduct of Messrs. Chorton and Elphick.

THE MILBORNE ST. ANDREW FARMERS' CLUB (Dorset) has held its annual meeting, when the principal prize, for general root crops, was awarded to Mr. Rogers. Mr. Hambro, M.P. for Weymouth, attended the dinner, and spoke strongly against the proposed new regulations of the Government regarding the Yeomanry Cavalry. He did not see how it was possible that farmers could leave home in the busiest time of the year for the purposes of drill.

CALENDAR OF AGRICULTURE.

The sowing of grains must now be finished as fast as possible.

Sow oats at the rate of five bushels on an acre, with two tines of harrowings lengthwise, two tines across the furrows, and two tines or one lengthwise to finish the process. Roll light lands with a ton-weight within two weeks after sowing, to retain moisture and to strengthen the hold of the roots of the plants.

Sow barley in two or one-and-a-half bushels an acre, covered by two or three single tines of harrowing done lengthwise with a cross rolling with a ton-weight to smooth the surface for the grass seeds, which are sown by the broad-cast machine, that with a man, a horse, and a lad will sow 30 to 40 acres in a day in a more level manner than by hand, and being near to the ground the work can be done in windy weather that prevents hand-sowing—over which this machine constitutes a very large improvement. A single or double tine of the light harrows finishes the process. The lands have carried a root crop, well dunged and fallowed, and the lighter soils have been enriched by the crop of roots being consumed on the ground by sheep, the surface of the land encrusted with urinary and solid feces puddled by the narrow-pointed feet of the animals, ploughed with one furrow, sown, and rolled with the least possible delay to retain moisture and debar the entrance of drought. For one crop hay no better sowing has been found of grass seed than one bushel of rye-grass with 10lbs. of red clover to an acre; for the next year's pasture these quantities may be reduced by one-fourth part, and there may be added 4lbs. of yellow clover, 4lbs. of dog's tail grass, and 4lbs. of meadow fescue. Except for strictly permanent purposes, very few of the grass plants are useful to the farmer. The rye-grass yet holds its ground on the most incontestible grounds of preference of general utility—in growing most readily and producing the largest produce of herbage in the greatest variety of soils and climates in a level crop of culms of a medium height, like to a grain crop of a quality that is much relished by all herbivorous animals when used green or in dry provender, and in yielding a large quantity of sound and healthy seed that is conveniently gathered and manufactured. These and similar physical properties in all the articles that constitute the produce of the farm are obvious to the exterior senses, and in all cases do most completely destroy the chemical qualities that are found by investigation, and very often arise from accidental circumstances.

Sow lucerne on well-prepared ground by fallowing in deep ploughing, or by trenching, with an ample manuring of the best quality. Sow at the rate of 20lbs. on an acre, on a finely-reduced surface, and cover by harrowing and rolling. The very ligneous struction of this plant will ever prohibit the use for general purposes like to red clover, of which the succulent stems most immeasurably exceed the quality of lucerne, and the growth is readier and more easily obtained. But on a convenient plot of good land near to the homestead, with a proper management in the cultivation and manuring, lucerne will afford an early cutting of green food when much wanted on the farm, and several cuttings will follow to assist in obtaining the constant supply of green food: the most valuable of all the attachments of the farm. A plot of two to four acres of lucerne will be very useful, according to the extent of the farm.

Sow flax seeds on good lands after a root crop, fallowed

and dunged; cover by harrow and roll. This plant belongs to cottier farming, and will ever recede from before an enlightened agriculture.

Finish the preparation of grass lands in the hay meadows and pasture grounds; in top-dressing, as a manure, bush harrowings, removing by hand-picking all stones and rubbish that would impede the scythe; rolling, and securing fences and gates against trespass. The pasture fields must be well fenced and with proper gates, with water abundant and easy of access, and a shelter shed to retire from rains and excessive heats.

Sow vetches in two seedings, in the first and second weeks of the month. Allow four bushels of seed to an acre including a small portion of oats, and cover by harrowing and rolling. The sowings will form the third and last seedings of that most valuable plant, which forms the green food of the farm for three months, and with the winter vetch, where it is grown, for four months, being the earliest growth of the year except the early irrigations, which are too local to enter into a general estimation. Stubbles of good lands are suitable to vetches, where not found leys are next.

Prepare in the early month the fallow lands for the early root crops of beets, Swedish turnips, and potatoes. One earth may have been given last month, and the land must have had two at least in addition to produce the necessary pulverization of the soil by ploughings, harrowings, and rollings, and to remove all stones and weeds by hand-picking. By the middle of the month sow man-gold wurzel; open drills on the level ground, well prepared, 28 inches apart, by a deep furrow of the common plough. Spread along the hollows an ample quantity of half-rotted farm-yard dung. Split the ridglets by a bout of the common plough to reverse the earth and the dung, and on the top of the newly-made drills, plant the seeds by hand-dibble, or by machine, and roll with a light weight, to press the seeds into position and exclude drought. The seeds may be steeped for a day in moist solutions, as suds and lees, and encrusted with hot lime. This preparation may advance the early germination, but not the after-growth of the plants.

The third week of the month may be taken as the average season of planting potatoes with varied soils and under the many climates of Britain. The land being prepared as above directed, drills are opened 30 inches apart by a "bout" of the common plough, deeply and widely done, as for a spreading root crop—farm-yard dung in a half-rotted state and moist to dripping, is spread along the intervals in an ample allowance of at least twenty one-horse cart loads to an acre: the tubers, cut into pieces with two eyes in each plant, and large rather than small, in order to feed the germination till the roots gather nutriment from the soil, are placed by hand and trod by the foot over the dung at the distance of nine inches apart; the ridglets are split and the earth reversed over the dung by a bout of the common plough, and the newly made ridglets are rolled into a level by a light weight. The dibbling by hand of the sets into the dunged lands, and dropping of sets into the plough, are done in various ways; but no method so well suits the cleaning of the crop, and the fallowing of the land, as the raised ridge in which the crop grows, with intervals in which the seeds are destroyed and the land pulverized.

Lime may be very beneficially applied with a crop of potatoes—lying in a thatched heap over winter; the cinders are dissolved into powder, and spread over the

land before the drilling, or the cinders may be spread in a broken state and ploughed under with the last ploughing, or the crude limestone may be broken small as eggs, and burnt into cinders, and ploughed into the ground, where, being powdered by the dampness of the soil, the emission of caloric will produce warm and moist exhalations that will prove very beneficial in raising the temperature of the ground, to encourage vegetation. The subsequent workings of the land will promote a very minute mixing of the soil and the lime.

Early crops will now require both horse and hand-hoeing—as carrots, lucerne in rows, wheat, beans, and peas.

Paring and burning of land will now proceed vigorously; burn the turfs into a black charred mass, which will contain most carbonaceous matter. It is the best method yet known of bringing into cultivation the waste lands that contain much fibrous, inert, and ligneous matter.

Rye and watered meadows, winter barley and vetches, will be ready in the end of the month for soiling cattle in the yards, and for being consumed on the ground by ewes and lambs. Cut and place the food in racks, to be moved regularly over the mown grown. Fold the sheep nightly on the cleaned space, allowing two square yards to each animal, and two nights in one place. Bare grass lands may be much improved by folding sheep on them, and consuming the food.

The lambing season will now be closed. Swedish turnips, potatoes, beetroot, and cabbages are yet the green food of the farm, and may be easily preserved to meet the crops of the current year in the earliest herbaceous plants. For sheep use a portion of oats and bruised cake

with salt. Remove the stronger lambs to the pasture fields.

Attend to the milch cows and the suckling. Give the former an ample supply of juicy food, natural or prepared: to the latter as much as they will take. When begun to be weaned, about the end of 16 weeks, give in racks in the calf pens, young vetches, bruised cake, beans, and barley-meals boiled, and linseed jellies. Place a lump of chalk and of rock salt to be licked—the latter to quicken the action of the digestive organs, and the former to correct the crude acidities of the stomach.

The last remaining fattening bullocks will be sold during this month. Use oilcake in finishing off the animals. The most backward in condition must go to grass.

The season for curing bacon being over, all pigs on hand must be kept for summer stores, and come in for early winter fattening. The earlier fat lambs will now come in for sale.

During wet weather carry all the dung from the cattle yards to the heaps in the fields, and litter the yards afresh for the summer soiling of horses, cattle, and pigs. Feed poultry and chickens with light grains, and mashed potatoes with meals, and provide clean houses and pure water.

Prepare by ploughing, harrowing, and rolling, the fallow lands for green crops, keeping most forward the portion to be sown with Swedish turnips the next month. Plough clay lands for wheat—fallow when convenience admits.

The thrashing and disposal of grains will be ended in this month, reserving a part for summer. Straw to be thrashed as required.

CALENDAR OF GARDENING.

KITCHEN GARDEN.

Asparagus beds are now prepared, either by seed sowing in rows a foot apart, or by two years old plants. The ground cannot be too turfy or too clear of stones; and if it be manured to the extent of full half the bulk of the whole earth, so much the better. In order to procure a real good "grass" of six inches high, perfect in colour, rich in flavour, and tender in its whole length, a method has been formerly described of making a deep rich bed, which being settled in the ground, is to be divided by twelve or fifteen inches wide alleys into so many beds, about three feet wide, as the ground will admit; these are to be raised about four inches above the alleys, by earth shovelled off the latter. The surface being raked into a perfect fineness, two drills are drawn an inch and a-half or two inches deep, one foot from the edge on each side, and as much apart. The best asparagus seed is to be sown two or three inches apart along the course of the drills, and immediately firmly covered with light earths. As the plants rise they are now and then thinned out, to stand at first three inches a part, and then six inches; guano water, very weak, will promote growth and strength. Such seedlings, when thinned to one foot asunder, and properly managed, will produce plants strong and durable, as if two-year-old plants were purchased. Should that plan, however, be preferred, the fine earths ought to be raked off into the alleys four inches, level depth; the line then being stretched, the plants are to be placed by it, the root being opened, spread flat, and extending every way over which, the crowns being retained upright in the centre; the earth is to be evenly spread and pressed carefully down; a good watering from the rose finishes the operations. The

Giant or Battersea asparagus is the chief plant in use, and though the procuring of a good crop requires some trouble and attention, it is amply repaid by a bountiful supply of that highly-relished and most nutritious vegetable.

Sea-kale being prepared in the same way, are to be sown with sound seeds, by the line, "three seeds" in a small circle of six inches diameter, two inches deep, and the circles two feet a part; the rows may be single at four feet distances, or, if double, two feet asunder, to form a bed.

Peas: Sow in the first and third weeks of the month "largely," as this season produces the largest supply of fruit during summer. Seed thickly in rows a foot apart, and on light soils; tread the intervals firmly by the foot, or lay a cover of turfy or coarse earth, or of rough dung. Cover the seeds lightly with loose earth. The Scimitar and Prussian varieties are the second early crop; Veitch's perfection and Ne-plus-ultra are the new varieties, and the marrow plants may be introduced in the later sowing. Sow beans twice, of any approved variety.

Sow cabbages for main crops to yield a succession of sown crops early and late in the month. Hill's dwarf and Enfield Market are the new distinctions. Savoys sown at the same time to yield the same succession. Kale in the same way, in the dwarf, green curled, and cottager's variety. Broccoli: the winter and spring varieties, as Grange's early white and Williams' Alexandra, and Siberian hardy. Brussels sprouts in the tall imported or good local selections, and the roseberry dwarf with the largest sprouts.

Sow spinach at several times. Beet in the superb crimson and pine-apple kinds. Parsnip in the new student variety. Carrots: the French horn and scarlet.

Onions, for bulbing, the true white Spanish and the brown globe silver onions, very thickly for drawing young. All these sowings in the first days of the month.

Sow celery, Leyman's or Cole's crystal white and the hardy red variety in gently warm and leafy beds, also nasturtiums and aromatic herbs. Lettuce: the brown and white colours. Radish: Wood's early and French breakfast in the kinds in the new names. Small salading twice or thrice.

Kidney beans: sow of both kinds in warm soils and dry, or rather in boxes under glass, to be transplanted when the leaves become strong; in the latter case sow early; in the former, not before the 15th.

Potatoes: plant a full sowing early as a second crop, and a main crop in the third week. The sets should have two eyes, and rather large than small. Plant artichoke suckers, if well rooted, in prepared beds, choosing showery weather.

Transplant lettuces (but expect them to run), cabbage, cauliflower, and sea-kale, and prick out upon beds of very rich soil with decayed manure a number of celery plants to become stocky, all from the seed beds to intermediate beds.

Dress all beds with hoe and rake; earth up and stick peas, and attend to neat order.

FRUIT DEPARTMENT.

Place mulch about and over the roots of wall trees, and opening others that are barren of covering. Strawberry beds, or rows newly planted, must have liberal supplies of water if drought set in.

Cucumbers should be thinned to a regular number of shoots, and stopped at a fruit, and not at a joint beyond it. Grafting is often done successfully, but must be finished early.

FLOWER GARDEN.

Sow annuals for a summer stocks; thin out seedlings in pots; propagate the herbaceous plants by slippings or rooted off-sets. Dutch-hoe and neatly rake the quarters, remove flowering stalks by scissors. Sweep and roll lawns, and begin to mow in showery weather. Plant or renew box edgings, and clean gravel walks, rolling after rain.

Any plants under glass require air and waterings, and a shift opposition to face the heavens in warm and cold exposures by the nature of the plants.

AGRICULTURAL REPORTS.

GENERAL AGRICULTURAL REPORT FOR MARCH.

The past month has been somewhat variable, the weather having been subject to very considerable fluctuation. At one period intense cold prevailed, while the change from a low to a high temperature was at times very violent. On the whole, the mean temperature of the month has been low, and vegetation has accordingly been much checked. Plants and trees of all kinds are backward for the time of year, while wheat has made but little progress in its growth. This latter fact is not greatly to be regretted, as the more genial weather that we may now look forward to will soon alter the aspect of affairs in this respect. As a rule, the wheats appear to have been well got into the land, which was in good condition for receiving the seed, and the check produced by the great degree of cold lately experienced will not have any hurtful effects beyond temporarily delaying the growth of the plant. Notwithstanding that the frost has prevented farmers from proceeding rapidly with out-door labours, there has been no disposition shown to thresh wheat out freely for market, and sales have accordingly been made slowly. The variations that have taken place in value during the month have been mainly caused by the temporary conditions affecting the market from time to time, such as shortness of supply or the non-arrival of grain vessels off ports-of-call. These variations have not been numerous during March, and wheat leaves off at the close of the month at values not materially different to those current at the opening. The imports have continued large, and the total receipts since September last show a very considerable excess over last year. At the same time, however, the stocks of foreign wheat in granary has sensibly diminished during the month, although the quantity of produce on hand is still large. It may be remarked that the amount of fine foreign wheat in granary is comparatively small, present holdings consisting chiefly of American and Russian descriptions, of which the imports have been very heavy, while the arrivals from the North of Europe have been comparatively small.

There appears to be little reason to anticipate any material variation from present currencies. Although the visible supply of wheat available for consumption in the United Kingdom is smaller than it has been for a long time past, there is every prospect of our wants being fully met. On the complete re-opening of the navigation—which is now near at hand—shipments will be received from the Continent, while the exports from the United States will probably also be heavy. Recently, however, shipments from New York have been interrupted by an advance in ocean freights, which has more

than counterbalanced the fall in gold. Towards the end of the month, town-made flour was reduced 3s. per sack at Mark Lane; but this was an unimportant feature, as the prices quoted have long been nominal.

Spring-corn generally has ruled firm throughout the month and there has been an increased demand for feeding stuffs. The arrivals of oats have been limited, and sound corn has been wanted at very full prices. Barley, beans, and peas may be quoted 1s. dearer on the month, while a rise of fully 1s. per qr. has taken place in the value of maize. This latter article is coming into very general repute as an excellent feed for cattle, though there are some important drawbacks to its use.

The stock of roots has been greatly diminished, though the holding is still large for the time of year. Potatoes of really choice quality are scarce, owing to the pressure of sales during the early part of the season, and values now show an upward tendency. Good English Regents have been disposed of at 110s. to 120s. per ton in the Borough Market, while Scotch Rocks have been in request.

The hop market has remained positively without feature. Choice qualities of new English have ruled very scarce, and have commanded full currencies; but in inferior and foreign hops there has been scarcely anything passing, and where sales have been pressed a considerable reduction has been submitted to. The imports from America have been liberal.

The Metropolitan markets have been well supplied with hay and straw, for which the trade generally has ruled dull at depressed quotations.

The English wool market has continued very inanimate. Some demand for fine lustrous has been experienced throughout the month, but all inferior samples have been utterly neglected. The new clip is expected in the market shortly, but the quality so far is not favourably spoken of. The next series of public sales of Colonial produce is fixed to commence on April 7th, which will divert the attention of the trade in some measure from English wool.

REVIEW OF THE CATTLE TRADE DURING THE MONTH OF MARCH.

The most important feature in the cattle trade during the past week has been the consummation of the first experiment of supplementing our resources for the supply of animal food, by obtaining stock from the boundless plains of the River Plate. In November last it will be remembered that the steam ship *Ariadne*, a vessel specially built for the service, left

this country for Buenos Ayres for the purpose of introducing, on a more liberal scale, the South American beasts into this country, about 17 of which had already made their appearance. This vessel has since returned with its first consignment, consisting of 144 bullocks, 300 sheep, 6 cows, 5 calves, and 7 horses; but, we regret to say, that owing to the delays incurred, caused by the tempestuous weather encountered during the passage, the condition of the stock, on arriving at Falmouth, was not such as to justify the assertion that the laudable attempt had been crowned with success, in fact, they were adjudged to be entirely unfit for the London market. The extremely low prices offered for them afforded a just criterion of the value put upon them by competent authorities, and we understand that, notwithstanding the contractor had agreed to place any number of cattle free on board, and weighing not less than 800lbs. each, for £4 per head, the importers will have to submit to a loss.

The tone of the cattle trade has been somewhat depressed. The receipts of beasts from our own grazing districts have been on a full average scale, and have included some fine Norfolk and Scotch beasts. Amongst the foreign arrivals also, we noticed some good serviceable stock. The demand has not been active, and although really prime Scots and crosses have occasionally made 5s. 2d., the more general top quotation has not exceeded 5s. per 8lbs.

As regards sheep the receipts have been on a more liberal scale, but there has been a decided scarcity of really prime breeds. In sympathy with beasts the trade has been unsettled, and lower rates have ensued. During the earlier part of the month the best downs and half-breeds made 6s. per 8lbs., but a decline of 2d. per 8lbs. has since been accepted. In the value of inferior and foreign breeds the fall has been more marked, sales being difficult even at a reduction of 2d. to 4d. per 8lbs. The best clipped sheep have realised 5s. per 8lbs.

In the lamb trade no material change has taken place. The supplies have been moderate, and the trade has been quiet, prices ranging from 7s. 6d. to 8s. per 8lbs.

Calves, of which a moderate supply has been on sale, have been dull, and lower in value.

The show of pigs has been less extensive. The trade has been dull, and prices have favoured purchasers.

In the pastures and meadow lands the supply of grass has been very moderate, and there has been, consequently, an improved demand for feeding stuffs, without, however, in any material degree, hardening the quotations.

The total imports of foreign stock into London during the past month have been as under:

	Head.
Beasts	3,023
Sheep and Lambs ...	25,830
Calves	676
Pigs	1,240
Total	30,769

The arrivals of beasts from our own grazing districts, as well as from Scotland and Ireland, thus compare with the two previous years:

From—	March, 1868.	March, 1869.	March, 1870.
Norfolk, Suffolk, Essex, and			
Cambridgeshire ...	9,100	4,806	5,950
Other parts of England ...	2,620	2,500	2,310
Scotland	2,224	815	906
Ireland	720	474	1,670

The annexed figures show the total supplies of stock exhibited at the Metropolitan Market during the month:

	Head.
Beasts	15,112
Sheep and Lambs ...	115,855
Calves	1,029
Pigs	440
Total	132,436

COMPARISON OF SUPPLIES.

March	Beasts.	Sheep and Lambs.	Calves.	Pigs.
1869	18,950	132,910	1,165	625
1868	20,380	127,260	1,146	2,270
1867	14,460	95,600	1,100	1,900
1866	15,511	117,550	1,075	2,205
1865	22,400	86,752	1,142	3,015
1864	21,500	91,890	1,218	2,690
1863	18,653	88,560	935	2,432
1862	18,200	83,040	881	2,310
1861	18,500	85,270	700	2,410
1860	18,160	93,409	853	2,042
1859	16,810	94,775	695	2,680
1858	17,321	74,410	704	1,915

Beasts have sold at from 3s. 2d. to 5s. 2d., sheep at from 3s. to 6s., lambs 7s. 6d. to 8s., calves 3s. 10d. to 6s., and pigs 4s. 6d. to 5s. 8d. per 8lbs., to sink the offal.

COMPARISON OF PRICES.

	March, 1869.	March, 1866.
	s. d. s. d.	s. d. s. d.
Beef from	3 4 to 5 8	3 4 to 5 0
Mutton	3 4 to 6 8	3 8 to 5 4
Veal	4 8 to 6 2	4 2 to 5 4
Pork	3 8 to 5 2	3 4 to 4 2
	March, 1867.	March, 1866.
	s. d. s. d.	s. d. s. d.
Beef from	3 4 to 5 2	3 4 to 5 2
Mutton	3 10 to 6 2	3 10 to 6 2
Veal	4 6 to 5 6	4 4 to 5 6
Pork	3 8 to 4 2	3 2 to 4 4

The dead-meat markets have been tolerably well supplied with both English and foreign meat. The trade, generally, has been quiet, as follows: Beef from 3s. to 4s. 8d., mutton 3s. to 4s. 10d., lamb 6s. 8d. to 7s. 4d., veal 4s. 4d. to 5s. 4d., and pork 3s. 8d. to 5s. 8d. per 8lbs., by the carcase.

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

The month of March has evinced very extreme fluctuations of temperature commencing with unusual mildness, and closing bleak and severe. So the old adage, that it should "Come in like a lion, and go out like a lamb," has been completely ignored. In fact, it has been a strange mixture of winter and spring, in the proportions of 3 to 1, though the natural order has been reversed. No decided complaints are general respecting the young wheat, yet it is impossible that these fluctuations can be good, and we do hear there is, in some places, a great deal of misplant, with a very patchy look, but the vitality of wheat is so great, it is by no means beyond recovery should there yet be before us a really genial spring. Though we have no faith in the equinoctial theory, we have often noted that the character of the season has been set by itself. Should this then be the case, last

harvest may be the precursor of many more like it, and then the present foreign plenty would be effectually absorbed by British wants; and should Russia and America have indications of a partial failure, the news would soon rectify the present depressed rates, and enable English farmers better to profit by their toil. Let it not be forgotten that we are still about 10s. below average rates, and that foreigners are as much dissatisfied with present prices as British growers, and that the late heavy imports, mostly burdened with granary expenses, have brought sad losses to importers, who with lessened means and discouraged feelings, are not likely to keep long at a losing game. Still a pressure for cash, like that now felt at Odessa, may force off liberal shipments for a time; while in America, maize, from the failure of the crop, must take off some of the surplus wheat, not only for

the Negro's use, but for the fattening of stock. The trade here, on the whole, has rather gained than lost, say to the extent of 2s. during the month, and most of the country markets, as well as that of London, closed with an upward tendency. Even Hungary, one of the great European granaries, has lately risen 1s. to 1s. 6d. per qr., and so have some places in the interior of Germany, through doubts as to the growing corn, from its present aspect, and the severe changes which have everywhere been experienced. The following rates were recently quoted at the several places named: White wheat at Paris 49s., red 46s.; white at Bordeaux 47s.; the top price of red in Belgium have been 44s. to 45s.; the best white new Zealand at Rotterdam, 44s.; red at Hambro' (Holstein quality), 40s. per qr. Range of prices at Stettin 34s. to 38s.; the best new high mixed at Dantzic, 50s. c. f. i., deliverable at open water, the port yet being closed. Wheat at Romanshorn, Switzerland, 51s. 6d., at Porrentruy, 48s., Pesth, in Hungary, 34s. to 39s. Wheat at Cologne for March 40s., for May 41s. At Mayence 41s. to 43s., with much speculation. Best wheat at Taganrog, viz., soft Ghirka 36s., ordinary wheat at Venice 41s. to 44s. Soft wheat at Algiers 46s. 6d.; white at San Francisco, 34s. Stocks 320,000 qrs., ashore and afloat. No. 1 best red spring at New York 39s. 6d. to 41s. per 480lbs.

The crops in Australia, lately expected to be heavy, have been materially reduced by unusual heat.

The first Monday commenced on a moderate supply of English wheat, with the smallest foreign arrivals noted for some time past, consisting simply of one cargo from New York. The show of samples during the morning from Kent and Essex was limited, and factors were consequently able to obtain an advance of 1s. per qr. on the best white samples; but red and low-conditioned qualities were dull. The foreign trade was not brisk, but American red brought the same improvement, and all sorts were held for 1s. per qr. more. Cargoes afloat brought an advance of 1s., with a fair sale. The more favourable advices from London were generally followed in the country by an improvement of 1s. per qr., and some places noted an advance of 1s. to 2s. Among these were Brigg, Manchester, Barnsley, Wakefield, Sleaford, Newcastle, and Melton Mowbray. Liverpool was 4d. to 5d. higher per cental for the week—say, about 2s. per qr., and all the Saturday markets were up 1s. to 2s. per qr. Glasgow noted a rise of 1s. to 2s., and Edinburgh 1s. per qr. Dublin was firm for native samples, and 6d. per brl. dearer for foreign.

On the second Monday the English supply was about the same, and the foreign much increased, though still only moderate. Not many fresh samples were then exhibited on the Kentish and Essex stands. The general rise in the country encouraged factors at first to demand 2s. per qr. more money; but this movement was not seconded by buyers, who succeeded eventually in reducing the rate to 1s. per qr., when a fair trade was done. The same confidence was not exhibited by holders of foreign, there being but few buyers at market, and the only sorts that obtained an advance of 1s. per qr. were American spring and winter red. As regards floating cargoes, the demand was fair, but no advance could be obtained. There was less decision this week in the country markets, while the weather was wintery, which was the case at the commencement of the week. The earlier markets noted a rise of 1s. to 2s. per qr. Among these were Sheffield, Hull, Sleaford, Gainsborough, and Barnsley. Many still maintained the improvement of 1s. per qr., as Leeds, Rotherham, Spalding, Rugby, Market Harborough, Lynn, Ipswich, Stockton, Bristol, Bury St. Edmund's, Rochester, and Manchester; but Birmingham and Wakefield, with good supplies, were tending down-

wards. Liverpool reported no improvement for the week, and several places on Saturday noted a decline of 1s. to 2s. per qr. Glasgow was only dearer for Scotch and American samples, and Leith advised a rise of 1s. per qr. Foreign wheat at Dublin was rather dearer; but the higher rates checked business, and there was no improvement in native produce.

On the third Monday both English and foreign supplies were moderate. But with a very decided spring-like alteration in the weather and the subdued tone of the latest country markets, notwithstanding the show of fresh samples was small, there was no doing any business till factors were content to take fully 1s. per qr. less on the best qualities, the badly-conditioned samples being neglected. There was a very limited demand for foreign. The best Baltic qualities being scarce, were held at former rates; but Russian and American red, of which the supply chiefly consisted, lost value fully 1s. per qr., with but little passing. Cargoes afloat were not, however, depressed, and former prices were paid freely for anything fine. Dull markets were this week prevalent all through the country. Many were 1s. per qr. down, as Barnsley, Gainsborough, Ipswich, Bury St. Edmund's, Gloucester, Rugby, Rotherham, Sleaford, &c. Others were 1s. to 2s. per qr. lower, as Alford, St. Ives, Lynn, and Market Rasen; but Birmingham noted an advance of 6d. to 1s. per qr., and so did Wakefield and several of Saturday's markets. Liverpool was 2d. to 3d. per cental lower on Tuesday; but on Friday this was recovered. In Scotland the wheat trade was rather cheaper. Glasgow found a dull trade, with rates tending downward, as well as Edinburgh. No native wheat appeared at Dublin, yet foreign was in very little request, though nominally unchanged.

On the fourth Monday the supply of English wheat was short, and that from abroad moderate. The show of fresh samples during the morning was small, both on the Kentish and Essex stands. It still being frosty, and several of the last country markets coming dearer, factors on the opening of the market asked 1s. to 2s. more, but this was resisted by millers, though at the previous rates there was a better sale. In foreign the only quality positively dearer was American, 1s. per qr.

The imports into London for four weeks were 20,114 qrs. English, 32,929 qrs. foreign; against 29,265 qrs. English, 67,232 qrs. foreign for the same period last year. The imports into the kingdom for four weeks, ending 19th March, were 1,820,137 cwt. wheat, 278,491 cwt. flour; against 2,390,626 cwt. wheat, 34,476 cwt. flour for the same period last year. The averages commenced at 40s. 7d., and closed at 41s. 9d.; those of London began at 43s. 7d., and ended at 45s. 6d. The London exports, in four weeks, were 855 qrs. wheat, 98 cwt. of flour.

The country and foreign flour trade have changed but little through the month, the former having gained about 1s. per sack, while the latter being relatively dear has been unaltered in value. On the third Monday town millers reduced their top price, which had long stood at 43s. to 40s. per sack, the previous state of the wheat trade for several weeks justifying the reduction. Below this point, we think it not likely that it will go, the finer qualities of wheat, both home-grown and foreign, getting scarcer every day. Norfolks range from 28s. to 31s. for the better sorts, and Canada to 23s. per barrel. The imports into London for four weeks were 85,986 sacks country; 3,206 sacks, 24,770 barrels foreign; against 81,559 sacks English; 15,032 sacks, 8,101 barrels foreign for the same period last year.

The supply of maize having been very moderate, and the opening prices low, this grain has advanced gradually through the month to the extent of about 2s. per qr.,

the best yellow being worth 29s., and white 30s. The imports in four weeks for London were 19,620 qrs., against 24,504 qrs. in 1869.

As respects malting barley the trade has been very quiet through the month, but extra samples, when they have appeared, and that has been seldom, were always taken off at rates above quotations—say up to 42s.; but 40s. has been a very fair top price. The foreign supplies having been light and the weather sharp, there was a good demand for sweet heavy qualities, as well as the lower sorts for grinding, at from 1s. to 1s. 6d. advance on the rates of February, though very light qualities may still be had at 22s. to 23s. per qr. The imports into London for four weeks were, in British qualities 10,647 qrs., in foreign 18,800 qrs., against 10,553 qrs. British, 74,796 qrs. foreign for the same period in 1869.

The malt trade has been dull all through the month, brewers still complaining of the great falling off in the demand for the want of work among the labouring classes, but prices have ruled nominally the same.

There has been a great falling off in the supply of oats, the entire foreign arrivals for the month being less than those per week in January last; while neither from Scotland or Ireland has there been a single shipment. Prices for the month, though improved fully 1s., still show the influence of the heavy imports of last autumn. But the granaries begin to be lightened by the long absence of liberal shipments through the frost, and a better sale for even stale parcels has been experienced, fair 88lbs. Russian a re worth 19s., 40 lb. Swedes 20s., and others relatively according to weight and freshness. As the ice is clearing away from the Sound and the season is advanced, the late improvement on this side the water will encourage more shipments at open water; but unless these are very plentiful there does not seem much room for a decline. The imports into London in the four weeks were 2,940 qrs. English, 35,614 qrs. foreign; against 3,224 qrs. English, 236 qrs. Scotch, 7,022 qrs. Irish, 124,980 qrs. foreign in 1869.

The rise in maize and low barley has benefited the bean trade to the extent of 1s. to 1s. 6d. on fine hard new and good old English or foreign, though prices yet continue low—say 35s. for mazagans and ticks, and 40s. to 42s. for pigeon qualities; old Egyptian 34s. to 35s. The imports into London for four weeks were 3,827 qrs. English, 3,358 qrs. foreign, against 1,686 qrs. English 6,552 qrs. foreign in 1869.

White peas, from the coldness of the season, have also somewhat hardened in value, extra quality being worth 35s. to 36s., which not long ago were offered at 34s. in vain; those for hog feed have also been rather dearer. The imports for four weeks were entirely English—say 1,910 qrs., against 797 qrs. English 8,119 qr. foreign in 1869.

Linseed has been firm and English-made cake more in demand for the lambing season, through the want of grass.

Fine red cloverseed, either foreign or English, has arrived in very small quantities, and holders have realized an advance of 2s. per cwt.; also trefoil and white seed have been improving in value, as well as tares; but the backwardness of the spring has hitherto very much restricted the demand.

PLATE V.

HOGARTH THE SECOND; A PRIZE SHORTHORN BULL.

THE PROPERTY OF MR. KERSY COOPER, OF EUSTON, THETFORD.

Hogarth 2nd (24148), a roan bull, calved August 30, 1866, and bred by the Rev. W. Holt Beever, of Pencraig Court, Ross, Herefordshire, is by Royal Butterfly 17th (22774), out of Rue by Rex (16833), her dam Heart's Ease by Hogarth (18036)—Snowdrop by 4th Duke of York (10167)—Science by Sir Thomas Fairfax (5196)—Starville by Young Sea Gull (5100)—Young Clarinda by Crusader (934)—Clarinda by Sultan (1485)—Young Cherry by White Comet (1582)—by Son of Chilton (136)—by Bolingbroke (86).

Royal Butterfly 17th (22774), roan, calved October 13, 1863, the famous 200-guinea calf, at the Towneley sale, in March 1864, and bred by Col. Towneley, is by Royal Butterfly (16862), out of Vestris 3rd by Valiant (12253), her dam Venilia by Tom of Lincoln (8714)—Venus by Belerophon (3119)—Verbena by Renown (2525)—Venus by Tartar (2738)—Miss Camidge by Colton (1849)—Cornforth by Pioneer (1321)—Coy by Marshal Beresford (415)—Cordelia by Cecil (120)—Cora by Favourite (252)—Countess by Cupid (177)—Lady by Grandson of Bolingbroke (280)—Phoenix by Foljambe (263)—Favourite by R. Alcock's Bull (19)—by Smith's Bull (608)—by Jolly's Bull (337).

Rue, a white cow, calved March 2, 1861, was bred by Earl Spencer, at whose sale in 1865, when Mr. Carr officiated for the first time in the place of poor Captain Spencer, Mr. Beever purchased her, being complimented by that good judge, Mr. Drewry, on having bought the best barreled cow of the lot. Fortunately she "nicks in" well with Royal Butterfly 17th, all her produce having the same attractive character. Of her lineage it was written under the head of "Shorthorn Intelligence," in *Bell's Weekly Messenger*: "Rue is by Mr. Troutbeck's fine Gwynne bull Rex, from a cow by Colonel Towneley's Hogarth, the grand-dam by Fourth Duke of York." Her dam Heartease was a show cow in the district, and took several rosettes to Althorpe.

As a young one Hogarth 2nd followed implicitly in the steps of his sire, being a grand, rich-coated calf to begin with, then becoming somewhat slack and leggy, but furnishing again gradually but surely, until he was pronounced to be "a grand heavy-fleshed bull," and exhibited, as a two-year-old, so strongly the familiar traits of

his fashionable progenitor, as to win from the *Mark Lane Express* the complimentary designation of "the stylish Hogarth."

He has been only locally shown as yet, with the following results:

1868. Norfolk Show, Downham Market.—As a yearling, second prize of £3, Lady Pigot's Rosolio beating him.

1868. Suffolk Show, Framlingham.—First prize of £4.

1869. Essex Show, Colchester.—Bulls open to all England, prize of £20, as well as the "Town prize" £20, with cow and offspring; beating Mr. Lynn's Grand Sultan, Sorcerer, Charles Le Beau, General Hopewell, &c.

1869. Norfolk Show, Attleborough.—First prize for bulls, £10, and £10 10s. Challenge Cup.

1869. Suffolk Show, Ipswich.—Bulls not under two years, First prize of £10 and Challenge Cup £10 10s.

Hogarth 2nd was purchased by Mr. Kersey Cooper just before the Smithfield Show, in the Cattle-plague year, and went up to London with an ox for exhibition; whereupon his life became at once forfeited to the great amusement of the shrewd purchaser's many friends. It was not, however, in Mr. Cooper's nature to surrender so readily, and it came about eventually through some leger-demain process upon a farm that was both in and out of the proscribed boundary that poor Hogarth managed to make his escape. He is now in training for Oxford, where it is to be hoped that he may maintain something of his early distinction, when he comes to break a lance with such celebrities as Bolivar, &c., in competition for University honours. "I have not seen the bull since I sold him," Mr. Beever writes, "but expect to view a striking likeness of him as he is now, unless Mr. E. Corbet has, which is unlikely, lost the quick eye that enabled his pencil, some years since, to faithfully, and almost as it were by magic, as I watched him, represent on canvas the pet members of my own herd; sketches which now I find often most useful on rainy days, when with the plethoric volumes of the 'Herd Book' alongside, one gets occupied in that most delicious of day dreams, the compounding in imagination of future animals, which are, of course, to be distinguished. Heigh ho! What would this world be if it were not for Shorthorns?"

PLATE VI.

JENNY LIND; A PRIZE HACKNEY MARE.

THE PROPERTY OF MR. HENRY OVERMAN, OF WEASENHAM, NORFOLK.

Jenny Lind is no doubt Norfolk bred; but neither her breeder nor pedigree can be ascertained. She is a chesnut mare, with a white face and a white heel, standing just fifteen hands high. She has capital shoulders, quite free from lumber or loading, a good middle, great quarters, and is altogether a smart, lengthy mare, on a short leg. She has very quick grand action, and the way in which she brings her hind legs under her is something extraordinary to look on.

At the Bury St. Edmunds Meeting of the Royal Agricultural Society in 1867, Jenny Lind took the first prize of £30 in the class for mares in foal or with foal at foot, suitable for breeding hackneys, and not less than fourteen-

two or over fifteen hands high. She was then sold to go to France, but was brought back by the late Sir John Thorold, and has again found her way to Weasenhams where Mr. Overman has another or two of much the same stamp.

Jenny Lind is entered for the Norfolk Society's show at Harlestone during this month, where, with a foal at foot, she will compete for Lord Leicester's premium. Mr. Overman is a tenant of Lord Leicester's, and he himself, as his father before him, holds a prominent position amongst those eminent agriculturists who have made the farming of Norfolk so famous.

THE POTATO.

BY CUTHBERT W. JOHNSON, F.R.S.

There is hardly any cultivated field crop that has made less advance in its produce than the potato. Indeed it is doubtful if the average yield has not been for some years decreasing. Our imports from foreign countries are certainly enlarging. In the year 1854 we imported 16,446 cwts.; this had gradually increased to 1,874,228 cwts. in 1867, and to 2,041,474 cwts. in 1868. This was equal to .07 of a pound for each head of our population in 1854, and to 7.52 lbs. in 1868. And yet the acreage devoted to this crop is on the increase. In the years 1867 and 1868 there were planted:

	1867.		1868.
In England	289,611 acres	...	327,178 acres.
In Wales	45,077 "	...	47,431 "
In Ireland	1,001,781 "	...	1,034,853 "
In Scotland	157,529 "	...	166,939 "

It is true that the population of our island has long been steadily increasing; but still it is very doubtful if the rate of that enlargement equals the increase of the importation, and the extension of the acreage devoted to the cultivation of this invaluable root. It is then of great importance that we should inquire into the best means of restoring the deficient supply of home-grown potatoes. We may here again refer with advantage to the hints which Dame Nature gives us. We learn from her that the potato plant delights in fresh soils; that the yield from land long devoted to pasture, or the site of an old wood-yard, is commonly at first very good, and that the tubers are fine. But that, if a succession of crops are taken, this produce gradually diminishes. This would reasonably lead us to the conclusion that something is abstracted from the soil by the plant, which even our ordinary dressings of manure fail to restore. Now, what hints have we lately received that may lead us to extend our experimental inquiries? In the last number of the "Journal of the Royal Agricultural Society," Professor Voelcker has suggested the trial for potatoes of the salts of potash, combined however with other fertilisers. Before we consider these valuable suggestions, we may use-

fully refer to the chemical composition of the potato tubers, and hence learn the nature of the various earthy and saline matters which the plant extracts from the soil. An analysis of the potato was made at the instance of the Highland Society of Scotland by Professor Anderson (*Trans. High. Soc.*, 1863, p. 38; 1864, p. 291). He found in the tubers of two varieties:

	Regents.	Dalmahoy.
Water	75.32	75.91
Starch	12.21	12.53
Sugar, &c.	2.75	2.93
*Soluble album. compounds..	2.16	2.10
Insoluble	0.21	0.15
Fibre	5.53	5.21
Ash	0.88	0.91
	100.06	99.69
*Nitrogen	0.397	0.360

The ash was composed of per cent.

	Regents.	Dalmahoy.
Peroxide of iron	0.31	0.35
Lime	1.79	2.04
Magnesia	5.75	4.56
Potash	50.62	49.62
Chlor. of potassium	5.39	6.53
Common salt	2.07	2.93
Phosphoric acid	11.49	11.21
Sulphuric acid	7.08	6.57
Silicic acid	0.98	1.25
Carbonic acid	11.30	10.26
Charcoal	3.65	4.52
	100.33	99.89

We may here note the large proportion of potash which the ash of the tuber contains. And it is from this fact, and from the results of a variety of experiments by Professor Voelcker, that the following experiments are specially recommended by him on light soils; each plot to be one-twentieth of an acre (*Jour. Roy. Ag. Soc.*, vol. vi, N. S., p. 145):

Plot	No.	lbs.	cwt.
1 No manure.	—	—	—
2 { Min. superphosphate	28	or at the rate of	4 per acre.
Crude potash salts...	11	"	4 "
Sulphate of ammonia	11	"	2 "
3 Good rotten dung ...	1	"	20 "
4 { Min. superphosphate	28	"	4 "
Crude potash salts...	28	"	4 "
5 No manure.	—	—	—
6 { Min. superphosphate	28	"	4 "
Crude potash salts...	11	"	2 "
Nitrate of soda.....	11	"	2 "
7 Peruvian guano.....	28	"	4 "
8 { Min. superphosphate	28	"	4 "
Common salt.....	28	"	4 "
9 Good rotten dung ...	1	"	20 "
10 No manure	—	—	—

"The artificials should be first mixed with ashes, burnt clay, or dry earth, and then dug or ploughed in quite early in the spring, when the dung is put on the land and when the potatoes are planted."

Various successful experiments when the potato crop was dressed with the salts of potash lead to the conclusions which our chemical examinations appear to support. The report of the experiments, carried on under the direction of Professor Voelcker by Mr. J. R. Hetherington, at Carleton in Cumberland in 1866 (*Ibid.*, vol. iii., N.S., p. 517), well deserve to be carefully studied by the potato-grower. In these experiments the potatoes (rough whites) were planted on the 23rd of April, on a piece of light land that had formerly been a beech plantation, and had only had one previous crop, namely potatoes. The manures used and the produce per acre will be found in the subjoined table, which gives the weight of large, second, small, and diseased potatoes:

Name of Manure.	Large.	Second.	Small.	Diseased.
	tn.cwt.gr.	cwt.s. grs.	cwt.s. grs.	tn.cwt.gr.
No manure.....	1 2 1	10 1	15 3	1 1 1
Dissolved bone-ash,				
4 cwt.....	2 2 0	18 1	10 1	1 1 1
Rotten dung, 20 tons	2 11 1	16 2	12 2	1 9 2
Dissolved bone-ash,				
4 cwt., and crude				
potash salts, 4 cwt.	2 13 2	18 1	9 0	1 1 0
No manure.....	1 15 3	15 0	15 0	0 14 2
Crude potash salts,	2 10 1	13 1	15 3	0 7 2
4 cwt.....				
Common salt, 4 cwt.	2 1 8	14 1	11 3	0 4 1
Dissolved bone-ash,				
4 cwt., and com-				
mon salt, 4 cwt....	3 2 1	15 0	14 0	0 3 3
Rotten dung, 20 tons	2 19 1	19 3	3 3	0 13 0
No manure.....	1 18 3	15 3	19 2	0 3 0

It was at a meeting, a few months since, of the Western Ross Farmers' Club (*Farmer's Mag.*, vol. liv., p. 66) that, during a valuable discussion on top-dressings, Mr. Sims, a large potato-grower, remarked, after speaking of the great importance of using a mixture of manures, "Of all crops, the most marked results of top-dressing are produced on potatoes. He found last year, by actual experiment, that it increases the crops by one-fifth; and, in talking the other day to a farmer, who has been a regular grower of potatoes for years, as to the quantity he gave to his potatoes, he told me he never used less than 6 cwt. per acre of a mixture of fertilizers, and he believed it would pay to give more. He found Peruvian guano 1 cwt., potash 1 cwt., and best dissolved bones 2 cwt., to suit him best; 2½ cwt. put down when planting, and 1½ cwt. when earthing up." We may here remark that the amount of the salts of potash in the ash of the potato

appears to vary with the manure employed. Professor Anderson found in 100 parts of the ash of the tuber of the Dalmainey Potato, grown on land dressed with different fertilizers (*Trans. High. Soc.*, 1865, p. 296):

Manure employed.	Potash.
5 cwt. superphosphate of lime	52.23
25 tons of dung	42.51*
35 tons of dung	57.61

* And 7.85 chloride of potassium.

The ashes of sea weeds have long been employed in the Channel Islands; but they apply these as a manure, which they call *vrac*, to the wheat crop. In Cornwall, sea-weeds are equally valued. Now it is noticeable that the ashes of these weeds yield, according to Mr. Hodges, about eight per cent. of potash. They contain also several other saline matters. In two sea-weeds, analysed by M. Gaultier de Claubry, he found, in the *Fucus saccharinus* and in the *Fucus digitatus*, which is much used in Scotland as a manure, the following substances:

Saccharine matter	Sulphate of mag-	Hydriod. of potash
Mucilage	nesia	Silica
Vegetable albumen	Muriate of soda	Phosphate of lime
Oxalate of potash	Muriate of potash	Phosphate of mag-
Malate of potash	Muriate of magnesia	nesia
Sulphate of potash	Carbonate of potash	Oxide of iron
Sulphate of soda	Carbonate of soda	Oxalate of lime.

The use of sea-weed as a manure, in the isles of Jersey and Guernsey, has been very extensive from time immemorial. Thus, in a work upon Jersey, by the Rev. Philip Falle, published in 1694, he observes that "Nature having denied us the benefit of chalk, lime, and marl, has supplied us with what fully answers the end of them in husbandry: it is a sea-weed, but a weed more valuable to us than the choicest plant that grows in our gardens. We call it *vrac* (*varce*), in ancient records *veriscum*, and sometimes *wreecum*, and it grows on the rocks about the island. It is gathered only at certain times appointed by the magistrate and signified to the people by a public crier on a market day. There are two seasons for cutting it, the one in summer, the other about the vernal equinox. The summer *vrac*, being first well dried by the sun on the sea-shore, serves for fuel, and makes a hot glowing fire; but the ashes are a great improvement to the soil, and are equal almost to a like quantity of lime. The winter *vrac* being spread thin on the green turf, and afterwards buried in the furrows by the plough, it is incredible how with its fat unctuous substance it ameliorates the ground, imbibing itself into it, softening the clod, and keeping the root of the corn moist during the most parching heats of summer. In stormy weather the sea does often tear up from the rocks vast quantities of this weed, and casts it on the shore, where it is carefully gathered up by the glad husbandman."

As to the soils best adapted for the growth of potatoes. It was at a meeting of the members of the Borough-bridge Agricultural Association, that a considerable grower, Mr. Appleyard, of Easingwold, observed (*Farm. Mag.*, vol. lix., p. 218): "The warp of the Humber and Ouse and of the Trent is acknowledged to possess the properties most requisite for their successful cultivation, as during a series of years the quality and quantity are very little deteriorated. Other kinds of soils will grow potatoes quite as well, but they require changes oftener; a loamy soil, or, as it is sometimes called, hazel earth, is next best to warp, and has been known to produce on some occasions a larger quantity per acre; and sandy soils will yield, if well tilled and properly treated, as many as four to seven tons. A piece of old sward, broken up before the winter and ploughed deep, so as to have the sod well rotted, generally grows a very deep crop, and a very desirable one, as their cultivation has a peculiar tendency

to free the fresh lands from grubs and wireworms, with which it is generally infested. Any kind of land which can be ploughed a sufficient depth, and which is well drained, can grow a crop of potatoes occasionally to advantage. The preparation of the land generally for potatoes should be begun immediately after harvest, if it is intended to grow them after a grain crop." The warp of which these excellent potato soils are composed, was analysed by Mr. Harepath (*Journ. Roy. Ag. Soc.*, vol. xi., p. 101). He found in an imperial gallon of warp-water

	Grains.
Organic matters	16.334
Carbonate of Lime	23.813
Carbonate of Magnesia	8.547
Potash and Soda	0.199
Lime	2.111
Magnesia	6.640
Peroxide of Iron	10.419
Alumina	10.487
Perphosphate of Iron	0.315
Silicio Acid, Sand, &c.	160.605
	<hr/> 233.380

The reader will here note the presence of potash, and of variety of other saline matters, all more or less valuable for the growth of this root.

The size of the sets, and the kind of potatoes are very important considerations. The question of the comparative produce of large and small sets, has been laboriously examined by Mr. G. Maw, of Benthall, near Brosley, who not long since, in the *Gardener's Chronicle*, remarked: "My experience convinces me that from one-fourth to one-third of the natural produce of the potato crop is lost solely from insufficiently large potatoes being planted; and that by a proper selection of sets an increased crop, representing a clear profit of several tons per acre, can be obtained. On the 16th of February I planted in rows 2 feet apart, and 1 foot from set to set in the rows, sixty uncut sets of early prolific potatoes, viz.:

20 sets weighing 3 oz. each.	
20 " " 4 oz. "	
20 " " 8 oz. "	
20 sets of 3 oz. each (2½lb.) produced 21lb. 5½ oz.	
20 " 4 " (5lb.) " 29lb. 0½ oz.	
20 " 8 " (10lb.) " 35lb. 3¼ oz.	

In the case of the twenty 4-oz. sets, the extra 2½lb. over and above the weight of the twenty 2-oz. sets produced a gross gain of 7lb. 10½ oz.; and a net gain, after deducting the difference in the weight of the sets, of 5lb. 2½ oz. of potatoes on the 40 square feet of ground, or at the rate of 2 tons 5 cwt. 1 qr. 1 lb. per acre net profit. In the case of the twenty 8-oz. sets, the extra 7½lb. over and above the weight of the twenty 2-oz. sets produced a gross gain of 13lb. 14 oz., and a net gain, after deducting the extra weight of the sets, 6lb. 6 oz. of potatoes on 40 square feet of ground; or at the rate of 3 tons 1 cwt. 3 qrs. 26lb. net gain per acre over and above the extra weight of seed. It will be observed that there was a large profit on each advance in the weight of the sets, viz. on the 8-oz. sets over those of 4-oz., as well as on the 4-oz. over the 2-oz. sets. Another experiment was made with second kidneys, planted at intervals of a foot, in rows 2 feet apart, on the 31st of March, viz.:

20 sets of 1 oz. (1½lb.) producing 15lb. 9 oz.	
20 " 2 oz. (2½lb.) " 16lb. 15 oz.	
20 " 4 oz. (5 lb.) " 19lb. 15 oz.	

Although the result in this case is not so striking as that of the early prolific, each advance in the weight of the set produced more than an equivalent increase in the crop, leaving a clear profit on the extra seed. On the 31st of March I also planted four lots of fluke potatoes, in rows 2 feet apart, each lot occupying 40 square feet of ground, viz.:

90 sets, 1 foot apart, of 1 oz. each (1½lb.), producing 15lb. 9 oz.	
90 sets, 1 foot apart, of 2 oz. each (2½lb.), producing 15lb. 15 oz.	
90 sets, 1 foot apart, of 4 oz. each (5 lb.), producing 19lb. 15 oz.	
16 sets, 1 foot 3 in. apart, of 8 oz. each (8lb.) producing 30lb. 12½ oz.	

In the experiments with the second kidneys and the flukes, it will be observed that there was little or no difference in the produce of the 1-oz. and 2-oz. sets, a small profit in favour of the 2-oz. early prolific sets, and a trifling loss in the flukes; but in the advance from 2-oz. to 4-oz., and from 4-oz. to 8-oz., the result is quite consistent with the other experiments, and exhibits even a greater profit in the planting of large potatoes of 8-oz. each. The twenty 4-oz. flukes (5lb.) produced 3lb. 12 oz. of potatoes more than the twenty 2-oz. sets (2½lb.), leaving a net gain of 1½lb. of potatoes on 40 square feet of ground, or at the rate of 11 cwt. 8 qrs. 14 lb. per acre clear gain, after deducting the extra weight of seed. The sixteen 8-oz. flukes planted at intervals of 15 inches in rows, 2 feet apart, produced 30lb. 12½ oz., so that the 5½lb. extra weight of sets over those 2-oz. in weight increased the crop in the 40 square feet of ground by 15lb. 12½ oz., and after deducting the extra weight of the seed, left a clear profit of 10lb. 4½ oz., or at the rate of a trifle over 5 tons per acre gain. The 3lb. extra weight of sets in the sixteen 8-oz. sets over the twenty 4-oz. sets increased the crop on 40 square feet of ground by 12lb. ½ oz., and left a clear profit of 9lb. ½ oz., or at the rate of 4 tons 8 cwt. 0 qr. 27 lb. per acre clear gain, after deducting the extra weight of seed. This question is in no way related to that of thin seeding. The distance at which the sets should be placed is another matter. I think when small sets are planted they are not put nearly thick enough in the rows. My experiments prove that the ground is capable of bearing a much greater weight of tubers than can be generated from 2-oz. or even 4-oz. sets, planted a foot apart, and I believe that such small sets, if placed at 6-inch or 8-inch intervals, would produce nearly as much to a root as if at a wider distance, and, of course, a much greater weight per acre."

The cultivation of the early potato, so extensively carried on in Cornwall and the Channel Islands, has recently been described by Mr. C. P. Le Cornu in his prize essay (*Journ. Roy. Ag. Soc.*, vol. vi., N. S., p. 136). It was when describing its cultivation in the Island of Jersey that he remarks (and the cultivation may be profitably extended in many of our southern districts):

"The preparation of the plant intended for sets is of the utmost importance. Kidney potatoes as a rule are planted whole, and the round varieties are planted in strong sets, with eyes from the crown of the plant. The kidney varieties commonly planted are the Ashleaf, the Prolific, and the Winford, alias Early Fluke. The round varieties most esteemed are the Cherbourg 'Trois Mois,' the Dalmahoy, and the Early Regents. Potatoes intended for plant should be dug before the haulm is entirely dried up; when dug they should be allowed to harden by exposure to the air and sun, occasionally turning them. Then at the fall of the year, if they are stored away singly in layers on wooden floors it will retard too early a vegetation, which otherwise is frequently the case. By a little attention the tuber in this way is checked in its habit of early growth, and when the moment arrives for planting it can, if required, be forced; but it is not often that any forcing is required, the eyes will break out into vigorous shoots, and when they are fully developed, say about half an inch in length, the tubers may be planted, taking care to place the shoots uppermost. In this manner one month at least may be gained in bringing the potato out of the ground. The preparation of

the sets must be viewed as of primary importance, taking care always to select plants of good and of early habit; this, together with a suitable and well-manured piece of ground, forms in fact the only secret in the culture of the early potato.

"The planting commences in January, and is usually all finished by the end of the next month. The next operation is the forking-up, or loosening of the ground between the rows; this is performed when the plants are fairly out of ground, either with the prong, the crook, or with a small implement in the form of a horse-hoe, usually drawn by two men. The soil being thus well opened, if not checked by frosts, which unfortunately is sometimes the case, the plants will grow quickly, so that by the middle of April they are all hoed up. In the early sheltered places some are much more forward, while in the later ground others are less. The first lot of any importance is usually sent up to the London markets about the end of April. As time advances the business rapidly increases, so that by the end of May, or the commencement of June, in ordinary years great activity prevails in connection with this trade. There is no season throughout the year in which the farmer is so busy as during the sale of his early potatoes. A day is frequently of the greatest importance in the market value of the goods, and therefore no sooner do they approach maturity than all hands are fork in hand at the work. Many consign their produce to salesmen in London; the goods are packed in baskets or barrels, and forwarded by the steam-vessels which daily ply between this island and the English ports, and thence on by railway to their destination. Others sell to the merchants here, who also export in the same manner, but on a larger scale. These, with the rest of the community, have the advantage, by means of telegraphic communication, of knowing hourly, if necessary, the state of the London markets.

"So much said respecting the time, the mode of culture, and the sale of the potato, let us look back at the fields whence the potatoes have been dug, and see what is there being done. Another crop is being sown to follow. It may be, if on a piece of ground which was cleared off early, that a late crop of potatoes is being set; this certainly is only the exception, the rule is to have a succeeding crop of either swedes, mangolds, or turnips; we have also seen barley sown, but rarely with advantage. It will now be understood that the heavy dressing of manure used for the potato is again to be called upon to supply nourishment to the succeeding crops, and what splendid produce of roots do we often see. During our experience in these matters we have invariably noticed that some of the heaviest and best returns of roots have been in immediate succession to early potatoes.

"In our remarks on the manure employed we have mentioned guano; we would observe that this article, so valuable to the farmer, was first brought to this island from Ichaboe in 1844, when its worth was much questioned and its use very little known; it is indeed comparatively only of late years that it has been extensively employed: its effects are surprising; we have seen on the same piece of ground two plots, one dressed with good farmyard manure, the other dressed and treated precisely in the same manner, but with the addition of guano at the rate of 300lbs. per vergee, and the two planted in fluke potatoes, when a difference or more than 50 per cent. resulted in favour of the piece where guano had been applied. We have also observed that where the potatoes were allowed to remain long in the ground, the haulm on the plot where the guano had been applied continued longer to vegetate than on the other; and finally, the haulm dried up somewhat in the manner be-

fore described. In 1867 there were imported to this island 879 tons of guano, and in 1868 the quantity amounted to 496 tons. It will be seen by this how much guano is now valued, and as its particular employment is for the culture of the potato, some approximate idea can be made of the quantity used for the crop. At the same time we must guard against drawing definite conclusions hastily on this point, as we know that guano is coming greatly into favour, and is being used by many for grass land in lieu of seaweed; and in a general way, if the farmyard cannot produce a sufficient supply of manure to meet the farmer's wants, he has frequently recourse to guano to make up the deficiency.

"By reference to the returns made here last year for the information of the Board of Trade, we learn that potatoes occupied 5,129½ vergees of our land; and as the whole superficial area of the island is calculated at 64,618 vergees, it follows that nearly one-twelfth part of the island's surface was devoted to the crop. Let us next see what has been the quantity of the produce exported from the island, and endeavour to compute what is the gross amount returned to the growers of potatoes by the export of the last year, 1868.

"From the collective statements kindly placed at our disposal by the custom-house authorities, the agents of the steam-packet companies, and merchants, we find the exports to have been as follows:

"In packages, by steam-vessels to Southampton, Weymouth, and Littlehampton, 5,458½ tons.

"The first package left the island on the 19th of March. This was followed by another on the 24th, by four more on the 26th, by two on the 7th of April, by forty-three on the 21st of April, when the season may be said to have opened. On the 30th of the month the number swelled up to one hundred and forty-three packages.

"In loose cargoes by sailing vessels there were shipped for the following ports:

	Tons.
Plymouth	31
Newport	276½
Southampton	100½
London	469½
Cardiff	505
Lymington	10
Swansea	917½
Liverpool	2½
Caernarvon	6
Gloucester	32
Sereq	1
Barbadoes	80
	<hr/> 2,431½

"Thus giving a total of 7,890 tons, the value of which we deduce from statements of returns to have been as follow:

	£
Produce shipped in packages... ..	44,131
Produce shipped in loose cargoes	11,442
	<hr/>
Total... ..	55,573"

The potato-grower may derive considerable benefit from the careful study of these facts. It is a hard conclusion that, when the amount of produce of our cereal crops has for ages been on the increase, the potato crop must be an exception to the rule. When, however, we remark what abundant crops are produced year after year on certain soils, such as the Warp, we may be well led to the conclusion that the potato plant may, by more careful attention to its cultivation and by the use of a mixture of artificial fertilizers, be restored in its produce and to its former freedom from disease.

LOCAL TAXATION AND THE TENANT FARMER.

There is an effort just now being made in certain quarters to awaken the attention of the tenant-farmer to the fact that Local Taxation is, above everything else, his especial grievance. It is against this abuse that he is instructed to go in; while his support, that is to say his subscription, is very earnestly solicited towards the maintenance of such an agitation. The wider the rateable area can be extended, the more people that can be caught within the meshes of the collector's net, proportionately will the individual burdens be reduced, and precisely so much the better will it be for the occupiers of land. And something in this fashion is the argument put. This, however, as it will at once strike every one who knows anything of the business of rural life, is but a very superficial view of the case, and it may be as well to come at something a little more definite from the best available authority. It would be, then, very unfair to ignore all that Mr. Genge Andrews has already done in this direction. He has, or at least so we had imagined, been of late most indefatigable in his endeavours to see the farmer righted; as it was, we take it, in his office of the champion of the agricultural interest that he attended the other day as a visitor at the dinner of the Yeovil Board of Guardians. But once arrived here, to our no little astonishment, Mr. Genge Andrews gradually shifted his ground. As it now appears, he is in this matter of Local Taxation by no manner of means the particular champion of the agricultural interest. As he himself puts it at Yeovil—"They would recollect that the question as he had set it before them was one between the owners of real property, great and small, down to the very smallest, and the owners of income arising from personal property. That was the question at issue. Even if they could say the tenant-farmer as a tenant-farmer had no interest in it, it would not alter the justice or the injustice of the exemption of personal property from the poor-rate." And, again, he declared with still more emphasis, towards the conclusion of the proceedings, how "he wished to repeat that he advanced this question, not as one between tenants only, or between tenants particularly, but as between the owners of real property and the owners of income arising from personal property. That was the ground he had taken; and he had only taken the tenant collaterally." Very good, as this is all intelligible enough. But then if, as Mr. Andrews would seem so ready to admit, the tenant-farmer as a tenant-farmer has no particular interest in this matter, why should he be called upon to make himself so busy about it? Let us say that real and personal property should each pay its due share of the rates and taxes; and let us say further that the more who pay the less will be each man's individual share. And then, what will the tenant-farmer benefit from this?

According to the tone of the meeting the Yeovil guardians did not seem to think much could come of it. Mr. Shore "was at a loss to see, and would pointedly ask Mr. Andrews *where the tenant farmers were going to get the advantage?*" To this Mr. Andrews replied at some length, as will be gathered from the full report we give; and having done so, Mr. Marden, addressing Mr. Andrews, said, "I think you have avoided Mr. Shore's question altogether, as to what you thought the tenant-farmers would gain by this;" as Mr. Raymond confessed that "he did not think the question had been answered; he did not think they had been assured how the tenant-farmer was to be benefited by

this change of the incidence of taxation." In fact, Mr. Andrews could not answer, for he had no explanation ready; and so, as we have already intimated, he was gradually driven to allow that it was not a question in which the tenant-farmers had any particular interest.

In plain truth, attempt to disguise it as we may, rates and taxes with the farmer are all very much a matter of rent. There is nothing so susceptible, nothing so buoyant as rent. Only once free it from its burdens, and up it goes in a moment, like a balloon. When on the strength of the position he has taken Mr. Andrews was recently called before the Commons Committee he said, speaking as a landowner, that if £200 a-year in the rates were reduced "I should get £200 a-year more; that is *very clear*." A TENANT FARMER quoted this answer in our own columns last week, and of course it was brought up again at the Yeovil dinner. The first question a land-agent asks on going over a property is not so much "What is the rent?" as "What are the rates?" The one, in a word, goes far to determine the other. Nevertheless, it is only right to say that Mr. Andrews made something of a point when he spoke to the gradual increase of rates, and the effect of this on tenants who had long been in possession: "Let them take the case of a man who entered upon his occupation in 1842, when the new Poor-law came first into operation, and that he had continued in his occupation under a good landlord ever since. Now the first thing that the new Poor-law regulations ordered to be done was to make an assessment upon the rack-rent to build workhouses in every union; and since then they knew that a large number of charges had been added to the poor-rate assessment by Parliament, such as police and other rates; many charges which he need not here enumerate had been thrown upon the poor-rate. Now he should like to know whether a tenant in that position, when he was not often interfered with by his landlord as to advance of rent or otherwise, whether he had not for thirty years paid the whole of the increase of the rates without receiving any corresponding reduction in his rent. Here, no doubt, is a hardship, but it is one which requires very delicate handling, and that it would be rather dangerous to make much noise about. There is a kind of recognized understanding that a man who has been in undisturbed possession of his farm for twenty or thirty years can by the end of that time, if he have done his duty by the land, afford to submit to some rise in his rent. But should the landlord be inclined to leave the tenant alone, it may be only politic that the tenant should not trouble the landlord. Otherwise, the remedy is direct enough by a representation to the agent, showing that the rates have increased so much and that a proportionate reduction of rent should follow. Still, a tenant who is always going grumbling to his landlord is not a very welcome guest, and the relations between the two are very easily disturbed. Indeed, Mr. Andrews' illustration would look to be best met by the course to which it is said the Government is favourable, and that Captain Dashwood, amongst his brother farmers has advocated so ably: "That the half-rating be made the basis—the occupier, as in Ireland, being responsible for the rate in the first instance—the half being recouped him at the payment of his rent." Here the tenant would get some proper consideration, not on the strength of any beggar's petition, but from a properly recognised claim.

Mr. Grey, the younger, of Dilston, has, indeed, in recommending a similar principle, assumed precisely such a case to be encountered as that which Mr. Andrews has drawn: "We have a precedent for this in the payment of poor rates in Ireland and other local rates in Scotland, where the plan works successfully. In support of the justice of this proposition numberless instances could be brought forward in this county where the rates on farms during the present leases have risen considerably, very much from causes over which the ratepayers had no control—such as county rate, contributions to turnpikes, &c. I think, therefore, that landowners should partly share in the fluctuation of local rates, as they are equally interested in the prosperity and peace of the district, and in the condition of its highways."

As we stated previously, Captain Dashwood has given evidence, of course agreeing in its tone with his published paper, before the committee now sitting; while, if we are to trust a summary which we have just seen in a Norfolk paper, Mr. Sewell Read has testified as directly against the adoption of such a plan: "Halving the rates would be no *pecuniary benefit* whatever to the tenant; landlords would recoup themselves, and in order to be safe, might in future agreements add *rather more* than half the existing rates to the new rents. Yeomen, owners living in their own houses, and the clergy, would remain in exactly the same position." Of

course it is something like a truism to say that people who live in their own houses would have no rates to divide with their landlords; but surely there would be some pecuniary benefit to the tenant in obtaining half any extra charge *until* a future agreement be made, when the same principle would still continue. The chief or indeed only particular evil which, as Mr. Andrews shows it, the tenant-farmer suffers, is the increase of rates that arises incidentally as it were during a term, and by half-rating the burden would be divided between the two, instead of as at present, fixing itself upon the one class. Could all rates, like rents, be permanently settled at the outset, there would be no grievance, because men would make their bargains with their eyes open; whereas it is this sliding-scale that, on the part of the tenant, we have specially to prepare against. Let it, however, only slide the other way—let only rates come down, and rents will most assuredly go up. As Mr. Andrews said in London, if there be only £90 instead of £180 to pay for taxes, he will get £90 a year more as a landlord. But then if this, as he says, is *very clear*, it is by no means so clear what it is that the tenant-farmers are to agitate for, or to what end their subscriptions are to be applied. The thing has been for some time past in a fog, which the Somersetshire farmers, at any rate, do not come to quite see through, even after the elaborate explanation at Yeovil.

LOCAL TAXATION.

At the dinner of the Yeovil Board of Guardians, Mr. JOHN TRASK, the Chairman, said: No doubt those who lived ten years hence would see vast alterations in the administration of the poor-law. He need not enter into that. But Mr. Andrews had endeavoured to lay himself out, at a very great cost on his part, and very great labour indeed, to ameliorate the injustice of the expenses which were now borne by the agriculturist and the small householder. He (Mr. Trask) held that the small householder in towns was as hardly borne upon as any man. A man who now rented a house, say from £10 to £25 yearly rent, was assessed upon that house, though he might not have £50 in the world besides; whilst his neighbour, with £80,000 in the bank, paid nothing for all that money, and was only assessed on his real property or occupation similarly to the poor man. He said that system bore hard upon that class, and he would give them an instance in the case of a very poor man, which came under his notice in the parish of Montacute—a man about eight or ten years older than himself. Years ago this man was an independent, hard-working fellow, who would have nothing from nobody, but would work for his own bread and earn it. He married a careful wife, and he put himself into a friendly society and his wife into another. Presently he saw that 2s. a-week for house rent made a great hole in his weekly wages, and, being of a most independent spirit, he resolved that he would get himself a house. Well, he laboured on and he bought himself a cottage. Now for many years the cottages at Montacute were not rated—until the Small Tenements' Act came into operation. Then this man's house was assessed; they could not make the rate without. He came to him (Mr. Trask) in great trouble. "It is the law, Hugh," he told him. "Well, sir, but I have to pay more for my house than you do yours." "Yes," he said, "you occupy your own. If I pay for those who rent my house there is a deduction for me, but there is none for you because you occupy your own." The poor man stamped and swore, and he didn't know if he didn't pull out some of his hair. He declared that he would sell the house. That went on some time, and by and by he actually did sell his house and spend his money, and he was now a pauper! He asked them what made that man a pauper? Why, the injustice of the poor rate.

Mr. H. GEORGE ANDREWS said: They were endeavouring in every county to combine, not particularly the board itself,

but the members of every board of guardians in England and Wales, as ratepayers in one combination for endeavouring to get the poor-rate assessment based on its original principle. That every Englishman should contribute his fair proportion according to his ability to pay; that was the pure and simple object of the combination of which the speaker had the honour to be a member. Now they knew very well that originally the poor-rate assessment was nothing more nor less than voluntary charity. The whole of the charge upon the rates—or the money, he would say, that was raised for the relief of the poor—previous to the Act of Elizabeth, depended upon the voluntary contributions that could be raised for the relief of the poor. That was found to be utterly inadequate, and Parliament then passed an Act making the relief of the poor a compulsory charge upon every inhabitant of England and Wales, "according to his ability." They (the associations) therefore only sought to restore the poor-rate assessment to its original principle of everyone paying his fair charge of a public duty which was originally a voluntary one. And he thought their object was one in which every man who had anything to pay to a tax ought fairly to endeavour to combine with them. He was sure that no real honest man—he didn't care what his position might be, whether he were a money-holder or a landowner—would shirk that duty, if he could see that it was a right and general principle to charge all persons according to their ability.

Mr. MARDEN said one thing he was going to ask Mr. Andrews to explain, that he had read. How was it that Mr. Andrews proposed to transfer all the responsibility to the owner and shelve the poor tenant? The tenants were not to have a voice in those affairs; the boards of guardians would consist only of gentlemen; and they would never have a tenant farmer or a manufacturer? He could not reconcile that with what had fallen from Mr. Andrews now, because, you see, you would have many owners who would reside away—in London, perhaps, or in Scotland; and would they know a pauper in the parish? He believed the printers must have made an error; Mr. Andrews never said it, or if he said it he never meant it (A laugh).

Mr. ANDREWS said with regard to the point which occurred in his examination before the House of Commons' committee, as to owners administering the poor-rate, Mr. Marden had quite misunderstood his meaning. He must

recollect that when you were before a Parliamentary committee you had to answer shortly and briefly the questions which were asked of you; you were not allowed to go into long explanations. Now he said, he believed, that if the present system, the present incidence of the rating, was to continue, that owners, who were really the payers of the rate, ought to be compelled to collect the money and to administer the rate; but he did not mean for a moment what Mr. Marden thought he meant—viz., that the owners alone should administer the rate ("No, no"), or that owners should be even much more prominent at boards of guardians than they were at present. What he meant was, that at the present moment owners were represented at the boards of guardians in the first place by the *ex-officio* members of the board, *i.e.*, the magistrates in the division; in the next place, as owners they had a cumulative vote up to six votes, which might be exercised by proxy, in the election of elected guardians. In the event of the rate remaining as at present—and they had paid the whole rate themselves—he would give them a further power in the election of guardians. Where they were non-resident, and where there were only one or two occupiers in the parish, they should have the power of nominating as their representative at the board their tenant or representative in the parish. And that every money-owner—for he was speaking of money-owners as well as land-owners—should have the opportunity of having his full share in the election of guardians. But in the scheme which they (the associations) proposed the tenant would pay his fair share of a far lower rate than now existed; and he would be entitled to have the same share in the administration as he had now. So Mr. Marden would see it was not as words were spoken, but they were taken differently from what was intended. Everyone would find that in all matters considerable explanation was required where you had always to make a direct and short answer; otherwise, it would be misunderstood by many people. He was quite sure himself that no alteration could ever be made in the administration of the Poor-law which would exclude a representative from every parish, however small it might be. It was utterly impossible, too, the Poor-law could be administered except by a resident guardian. But he didn't care how large an influence you had from any other class at that board; for he was quite sure that, whether the law were administered as now from the union fund, or by a common fund for England and Wales, he had confidence enough in his brother farmers and representatives of parishes to believe that it would not have an atom of influence on them as to their mode of dealing with the poor or with the ratepayers. He was not one of those who believed that they were of such a degraded character that they would throw away public money because it came out of a larger area than a union. Why, he should like to ask, what private interest could any guardian have, when it was a common fund for the union, whether a pauper received 2s. 6d. or 2s. 9d. per week? The individual interest now we had a common fund for the union was so very small that he could see no difference in the principle on which the law would be administered, whether it were a common fund for England and Wales including all property, or whether it were as now with a local union-rate.

Mr. HENRY PARSONS said that there would be very great alterations before many years as to rating generally; but how and in what way that was to be done he was rather at a loss to know. He should not quite like to see the rates dispensed by Government, which would be the case ultimately if all property were taxed. No doubt there would be paid men sent down here, and we should not have the least supervision over it—he didn't think, he couldn't see, that we should. Looking back at what he had seen before, he thought we should not have the least local supervision. And, of course, strangers would not be as well fit for it as we who were living in the parishes (Hear, hear). There was no class of men that could be so well acquainted with the different cases transpiring in the parishes as the present guardians. Depend upon it, if the Government dispensed the poor-rates, we should have very little supervision. As he had said before, he felt quite satisfied that before many years—they knew that things were moving in all sorts of quarters, friend Andrews and lots of other people—we should see a great alteration.

Mr. SHORE said: This was the first opportunity he had ever had of meeting Mr. Andrews in public; and he should like to ask him one question. Mr. Andrews had oftentimes very

prominently brought forward this local taxation question before the boards of guardians and tenant farmers; but the speaker was at a loss to see—though he quite agreed with the principle enunciated—he should be glad if Mr. Andrews would elucidate this: Where the tenant farmers were going to get the advantage of it. If he would explain that satisfactorily he would fight for him through thick and thin (Hear, hear, and a laugh).

Mr. ANDREWS observed that they were all aware that it was very much easier to ask questions than to answer them. One of the great objections arising out of the including of personal property in the poor-rate was that to which Mr. Parsons had alluded connected with local administration—local control. Now he should just like to analyse, as it were, what control they had at present in the amount that they should expend for the relief of the poor, as authorised and in fact enforced by the law. In a union it was a matter of course, as he took it, that their expenditure must be limited by the demands which were made upon the board by the claimants for relief. Now they knew very well that the Poor-law Board had at the present moment the most entire and complete control of the administration of the poor relief, and that they (the guardians) were at present only the agents and the tools of the Poor-law Board (Hear, hear, "Just so"). They dared not alter the diet of their unions, they dared not alter any one thing; but the Poor-law Board could immediately come down upon them and direct them what they should do. Now he wished to know how that power was to be extended, when they knew that at present every order of the Poor-law Board must be obeyed by the guardians, even in the smallest as well as in the largest amount of administration. Where the Poor-law Board required it they had to alter their unions; where it was ordered they had to build new ones; they had to do everything they were told. Now the only control the guardians had in the amount spent by the Poor-law unions was that very small difference which they might make in out-door relief, and they all knew that every board of guardians had a sort of standard of the maximum and minimum of the amount of relief to be given to an out-door pauper. Having had their legal control reduced to that very small portion, did they suppose that any board of guardians in England or Wales was going to submit to pay three times the amount of relief they ought to pay for the sake of the control and option of giving a pauper 2s. 6d. or 2s. 9d.? If they supposed that, he should suppose that boards of guardians in England and Wales had lost their senses. Now with regard to the question just asked him, as to the benefit which the occupier would receive from the extension of the area of the poor-rate from real property to personal property, he should make this explanation: Let them take the case of a tenant who entered upon his occupation in 1842, when the new Poor-law came first into operation, and that he had continued in his occupation under a good landlord ever since. Now the first thing that the new Poor-law regulations ordered to be done was to make an assessment upon the rack-rent, to build workhouses in every union; and since then they knew that a large number of charges had been added to the poor-rate assessment by Parliament, such as police and other rates; many charges which he need not here enumerate had been thrown upon the poor-rate. Now he should like to know whether a tenant in that position, when he was not otherwise interfered with by his landlord as to advance of rent or otherwise, whether he had not for 30 years paid the whole of the increase of the rates without receiving any corresponding reduction in his rent (Hear, hear)? All of them could determine that fact for themselves.

A GUARDIAN: I have for one.

Mr. MARDEN: They have not increased ("Yes, yes").

Mr. ANDREWS: They have increased since 1842 from £8,000,000 or £7,000,000 to £11,000,000 or £12,000,000! He hoped they would put those facts in their pipes and smoke them. Questions were often asked, and often they were answered fallaciously on purpose to lead them off the scent. He believed that whatever increase might take place in the future, as well as in the past, it would ultimately fall upon the occupier, both town and country. And he believed it was to the interest of the occupier of land in the country and of houses in the town that every income in this country of any considerable amount should pay its fair share to the relief of the poor, and all the other charges which were paid out of

the poor-rate. That was his opinion, and he believed, as far as he could gather, that it would be the opinion of every board of guardians in England, if they were fairly called together, and had the question fairly placed before them. That was his answer to his friend on the right, as to how the tenant was interested. But that was not all the extent to which they were interested. Let them suppose that a tenant went and took a farm for 21 years, and it was in a very inferior state of cultivation: he was an owner of money, and he made up his mind to invest £3,000 or £4,000 for the purpose of putting the farm in a first-rate state of cultivation, with the view, of course, of reimbursing himself his capital at the end of the 21 years. Now a number of those now present were members of the assessment committees. Suppose that after two years that money had been expended on the farm, and some neighbour then said: "Your land, which was only worth 25s. an acre when you entered upon it, is now worth 40s., and I don't see why you should not be assessed accordingly." If he was brought before the assessment-committee, what was the result? They were bound by the law to assess him according to the then value of the land which he occupied. ("Just so.") Was not the tenant-farmer interested in that question? It was for them to judge; he did not wish to persuade them if they could not see it. It seemed to him that the tenant-farmer was in such a case very deeply interested, because he was assessed on his outlay of his personal property at the same rate as he was assessed on the land which was originally worth 25s. an acre. That was another instance. But he went beyond that. He had never placed this question in any other position than this: that it was a question between the owner of real property—i. e., land and houses, land and anything upon it—and the owners of money. That was the ground on which he had always placed the question, and he had only placed the tenant as interested in it deeply but collaterally, on one side, as it were, of the principal question. He could not understand why the owner of houses in this town, for instance, should be assessed at 2s. 6d. in the £ for poor-rates, and 1s. or 1s. 6d. for town-rates—(Mr. RAYMOND: 2s. 8d.)—while the owner of money escaped altogether. He couldn't see any equity in that, £100 received as rents was certainly no better than £100 received from bank-shares or interest on mortgages or any other capital whatever invested. Go into the market, and £100 from one source would not buy more potatoes than £100 from any other source. If there was one principle dearer to Englishmen than another it was that they should be equally taxed and equally bear all contributions to the State, and all matters of public duty. Now if there was one public duty particularly and specially incumbent upon every man it was the relief of the poor and the administration of our criminal jurisprudence, and they must recollect it was not only the poor but the maintenance of lunatic asylums, county gaols, administration of justice, registration, vaccination, police, and so on. He would include even highways, which must come upon us by and by. He said that every man who had an interest in money or in the public welfare of this country was as much called upon to contribute to all these objects as was the owner of a house or a field. The poor-rate had its origin in Christian charity. Did money-owners mean to say that they were not Christians, and were not called upon to contribute towards the relief of the poor as well as the owners of real property? He didn't believe that even a money-owner, when he saw the equity of that, would resist a question which they (the associations) were determined to preserve in agitating until they had received that redress to which they were entitled.

Mr. MARDEN: I think you have avoided Mr. Shore's question altogether, as to what you thought the tenant-farmers would gain by this. You told the committee that if you paid £180 on the rates of your farm, you should take care and charge the tenant for it.

Mr. ANDREWS: I thought I had answered Mr. Shore in showing how the tenant is interested. My answer has reference entirely to a continuance of the rate in its present state. The committee was not dealing with the question which I advocate of an extension of the area of the rate to all England; they were not dealing with that question at all.

Mr. MARDEN: Then they were speaking to you personally, of your own—

Mr. ANDREWS: Exactly. Well, personally, do you expect

that, if the rate were divided between owner and occupier, that the owner would pay that which he has paid before?

Mr. RAYMOND: No, I should think not.

Mr. ANDREWS: Therefore I say it is an absurd proposition to attempt to divide the rate between the owner and occupier, when I should immediately charge the occupier with that which he did not pay, and which I was obliged to pay before. But the question I advocate works totally different. It would work in this way: Reduce the rate to 6d. in the £ instead of 2s. 6d., and the tenant would be only too glad to pay 3d. and the landlord 6d. The tenant would say to the landlord, "I am charged for the capital invested in this concern; you are charged for the capital invested in the estate. Both are equally taxed. If you think my farm is too cheap, raise the rent; for I do not object to a rise in the rent while I am assessed at 3d. in the £ and you at 6d." That is quite a different question to that asked of me in the committee. You can see for yourselves that, if the rate were reduced to an average of 6d. in the £ throughout the union, all capital would be assessed; the tenant would pay 3d. in the £ on his income, and the landlord 6d., and both would be equally assessed. The rising or falling of rents does not depend entirely upon the rates (Oh! oh!) Yes, if that question arises between owner and occupier whether the landlord could raise the rent would depend upon the state of prices and the state of agriculture at the time. If things were dull the tenant would say, "I cannot pay higher rent." On the other hand, if things were going upwards, the landlord may raise his rent whatever may be the state of the rate. These things depend on competition as well.

Mr. W. RAYMOND must confess that he should like to have heard that question of Mr. Shore's answered more distinctly. He didn't think that question had been answered; he didn't think they had been assured how the tenant-farmer was to be benefited by this change of the incidence of taxation.

Mr. ANDREWS was sorry that Mr. Parsons or the gentlemen present should misunderstand that point with which he started. They would recollect that the question as he had set it before them was one between the owners of real property, great and small, down to the very smallest, and the owners of income arising from personal property. That was the question at issue. Even if they could say the tenant-farmer as a tenant-farmer had no interest in it, it would not alter the justice or the injustice of the exemption of personal property from the poor-rate. But, if their scheme were agreed to that all income should be assessed to the relief of the poor, then the landlord would pay the whole tax on his part, and put it on the tenant if there were an increase of the rate. He would have to get the increase if he could back from the tenant. At the present time, and in the time past, the tenant had got to get it back from the landlord—but had he ever done that? (No, no.) No, nor it never would be! That was the real answer to the question.

Mr. PARSONS said the question in his little experience if he had a house to let, say £20 rent, and if there were two or three applications, nearly always the first question was, "What are the rates?" (Hear, hear.) Then he said if the rent was £100 and the rates were £20, of course the applicant would take that into account; but he did not see that it affected him (the tenant) in any other way. He knew a landlord who did not wish any of his tenants to pay church-rates if they had any conscientious objection; but they who did not pay church-rates, he would pay it for them, and charge it on the rent! (Hear, hear, and laughter.)

Mr. ANDREWS replied to Mr. Parsons' objection, that a house would let for more if it were free from poor-rates. Exactly so. He would take the case of a man in this town who laid out his money in building a house. He expected to receive a certain interest for his outlay—the capital invested in the building. Now before he could receive his interest, the tax levied upon the house for poor and town rates must be paid. If the poor and town rates were a matter of 6d. in the pound, instead of 2s. 6d., the renter could either have a better house for his money, or the builder could have a larger profit on his investment; but as it is, investment in building will be kept down. Mr. Parsons had referred to what he had said about the increase of rates after they had taken their farm, and the new charges laid on it—burdens which they would have to pay in the future as they had had to pay in the past; but, leaving out all that, independent of those two

points, which were very important ones, he said that a tax of eleven or twelve per cent. upon a business in which any man embarked capital—for he took it that the owner embarking his capital in the land, and the occupier embarking his capital in its cultivation, were in effect one person engaged in one business—was a heavy tax, which could not fail to be a great discouragement if it were put on any other business (Hear, hear). One of the greatest aims of the present age had been to relieve raw material and certain classes of productions from taxes. Now he wished to know whether they (the agriculturists) had not been deprived of all advantages, and whether all the charges upon them had not at the same time been continued and increased, and whether it was possible that it could be any other than a relief to have those taxes reduced by a proper extension of the area on which they bore? (Hear, hear, and applause).

Mr. MARDEN thought Mr. Andrews had not answered exactly what they wanted. Supposing his scheme were carried out, and the tax reduced to 6d. in the £, didn't he think that would be added to the tenants in the shape of rent? As to the increase of poor and highway rates, Mr. Marden testified to that by the figures in his own case; and then proceeded to inform the meeting how his mill and premises became included within the borough, so that he had also to pay £17 extra yearly on that account. When the meeting was held at the Town Hall he was not present, but Mr. Harbin, his landlord—and there could not be a better landlord (hear, hear)—was there, and suffered Mr. Batten to draw the boundary-line of the borough so as to include his occupation. The first intimation he received of it was the visit of the borough rate collector.

When he next met the squire he told him he hadn't expected that; and the squire very good-naturedly replied, "Well, I think our agreement was that you were to pay all parochial impositions" (Laughter). And so he had paid it from that time to this. Now he did not think that his squire, if he were lowered 2s. in rates, would put it on him in the rent (hear, hear); but he believed that landlords in general would do so at once (Hear, hear, and no, no).

Mr. ANDREWS considered that Mr. Marden had advanced one of the strongest cases possible in confirmation of what he had said, that all the rates, past, present, and to come fell and would fall unquestionably upon the occupier (Hear, hear). But he wished to repeat that he advanced this question, not as one between tenants only, or between tenants particularly, but as between the owners of real property and the owners of income arising from personal property. That was the ground he had taken; and he had only taken the tenant collaterally, and Mr. Marden's instance confirmed what he had said as to the increase of rates falling upon the tenant. But if their (the association's) plan were carried out, it would fall in the first place upon the owner. The great influence of money was in the House of Commons; and, once put it upon the owner, they would take care that no new burdens on the poor-rate and no increase of the poor-rate were made if they could help it. Therefore, although not primarily interested, the tenants were very deeply collaterally interested as well as the owners.

Mr. ANDREWS could only assure them that the examination he had undergone here had been almost equal to the examination he underwent in the House of Commons (Hear, hear, and laughter).

THE EXHAUSTION OF THE SOIL IN RELATION TO LANDLORDS' COVENANTS.

Two most important questions have been recently considered by the Central Farmers' Club, "The Exhaustion of the Soil in relation to Landlords' Covenants," and "Tenant-Right" as applicable to payments for unexhausted improvements. The first of these subjects was introduced by the distinguished experimenter, Mr. J. B. Lawes, of Rothamsted, and the subject of "Tenant-Right" was introduced by Mr. Corbet, Secretary of the Club, who is well known for his able advocacy of those agricultural questions with which the interests of tenant-farmers are intimately associated. The reading of Mr. Lawes' instructive paper on the exhaustion of the soil took place at the meeting proceeding that at which Mr. Corbet's paper was read; and the latter may be regarded as a sequel of the former. In considering Mr. Lawes' paper, we may remark that the experiments which have been conducted for a long series of years at Rothamsted are now generally regarded, from a scientific and practical point of view, as the most instructive of any which have hitherto been undertaken by scientific observers in Europe. We have more than once taken exceptions to some of Mr. Lawes' deductions from his experiments, especially his under-estimating of the important part which the mineral constituents of plant life perform in the building up of vegetable growth, more particularly of those plants which are utilised for the support of man and the domesticated animals.

Every one who has bestowed attention to the cultivation of the soil knows that there are extensive tracts in both hemispheres which have never been subjected to cultivation, and the plants which grow on them are not utilised by man; while countries which were at one time most productive in corn are now comparatively waste. Some of the wild animals which are supported by the spontaneous vegetation are preyed upon by a thinly-scattered population. The unreclaimed tracts of the world, particularly those of North America—which are, however, every day being rendered more accessible by railways—and of the lands in Europe, Asia, and Africa, accessible by the Mediterranean, are being gradually brought under the plough, and both wild animals and their hunters are giving way before the advancing pioneers of these unreclaimed lands.

As the ports of Great Britain are generally regarded as the ultimate destination of the surplus grain produce of both

hemispheres, the British farmer has yearly to compete with an increasing number of foreign producers of corn, which corn is imported to meet the consumptive demands of the British Islands. It appears from Mr. Lawes' experiments that the acreable produce of wheat from lands unmanured during the course of twenty-six years—wheat being grown in succession without an intervening green crop—equals that obtained from manured and unmanured lands in France and North America, as ascertained by the French and United States Governments, viz., between 15 and 16 bushels of wheat per acre. There is no statistical information of the lands annually under wheat in Great Britain. It has been estimated by some writers that 28 bushels, and by others, that 31 or 32 bushels are the average acreable produce of wheat in this country. The acreable produce being so much dependent on the condition of the land and the growing of prolific varieties, there is no reason why it should not be raised beyond the highest estimated average. What applies to wheat applies still more strongly to the other grain crops—barley, oats, and beans. It is chiefly by these means that an increased amount of produce from British soils is to be derived. The British farmer, in order to compete successfully, has to bestow increased attention on improving and maintaining the condition of the lands he occupies; and to do this he requires greater security than he has at present for the outlay of capital, with greater freedom of action than is generally accorded to him by the conditions in landlords' covenants.

Mr. Lawes proves that such changes would not involve any injury to the landowners, as the productive powers of land are not so dependent upon a rotation of crops as is generally believed.

Mr. Lawes graphically describes the changes which have taken place in the condition and practice of agriculture since the commencement of the present century. Previous to the use of bones as a manure and the introduction of guano, nitrate of soda, and auxiliary manures generally, the fertility of the soil was mainly dependent upon farmyard manure, which, being necessarily limited in amount, could not be applied in extra quantities to lands without the comparative impoverishment of adjoining lands.

The questions submitted by Mr. Lawes were: "1st, Whether, in order to preserve the soil from exhaustion, it is neces-

sary to enforce a fixed rotation of crops? 2nd, What are the best, or most generally applicable means at our disposal for the estimation of the value of unexhausted manures? As an illustration of the condition of land, he gave the result of a number of experiments conducted over a long period at Rothamsted. These experiments, to which we have already referred, conclusively prove that the condition of land can be maintained either by farmyard manure or by artificial manures, as was evidenced by the produce of grain crops and permanent meadow grasses. They further prove that the effects of farmyard manure are apparent for longer periods than those of the artificial manures he experimented with. These were mixed mineral manures and ammoniacal salts used together and separately. Mr. Lawes infers that the expenditure of capital in the purchase of cattle food, or direct manures, should be reckoned the property of the tenant; consequently on the termination of his holding, the tenant should be paid the value of the unexhausted manurial substances employed by him to raise the fertility of the land, whether these substances have been manures used on the lands or cattle food consumed by stock, the manures so produced having been applied to the lands. This system of payment for unexhausted manures is acted upon in some parts of England, chiefly in the county of Lincoln, and has been productive of great benefit to the occupying tenants, landowners, and the country generally. Without pursuing Mr. Lawes' paper further, or entering upon the points brought out in the discussion which followed the reading of it, we commend both to the consideration of all persons interested in the progress of agriculture and improved farm management, and still more to landowners and agents acting for them. Mr. Lawes' paper, with the discussion, appeared in last week's issue of the *North British Agriculturist*.

Mr. Corbet's paper on "Tenant-Right," with the discussion to which it gave rise, will be found in another part of to-day's impression. The subject of Tenant-Right has been for many years before the public. The late Philip Pusey, one of the most thoroughly practical agriculturists which ever sat in the House of Commons, zealously advocated the legalizing of a system of Tenant-Right, especially as regards the payment, at the termination of the tenant's occupancy, of the value of buildings erected at his own cost during the period he occupied the lands. Mr. Pusey three times successfully carried through the House of Commons his Bill, which provided for payment to the tenant of the value of buildings erected by him, the consent of the landlord to erect the buildings having

been first obtained. The House of Lords having on the three several occasions thrown out Mr. Pusey's Bill, he desisted from introducing it a fourth time into the House of Commons. Since then the law of landlord and tenant, as regards the erection of buildings, has been somewhat altered in England, and rendered more favourable to the tenant who erects buildings with the consent of the owner of entailed lands.

Since the introduction of the Irish Land Bill into the House of Commons, and the debates to which it has given rise, public opinion has made rapid advances towards the recognition by law of the claims of the occupying tenant of lands for payment of improvements effected by him during the period of his occupancy, whether these lands are situated in Ireland or Great Britain. The discussion which followed upon the reading of Mr. Corbet's paper may be taken as evidence that in England the occupiers of land may soon agitate for an English Land Law Bill. In Scotland the attention of farmers is at present occupied with the Game-laws, and they are disposed to wait until they see the ultimate fate of the Irish Land Bill, which Bill, or a similar one, will doubtless become law during the present or next session of Parliament. It should be obvious to landowners in Scotland, that while they have reaped the greater part of the benefits arising from the intelligence and enterprise of the tenant-occupiers, they have not generally bestowed much attention upon the claims of the improving tenants upon the termination of their leases, for repayment for any part of the improvements they have effected, whether in the erection of buildings, the reclamation of waste lands, or amelioration of the condition of lands which were reclaimed previous to their entry into their farms.

Hitherto a lease for the period of nineteen years has been held as a sufficient security in an agreement for the tenant indemnifying himself for the improvements he has effected, and that whatever these may be he shall give up the houses and lands to the landlord at the termination of the lease without any claim whatever for compensation. With the more general use of auxiliary manures and feeding stuff, however, the question is being forced upon farmers, should there be no payment for the manurial value of unexhausted manures; apart from the question, Should the landowner not reimburse the outgoing tenant for the value of any buildings erected by the tenant, and which are calculated to enhance the rent of the lands when in the market to be let to another tenant?—*The North British Agriculturist*.

THE AGRICULTURAL AND COMMERCIAL VALUE OF ARTIFICIAL MANURES.

Professor Voelcker has delivered a lecture at Derby to the members of the Derbyshire Agricultural Society on this subject, special reference being made to those manures most suitable for grass lands.

Dr. HITCHMAN presided, and, in introducing the lecturer, said: Like almost all men possessing great knowledge, Dr. Voelcker is most cautious in induction and modest in statement, and is ever ready to receive with courtesy and thankfulness any facts which may be communicated to him by practical and observant men. Facts from such a source are always most acceptable, provided they are facts, for it is a sad fact that there are many things alleged to be facts, and given in all good faith by the communicant as facts, which are nothing less than illusions, mistakes, part-truths, or entire blunders, and which, taking the place of facts, act as barriers to progress, prevent or retard discoveries, act, indeed, like sand-shoals in the ocean of truth, until their true nature has been revealed, and the alleged fact is found to be a phantom, what Lord Bacon would have named an idol, called into existence by false perception or erroneous induction. To observe accurately is a valuable quality, and one by the acquisition of which the most humble of us may contribute something to that great storehouse of knowledge, from which things new and old are being daily called forth by scientific minds for the benefit and instruction of mankind. I have watched with interest and admiration the career of Dr. Voelcker for more

than twenty years; and I confess that his industry, honesty, caution, practical sagacity, and inductive skill have excited my reverence and esteem. He has never been fond of indulging in "sensational" theories, has not emulated the brilliancy, the scientific romance, of some other great chemists, has never longed to "o'erstep the modesty of nature;" but with child-like docility he has sat at her feet, and with inexhaustible patience awaited her teachings, and then placed them in calm, clear language before his own auditors and readers; and if he has not dazzled us with the splendour of his genius, neither has he led us into quagmires by its delusive coruscations. I am, unfortunately, old enough to remember the hopes which were excited in the minds of ardent agriculturists by the earlier writings of Liebig and his imitators. Enthusiasts began to think that agricultural chemistry was an Aladdin's lamp, to conjure up corn crops from a deal board; and even soberer men expected that any number of crops might be successively raised from any plot of ground by substituting a few pounds of potash for the crops removed. Persons talked in such a manner of manuring a large field with a mere hatful of salts as to call forth the satirical remark that, when that took place, they might bring back the produce in the waistcoat pocket. Those days have passed; and practical chemists like Dr. Voelcker know that there is a wide difference between chemical compounds subjected to the influence of soils, of wind, of light, of moisture, cold, and warmth, in variable and

varying quantities, in the external air, and to the added influence of the special vital qualities of the growing plant, and the same compound obediently complying with the wishes of the chemist in the scales and retorts of his laboratory. Dr. Voelcker has conferred great benefits on the cultivators of arable soil, by his valuable analyses, by his description of fertilising earths, by his exposure of the frauds of dishonest manufacturers of cattle food and manures, and by the information he has imparted on the manures best adapted for special soils and seeds; and he has now, under the kind auspices of that wise and estimable friend of the farmer (and indeed of all classes) the right hon. Lord Vernon—now come among us, to tell us something of artificial manures and the agencies best adapted for the fertilization and sustentation of our grass lands.

Dr. VOELCKER in commencing his address said: He must be allowed, before commencing the actual subject of his lecture, to make a slight digression to congratulate all the members of that influential society who had taken so deep an interest in the establishment of the Cheese Factory in the town, that the undertaking had been placed in a position which gave every assurance of success. He was extremely gratified that the men of Derbyshire, who were not always proverbial for being in the front rank of agricultural improvement, had taken the wind out of the sails of other counties, and were certainly the leaders in what he could not but call a great national improvement, which must very materially influence the social, and, from the high price he hoped they would secure, the economic position of the farmers of the country. He had been delighted that day to find in Derby, in actual and successful operation, what he recommended so long ago as ten years—the Cheddar system of making cheese. It was about ten years since he investigated the subject of cheesemaking, and the result was that he came to the conclusion that the only method which admitted of being carried out successfully, on an extensive scale, was the Cheddar. The adoption of the factory system would relieve farmers' wives from much of the drudgery, not to call it the slavery under which the wives of dairy farmers at present suffered. It was a plan which, when strictly carried out in all its details, not by guess work, but according to definite rules, must give as definite results as to the observance of those rules would naturally imply. He had scattered those notions abroad ten years ago, and strange to say they were first taken up in America, and long before his papers were, he believed, much read in this country, the suggestions they contained were practically applied in America, and were sent back to us in the shape of a system which contained in it all the elements of success. There could not be a shadow of doubt that if they proved successful in their endeavours to carry out the American system, that they would see small factories springing up through the length and breadth of the land in all the dairy districts of England, and he most heartily wished them success in a project in which he had always felt the deepest interest. Coming now to the subject of Artificial Manures, he need hardly say that it was a subject of annually increasing importance, for where five or ten years ago men spent their tens of pounds in the purchase of artificial manures they now spend their hundreds, and those who spent their hundreds now spend their thousands. To see how important the question was becoming they need only look at the many manufactories of artificial manures which were springing up everywhere, and at the keen competition which existed between rival dealers; indeed, the dealer in artificial manure had become one of the greatest bores in the market. They could not go into a market without being pestered by some agent for an artificial manure manufacturer, who praised his wares often to the detriment of those of his rivals. There were now makers who produced from thirty to forty thousand tons per annum; others twenty and ten thousand, and some a thousand or five hundred. Very large sums were invested in the manufacture, and it was unnecessary to say that large sums were paid annually for these manures by agriculturists who must, in the present day, if they would successfully cultivate their land, spend a good deal of money for the purchase of these manures; for the present state of agriculture necessitated the application to the soil of more fertilizing agents than could be conveniently obtained from farm-yard manure. Seeing that so large an amount was spent on these manures, it was of the greatest importance to the farmer that he should lay out his money to the greatest

advantage, and how could he do this unless he possessed some knowledge of the fertilizing constituents which enter into the composition of the manures offered for sale? The time was long past when the fertilizing powers of certain materials were ascribed to a certain unknown force, and they now knew pretty well on what substances the value—both economical or money value, and the fertilizing or practical value—of the manures depended. It was not by any process of cooking or of turning over that they could obtain good manures; they could only secure them by incorporating the right materials. There was a time when a mistaken notion prevailed that farm-yard manure should be turned three times, and that it got better every time. Now there was, as was generally the case, a little truth mixed up with the error involved in that idea. To turn manure helped to make it rotten, and rotten manure was better than fresh, bulk for bulk; but by its standing exposed it was apt to lose a great deal of its fertilizing properties, and the more economical plan was to cart the dung to the field as soon as possible, and then they avoided the risk of losing a portion of its valuable properties by evaporation or by drainage. They knew well that the value of animal manure depended very much upon what they put into the animal's belly, and that it would be very different if they used plenty of oil cake, or other rich food, than if they gave their stock an insufficient amount of poor food. So with artificial manures. Their value depended on the materials put into them. They might concoct a manure of the sewage matter of London, or Birmingham, or Derby, by sifting out its solid parts, but its fertilizing value would be very little, and it would largely consist of soil, clay, or sand, with some organic matter of no great value. They must not expect to get much fertilizing matter from town sewage, unless they incorporated with it a good deal of Peruvian guano, or good bone dust, or nitrate of soda. The fertilizing value of manures depended mainly on the nitrogenous matters, phosphates, and salts of potash they contained. Nitrogenous matter was derived from animals, and existed largely in blood, flesh, skin, hair, and other refuse animal matters. Dried flesh contained almost as much nitrogen as Peruvian guano. As a rule ammoniacal salts produced bulk, and phosphates produced quality, and his aim would be to get both. He would now direct their attention to a few of the more commonly used artificial manures. The fertilizing value of guano depended essentially on the amount of nitrogenous matter, which was measured by the amount of ammonia it yielded. The fertilizing value of guano was declining. Formerly it would often contain 19 per cent. of ammonia, but that was a great rarity at present. A few years ago they might fairly have expected 16 per cent., and often 17 or 18 per cent., with very little insoluble silicious matter, which was only a long name for their old friend sand. Dr. Voelcker then directed attention to a diagram showing the composition of four samples of guano, and of which the following is a copy:

	I.	II.	III.	IV.
Phosphates of lime	25.07	19.31	30.98	42.93
Organic matter:—				
Ammoniacal salts	52.98	59.11	33.94	19.79
Insoluble silicious matter 1.50	1.45	14.50	9.36	
Yield of Ammonia	17.21	19.30	11.80	4.35

This showed that whilst two specimens of Peruvian guano contained about one-and-a-half per cent. of sand, another, which was evidently adulterated, contained 14½ per cent., and another nearly nine-and-a-half. The last had once been Peruvian guano, but it had suffered from the action of the weather and the sea water, and its valuable constituents had been washed out. Whilst the first yielded upwards of 17 and the second upwards of 19 per cent. of ammonia, this yielded only 4½ per cent. The ammonia was easily removed by the exposure and washing of the sea, but this specimen contained a good deal of the phosphatic materials, which were not so valuable, and were not so easily affected by the water. It was really guano no longer. Peruvian guano was getting less and less valuable, and if they could this year get it from the Government directors' stores to yield 15 per cent. of ammonia, they would have no reason to grumble, and they would have a good chance of getting only 13 per cent. The manufacturers knew well the difference in the value according to the yield of ammonia. Each per-centage of ammonia in a ton was worth 12s. to 16s., so that the difference between 13 per

cent. and 16 per cent. would be at least 36s. in value. If they paid £14 per ton for guano yielding 16 per cent. of ammonia, which they might fairly expect to do, they ought to pay 36s. less, if the yield was only 13 per cent. all the other circumstances being equal; and he had no hesitation in saying that many a farmer had paid too dearly for Peruvian guano. The importers could always sell the good guano to the manufacturers, and he was not sure whether farmers could not now often buy prepared artificial manures more cheaply than Peruvian guano. At any rate it was manifestly unjust to charge the same for Peruvian guano yielding 13 per cent. of ammonia, as for that which yielded 16 per cent. It was the interest of the farmer to put the screw upon the dealers in this matter. An inferior guano was perhaps the dearest thing the farmer could buy. Genuine guano was light in colour; it had not a pungent but an aromatic smell, and a cheesy flavour when tasted, which was derived from the undigested fish on which the birds fed, and which disappeared when it had been washed by the sea. The inferior guano was discoloured, and was generally of a darkish brown, somewhat like the colour of varnished oak when neither very new nor very old, and invariably lost the peculiar taste to which he had referred. Inferior guano always weighed more in proportion to the bulk than the best. It should not exceed 68 or 70 lbs. per bushel. By applying those tests every farmer could tell whether the article was genuine or not, or whether it was of inferior quality or not. He had had many samples of guano direct from the importers, and from respectable dealers, which contained 12 or 14 per cent. of sand. It had not been mixed with it purposely, but the guano had been scraped too near the rock, and some of the rock had found its way into it. The sand should not exceed two or three, or at most four per cent., as it was dear at £14 a ton. He would strongly urge them, as practical men, to agitate the question of the purchase of guano being so regulated that they might buy it to pay only for what valuable properties they actually received, and not to pay alike for good and bad. Nitrate of soda was often used with great advantage, especially for cereals, and it was useful as a spring dressing for wheat, but like many other manures of high value it was often adulterated, and often a large quantity of common salt was mixed with it. Not long ago a Worcestershire dealer in manure went to him, and asked, "What are we to do this season? The price of nitrate is going up so frightfully that we cannot sell it unless it is mixed with salt. If I don't do that my customers won't buy at all." He mentioned that as an example, and all the cases to which he referred had come under his own experience, or were vouched for by correspondence. They were not the creations of fancy. Now as the retail price of nitrate of soda was £17 per ton, and that of common salt 16s. to £1, it was plain that a mixture of ten per cent. of common salt would pay very well. Whilst all manures were very much adulterated, none were so much adulterated as bone dust. It was extremely difficult to get genuine bone dust, as bones were getting scarcer and scarcer. People had learnt to appreciate their value as manures, and they had also learnt to appreciate the comparative value of bone phosphate, in comparison with mineral phosphate, which was used extensively in the shape of coprolite. The superior value of bone phosphate arose from its containing a large proportion of nitrogen, and genuine bone dust yielded from 4½ to 5 per cent. of ammonia. For pasture land he preferred steamed bones to boiled bones, because in steamed bones the fat, which was naturally contained in a large proportion in bones, was removed. Fat, as an element in bones, had no fertilizing qualities whatever. It consisted of carbon and hydrogen, and they need not trouble themselves to supply those elements to the plants. Fat was decidedly injurious in its effects, for it prevented the decomposition of the bone dust, and fresh bone would be in the land for many years before it came into active play, the fat preventing the rain from affecting it. Bone dust put into a heap, especially when it was a little wet, heated; and the effect was to cause the ammonia to combine with the fat and to make what was called ammonia soap, which would not prevent the rain obtaining access to the bone phosphate which was then rapidly brought into operation. Superphosphate was another kind of manure on which he would offer a few remarks. He was often asked to give the composition of a good superphosphate, and also what was a fair price for it. The general answer to the second question was, "As much as it is worth."

The determination of the value of a superphosphate was not easy. It could not be ascertained by merely looking at it, or handling it, or smelling it. It might be necessary to handle it to see its condition, whether it was dry, and so on; but they could not test its value by smelling at it. Pointing to a table showing analyses of eight specimens of superphosphates, Dr. Voelker said the value of a superphosphate of lime depended on the amount of soluble phosphate of lime it contained, and the amount, in comparison, of insoluble phosphate. The former would be greatest in the case of bone dust, the latter in the case of mineral phosphate, and that made all the difference. Coprolite, which was a mineral phosphate, had hardly any practical value. In the next place the value of a superphosphate depended upon the amount of organic matter it contained, and a very good test of that was the amount of ammonia it yielded. Speaking generally, the value was regulated by the amount of soluble phosphate of lime. The quantity varied from 10 per cent. to as much as 40 per cent. It was entirely a question of what they would pay. They might say, "I pay, say £6 per ton; what sort of manure should I get for it?" or they might say, "Here is a manure, what ought I to pay for it?" His advice was that it should be bought at a rate fixed according to the quantity of soluble phosphate it contained—so much for each per centage of soluble phosphate—say 3s. 4d. to 4s. per cent. There was a class of manures termed phospho-guanos, some of which were very good. They were a mixture of phosphates with ammoniacal salts, and combined the good qualities of superphosphates and of guano. They were sold under various names. Their value depended on the amount of soluble or insoluble phosphates, and the amount of ammoniacal salts which were present. Another class was that of nitro-phosphates, which was only another name for a description of superphosphates. These often did not contain nearly so much nitrogenous matter as ordinary bone superphosphates. Fraudulent mixtures, he was sorry to say, were very frequently sold in England. There was one which had almost gone the round of every county, for after being exposed in one place it was sold with vigour in another district. It was not improving. One sample he had analysed yielded six-tenths per cent. of ammonia, a later one a third per cent., and the last not a trace. It consisted of gypsum, salt, and vitriol, and was of no value whatever. It was true that the proprietor got many testimonials, and no doubt most of them were genuine, but it was not difficult to see how they were obtained. Small specimen bags were sent gratis to a number of persons with a request for a statement of the results, and the maker wisely advised that only a small quantity should be used, not exceeding 1 cwt. or 1½ cwt. per acre, and for the simple reason that if used in any quantity it would seriously injure the land. Every one knew that the result of the best manures was peculiarly affected by the season, and that a crop which had been treated with the best manure would sometimes look worse than one badly manured. Hence a certain number of crops to which this stuff was applied would turn out pretty well, and as all the worst results went into the waste-paper basket, in the course of a few years (with a liberal distribution of samples) a good many testimonials were obtained. It was impossible to form a decided opinion of the value of manures without repeated trials under different circumstances, there was so much variety in the seasons; and he would advise them not now to spend any money in top-dressing, the season was far too much advanced for it, and it would do more harm than good. Nitrogen existed in organic matters, in the shape of ammoniacal salts, in the shape of nitrates, which consisted of nitrogen and hydrogen, and as nitric acid, which consisted of nitrogen in combination with oxygen. The next in value to nitrogenous compounds as fertilizing elements were phosphates, which were compounds of phosphoric acid with another substance, often with lime, and were very important elements in many artificial manures. The third class of fertilizing substances was salts of potash, and the value of an artificial manure, speaking generally, depended on the quantities it contained of nitrogenous matters, phosphate of lime, or potash salts. Of course there were other matters essential to the growth of plants, but they were of minor importance because they either existed naturally in abundance in the soil, or if not they could be readily supplied in a cheap form. Gypsum, for instance, was a useful fertilizer on many soils; but it would be better to apply it directly to the land requiring it than to buy it in the

shape of artificial manure. Lime was very valuable on some land, and especially pasture land, and also on some arable land; but he need not say that it answered infinitely better to lime the land than to buy lime in the shape of artificial manure. So common salt was another useful fertiliser, and mixed with lime was the means of renovating many poor pastures; but they could use those materials in their ordinary form. He would name a few constituents that should not be present at all, or only in the smallest possible quantities, in artificial manures. They did not want vegetable matter in the shape of peat, or sawdust, or rotten straw, or such cheap substances, which he was sorry to say sometimes entered very largely into the composition of artificial manures. Peat had been called one of the best friends which artificial manufacturers had; and he knew that sawdust, impregnated with sulphuric acid, often did duty for superphosphate. Superphosphate was an acid substance, and was often cleverly simulated by acid sawdust. There was a manure called bone phosphate, which did not contain bone or phosphate in any shape or form. Sand was a substance which should exist in artificial manures in as small a proportion as it was possible to obtain it. It was impossible for any commercial product to be chemically pure, and substances could not be dealt with for the purpose of manufacture without a little sand being introduced into them, and it was found in small quantities in the best artificial manures, but the quantity should be as small as possible. So far as the value of manures depended on the matters employed in compounding them, it could be ascertained by analysis, but their value depended also on the form in which the elements of fertility existed in them. In certain combinations nitrogen acted much more rapidly on vegetation than in others. Nitrate of soda when properly washed into the soil showed its effects in the course of three or four days, by imparting a darker colour and a healthier appearance to the grass. But this would not be witnessed in dry weather, and it was only fit to be applied in showery weather, or it would be lost. It was the most powerful form in which they could apply nitrogen to the soil, was most easily taken up by the plant, and the quickest in its effects; but it readily disappeared from the soil, and those substances which were quickest in their operation most readily passed away in drainage and otherwise. Ammonia in the shape of ammoniacal salts was not quite so active as nitrate of soda, so that it could be applied with less risk of being lost. They might top-dress the land with manure containing ammoniacal salts in the autumn, but it would be a bad plan to top-dress with nitrate of soda. It was a remarkable fact that the soil possessed a special power of laying hold of ammonia in the form of ammoniacal salts. That constituted, he considered, the second stage in which nitrogenous matters were presented to the plant, an intermediate stage between the crude fertilizing material, such as they found in fresh manure, or in dried blood or flesh, which entered into fermentation readily, and was changed into ammoniacal salts. The soil readily laid hold of these ammoniacal salts, and during the winter months converted them into nitric acid, which was, he believed, the form in which nitrogen was taken up by the crops. That was a lesson from Nature that time should not be lost, but that the farmer should make good use of his spare time, and cart his manure to the land as soon as his leisure would admit of it. It would never do to apply fresh manure, as they well knew, in the spring. It would have very little effect comparatively on the root crops. Rotten dung answered a great deal better, for the simple reason that it had undergone the necessary change, that the nitrogenous matter existed in it in the appropriate form. In considering the value of artificial manures they must consider, not only the value of the materials which entered into them, but also the form in which they existed in the manure. They might have nitrogenous matter, for instance, in the shape of nitrate of soda, Peruvian guano, or dried blood, in which case it readily became effective; or again in the shape of shoddy or wool refuse, which required a long time before it came into action, unless specially prepared. Ammonia existed in shoddy or wool refuse, but it was impregnated with greasy or fatty matter, which prevented its decomposition; and this greatly detracted from its value. Again, nitrogen occurred in leather; but do what they would with leather, let them reduce it to the finest powder, the nitrogen would remain inactive. Some manufacturers knew well how to compound a manure, which on analysis would

show a large per-centage of nitrogen; but it made all the difference whether it was in such a form as leather powder, or as Peruvian guano, in which latter shape it was readily taken up by the soil. He would rather have one per cent. of nitrogen in the shape of sulphate of ammonia, than six per cent. in the shape of powdered leather. They must not, therefore, too implicitly trust to analyses, which were sometimes made for sale as much as the manures themselves. A mere number of figures of per-centages would not put them into a proper position to judge of the true value of manures, but they would show in what force the various constituents figured in the analysis were present in the manure. Another point was the mechanical condition of the manure, whether dry or wet, whether finely powdered or lumpy, which had a material influence on its value. Dryness and fineness of division could not be obtained without expense, but the farmer was well repaid for paying something like 7s. 6d. or even 10s. per ton extra for a manure in a dry and finely powdered condition. Again the fertilizing value of manure depended very much on the use the farmer made of it. Certain manures answered best for cereal crops, and others for root crops; some were adapted for one kind of soil and some for another; and their value also depended on their being applied at the right time of the year, and in right manner. Some years ago he made a series of experiments with a variety of artificial manures as applied to grass land, and the result of those experiments, carried out on a tolerably large scale in several counties in England, was to lead him to the conclusion that the most economical and most efficient manure which could be applied to grass lands was good farmyard manure. No manure produced so good a result, if they could get plenty of it, as good stable dung on grass land; but as they could not always get enough they must get the next best, or the land, instead of becoming richer, would become poorer and poorer. In determining what was the best substitute they had to consider what was the character of the land. If, as was the case with most of the Derby pastures, the land required lime they should lime it well, and having done so leave it for a couple of years without putting any manure at all upon it. His experience showed that in most counties of England it was desirable to apply bones to grass land, but bones never did well on newly limed land, and in many cases where it had been so applied he had not been able to see even where the bones went to. It was very important to settle the point whether the land needed lime. If the herbage looked unhealthy or deathlike, as people said, they might take a little of the soil, and pour upon it weak spirits of salt, and if there was an effervescence that would be an indication that there was enough lime. If they tested the land in that locality, they would find that by far the larger part of the pasture land required lime. The effects of liming might be regarded as permanent, and after its application they should adopt other means. Supposing the lime to be thoroughly incorporated with the land, the next thing to decide was whether bones would answer as a manure. There were no general rules which would hold good under all circumstances. On some descriptions of land bones had little effect, on others the effect was perfectly marvellous. Speaking generally on heavy soils fresh bone dust, at any rate, did not show so well as on light and more porous soils; and as bone manure was rather expensive at the present time it was well to make an experiment on a small scale before applying it extensively. The result of his inquiries went to show that all good artificial manures for grass lands should contain a certain proportion of phosphatic materials, if possible in the shape of bonedust; and light land should also be supplied with salt of potash. Pasture lands, to yield a good crop, must be also supplied with a considerable proportion of nitrogenous matter in the shape of ammoniacal salts, and he would recommend for light pasture lands mixtures of manures, which should include potash—a good deal of which was now got from Germany, where it had been discovered in a state called kainit. They ought to pay for that something like £3 to £3 10s. per ton retail. It was imported into England for something like £2 10s. It was retailed at £4, which was rather too much profit, and the farmers should insist upon getting it for less, and the dealers could well afford to reduce the price. He would recommend for light marly grass land one cwt. of superphosphate, which would cost 6s.; 2 cwt. of bone dust, which at 7s. 6d. would be 15s.; 2 cwt. of potash salt at 4s., which would be 8s.; and 1½ cwt. of Peruvian guano, which

would be £1 or 21s., making a total of £2 10s. per acre. He would not advise them to lay out less than that, if they wished to apply artificial manure to grass lands at all, as he thought it would be like wasting away powder by dribbling it into the breech lock of a gun, where it would produce no effect. Two cwt. of bone dust, and the same quantity of Peruvian guano, and $\frac{1}{2}$ cwt. of nitrate of soda made a very good dressing for light grass land. On heavy soils they might leave out the potash salts, more especially if they contained a fair proportion of the better description of the more unctuous kinds of red clay. In buying artificial manure they should first ascertain what would suit the land, and they could ascertain that for themselves, if they were not ashamed of being called experimenting farmers; and every farmer should be that, for observation and experiment were essential to progress. He would advise them to deal with respectable men, who had a reputation to lose, for in buying cheap manure from some one who went on for a short time and then failed, they would, in the long run, not gain any advantage. He would advise them not to be led astray by statements of analytical results, for, as he had stated, nitrogen might be present in the form of leather, or phosphate in an insoluble mineral, like coprolite, which would have very little effect. He would not, on the whole, advise them to deal with their brother farmers, who made a little manure, and chopped a few horses, and so on; as generally speaking they would get an inferior article. He would not recommend them to buy cheap manures, and he showed by reference to analyses that many of the cheap manures were by far the dearest. Some of these manures consisted mainly of dried night soil, which was perhaps worth about 5s. for a good cartload, and which were sold at £3 or £4 per ton. If

they bought superphosphate they should buy by analysis, and when they were certain that they had got what they wanted, they must give the price for it. In buying nitrate of soda they should have a guarantee stating the amount of impurities it contained—5, 6, 7, or 8 per cent. This was called "refraction," and deducting it would show the amount of nitrate it contained. He should have liked to have spoken on the question of Supply Associations, for the purpose of ensuring genuine manures, but could only recommend the question to them for discussion. Such associations were springing up in various counties in England, and some were carried on in a very profitable manner.

In reply to Mr. Robinson, of Melbourne, Dr. VOELCKER said there was no better easy test of guano than weighing, filling the bushel lightly, and sweeping it off level; and the weight as above stated should not exceed 68 or 70 pounds. Any material mixed with guano weighed heavier, and they would find some weighing 72, 73, and even 74 lbs. The test of the application of quick lime with a view to determine the amount of ammonia could not be relied upon, as a small quantity of ammonia would produce a good deal of effervescence, and cause a strong smell. Hence dealers in inferior manures were fond of putting that test forward.

Col. WILMOT proposed a vote of thanks to Dr. Voelcker for his lecture.

The Hon. E. K. COKE in seconding the vote of thanks observed, that whilst that large audience was there full of practice, Dr. Voelcker was there full of science, and the combination of the two was what they wanted.

Dr. VOELCKER returned thanks, and the meeting broke up.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

HALF-YEARLY MEETING.

The half-yearly meeting of this Society was held at noon on Monday, May 23, in Hanover Square.

In the absence of the President, his Grace the Duke of Devonshire, the chair was taken by Lord Walsingham. The attendance was very small, owing probably, in a great degree, to the circumstance of the meeting happening to fall this year upon a Monday, under the provision of the Charter relating to the period for holding it.

The Trustees and Vice-Presidents were re-elected. The House-List of Members of the Council submitted to the meeting was adopted. There was only one new member elected, namely, Mr. William Earle Welby, M.P., Newton House, Folkingham, Lincolnshire.

The Secretary, Mr. H. M. Jenkins, then read the Report of the Council, which was as follows:

Since the last general meeting in December 4 Governors and 69 Members have died, and the names of 199 Members have been removed from the list; on the other hand 1 Governor and 212 Members have been elected, so that the Society now consists of

- 74 Life Governors
- 74 Annual Governors
- 1,511 Life Members
- 3,764 Annual Members, and
- 15 Honorary Members,

making a total of 5,438. The half-yearly statement of accounts to the 31st December, 1869, has been examined and certified by the auditors and accountants of the Society. This statement was published in the last number of the *Journal* together with the Manchester country meeting account, and a balance-sheet for the whole year 1869. The last-mentioned document shows that independently of the financial results of the country

meeting at Manchester, and after charging on income the cost of all additions to the permanent country meeting plant, the receipts of the year exceeded the expenditure by a sum of £675. The funded capital of the Society remains the same as at the last half-yearly meeting, namely, the permanent fund of £20,000 New Three per Cents., and the Reserve Show-fund of £4,612 7s. 8d. New Three per Cents. In addition, the sum of £3,800 lies on deposit with the Society's bankers, and the balance of the current account on the 1st instant was £3,583 0s. 10d. The Council have granted a sum of £500 to the Manchester Local Committee, in aid of the extra and exceptional expense occasioned by the compensation awarded to the tenant of the trial-ground. Mr. Charles Whitehead, of Barming House, Maidstone, Kent, has been elected a member of Council to fill the vacancy caused by the election of his Grace the Duke of Devonshire, K.G., as a vice-president. At the first anniversary meeting of the English Agricultural Society, held thirty-one years ago it was stated that the prizes offered for stock to be shown at the then approaching Oxford meeting would amount altogether to £740, besides £50 for extra stock, implements, roots, and seeds, £50 for draining plough, and two prizes of 50 sovereigns each for the best specimens of white and red seed-wheat. At the forthcoming Oxford meeting the prizes to be competed for amount to £3,130 for live stock, and £395 in addition to ten silver medals for implements. A contrast of these figures will enable the members to realize the growth of the Society's operations during the interval; and to estimate the nature and extent of its influence on the progress of British agriculture. The interest thus attaching to Oxford, where the first country meeting of the Society was held, promises to invest the forthcoming show with unusual attractions. The show,

yards for implements and live stock comprise nearly sixty acres. The entries for implements, machinery, &c., which closed on the 1st instant, prove that in this respect the display will be quite as extensive as the remarkable collection exhibited last year; while it is confidently anticipated that certain classes of live stock will be extremely well represented. Another element of instruction and interest will be found in the competition for the prizes offered last year by the then High Sheriff of Oxfordshire, and the Society, for the two best managed farms in the district round Oxford. A list of the competitors (21 in number) and the names of the judges appointed by the Council have already been published; and it is hoped that the awards of the prizes may be made known at the general meeting of members held in the showyard. The Council resolved last year, that the society's country meeting for 1871 should be held in the division comprising North Wales, and the Counties of Cheshire, Shropshire, and Staffordshire. Invitations having been received from the authorities of Shrewsbury, Stafford, and Wolverhampton, a committee was appointed to inspect and report upon the various sites and other accommodation offered by the competing localities. After duly considering the report of this Committee, and after a conference with deputations from the three towns, the Council have decided that the Country-meeting for 1871 shall be held at Wolverhampton. The Council have also to announce that the Country-meeting for 1872 will be held in the district comprising South Wales and the counties of Gloucester, Hereford, Monmouth, and Worcester. The President and Council of the Société des Agriculteurs de France have invited the Royal Agricultural Society of England to take part in an International Agricultural Congress to be held next year in Paris, and to furnish a report on British agriculture. They also request suggestions as to any of the subjects of interest which should be discussed at the Congress. The Council have determined to accept this invitation, and have suggested the following as subjects worthy of discussion, and affording opportunities of illustrating the present position of English agriculture:—(1) Drainage, (2) Implements and Machinery, (3) Manures, (4) Rotation of Crops, (5) Fattening of Cattle and Sheep, and (6) the Labourer. In accordance with the resolution mentioned in the last half-yearly report of the Council, the Society's consulting chemist has presented two quarterly reports on samples of guanos and bone manures forwarded to him for analysis by Members of the Society. The immense increase in the manufacture of artificial manures and feeding stuffs, and the competition amongst dealers and manufacturers, have introduced into the market low-priced and inferior articles, which often tempt purchasers by their apparent cheapness. It was hoped therefore that the publication of analyses of different manures and feeding stuffs submitted to the consulting chemist might render purchasers more cautious in their dealings, and prevent that disappointment which follows the purchase of inferior or adulterated articles, and the Council have reason to believe that the publication of these quarterly reports in the Agricultural Journals has already been productive of good results. The Council have resolved that in future, the annual grant of £200 to the Royal Veterinary College shall be divided under two heads: (1) That £150 shall be paid to the Royal Veterinary College, for the general advancement of veterinary science in reference to cattle, sheep, and pigs, as heretofore; and (2) That £50 shall be retained under the control of the Council for the purpose of being applied to experiments on the diseases of cattle, sheep, and pigs. The Council have directed their attention to the desirability of improving the society's library, by the purchase of recent works bearing on the practice and science of agriculture, together with such

Parliamentary papers and reports as refer to agricultural subjects; and they confidently anticipate that a useful library of reference will shortly be at the command of the members.

Lord CATECART said he felt great pleasure in proposing that Lord Vernon should be the president for the ensuing year, adding that his lordship had worked very well in the cause of the Society.

Mr. FREEBODY seconded the motion, which was then adopted unanimously.

Mr. BOTLEY, in moving the adoption of the report, remarked on its satisfactory character, shewing as it did what vast progress had been made since the meeting held at Oxford 31 years ago. He particularly congratulated the meeting on the paragraph relating to the International Agricultural Congress at Paris, and he expressed his belief that England would more than hold her own on that occasion, and that the gathering would tend to the advancement of agriculture all over the world.

Mr. ROBERTS, in seconding the motion, entered into some elaborate remarks in reference to the future of the Society. As regarded implements, he considered that, however desirable it might have been to give prizes many years ago, it was not so now, as inventors and manufacturers obtained an ample reward without any of the money of the Society. As to the improvement of agricultural or farming operations, he maintained that the Society had not carried out its motto, "Science with practice," and that Mr. Lawes of Rothamstead had done more for agriculture in that respect than the Royal Agricultural Society. As regarded the important question of agricultural education, he expressed regret that the examinations must be considered a failure this year, there being no mention of them in the report, and expressed his conviction that this failure was owing to the limitation of age to 21.

Mr. FREEBODY said, occupying as he did the position of No. 41 in the list of life-members, he regretted to say that he agreed very much with those who thought that the Society had not fulfilled its duty or its mission. He disapproved of the Society's keeping such a large balance, instead of employing it for the improvement of agriculture; while as respected Mr. Mason's prize for the best farm in the Oxford district, he urged that the competition ought not to have been clogged as it was with pecuniary conditions. He afterwards criticised the manner and matter of the *Journal*, and the unsatisfactory result of the inquiries with respect to cheesemaking. He intimated that at a future meeting, he should propose some such resolution as the following:—"That a committee, to consist of 3 governors, 3 life-members, 3 annual subscribers, and 1 honorary member; not heretofore in any way employed by this Society, be appointed to inquire and confer with its present honorary and official staff, in order to report at the next general meeting what measures this Society can best adopt in order that some of its accrued founded capital should become of greater practical service towards the general advancement of English Agriculture, than of being invested in the New Three per Cents."

Mr. DENT, in replying, contended that the reports issued from time to time on the authority of the Council on practical agricultural questions, were very valuable, instancing those relating to the growth of cloverseed and of mangold wurtzel, and the experiments of Professor Voelcker upon various kinds of manures sent by farmers for analysis. He was surprised at Mr. Freebody's comments on the *Journal*, as it was generally admitted that it exhibited great improvement, especially the two last numbers (Hear, hear). The Society's balance would soon be exhausted if it kept an experimental farm with an expensive manager and staff.

After some further remarks by the Chairman, Sir Massey Lopes, and Mr. Wells, M.P., the latter of whom stated that only two candidates had presented themselves for examination in agriculture,

The Report was adopted, and the meeting terminated with some formal votes of thanks.

KINGSCOTE AGRICULTURAL ASSOCIATION.

FARM-YARD MANURE.

At the last monthly meeting for the season, Mr. H. HAYWARD read the opening paper, in which he said: When I commenced my agricultural education—which, as my grey hairs indicate, must have been a good many years ago—Cirencester College was not thought of, and chemistry as applied to farming was in its infancy; consequently I had not the advantage of receiving the instruction in that branch of the science of agriculture which is now so generally taught, and which institution no doubt has very good results when not, as is sometimes the case, carried too far—for, at the same time that I admit a scientific education to be very important, I am bound to confess that I have not unfrequently observed considerable losses sustained by its taking precedence of practical knowledge, and my advice to young men learning farming is to acquire a thorough knowledge of the practical part *first*, and study the scientific as much as they like afterwards. The manure subject, as a whole, embraces so extensive a field, that I have thought it best to confine the few remarks I am going to make this evening to the value and management of real manure, and only to allude to other varieties when finding it necessary to do so for the purpose of comparison. So much is written and said by scientific men of the present day about artificial manures, that I feel disposed, as an old practical farmer, to stand to my colours, and say all I can to support our truly conservative friend—the dung-heap; for unless it found some such supporters in men of the old school, like myself—judging from what is too often seen—it would, I fear, be less thought of, and become more neglected than ever, thus necessitating its place being filled by its more fashionable artificial relations. Farm-yard manure, properly speaking, is the residual produce of all vegetable substances employed in the feeding and littering of the various kinds of live stock kept within the precincts of a farm-yard. It therefore contains all the elements of the food and litter consumed by live stock, excepting those which are converted into flesh, bones, milk, &c., and it is scarcely necessary to say that the better the cattle are fed, the better will be their manure; indeed, I consider nothing to be more profitable than giving store cattle a moderate quantity of linseed cake with their rough fodder when a sufficient supply of roots is not obtainable, as not only benefiting the animals, but greatly improving the dung-heap, and thereby economising the use of artificial manure. Of all the kinds of manure known and used, I believe it is the general opinion that that coming under the denomination of “farmyard manure” is the most efficient; and containing, as it does, all the food upon which plants thrive, it must necessarily be of the greatest importance to the farmer that it should be managed in the best possible way. Owing to neglect, great waste of this valuable article is by far too general; one writer goes so far as to say “Good management will produce double the amount obtained under neglect”—and I am disposed to agree with him. Inconveniently arranged yards and buildings are very frequently an obstacle. But this evil, which can only be rectified by the landlord, should not be made an excuse for mismanagement; on the contrary, then is the necessity the greater for care and economy. In alluding to bad practices, too generally in use, I will mention that of allowing manure to accumulate in open yards, or in heaps thrown out of feeding stalls and stables much too long, before removing it to the dung-heap: thus exposed to the washing of the rain and to the water which runs off unshooted buildings, a valuable portion is carried away and consequently lost. There is, of course, a time when it is in the most advantageous state to be carted away and made up into a well-constructed heap, that time depending upon how thick the cattle have been kept in the yard, and the amount of litter supplied; but it should not remain long enough to get too rotten, or a loss will be sustained by the liquid manure running from it; just before that would take place I conceive to be the best time, instead of its remaining the whole winter, then to be turned up in the yards where it has been made. Independently of other losses, it is not easy in this way to make the heap of equal quality throughout, seeing that round

the cribs and under the sheds it will be much better than over the other parts of the yard; and seeing that as turned up so it will go to the field, an unequal manuring will be the result; whereas if taken away at proper intervals to some other convenient place, and the carts drawn over the heap in forming, waste from over-heating and other causes will be prevented, and the dung will be equal in quality throughout. Another bad practice which I will mention as being frequently seen in this neighbourhood is the way in which heaps are formed by the roadside, or in waste places, for weeks or perhaps months together, by shooting up a few loads occasionally, and these not even thrown up into form, as if the object were to get rid of a nuisance instead of husbanding a valuable commodity—one end perhaps being good rotten dung, the other inferior, or mould or road-earth, which is valuable no doubt as a mixture, but can only properly be made so by putting it under or carting it over the heap in regular layers. A dung-heap got up in this manner, and remaining a long time without having been consolidated by pressure, will not only lose in quantity and quality, but be uneven in value, one end of the heap proving good, and the other bad, so that when spread on the land the same uneven dressing will be the result as when heaped in the yards. There is another method very general upon the Cotswold Hills, certainly superior to that I have just described, but still wasteful, and which may be greatly improved upon: I mean the making heaps through the autumn and winter—at certain distances apart, in the fields where it is to be applied for roots in the spring. The plan no doubt is convenient so far as that it provides the manure near at hand when required to be ploughed in at a busy time; but the loss from evaporation and the washing of a winter's rain must be very evident, and far out-weighs the economising of labour; I believe if any person would count the loads carted out, and count them again when used, he would find the loss to be so great that he would be induced to alter his system to that of forming larger and more consolidated structures. Still, I see no objection to later-made dung, required for almost immediate use, being made up by backing the carts against the heap instead of driving over; it then lies more loosely together, ferments more rapidly, and, if frequently turned and separated, will soon acquire that rotten mixture which enables it to be easily ploughed in. Horse-dung should from time to time be spread over the cattle yards, and not remain as thrown out of the stables until in a state of fermentation, being more valuable so mixed, at the same time doing the cattle good, and preventing loss by evaporation. I doubt whether there is any operation upon a farm of greater importance than that of clearing out and re-littering yards. It is, therefore, my opinion that no other work should be allowed to interfere with heaping your manure at the proper time. There are many who think nothing of expending money upon guano, superphosphate, and various concoctions of the present day, and begrudge the labour that might be so profitably expended upon the natural article. It is not easy to explain the exact time at which an open yard should be cleaned out and re-littered; but I think it should be as soon as possible after the liquid begins to drain from it in a discoloured state. Liquid-manure tanks, which promised to become very general some years ago, appear to have been more valued in theory than in practice, as we hear but little about them now, and those who adopted the plan seem in most cases to have relinquished it, proving that it did not pay. The best method therefore must be to prevent as far as possible the loss of this valuable part of the manure, which, I hope to show, may in a great measure be done by the proper construction of the dung heap. Dung made by cattle fed in boxes is fit for immediate use, and cannot be more economically treated than by carting it direct to the field and ploughing it in at once: not so with regard to long dung from the open yards, for, although the practice is often followed by good farmers, I believe it to be wrong, especially upon the light soil of the Cotswold hills. There is, however, a prevailing opinion that box feeding is not so healthy as the ordinary fattening stalls; so it is to be feared that this excellent

method of preparing natural manure cannot become so general as could be desired. Having given you my opinion upon wasteful management, I must endeavour to prove the most desirable method of preparing and preserving farmyard manure. This greatly depends upon the proper construction of the dung-heap and the condition of the materials of which it is composed, which materials no doubt most practical men know as well as myself. In heaping manure (unless intended for immediate use) the carts should always be drawn over it, and be constructed upon an inclined plane, on either side, so that horses could draw up on one side, and down on the other, as the more it is trodden down by horses and wheels by its being drawn up load upon load the better: it will rot quite rapidly enough when so compressed, and there will be very little loss by the dissipation of gases from over-heating, even if it should be required to remain for a long time; and once well turned about a fortnight before using will generally be sufficient to produce the proper consistency for ploughing in. Mr. Lawrence, of Cirencester, says of the plan which he has adopted—"Some three or more spots are selected according to the size of the farm, in convenient positions for access to the land under tillage, and by the side of the farm-roads. The sites fixed upon are then excavated about two feet under the surrounding surface. In the bottom there is laid some three or four inches of earth to absorb any moisture, and upon *this* the manure is emptied from the carts. This is evenly spread and well trodden as the heap is forming. As soon as this is about a foot above the ground level, to allow for sinking, the heap is gradually gathered in until it is completed in the form of an ordinary steep roof, slightly rounded at the top by the final treading. In the course of building this up about a bushel of salt to two cartloads of dung is sprinkled amongst it. The base laid out at any one time should not exceed that required by the manure ready for the completion of the heap as far as it goes; and within a day or two after such portion is built up, and it has settled into shape, a thin coat of earth in a moist state is plastered entirely over the surface. Under these circumstances decomposition does *not* take place in consequence of the exclusion of the air, or at any rate, it is to so limited an extent that the ammonia is absorbed by the earth; for there is not a trace of it perceptible about the heap, though when put together without such covering this is perceptible enough to leeward at a hundred yards' distance. The base may be ten to twelve feet wide, and the roof about nine feet from the base, which settles down to seven feet." I think, instead of three or four inches of mould laid in the bottom, Mr. Lawrence's plan might be improved upon by having a foot to fifteen inches; and a covering of ten to twelve inches over a level surface when the heap is about four feet high would answer the purpose quite as well as gathering in the top to form a roof, if the mass be well consolidated by the pressure of horses and carts. There is another kind of manuring that it may not be out of place shortly to allude to, which I have seen practised, with very good results, in some parts of the country, though not often adopted in this neighbourhood. I mean green-manuring, or ploughing in green crops, such as vetches, mustard, &c., of which *Morton's Cyclopaedia* says—"Vegetable substances in their green and succulent state are powerful fertilizers when thoroughly incorporated with the soil. A great portion of the bulk of green crops is obtained from atmospheric sources; and after a green crop is ploughed in, the soil necessarily contains more of the organic elements essential to vegetable nutrition than it did before that crop was grown; it is richer, in fact, by the carbon, oxygen, hydrogen, and nitrogen, which the green crop has obtained from sources independent of the soil. In like manner, the crop grown after a green crop has been ploughed in has the advantage of a regular supply of mineral elements, which have been worked up by the roots of the fertilizing crop from the soil and subsoil, and which in many instances, owing to their sparing solubility, are with difficulty obtained under ordinary circumstances." The value of green crops so applied is thus scientifically described, and I can bear practical testimony, upon ample experience, of its being most efficient. I should be very sorry for it to be inferred from any remarks that I have made that I wish to depreciate the importance of the use of artificial manures, especially guano, bones, blood, &c. But I am of opinion that a vast amount of rubbish is manufactured now-a-days. It may have the effect of exciting the soil to produce a crop of roots—though I have no faith in

it with regard to white-straw crops—and it may be an advantage for the time being. But the important question is, how long will land answer the whip to this treatment? We know that land will get sick of certain crops if repeated too frequently, and it strikes me rather forcibly that the time will come, and in some instances may have already arrived, of land being artificially manure sick; and I hope this evening to hear from those who have been using light manures for some years whether they do not find that a more liberal dressing is required now to produce the same result than when first applied. If so it is to be feared that the soil must be deteriorating rather than improving. I have alluded to artificial manures for the purpose only of proving the importance of paying greater attention to the preparation and preservation of that manufactured in farmyards and stalls, of which there is no danger of land ever getting sick. I will conclude by quoting, as nearly as my recollection serves me, the words of some one speaking upon the subject which I have introduced for this evening's discussion at an agricultural meeting in Ireland, and which came under my notice two or three years ago: "It is by the preparation and application of manure that good crops *can* and *will* be produced, and just in proportion as it is largely applied so will the farmer be enriched. If you want a large crop of turnips, prepare manure and apply it; if you want abundant crops of flax, prepare manure and apply it; if you want large potatoes, manure; if you want plenty of oats, manure; in a word, if you want plenty of money, I would say prepare manure *properly*, and apply it."

Mr. HOLBOROW, the Chairman, said they had been going on contentedly with our system of managing manures, but that he did not doubt they had yet much to learn in this as in other branches of their business. His practice, he said, was to make as good dung as possible through the winter. Some of his animals were fed on hay, and some on straw and cake. He often mixed the two manures together by putting them into one heap, which he hauled out on the ground, after his wheat crop had been taken off, into heaps of sixteen or twenty loads each, to be applied to the root crop in the following year. He did not consider he could get his green manure made into a suitable condition for the swede crop the same year; neither did he think there was so much loss by keeping dung as some people imagined, if the dung was only turned up into a good large heap. The plan Mr. Hayward had recommended of drawing the horses and carts over the dung-heap was practised on a farm he now held, when he was a boy; and although that system had been discontinued, he was at a loss to know why, as he believed it a means of preventing too much decomposition. Having plenty of straw, he kept his animals well littered; and therefore he did not think the loss from washing by rain was anything like so great as in many other instances. The many hints which Mr. Hayward had thrown out might be a source of much profit, if they could be practically adopted.

Mr. T. PRICE said he was not one of those large farmers who could put aside old dung, and have a store. He applied his manure to his roots for the same reason that he made it. His system was to have all his dung made from his horses and cattle in the same yard; and when a frost came, and he could do nothing else, he hauled it out, and threw it up loose in a heap; and, by having it once turned before using, he never found any difficulty in getting it in a fit state to produce a good crop of roots. He felt sure there was a very great loss from the washing of the rain on the manure which lay in the yards a long time.

Mr. GARN said he could speak from experience in regard to green and rotten dung when applied to grass land. Last season he manured one portion of a field with green dung out of the yards, and the other with rotten; and while by far the heaviest crop of hay was made from the former, the herbage of the latter was superior. This year he hoped the herbage of the portion manured with the green dung would be much improved.

It was unanimously resolved: "That it is of the greatest importance to pay more attention to the management of farmyard manure; and we fully agree with the system recommended by Mr. Hayward of managing it in such a way as not to produce decomposition long before using."

Votes of thanks to Mr. Hayward, and to Mr. D. Holborow for presiding, concluded the proceedings,

ABOUT HENS.

THE EXPERIENCE OF HEN-WIVES.

Only a few jottings of my own experience concerning them, and of the experience of sundry old women whose brains I have picked of their poultry-lore—nothing pretending to be a complete treatise on the subject, though I begin by going back to their origin.

Hens come from the Far East; but we do not know at what period they joined the great procession of civilisation that has been moving eastward round the world ever since man came upon it. They were probably brought to Tyre and Sidon by Phœnician mariners, and introduced by them afterwards into Europe. They may have come to Judæa in the fleet which once in three years brought gold and silver, ivory, apes, and peacocks to Solomon; but the historian of his glory has not recorded the arrival of the sober-suited birds, nor has the royal naturalist himself made any mention of their quaint ways, which might well have illustrated a proverb. There is nothing in the *Old Testament* which can certainly be said to refer to them; familiar to every one are the solemn, pathetic passages of the *New* which speak of the crowing of the cock, of the hen's maternal love.

The oriental origin of these birds is a fact of the more importance, that they cannot be said to be thoroughly acclimatised. No amount of care will make chickens do well with us in wet years; and though the old birds are not injuriously affected by moisture as the young, they thrive much better in dry, airy situations than they do upon damp soils, near water, or where trees or walls hinder free ventilation. Chaucer knew this well, when he made

—“A yerde enclosed all about

With stickes, and a drie ditch without,”

the dwelling of his cock Chaunteclere, whose “voice was merier than the mery organ,” truer to time “than is a clock or any abbey orloge” (sure signs these of a well-conditioned fowl), and who for his fine points might get the prize at a modern poultry show:

“His comb was redder than the fine corall,

Emballted as it were a castle-wall:

His bill was black, and as the jet it shone:

Like azure were his legs and his toen,

His nailes whiter than the lily-floure,

And like the burned gold was his colour.”

The comparison between the battlements of a castle and the cock's indented comb is perfect as comparison can be. But the game cock, before he was allowed to fight, was usually deprived of this ornament of valour, lest, hanging down torn and bleeding, it should blind him, it being the favourite point of attack for the beak and claws of his adversary. Thus trimmed, cocks were said to be “dubbed;” they were also, like ancient knights, girt with spurs of steel or silver. Sufficiently cruel, so might any one think that has ever seen them fight, are the blows that they give with their own weapons, using the wing as a mallet to drive the spur home.

Natural aristocrats game fowl are, excelling all others of their kind as much in elegance of form and beauty of plumage as in pride and courage. Their eggs and flesh are delicate in flavour. The hens are good layers and careful mothers, but it is seldom possible to rear more than half the chickens of a brood, they fight so fiercely, hens as well as cocks, when once they are feathered.

Very different from these are the big, gentle, helpless Cochins. Too stupid to care for rambling, too lazy to find their own food, they are just the birds to be happy in a poultry-yard. The hens are excellent layers; the chickens sturdy, long-legged, young ragamuffins with scarcely a feather to their backs. They are not, however, very valuable for early broods notwithstanding their extreme hardness, for they are slow in coming to maturity, and until they are fully grown it is impossible to cover their big, ill-shaped bones decently with meat; coarse sapless meat it is too.

Dorkings, on the other hand, have quite a talent for keeping themselves in condition, and they are so well shaped that a moderate amount of flesh makes them look plump and sightly. But Dorkings, living or dead, are the very pinks and patterns of poultry perfection. Their chickens, indeed, are not quite so hardy as the young Cochins, but with ordinary care there is no difficulty in rearing them, and their mothers bestow extraordinary care upon them; no hens are to be compared to them either for affectionateness or for cleverness.

Nothing can be more elegant than the Spanish hen's person, nothing in better taste than her costume: a rich black robe, reflecting in its glossiness every rainbow hue, white drapery about the small shapely head, high scarlet comb surmounting it, down to the dainty feet and legs—the donna all over; and her lord is as stately as she is graceful. Him I like rather better of the pair: one is as proud, as unsocial, as untamable as the other; but these are qualities that somehow become a hen's character worse than they do a cock's. Besides she is a bad mother. Her chickens, poor things, are rather delicate; indeed, the whole race seems deficient in vital force, a stock of Spanish fowl often without any apparent cause dwindling away and dying out. Their eggs are larger than those of any fowls, and they, as well as the flesh of the birds themselves, are of delicate flavour and of snowy whiteness.

It would not be easy to make a choice between the white-crested sable-tinted Polish fowls and those dressed out in cloth of silver or cloth of gold all twinkling with jet spangles. Very charming both kinds are, with their plump, compact persons, their gentle dispositions, and the brisk motions to which those big head-dresses of theirs give such an odd emphasis. It was, it will be remembered, these top-knotted fowls whose company was such a solace to the Italian girl in George Eliot's “Scenes of Clerical Life;” it is of them the author is speaking when she says that “in certain sorts of mental trouble more relief is found in looking into the ways of poultry than in listening to the songs of nightingales.”

I must pass over the Malays, the Brahma Pootras, the Hamburgs, the Bantams, the Crèvecoeurs—the description of their perfections and the story of their triumphs, are they not written in the shilling handbooks? here I have hardly space to touch upon them. But for a piece of advice about them I must find room. Give them as much liberty as possible; keep but one sort if you must have purity of breed, for then they may, by taking great pains, be made to do tolerably well in the separate compartments of a poultry yard; they can never be as healthy and vigorous as they would be if allowed to range at large. Hens of mixed race (not the old unimproved sort of fowls, but crosses between them and the new breeds) lay more eggs than do the blue-blooded feathered gentry that make a figure at poultry shows; their eggs produce more chickens, and their chickens are more easily reared. But of whatever sort of fowls a stock be composed, it is essential to its well-being that the individuals composing it are healthy, that they be chosen from spring broods of chickens, and that new blood (fowls not akin to the rest) be often introduced into it. A favourite will of course be kept till she drops off the perch from age and fat; but, as a matter of business, it is better to put hens away when they are three years old; after this, they seldom lay well—only for a little while in spring, when eggs are plentiful, and so of small value.

Gentleness cannot be too much recommended in the management of the poultry yard. A pet hen generally makes a good mother (the best I ever knew nestled in a doll's bed in the days of her chickenhood, and was fostered by a cat); but a wild timid one is perpetually making herself and her chickens miserable about something or other, besides often trampling them to death from mere fury and nervousness. And besides the profit that there is in making friends with them, there is a great deal of amusement. To know one turkey, goose, or duck is to know all; but hens, like other highly civilized races, manifest endless diversities of character. One is always get-

ting into tantrums, hysterics of fear, anger, maternal affection, or all three together. Another, though a good sort of body in the main, is such a manager, that there is no doing anything with her. She is so jealous of interference, that she will keep her chickens out in the rain rather than allow anyone but herself to put them up, and she will call them off from their dinner, if she be not allowed to scatter it on the ground, and manipulate it after her own fashion. The chickens of a third are always hungry, dragged, and cross; wherever she has been, a couple of lost ones may be heard crying after her; while her neighbour's family will be plump, clean, and merry in the most unfavourable circumstances. Some hens peck strange chickens to death; others steal them from their mothers and adopt them. One of this last kind I have known to take very kindly to a pair of nestling hawks that were half fledged before ever she saw them. When a hen wishes to sit she lies upon the nest, not rising when meddled with, but scolding vehemently, angry at the disturbance of her sweet maternal dream. This same peevishness of temper of hers is often taken advantage of when it is thought advisable to check the brooding inclination; a crib is provided wherein all such patients are confined together, and there they soon forget all softer wishes and fancies in striving to torment each other, and in longing to be rid of each other's company. A less cruel way is to feed them highly, which will induce laying. Sometimes a hen forsakes her eggs after sitting for a few days on them, so it is well, especially in early spring, to test her constancy by giving her at first a few of small value; food should also be left near, that wandering too far may not make her forget them. The hen's natural nest consists of a hollow rudely scratched in the ground under cover of weeds or shrubs, a few dry stalks of grass or dead leaves surrounding the eggs, not under them. The best artificial one is a box half full of earth, with a little well rubbed straw over it. She likes to sit where she has laid, but she is much better away from the other hens, she being made to sit any where by giving her the eggs at nightfall, when she has just light enough to see them and arrange them to her satisfaction before she goes to sleep. A wearisome task indeed is before the poor bird. Think of sitting still for three weeks without as much as a novel to read or a bit of knitting work to do, and then, perhaps, after all she is flung disregardfully off her nest that her chicks may be added to the brood of some hen that began to sit at the same time, for a large flock gives no more trouble than a small one to us, and they, though they cannot well cover more than twelve eggs a-piece, can rear twenty chickens a-piece, or more in warm weather, and when well supplied with food for them.

The hen, though she will hatch the eggs and bring up the young of other fowls, is not without her preferences. She is visibly discontented when they are smaller than her own, but they cannot be too big for her taste. Her delight in goose eggs and goslings is something to see. Every one knows that chickens must not be reckoned before they are hatched; now-a-days only a wise old woman here and there knows that it is most unlucky to count them after; that if the number of a flock be known, so surely will it be diminished. Is it not strange in how many forms that old superstition meets us? the belief, I mean, that the superior powers are envious of the prosperity of man. But it is hardly worth while to count chickens at first, such numbers of them are cut off by pip, inflammation of the throat that is, or gapes, as the disorder is called in its worst stage, when the bird's throat becomes full of strange double bodied worms. A very dreadful disease pip or gapes is to unfledged chickens especially; older ones it often attacks, but it seldom kills them after they are six weeks old. Of remedies for this disorder I could tell dozens; some surgical, such as the extraction of the worms with a little feather; some medicinal, such as the administration of a drop of turpentine; some utterly absurd, such as the removal of the little horny membrane which all chickens, sick and well, have at the tips of their tongues; all alike useless. Warmth, fresh air, nourishing food, cleanliness, these are the only things that I have ever known of the least service. For chickens with pip, for fowls that from any cause are out of order, there is no tonic at all to be compared to wheat; and they should from the first be trained to eat it, for it is still more admirable as a preventive of indisposition than as a cure. Grains of wheat, it is true, are rather unwholesome morsels for the tender beaks of baby chicks, but wonderfully soon they learn how to send them

down as grist to those hard worked little gizzards of theirs; once they can do this they prefer wheat to any food; too much of it makes them quarrelsome. Chickens sometimes get pip in dry weather, but cold and rain are sure to bring it on; above all, poor little early birds that they are, they get worms in their throats because their mother chicks them out of their warm beds as soon as there is light. Her instinct, admirable as it is, was intended to be used in a dry climate, and it cannot always be depended on in a damp one for the prudent management of her young. From rain she saves them well; calling them into shelter, and hiving them under her wings, regardless altogether of herself; and nothing makes a hen so uncomfortable as rain, but against dew, which is almost as hurtful to them, she is not on her guard. At nine of summer, at ten of spring and autumn mornings, is quite early enough for unfledged chickens to leave their dormitory; the hen will bring them back to it between three and four in the afternoon, but in damp cold weather they must not be left out so long.

Newly-hatched chicks should be fed with bread (by the way it is generally crumbled so finely that they can hardly pick it up). After they have learned to eat there is no better, no cheaper food for them than maize meal, either boiled into a stiff, rather dry mess (chickens hate tough clammy food), or else moistened with milk or water. At first they must be fed almost every hour of their working lives (their breakfast to be left with them over night); by degrees they are to be reduced to three meals a day, or to two, according to their opportunity of foraging for themselves. The hen is a snapper up of unconsidered trifles, and if she have good range she will eat fully half the food required by herself and her family. Upon heaps of rubbish she may be seen, in dry trenches, under plantations, scratching up corn, fir needles, small stones, and clods of earth; in search of worms, earwigs, beetles, mille pedes, and such small deer; many a good bit she picks up in the stable and cowhouse—many a grain of corn at the barn door and in the stackyard; she rambles a field in search of seeds, green-meat, and insects; and if she can get into the garden she is quite sure that the beds were dug and raked so trimly that she may the more easily turn them over. And the cock caters almost as assiduously for the hens as they do for the chickens; very hungry he must be when he eats anything of which he does not call them to take share. There is not much danger of these suffering from sameness of food, but poor jail birds, that can do nothing to supplement their rations, must have them varied. Carrots, turnips, lettuces, or cabbages, thrown whole into the poultry-yard, give a useful change of diet besides a great deal of amusement to its inhabitants. Meat should be given occasionally (they do not require prime joints, livers and lights will do), and the chickens should now and then get hard eggs chopped small, curds and milk. Winter chickens must always be supplied with animal food; because of the cold this is necessary, because there are few insects for them to eat, and above all because high living makes them soon fit for the table, which is the chief thing aimed at in the rearing of those very early broods.

On the banks of the lower Mississippi chickens live almost entirely on buffalo gnats, blood suckers more terrible even than the mosquitoes of these parts; from morning till night they are picking them off the cattle that crowd around the wood-smokes that are made to mitigate the pest, and this food—essence of meat in natural capsules—so stimulates their growth that at less than two months old they are eaten in their turn. Quite the best use it is too to make of over precocious bird; such are seldom either large enough or healthy enough to make it advisable to recruit from them the store flock.

Potatoes, when they are in season, may be the standing dish, boiled and mixed with meal, both for laying and fattening fowls. Other excellent articles of provision for them are grain of all sorts, including buckwheat, maize, and sunflower-seeds, oatmeal and maize-meal either raw or boiled, and boiled rice. They thrive better when supplied with grain and soft messes than they do upon either alone. Their feeding-troughs should have moveable lids, pointed and barred like the raftered roof of a house before the laths and slates are put on; they destroy more food than they eat when they are allowed to scatter it about and trample it under foot.

Chickens under three months old must not be coop-fed. For pullets it is not necessary at all; they are quiet, small-boned, and acquire flesh readily, but it is much the best way of preparing cocks for the table; and they must not have

much light, else instead of growing fat they will fight and crow even more incessantly than they did outside. Give them twice a day as much potatoes and meal as they can eat; let them have a little corn now and then; do not forget to supply them with gravel, without which their gizzards are like mills without millstones, and they will grow fat enough in all conscience, though certainly nothing produces such enormous fowls as the odious practice of cramming.

Hens, though haters of water, are great lovers of cleanliness, a heap of sand, of dust, of ashes, or a dry bank of crumbling clay, serves them for dressing-room and toilet apparatus. Of fine days they are sure to be found basking in such places—nestling and fidgeting in their bath of dust, and working themselves into it feet foremost, so as to force it under every feather. Then rising, they shake it smartly off, and adjust their ruffled plumage; and so again and again they go through the whole process, looking as solemnly self-satisfied all the while as so many Turks. By the way they, too, use sand for their daily purifications—but only in default of water.

Hens confined in a poultry yard must by all means be provided with a dusting-place. Another essential requisite for them is material for egg-shells—lime rubbish or chalk; for want of this they often peck the mortar out of their houses as far as they can reach all round. And, besides these real wants, hens have a fanciful one which it is well to bear in mind: they delight to lay in places that they are not accustomed to; and if they be not occasionally provided with new nests in their houses they will if at liberty lay abroad.

If air be excluded from newly laid eggs, which may be done by rubbing them over with oil or butter, or by dipping them for a moment in boiling water, they will retain their first milky freshness for a month. In a mixture of lime and water, of about the thickness of batter, they will keep for six months or more, fresh, but with a slight taste of lime. It must, however, be borne in mind that these and all other methods of preserving eggs destroy the principle of life that sleeps so mysteriously within.

The seeds of plants and the chrysalides of butterflies are the emblems of the resurrection with which we are most familiar; eggs were a more popular type of it than either, anciently; and still the custom of giving and receiving them at Easter lingers in remote corners of Great Britain and Ireland. In Russia it is in full force; there the humblest peasant, presenting to the highest lady in the land an Easter egg, with the salutation, "Christ is risen," received in return the kiss of peace, with the answer, "He is risen, indeed." Eating tansies at Easter was an old English fashion. They were a sort of omeleta, made of eggs and the herb tansy (*athanasia*), the immortal herb.

Tansies and Easter eggs are customs out of date, but the thought which they symbolised is one that may well come in to the mind of any one upon finding a nest, where yesterday were but eggs, discoloured and dead seeming, full of pure, lovely, bright-eyed creatures all joyous life.

POPULAR ERRORS CONNECTED WITH VETERINARY MEDICINE.

At a meeting of the Breconshire Chamber of Agriculture, Mr. FERRIS, veterinary surgeon, read the following paper:

These errors are connected both with the agriculturist and the owners of domestic animals generally. Your assistance is solicited to eradicate them, and to establish just and true principles in all their requirements. Just think for a moment of the vast quantity of valuable animals in the county, and which form a considerable portion of the county wealth. Think of the splendid herds of cattle, flocks of sheep, and horses—scarcely better to be found in any other part of the United Kingdom. The time is not very long since when there was not a single veterinary surgeon in the county—when the proprietors of those animals had no other aid, if disease attacked them, than the farrier or blacksmith, and to him alone was entrusted their care. These people, ignorant of all principles which should guide them, and many of them often half drunk, groped their way without the least shadow of knowledge, and, as a rule, did much more harm than good. I am convinced that it would be better for the owners of the soil, one and all, rather than trust them in the hands of such men, to let nature have her own way, and not to pervert her laws by cruelty and ignorance. The darker days of farriery were remarkable only for ignorance and cruelty. Then boiling lead was poured into the tissue of living animals for the cure of disease, and their bodies cut and hacked as if the poor creatures possessed no feeling. Then the remedies resorted to constituted a mass of incompatible substances, the one counteracting the effects of the other, and the whole forming a compound which might or might not, according to chance, prove of benefit, or be the means of assisting nature in the removal of disease, administered without the slightest idea whether they would do good or harm. The employers were often as ignorant as the employed, and could not have valued science had it been within their reach. During the last few years agriculture has perhaps made more rapid progress than it ever did before in a similar time. The progress of veterinary science has done much toward the amelioration and prevention of many diseases, which formerly devastated the property of the stock owners. The public have benefited largely by its advancement in the treatment and prevention of diseases, though at the pecuniary cost of the profession. The advancement is seen by comparing the diseases of the present day with those that were prevalent formerly. How seldom do we now see glanders, farcy, pole evil, fistulous affections, &c. They now appear seldom

because our increased knowledge enables us to fathom not only the nature but the cause of disease. We have now, as it were, suddenly emerged from the times of superstition and ignorance, and are expected to give a reason for all we do on true principles, and to ensure the proper medical care of our patients. Still, errors even in this period are committed, and of such grave magnitude that it has already cost, and will continue to cost, veterinary practitioners of the present day almost endless application to eradicate them. These errors are the more frequent because the long continuance of them has caused stock-owners to be confirmed that they are undoubtedly correct, when they are mere shadows and delusions—nay more, superstition, ignorance, and cruelty. I would have you this day consider some of these erroneous opinions, which I shall hereafter point out to you as such, to weigh and balance them in the scale of reason before you apply them. Professor Varnell, in alluding to the subject of veterinary surgery, says it is the preservation of the health of our horses, flocks, and herds, and when they are invaded by disease to bring to bear as much skill and attention as we possibly can, with a view to remove it: and in all our operations, or in any other treatment we may have occasion to resort to, we are bound to be as humane as possible, and not to put any creature to unnecessary pain; nor shall we allow in our presence or to our knowledge any animal to be mis-used or ill-treated. In this respect we may, with much consistency, consider ourselves the guardians of domestic animals. Now, if I neglect this opportunity to point out to you the follies and errors which are daily practised by ignorant men on our valuable animals, I certainly should abuse this trust. Can anyone think for a moment that the days of charms and charlatanism have not passed, and that this grave ignorance and superstition is still in operation? I feel persuaded that no one here expects a veterinary surgeon to charm away the disease of their patients, and yet such quackery and superstition appear not to be entirely eradicated by science even now. I am sorry that I have to invite you gentlemen, who attend here, who have regard for science, to use your influence to scorn such practices whenever an opportunity offers. The man that has his animal charmed with a view to remove disease must be extremely ignorant, and the person that practices such deception and dishonourable conduct is not worthy to treat animals, because he must know that disease will not listen to him. It is common to find such men charming a horse for something in the shoulder, and keeping the animal in torture for days, and even months, when

the foot has been the seat of injury, whereas if proper treatment had been resorted to at the beginning of the injury the animal might have been relieved almost immediately. From neglect of proper treatment the foot often becomes diseased to an immense degree, sinuses form in all directions, rendering the animal a cripple during his lifetime. This cruelty is frequently the effect of charming. However dazzlingly brilliant for a time may be the reign of false doctrine in veterinary science, or in any other science, the truth must come out, the mask fall, and the rotten building must crumble. Is it not a cruel operation to cut open the belly or abdomen of an animal supposed by the ignorant to have twist or gut-tie, when no such thing exists, thereby rendering the life of the animal in jeopardy? Not long since I was called upon to go some four miles to operate on a bullock which had the twist or gut-tie, and bring such instruments as were required for the operation. On my arrival I found that I was only second, as the owner had sent for an old practised hand, who was sure it existed, and declared that he had operated on scores in the manner mentioned above. I told him if he had operated on scores the same he had tortured the poor dumb creatures enough, and that it would be wisdom on his part not to do so any more, and a very great saving to the owners, because the supposed disease rarely existed in cattle. In this case the bullock was suffering from mere constipation, and treated by me accordingly, and in a few days after the little animal quite recovered, without having his belly cut through, and his intestines roughly handled. Is it not unwise thus to treat animals in an economical point of view in performing such unnecessary operations which frequently destroy the life of the animal? Ought it to be legitimate for the ignorant pretender to cut and hack the poor creatures in such a manner, and is it not wrong for no one to take their part? These tortures have never been turned to any other account than that of provoking unexpected manifestations, which serve to build up artificial theories, only made to be overthrown by the experience of judicious practitioners; and they are repulsive to all feelings of humanity, Christianity, and civilisation. Another error is cutting the tail of cattle supposed to be diseased, which supposed disease is known by various names, such as tail alip, tail ill, notch in tail, &c. It is thought to consist in a softening of the substance of the tail some few inches from the end downwards, which can be easily doubled back upon itself; also, that at the place where it is capable of being doubled it has a soft relaxed or elastic kind of feel. Now, this imaginary diseased state is a natural condition in the tail of cattle; but when an animal is weak or suffering from almost any debilitating disease, this softening is more perceptible; hence it has led many to believe that it is the tail which is diseased, when in reality it is only a symptom of sickness. This injurious and cruel operation is performed by making a longitudinal incision into the substance of this soft part of the tail, and then filling it up with some irritating nostrum. Many a poor cow, even while suffering from some real constitutional disease, has been subjected to this torturing operation, and thereby has got added to her other complaints a foul, sloughy, carious sore, frequently causing a portion of the tail to rot off. Another error is cutting or burning out the lampas and flaps, as they are called, in young horses, in which the front teeth, as a rule, are short, and, in consequence, the palate prominent. When they evince a loss of appetite in addition to this appearance, they are said to have the lampas, and if a sensible practitioner refuse to cut or burn them, the horse is taken to a farrier or blacksmith, who is ready with his hot iron to perform this useless and cruel operation. Flaps are supposed to be on horses, and more (especially pigs that do not feed well. An absurd and cruel operation is performed by cutting out some of the loose tissue that connects the lips to the jaw. Whoever will thus treat animals ought to be severely punished. I may here observe the error of amputating animals' tails. Nicking, fortunately, is almost forgotten, and it would be well if docking were so too. I think it might be stopped if agricultural societies would not award prizes to any animal that has been mutilated. It is said that the cropping of dogs' ears and tails is vivisection with a vengeance, and ought to be taken notice of by the Society for the Prevention of Cruelty to Animals. But think of the poor horse, how many a one has suffered torture for days with that formidable disease lock-jaw or tetanus, caused chiefly by docking. Many have died from its effects, others have been less severely injured,

and have a partial contraction of some of the muscles of the quarters, and have lost that beautiful bending action, and drag their legs throughout life as a consequence. The French vivisection, cruel though it be, is scarcely more so than the daily mutilations which take place in our town and neighbourhood; yet the London Society for the Prevention of Cruelty to Animals sent a committee to have an interview with the Emperor of the French some few years ago to complain of such practices. Would it not be well if the society put an end to vivisection in our own country first? I will now give you a few of my reasons for considering the docking of sheep an act of cruelty. When any portion of an animal is amputated the cold always affects that part sooner than any other. If, therefore, you cut off a sheep's tail, you not only deprive it of a natural protection, but you also make the unguarded part tender as well, so tender that when this operation has been performed in cold weather animals have often died in consequence. Again, by seeing a sheep's tail it is often much easier to tell its breed—a fact which has hitherto often been overlooked, even by large stockowners, and I think it will be admitted by any impartial man that an animal with this appendage has a much more pleasing appearance than one without. Surely no gentleman will be bold enough to assert that he can improve upon Nature by mutilating it. Who would think it an improvement to his appearance to have his nose or hand cut off. Many farmers have told me that after docking sheep always grow bigger. If this is true, I can only say that the increase in size takes place the very moment they have lost their tails. The fact is that the increase is only apparent, which is owing to the eye being entirely taken up by the sheep instead of, as before, its attention being claimed by a woolly tail as well. I have been told too, that docking is advisable for reasons of cleanliness, the tail being apt to be covered with excrement. This, though seemingly a more reasonable reason than the last, will not stand criticism, for unless the sheep has diarrhoea its tail will not get dirty, and when it has this affection it is quite as effectual to cut off a portion of the wool as to cut off the tail itself. A very serious error is that of riding and driving a horse about hurriedly when suffering from an attack of colic, or gripes, and inflammation of the bowels. There is a fixed opinion that this is the best remedy for the disease, whereas, though occasionally it effects a cure, in nine times out of ten it causes the death of the animal. The following is the reason: When the functions of digestion are arrested from distention of food and gas, the belly becomes tympanitic, and the subject consequently exhausted. If at this time it is violently exercised, of course the exhaustion is increased, and at one time we have rupture of the stomach or intestines, and then death; at another, the minute blood-vessels giving way, and an immense exudation of dark, jelly-like blood taking place, which covers the mucous surface of the intestines, the end is equally fatal. In this case, we have been speaking of a horse suffering from a combination of colic and enteritis. When the disease is simply one of colic, I admit that the treatment just condemned is often successful, though attended by considerable risk, and very brutal. Lastly, I may observe the errors of periodical bleeding and physicking, which, however, are not so common as formerly. The continual giving of diuretic balls and powders is very erroneous, because such medicines weaken the animal, and more than that, they not unfrequently bring on disease. A horse or other animal in good health requires no medicine of any kind, and all balls, or powders, whether condition, alternative, cordial, or any other sort, are to be condemned, as they only tend to fill the pocket of the apothecary, and destroy the health of the animal that receives them. Although not an advocate for giving medicine when in health, when disease occurs the case is quite different, for it becomes our chief means in assisting nature to bring about a restoration to health; and when it has been applied early and judiciously, it has been the salvation of many animals. Those who use medicine for the cure of disease must have a thorough knowledge of the action and use of such medicine before it can be applied judiciously, and also a knowledge of the complaint for which it is used, otherwise they are groping their way in utter darkness, and their medicine becomes reduced to a mere lottery and empiricism. From a want of this knowledge, many an animal has been lost: hence to gain it is one great object of our science. Many of the modern discoveries made, and the doctrines promulgated, are worthy of admiration, in the setting

aside as erroneous opinion once firmly maintained to be right, and the explanation of the phenomenon of health and disease. Before concluding, I wish to say a few words on a subject which was introduced by Mr. D. Downes at the last meeting. I allude to the scab in sheep. It is really an extraordinary thing that some farmers will not look after their own interest, but from sheer laziness are contented to suffer the value of these animals to be lessened to an almost inconceivable extent by so loathsome a disease. This affection is one of the most contagious to which the sheep is liable; so much so, that one scabbed sheep is sufficient to affect the whole county. No punishment can therefore be too severe for a man who allows such an animal to stray; yet I constantly see sheep about the roads one mass of scab, helping to spread over the neighbourhood a disease which, by proper care, might be wholly exterminated.

The CHAIRMAN said with all due deference to Mr. Ferris and to his skill as a veterinary surgeon, he still thought there was yet much to be learnt with regard to the diseases of animals and the way of curing them. It was a humiliating thought that when such a disease as the cattle plague came into the land, with the knowledge before us that it had re-appeared from time to time, yet the only remedy for the evil—if remedy it could be called—was what was termed “stamping it out,” which was simply a euphuistic phrase for wholesale slaughter. So far back as the early times of the Roman empire the poet Virgil described this very cattle disease, and recorded that the only remedy was to slaughter all the herds that were infected with it. He had seen it stated that the diseases of pigs were manifold, and the remedy very uncertain; and we were told to make bacon of them at once or give them medicine. Now he thought that those who possessed animals were greatly to blame; for he did not consider that sufficient attention had been given to this important question. They had not, in his opinion, given the encouragement to science which they ought to. It was incumbent upon them to do a great deal more in the way of encouraging men like Mr. Ferris, who was actually the only veterinary surgeon for miles round. That gentleman in his paper had alluded to blacksmiths’ doctoring. He (the Chairman) could never understand why because a man happened to be a blacksmith, he should be endowed with the power of curing diseases, or why he should be invested with the robe of *Æsculapius*. He should never forget the utter horror he felt on one occasion when he saw an attempt by an unskilful practitioner of the art of dentistry to extract a tooth. He placed the patient’s head between his knees, and tugged away until he succeeded in pulling out a portion of the jaw and two or three teeth with it. If they would employ ignorant men, they must naturally expect to be imposed upon; and in fact it was not the fault of these people that they should do so. For instance, there was a class called bone-setters who were still believed in; and not only were people credulous enough to believe in blacksmiths’ doctoring, but even the children of such persons were to be found practising their so-called curative art. They ought seriously to take this matter into consideration. The population was rapidly increasing, and in the progress of years we had found artificial means of augmenting the crops and produce of the soil, and we ought in the same degree to look to the better care and treatment of our flocks and herds, and do our best to find the means of preserving those animals which God had entrusted to our care; for to men this was quite of as much importance as it was to raise good crops of corn and good crops of hay. He had no wish to be too hard on the blacksmiths, for there were very many good ones; but he did contend that it was most unwise to leave the treatment of cattle to unskilled and ignorant men instead of encouraging science. The demand would create the supply, and if they valued more highly the medical skill of those who were properly taught and took an interest in the development of science, we should get more knowledge a great deal than we possess now, for it could only be learned by searching for, and finding it out; and among other things that would result from this knowledge, would be the discovery that blacksmiths were not able to save life. There was no better sign of the growing interest of farmers in this kingdom than the discussion of such topics at assemblies like the present, which were held in every county throughout the land, and surely there was no subject that more required their careful consideration than the best means

of preserving and improving the food of the people. It behoved them therefore to press this great subject forward upon the attention of those who were chiefly interested. But he thought Mr. Ferris would agree with him that the subject was still in its infancy. Look, again, at the simple fact of there being only one such man as Mr. Ferris in an enormous district where there were thousands of persons and animals around. He quite believed that had there been more men of this class, and a greater knowledge of the treatment of the disease, the scab in sheep might have been stopped at the beginning. In conclusion, he would only reiterate his hope that the matter would be dealt with in earnest.

Mr. SMITH remarked that it was mostly the poor sheep that were attacked with the scab; the fat ones very rarely caught the disease. He believed that many of the sheep so attacked might be cured if only the proper remedies were resorted to in time. He thought that sometimes it was as well to kill or “stamp” them out; for it was a shocking disease, and one scabby sheep would affect a whole flock.

Mr. FERRIS, in answer to a question with regard to cutting off sheep’s tails, said he did not approve of the practice, which he considered to be cruel as well as unnecessary. The tails of animals were never intended to be cut off. As to the scab, if fat sheep took it they became poor; and poor sheep were more liable to it than fat ones; and the disease being highly contagious, a whole flock would soon become infected.

Mr. BENDALL said that during twenty-two years he had lost from one to three per cent. of his sheep through cutting their tails off. The disadvantage resulting from this practice was considerable.

Mr. WILLIAMS thought it was the last speaker’s own fault; the proper plan was, when the tails were cut off to tie a piece of string round the end of them.

Mr. REES WILLIAMS believed that he should have lost many of his sheep if he had not cut their tails off.

The CHAIRMAN inquired what was the best time for cutting the tails.

Mr. SMITH: The sooner the better.

The CHAIRMAN said it appeared a logical conclusion that if a farmer lost a certain number of his sheep by cutting their tails it would be better not to cut them.

Mr. CORNISH said he had not lost a sheep by doing so. Did Mr. Ferris, he would ask, advocate animals being altogether left alone in this respect? It was generally understood by men of wide experience to be the best plan. He knew that in Somersetshire, for instance, they always cut off the tails; and he had never heard until to-day that lambs were lost in consequence. All his were cut, and he never lost any.

Mr. HANDLEY could fully bear out Mr. Cornish in what he had just said, for he had never lost any; and he apprehended that when they were lost it was in consequence of the tails being cut late.

Mr. FERRIS was of opinion that the practice of cutting the tails off sheep did not improve, but rather deteriorated, the stock. His desire was to improve the breed, and he could see no advantage in this habit.

Mr. THOMAS WILLIAMS observed that there was a difference between cutting the tails too short and cutting them too long.

Mr. DAVID WILLIAMS supposed it would not do to cut the tails of lambs in frosty weather.

Mr. CORNISH remarked that as Mr. Ferris had never been a shepherd it was to be presumed he could not understand the management of sheep; and as to the question put by the last speaker, he could only say that no man in his senses would ever attempt to cut the tails off lambs in frosty weather.

Mr. FERRIS replied that he had been brought up with sheep all his life, and his father was a farmer.

Mr. DOWNES believed that more young lambs died from congestion of the lungs than any other cause.

Mr. FERRIS knew that very well; but they were still more likely to die from that cause if their tails were cut.

Mr. CORNISH said in Scotland they never cut the tails off the highland sheep; and the long-tailed sheep of the mountain breed were very prolific.

The CHAIRMAN said whether they were agreed or not as to the desirability of this practice, he was sure they were all very much obliged to Mr. Ferris for the interesting and able paper which he had read to the meeting.

QUARTER-ILL IN CATTLE.

At a meeting of the Newcastle Farmers' Club, Mr. HENDERSON, of White Lea, read the following paper: I make no pretension to veterinary-surgery, but I have saved a great number of young cattle attacked by the quarter ill, and some of them in the last stage of the disease. The prevention and cure of this disease are so simple, that any intelligent and active person can easily carry out the instructions I have to offer in this matter, and my experience warrants me in saying that if these instructions are carefully attended to, they will be very seldom unsuccessful. But, first of all, I must endeavour to explain the nature of the stomach. The first stomach is the great belly, which receives the food after it has been slightly chewed. The second is called the honey-comb, and is so closely connected with the other that it may be said to be a part of it. I have had several young cattle that have died of the quarter ill, and the last three that died I opened. In the first case, there were, before death, no symptoms of wind contracted in the bag; it was hard to the touch, as if over full, and when I opened the stomach I found the first stomach so tightly wedged that there was no room to get my finger between the membrane and the unchewed food; and in the strait or narrow passage between the first and second stomachs, the food was so dry and hard that I could crumble it into dust between my fingers. When skinned there was not much discolouration in the hind-quarters; the reason of that is, that it had not commenced to fill with wind, or it had got the wind passed; but about the neck and shoulders there was a complete gore of black blood. The other two were in a different state before they died: they were swollen in the bag to a large size, and the hips were hoven up and in a crackly state when touched with the fingers. After death I opened them, and found them the same as the other, with full stomach, and pressed tightly against the artery and lungs. And when skinned, between the skin and flesh, all over the body was in a state of gore and frothy blood. This frothy blood is the blood and wind working together beneath the skin, and that is the cause of the crackling you find in the hips. I need not tell a farmer what will overload a beast's stomach. Young cattle will take it at any season of the year, and it depends greatly upon the farmer himself how he feeds and looks after his cattle. It is four years since I discovered the cause of this disease, and although there may be many farmers who know this cause as well as I, yet there are some who do not, and to such I cheerfully offer the results of my experience. Many persons think that this disease is infectious, but after I was satisfied of the cause of death in the worst of the three cases before-mentioned, I laid the carcase in the field, where all the young beasts were going and smelling at it every day, until the dogs picked its bones, and none of the cattle took the infection. When you ask a farrier what is the cause of the quarter ill, he will say it is a stagnation of the blood; but he does not tell you what it is that stagnates the blood; and any one knows that when a beast is found in the state above described, there is then no time to get a doctor, for the beast may be dead before he arrives. I need not say anything more as to what will stop the action in a beast's stomach, for any sort of dry food will do so when the animal does not get water sufficient along with it. The great injury is done when the stomach being full of dry food, the beast takes too much water upon it after fermentation has commenced. When you find your beast in the state already described—that is, when it looks dull, sticks out its head, moves stiffly, is afraid to turn round, and is swollen—you may be sure, from these symptoms, that there is something wrong in the stomach. Suppose it is not swelled, the first thing for you to do is to give a plentiful supply of oil, not over large a hornful at a time. You may give as much as a quart before it will dissolve the contents of the stomach, and then, immediately after the oil, give to a large beast $\frac{1}{2}$ lb. salts, 2oz. salts of tartar, and rub the chest and neck with mustard and turpentine, or the receipt No. 1 lotion. When the beast is swollen, the first thing to be done, before you begin to tease it with putting the drink into it, is to stick it in the bag, the same as you would stick a cow when she has a turnip in her throat—that is, half-way between the huck and

rib, and about three inches below the loin; then give the medicine above mentioned. When I find that the salts of tartar do not take the wind down quick enough, I give the following: 1 pint of water, then 1 drop sulphuric acid into the water till it becomes of the acidity of vinegar—say, twenty or thirty drops; then I put it into the horn or bottle, and when ready to put it into the beast's mouth, add $\frac{1}{2}$ oz. volatile salt powdered, or spirit of sal ammoniac, and give immediately whilst effervescing, and rub all the quarters with turpentine and mustard, or the lotion No. 1. About five days after, if the beast is stiff and sore, use the mustard again, or No. 1 lotion; keep the animal warm, and give linseed jelly, adding to every quart about a teaspoonful of gentian, root powder. Afterwards, if the beast seems to be dry in the skin, rub it along the back with Galipoli oil. This oil is also a perfect cure for lice on cattle. Some may say they have had a beast that died of quarter ill, and it did not ail anything in the stomach; they will say that it started in the leg or some other part of the body. It is very natural for them to think so, because they have never observed it in the first stage of the disease. Some, indeed, think very lightly of a beast standing swelled; they think it is over-full—it will soon go off. Perhaps it may go off; but in the meantime the heavy pressure on the artery forces a superfluity of blood beneath the skin—in fact, it goes all over the body and congeals in the weakest parts, and if allowed to remain in that state for a few days mortification sets in. As soon as this is discovered, use the remedies described; but if you find the beast lame and sore to the touch, put setons in the hips and chest. The common packing-needle threaded with a woollen cord will answer the purpose. Run it through under the skin; tie the cord into a loop, and wash it every day with turpentine or any stimulant, and rub well along the back with blister No. 1 or mustard lotion, and keep the beast well wrapped up. I append a few useful receipts, the ingredients for which every farmer should constantly have by him: Receipt No. 1.—To make black oil or sweating lotion: $\frac{1}{2}$ pint of linseed oil, 1 gill of turpentine, 2oz. sulphuric acid, to be dropped in till it boils; add the turpentine and oil together, then drop in cautiously the acid; mix in a strong vessel, as it boils very violently. No. 2 is adapted for any swelling or to rub on corns, udders, or any sprains: $\frac{1}{2}$ pint of spirit of wine, $\frac{1}{2}$ pint of vinegar, 2oz. of oil of regnum, 2oz. of crude ammonia or spirit of ammonia; dissolve the ammonia in a gill of warm water, then add the whole together in a bottle, and keep tightly corked. No. 3.—Ointment for foot-rot in sheep or hie in the foot: 3 oz. of tar, 3 oz. of lard, 1 oz. of bees' wax; melt them together, and, when nearly cool, add two grains of corrosive sublimate. No. 4.—To make green ointment, or what is commonly called "Stobart's Ointment": 3 oz. of sweet butter without salt, or lard; 2 oz. bees' wax, 2 oz. Venice turpentine, $\frac{1}{2}$ oz. red nitrated quicksilver, 1 oz. verdigris; stir in the two last when the other is melted and nearly cold. If over stiff, add more butter or sweet oil, or if too thin add more wax, and melt them over again. No. 5.—A drink for scouring in either calves or sheep, or for the flux in any animal: $\frac{1}{2}$ lb. of tormental root boiled in a quart of water, or, if tormental cannot be had, the inner rind of oak bark, 2 lb. to a quart of water (tormental if it can be had), and add the following: 1 oz. of Armenian bole, 1 oz. of magnesia, 1 oz. of rhubarb in powder. If the calf is very weak give a teaspoonful of black oil, No. 1, twice-a-day for a day or two, and if the above mixture stop the purging too quickly, give castor oil as required.

The CHAIRMAN said many gentlemen would have experienced this disease in their cattle. He had seen many instances himself; and it was always considered most doubtful whether the animal attacked could be recovered or not. The general opinion was that the disease arose in the stomach from too suddenly giving rich food after having been kept in a poor condition for some time previously, and was more of the nature of inflammatory fever as it arose up to the stage in which Mr. Henderson described it. Sometimes he had seen his neighbours remove their cattle likely to be affected from a rich field of clover, for instance, where they were likely to

get too much rich food, into a bare pasture, which had a very good effect in reducing the surplus of food which they had had. As Mr. Henderson said, the disease seemed to begin in the stomach: the quarter seemed only the seat of the disease, and the real seat was probably in the stomach. What sort of oil did Mr. Henderson give them?

Mr. HENDERSON: Any sort of oil. The case last Friday was brought on by a young beast eating very much heavy dry turnip tops. Mr. Reid sent for him. The beast was swollen most fearfully, and rubbing it along the back sounded like paper crackling, and also down its hips. The air and the blood were working together under the skin and flesh; that was where the quarter ill was. If you got the stomach clear and the frothy blood away, that was all you wanted.

Mr. ARMSTRONG had seldom heard of any beast being cured.

Mr. HENDERSON: I have cured seventeen decided cases.

Mr. ARMSTRONG: I am very glad to hear it. It will be the most useful thing we have had for a long time.

Mr. JACOB WILSON: What proportion of patients have been cured?

Mr. HENDERSON: I have cured every animal yet. I have not lost one. I will tell you of one case. I lost a beast for two days. It was a long way advanced in the disease. It was lost in the wood, and it had got home probably with the other beasts, and was lying at the outside when I found it. The whites of its eyes were turned up, and it was blown so full that it could not move one way or another. It was blown in the hips, and when I cut it in the hip with the needle there was nothing but black blood came out. He worked all night with it; but it was worth £5. He would not like to say he could cure another so far advanced; but no farmer needed to let his cattle get that far if he watched them properly. If he saw them every day he could cure them by the instructions in that paper, and then by stimulants. He considered that common sal ammoniac was quite sufficient to carry off gangrene. It was only in the skin, not in the flesh.

Mr. ARMSTRONG: It would generally seem to affect the flesh.

Mr. LITTLE (Vigo House): It is generally confined to young cattle; but if the reason assigned by the reader of the paper be a correct one, cattle at all stages of their existence will be liable to take it.

The CHAIRMAN: Occasionally they do.

Mr. LITTLE: Very seldom.

Mr. HENDERSON: I have had beasts from a month old.

A MEMBER: I had one three years old, which died of it.

Mr. HENDERSON: They are very exceptional cases.

Mr. JACOB WILSON said he had gone there that afternoon rather by accident, and simply as a listener, and one who wished to gain some instruction, which necessarily would fall from a paper of that importance. He must say that the matter contained on that paper was of considerable value to the agriculturist generally, although he should be rather prepared to express his doubt as to proving a panacea for all the evils represented in it. It was a question which he had personally given some attention to, because in his young and aspiring days—(laughter)—rather imagining that one could go before the common times, he thought he could cure this disease, and he had a try at it. He took a young bullock, eighteen months old, which was about the usual age at which the disease might be said to make its attack—from 12 to 18 months. There was no doubt he took the animal at a stage when the symptoms were the most marked, and, perhaps, in the most chronic stage, that was, when the quarter itself gave way. Like the gentleman who read the paper, he sat up all night also (laughter). He used remedies in the shape of hot fomentations, and he actually succeeded in driving the disease from that quarter; but it was simply to drive it to another. There was no doubt that, although the direct symptoms of the disease lay in a local part, and exhibited themselves to the eye in some quarter of the animal, yet the seat of the disease was the stomach. He perfectly agreed with Mr. Henderson on that point; but as to the cause, he thought they would generally notice that the disease occurred either in the autumn or the spring, most frequently, probably, in a clover fog, slightly frosted, or perhaps in the case of young cattle grazing out on turnip tops. But he thought, with all due deference to the gentleman who had introduced the subject so ably, that the experience of this country would go to teach us that it was

not a disease which was usually cured (Hear, hear). He quite admitted that there was a possibility in everything. There was a possibility that the information contained in that paper, which possibly up to the present time had been withheld from the public, might hereafter furnish receipts which might be of advantage to the farmers of this country, and might prove a panacea for the disease. He had his own doubts upon that point; but he believed that most practical men would tell them that they might take for dead any animal attacked with the disease.

Mr. HENDERSON: Well, you have the prevention there.

Mr. WILSON thought that a very great deal of the importance of cattle management upon improved systems would also furnish them with the means of preventing this disease. He believed that no better general principle could be observed than the use of something which kept the stomach in a uniform way; he referred to a healthy good oilcake, or linseed, which kept the stomach uniform and not constipated. He made these remarks simply to encourage discussion, in which he was glad to lend a helping hand. He simply said that in this particular case prevention was better than cure.

Mr. HENDERSON: You are left at liberty to think whether this is a prevention or not. I know I have not lost one since I used it.

Mr. WILSON added that he took this precaution every autumn or spring to physic all his young animals, and to seton them all.

The CHAIRMAN: I was not aware of that.

Mr. WILSON: The seton is a precaution; if they happen to get ill with wind below the skin they may get vent there.

The CHAIRMAN: Do you apprehend that particular districts are liable to it?

Mr. WILSON: It looks very like it.

The CHAIRMAN: Is it epidemic or infectious?

Mr. WILSON: I think not either. It is very much confined to districts, and probably to districts which may attract a large amount of moisture, and, therefore, a large amount of hoar frost.

Mr. HENDERSON: In dry seasons I have had most quarter ill.

Mr. WILSON: There is always most moisture in the atmosphere in a dry season.

Mr. HENDERSON: A dry season overloads the stomach.

Mr. WEEKS (Ryton) said he had lost several cattle by quarter ill, but it was always in the spring—never in the autumn. He had two farms within 300 yards of each other, and the disease was on one and not on another. Last year he put setons, and they died.

Mr. HENDERSON: How did you feed them? Perhaps in one place on straw, and in the other a plentiful supply of turnips?

Mr. WEEKS: There may be something in that.

Mr. HENDERSON: If the beasts get a plentiful supply of turnips, they never would have quarter ill.

Mr. WEEKS: At one place we have; there may be something in the field.

The CHAIRMAN: What do you attribute it to?

Mr. WEEKS: Whenever I hear of one of the young beasts being ill, I have always considered it a dead animal, and it has always proved so.

The CHAIRMAN: I hope a brighter day is coming.

Mr. JOHN ROBINSON (New Town Hall) said he was not very much experienced in agriculture, but he should state his experience. The farm which he had now was before in the possession of a person who was in the habit of turning his cattle into the fields in the spring to roam about. They very often got starved, and suffered very much from the cold atmosphere. He had several died from it, and he (Mr. R.) told him that it was from letting them go out too much into the cold: being so young, they could not stand it, and should be kept in the folds. He adopted the advice, and had not near so many casualties. He (Mr. R.) had now had the place for two years; he had had as many as 100 young cattle, and he had been very particular in keeping them warm, and in feeding them well; and they had never had a single case of quarter ill.

Mr. HENDERSON: Keeping them properly fed is a great point.

Mr. ARMSTRONG: But curing them after they have the disease is a greater point. Prevention is better than cure.

Mr. HENDERSON: There is only a road breadth between me and Mr. Weatherspoon, and there they have them dying continually. He has had 14 died in two or three years. He has fed with nothing but straw and hedge backs. Nothing but dry food causes quarter ill. It accumulates in the stomach, and the beast will not drink water.

Mr. LITTLE (Vigo House) thought local formation had something to do with it. On the old red sandstone he had never lost one, whereas a tenant going to a place where there was free sandstone lost some every year. He had also observed that down one side of a river's bank cattle were never affected with it; while on the other it frequently happened.

He referred to the river Till. He could also endorse the sentiment of Mr. Wilson that prevention was better than cure. With all deference to the person who had read the excellent paper, the great cause was that young cattle got a check in their progress, and then afterwards made blood too fast when they got on to improve more rapidly.

Mr. BELL (Cramlington) moved, and Mr. ARMSTRONG seconded a vote of thanks to Mr. Henderson for his paper, and it was carried unanimously.

On the motion of Mr. WEEKS, it was resolved that the paper be printed and circulated among the members; and a vote of thanks to the chairman concluded the meeting.

AGRICULTURAL CUSTOMS.

At a general meeting of the Midland Farmers' Club, held in Birmingham, Mr. W. FOWLER said: "Customs of the country," in the ordinary acceptance of the term, by which is understood that traditional custom which must regulate the mode of quitting a farm when no written agreement exists to the contrary, might safely be pronounced a delusion and a snare. It resembled an *ignis fatuus*, which, when we almost seemed to grasp it, suddenly disappeared, and left us floundering in doubt and darkness. Not only does the custom itself vary, in the most perplexing manner, as between one county and another; but even adjacent parishes, and sometimes even private estates have customs of their own, all more or less obscure, known only to few, and to them imperfectly, always more or less involved in doubt, depending upon endless collateral circumstances, and always modified and governed by the one invariable custom, that in the absence of an agreement to the contrary a tenant is entitled to quit on the same principle as that upon which he entered. Even this one well-known principle, though universally admitted, and recognized in courts of law and elsewhere, is constantly misunderstood and misapplied. It is a very common mistake to suppose that, assuming a man may leave as he enters, after having occupied a farm for a long series of years, during which time, if he is only a very ordinarily decent tenant, he cannot fail to have got his farm into a good state of cultivation, however wretched may have been its condition when he entered, he is nevertheless justified, in the last years of his tenancy, in as far as possible reducing everything to the same state of desolation as that in which it may have been left by the previous tenant. He apprehended that this universally recognized principle would bear no such unreasonable construction. He understood it to mean simply this: that if a man enters upon his farm at Lady-day, at Lady-day he shall leave it; that if when he entered the previous tenant took the whole or any given proportion of the wheat crop, on the same terms shall he quit; that if the hay and straw were taken to by him at a consuming price, so he shall leave them for the in-coming tenant; that if at the commencement of his tenancy he was permitted to enter, say at Candlemas-day, to plough and sow the spring crops, so shall he grant the same privilege to the in-coming tenant, and so on in regard to other similar matters. But to suppose that, because the previous tenant left the land foul, and the whole farm in a desolate condition, a tenant would be justified, after years of occupation, in quitting the farm under precisely similar circumstances, was utterly unreasonable. There was, moreover, this further difficulty—that nineteen times out of twenty, after a moderately long occupation, no living man, except the tenant himself, knows the circumstances under which the tenancy commenced. Even the time of entry upon the farm—a most important circumstance, in the absence of a written agreement—is frequently a matter of doubt; and the out-going tenant is often in a position to set up almost any kind of claim that his conscience will allow him to make. These difficulties might all be obviated by the simple expedient of having a written agreement which shall specify the time of entry, the amount of rent, and the terms on which the tenancy shall be terminated; and these were, in his opinion, almost the only real uses of an agreement. No covenants on earth, however stringent, would make a man farm well; but if an agreement were carefully drawn, it would at least prevent

the possibility of any serious dispute at the termination of the tenancy. The custom of relying upon the "custom of the country," instead of a written agreement was, in his opinion, "a custom more honoured in the breach than the observance." Having said so much upon the general aspect of the question, he proceeded to the local customs prevailing in the immediate neighbourhood. On the Staffordshire side of Birmingham what was generally known as the "Staffordshire custom" almost universally prevailed—that was to say, the tenancies nearly all terminate at Lady-day; the out-going tenant taking away two-thirds of the fallow wheat and one-third of the turf wheat, and being paid for cloverseeds, winter ploughing, carting, and spreading manures, pleaching hedges, &c., and also the consuming value of any hay, straw, or roots which may be left on the premises. This was, upon the whole, a convenient and equitable mode of quitting, and it was one that he introduced wherever the opportunity occurred; and where it was combined with a written agreement which required the out-going wheat crop to be taken at a valuation, and paid for by the in-coming tenant, it appeared to him to be almost entirely free from objection. He could not approve of any agreement or custom which did not give to the in-coming tenant the absolute and sole occupation of the farm from the day on which his tenancy commenced. Where this arrangement did not exist, difficulties and disputes were liable to occur. When the out-going wheat crop is not purchased by the in-coming tenant, the out-going tenant must reap the whole crop, and then the stocks of corn must be divided in the relative proportions belonging to each person respectively. Sometimes the out-going tenant will claim as fallow wheat two-thirds of that which may be grown after turnips. This he always resented, because the turnip ground ought to be left for the in-coming tenant to sow with barley; and unless it should have been quite necessary to sow some portion of the turnip ground in order to make up the proper off-going quantity of wheat, he would only allow seed and labour, and even that unwillingly. The out-going tenant would sometimes claim to be allowed the consuming price of the straw of the off-going wheat crop, and this might become an extremely difficult question, because if he could show that he paid the consuming price of the wheat straw when he entered he would be entitled to the same allowance on quitting; and it must be borne in mind that if he is entitled to be paid the consuming price of the straw, it followed that he is entitled to consume it on the premises, if the in-coming tenant will not consent to give the price demanded for it. In his opinion the straw of the off-going crop should always be deemed the property of the in-coming tenant. Thus again, the wheat crop is held to be until harvest in the possession of the out-going tenant, who may lock the gates of the fields, and refuse to allow the in-coming tenant to hoe the wheat, even at his own expense. All these difficulties might be avoided by a written agreement. He was not aware of any special custom in Staffordshire with reference to a Michaelmas quitting. Customs, he believed, were much less common in that county than in Warwickshire or Worcestershire. In North Warwickshire there was, so far as he knew, no well-defined general custom. A man always leaves as he entered, and there were hardly two cases exactly alike. The majority of tenancies commence at Lady-day, but many also at Michaelmas. In the former case, when the Staffordshire custom is

not adopted, the out-going tenant generally takes the whole of the fallow wheat, paying sometimes a year's and sometimes only half a year's rent, tithe, and taxes upon the land on which it was grown, and receiving also the cost of seed and labour for the brush wheat. In other respects the conditions of quitting would be very similar to the Staffordshire custom. Sometimes the straw is left without compensation, and sometimes it is paid for at a consuming price. In the case of a Michaelmas quitting, the out-going tenant generally has the use of a room in the house, and in some cases the whole of the house, till the following Lady-day. In that part of Worcestershire lying near to Birmingham, there was a local custom, extending over perhaps five or six parishes, where the out-going Lady-day tenant takes the whole of the wheatcrop, paying to the new tenant 6s. 8d. per acre for the fallow wheat, and 13s. 4d. per acre for the brush wheat. Sometimes the out-going Lady-day tenant pays the half-year's tithe rent-charge to Michaelmas on the wheat land; but this is only where it is clear that his predecessor did the same. In fact, half the questions connected with the quitting, here and elsewhere, were determined rather by the alleged mode of entry in each particular case than in accordance with any recognised general custom. This was one of the great objections to relying upon custom for the manner of quitting a farm. It was almost a necessary result that in dealing with an out-going tenant who happens to be a troublesome or unprincipled man, the in-coming tenant is forced to pay him on quitting far more than he is really entitled to, because, in most cases, the out-going tenant alone knows how he entered, and may allege anything he pleases, which would be generally very difficult to rebut, however unreasonable or improbable it might be. It is, of course, just as possible for the in-coming tenant, or the landlord if there be none, to be awkward and unreasonable too. Having referred to existing customs, it might perhaps be expected that he should offer some suggestions on the possibility of amending them. He felt this to be very tender ground; but he should bring the paper to a very lame and impotent conclusion if he did not venture to give some kind of an opinion upon this, the most important feature of the question. He would state at the outset that he did not desire to see the "custom of the country"—meaning thereby the unwritten custom—extended beyond its present limits. Any allowances for improvements, of whatever kind they may be, should be the subject of a carefully-written agreement, or great difficulty and mischief may arise. With the proviso that no man shall be entitled to such allowance by virtue of any alleged custom, he should be glad to see, within reasonable limits, a general practice prevail of compensating an outgoing tenant for any outlay on his part from which he has not derived a fair and adequate return. It was obvious, however, that the details of such an arrangement must be carefully considered, and the limits accurately defined. It must not be forgotten that the landlord had some rights in the matter; and, moreover, there was the incoming tenant, whose interests were as much entitled to fair consideration as those of the tenant who was quitting the farm. With regard to permanent improvements of all kinds, such as new buildings or draining, these should, if possible, always be done by the landlord, the tenant paying an increased rent by way of interest on the outlay. Where a landlord is either unable or unwilling to expend money on such objects, permission in writing should be asked and given to the tenant to execute these works, with the understanding that the outlay shall be considered as spread over a given number of years, and that, if the tenancy shall terminate before that time has expired, a proportionate part of the cost shall be paid by the incoming tenant. Such permission would of course not be given unless the necessity or advantage of the proposed outlay was apparent; but if a tenant desired to erect buildings which to the landlord did not seem necessary, there could be no reasonable objection to give permission to remove them at the end of the tenancy if the new tenant declined to pay for them. A legal difficulty might arise in certain cases where the landlord, being only tenant for life, could not bind his successor; but this might be easily remedied by legislation. With regard to any allowance for purchased manures, or oilcake, or other food consumed by cattle, this was a question purely between the out-going and in-coming tenant; and he saw no objection to making it part of the ordinary agreement for letting a farm that, under certain conditions, and within defined limits, a reasonable allowance

should be made to the away-going tenant on quitting his farm. It was essential, however, that this system should not be carried too far, and that such allowances should be carefully restricted, so that the in-coming tenant might not have to pay for anything from which he would not derive a clear and palpable advantage. Any allowance for manures ought to be strictly confined to such as are used not in lieu of, but in addition to that which arises from the consumption of the produce of the farm. No manure should be allowed for, under any circumstances, which has been used upon corn crops; and the allowance, whatever it may be, should be confined to the last year, or at most the last two years of the tenancy, except in the case of bones applied to grass land, the advantage of which would extend over a period of several years. It would be necessary also that the character of the manures, and the proportion of the cost thereof to be allowed for, as well as the kind of crops on which they may be used, should be carefully specified. With regard to cake and corn consumed by cattle, he was willing to admit that some allowance might fairly be claimed, but the proportion allowed for ought to be small, and the allowance should not go back further certainly than two years, and he was rather inclined to think only for the last year of the tenancy. Let it be clearly understood that the object of such allowances was not merely to enable an off-going tenant to put a large sum of money into his pocket when he quits his farm, but rather to promote a better system of cultivation, and to provide that the in-coming tenant shall pay his fair proportion, but no more, for the advantage which he will undoubtedly derive therefrom. Such a system, however, if carried to an undue and unreasonable extent, might entail an unfair burden upon the in-coming tenant, and ultimately involve the landlord in most unpleasant consequences. It was every man's duty, and ought to be his pride, on quitting a farm, to leave it in such a state that he would not himself object to take it; for in farming, as in every other vocation in life, "Do as you would be done by" was the truest principle of action; and the soundest maxim, "Honesty is the best policy."

Mr. BALDWIN said the reason why agreements were not more general in times gone by was that the farmers were possessed of so little education that they did not know how to draw one up, and could not understand it when it was drawn up. But they were now better informed; and he was convinced that no interest would benefit more by the diffusion of knowledge than the agricultural interest. Farmers meant for the future to have their fair share of the profit arising from the cultivation of the soil—not in an offensive sense, but in order that all might strive together to promote their mutual interests. He was satisfied that a written agreement was necessary between landlord and tenant in every case; and that it should be simple and fair to the in-coming as well as to the out-going tenant, and also to the landlord.

Mr. LOWE said the management of farms was a subject of great interest, not to one, but to three classes—namely, the landlord, the tenant, and the public. The landlord was, generally speaking, the most favoured party. This was attributable, not to the selfishness of the landlords, but to the good-nature of the farmers themselves, who in times gone by had not sufficiently exerted themselves for their own benefit, and in their own particular interest. They had taken things for granted more than, as men of business, they were quite justified in doing; but with the spread of education they would, he hoped, become wiser. Some twenty years ago a Royal Commission was appointed to inquire into the subject the club was then discussing; and the suggestions which were contained in their published report were in a great degree similar to those which Mr. Fowler had advanced in his paper. The great desideratum was a thoroughly mutual and equitable agreement between landlord and tenant, nothing being left to custom.

Mr. FORD could not agree with Mr. Lowe and those who thought that the public had any right to interfere in questions as to the relations of landlord and tenant. He was fully impressed with the importance of having agreements. The chief consideration, however, was not the agreement, but the terms of it. If an agreement were clogged with all kinds of old-fashioned restrictions as to the amount of acreage under different crops, the succession of crops, and such-like, he thought it had better not exist at all. The object should be, not to instruct the tenant how to farm his land, but to tell him how he must leave it.

Mr. HORLEY said that, in regard to compensation for unexhausted improvements, the consumption of cake, &c., an average of several years should be taken, and not the last year only. The outgoing tenant, too, should not be allowed to spend more during the last year of his occupancy than his previous average. Nothing would do so much for the farming interest as the establishment of a fair system of compensation to an outgoing tenant for any outlay of which he had not reaped the benefit. In Lincolnshire this kind of agreement was almost universally the rule; and he attributed the very superior cultivation of that district to the beneficial working of such agreements.

Mr. WRIGHT thought that Club was pretty much in the same position with respect to the subject then under discussion as it was on its formation five years ago. They appeared to him to be only doing what, as had been admitted those philanthropic persons who were anxious to lessen the poverty, ignorance, and crime to be found in our great towns were doing—simply scratching the surface. No scheme of compensation for unexhausted improvements would, he believed, be found sufficient fully to develop the agricultural resources of this country, or to place the farmers in a position which would induce them to employ in the cultivation of the soil that amount of capital which was necessary if its productive power was to be increased to the fullest extent of which it was capable, and which it was most desirable should be done, not only for the benefit of the farmers themselves, but of the whole community. He could not agree with those gentlemen who contended that questions of this nature did not concern the towns. On the contrary, he maintained that the towns were interested in a great degree, not only in the means necessary to ensure the increased production of the soil, but in regard also to the employment of labour in agriculture. He coincided in the opinion expressed by Mr. Bright some time ago, to the effect that the land does not, and has not, employed its fair share of the labour of this country. The consequence of this had been that large numbers of the labouring classes were driven from country districts into the towns, where the condition of masses of the population, as some gentlemen present well know, was wretched almost beyond belief. We were now legislating on the tenure of land in Ireland, and proposing to give the sanction of law to some of the customs already existing there; and, where no customs existed which afforded protection to the tenant, to impose a penalty for arbitrary eviction. In the course of last year attention was drawn to a case which would hereafter be known as the Mansfield case, in which, owing to circumstances to which he would not on that occasion further allude, a highly respectable tenant had notice to quit. He had occupied two large farms for a number of years, and the loss in the value of his stock, in consequence of the forced sale which necessarily took place, was estimated at at least £1,500. Now he (Mr. Wright) would ask any farmer present whether, if he were compelled to leave his farm at six months' notice, and, having no other farm to go to, his stock had to be sold, he would not be very much in the position of the farmers in many parts of Ireland? A farmer without a farm was almost as helpless as a fish out of water. No compensation on the principles suggested by Mr. Fowler would meet the case to which he had alluded, and no system under which it could occur was likely to attract sufficient capital to the cultivation of the soil. In discussions of this kind it was all very well to talk of the application of the commercial principle, as his friend Mr. Lowe did; but it must be borne in mind that the state of tenants in town and country was widely different. In towns, a man had usually the choice of a number of shops, offices, or manufactories; but in the country, if a farm were vacant, there were a dozen or more applicants for it. At the same time, a farmer could not make his own terms, for, as Mr. Fowler would bear him out in saying, on nearly every estate there was a special form of agreement to which the applicant for a farm must bind himself if he became a tenant. No form of agreement at present in existence, he repeated, was sufficient to justify a farmer in using increased capital on his farm; and, while he did not ask for fixity of tenure, he contended that, either by leases or in some other way, the position of the tenant farmers of England must be rendered more secure and satisfactory than it had hitherto been.

Lord LICHFIELD agreed with every word of Mr. Fowler's paper so far as it went; but he was a little disappointed at

finding that that gentleman had not had sufficient time to enable him to prepare a paper which should touch, not merely upon the customs in the immediate neighbourhood of Birmingham, but those existing throughout England. At this time, when the whole question of land tenure was occupying so much attention, such a paper would be most valuable. There was no doubt that, in regard to the question of compensation for unexhausted improvements, a very strong feeling was prevalent amongst tenant farmers, and sometimes amongst landlords, that some system, as nearly uniform as possible, should be generally adopted. He thought all present would coincide in this; but the question was as to how it could be brought about. Many suggestions upon this point had been made. Some persons advocated legislation; but legislation upon this subject he had always maintained to be a very difficult matter, although to a certain extent he was in favour of it. If they were to legislate, the first step was to ascertain whether they had any customs existing in any part of the country, and then to combine them in such a manner as to secure something like a practical measure. But in dealing with Mr. Gladstone's attempt at legislation with regard to Ireland, the House of Commons were going to work with apparently the utmost possible ignorance on the whole subject; and they were legalising—at least they thought they were legalising—a variety of customs, none of which anybody could define, none of which anybody attempted to understand, and none of which anybody expected to see any legislation affect. He protested in the strongest terms against the way in which this Irish legislation was being carried out, because it showed what he considered a want of intelligent consideration for those upon whom they were going to apply it. He had listened with attention both to the paper and the discussion, and had not heard a single practical suggestion. The tenour of the remarks which fell from Mr. Wright was evidently in favour of legislation; but they did not point out the manner in which it should be applied. So far as agreements were concerned, he had done his best to procure the adoption of one which was reasonable, and suited to the requirements of the country at large. He was only sorry that more interest had not been taken in the subject, both by landlords and tenants; for if such had been the case, a tolerably uniform agreement would by this time have been in operation. Mr. Fowler had said that an agreement should be as simple as possible. It must, however, be remembered that if you had an agreement, which, after all, was to be interpreted at the end of the tenancy by arbitrators, you must have something in that agreement to show the arbitrators how to act. So long as agreements provide that the tenant during the continuance of his occupation shall be free to make the best use he can of his land, you could not be too particular in laying down the principle upon which the arbitrators are to act when the tenancy ceases. His own agreement had been very much discussed; but he had never heard that any practical amendment of it had been proposed. He had told his own tenants to try to pick a hole in it; and it had gone through the ordeal so satisfactorily that he had seen no reason to make any alteration. He wished Mr. Wright had intimated what other course ought to be pursued. What that gentleman evidently wished for was fixity of tenure, either by leases or some other means. To give complete fixity of tenure the leases must, of course, be compulsory, which entailed the further question of Government valuation. He thought, however, they would all admit that any attempt to make leases compulsory would be simply a farce, unless the rent was also fixed by Government. He knew of no way out of the difficulty except the one he had always suggested as being really sufficient, provided the landlords and tenants throughout the country would agree thereto—namely, to adopt a system which shall give such ample and full compensation under the agreement for everything that the tenant can in justice ask for that it could not possibly be the object of the landlord to turn him out so long as his farming was good.

Mr. MASFEN, the Chairman, regretted that Mr. Fowler had not gone more deeply into the subject, and said he would especially have liked to hear his opinion upon the agreement to which the prize of the Royal Agricultural Society was awarded. A twenty-one years' lease meant, in his opinion, seven years of improvement, seven years of keeping up to the mark, and seven years of deterioration. He thought nothing was more fair than that the in-coming should pay the out-

going tenant for any improvement the latter might have made during his occupancy. All restrictions as to rotation of cropping were very irritating; and the greater the freedom allowed to the tenant in these matters the better. In order that the

subject might be thoroughly discussed, he should wish the consideration of it to be adjourned to some future time, when he would be prepared with a schedule of what he thought was fair compensation from the in-coming to the out-going tenant.

FARMING IN SOUTH AMERICA.

Mr. E. W. LOGGIN, brother of the Secretary of the Mel-plaish Agricultural Society, who has had some experience in Uruguay, recently read the following paper:

The republic of Uruguay is not an agricultural, but a grazing country, but yet grain is grown there to a small extent. Wheat, Indian corn, and barley are grown, but oats do not thrive well. The land having been for so many years used simply for grazing, does not require manure. The climate is very variable, sometimes a great deal of rain falls in summer, and at other times none at all. The winter is also subject to some changes. It is also very hot in summer, and for months together, but never very cold in winter, the glass seldom going below freezing point, and even then I have never observed ice to last after mid-day. The land is ploughed by oxen and a plough "of which I have made a rough imitation for your inspection," and I really believe that Adam, if ever he used a plough, must have used a very similar one (laughter). Of late years English and American ploughs have come greatly into use, but it is astonishing how difficult it is to persuade some of the natives of their advantages over their own. Horses are but seldom used to plough. They are very small and have not sufficient weight to throw into the collar, and further are found not to stand the same amount of work, day after day, that oxen will. The crop is reaped with a hook and stacked as in England, but it is afterwards thrashed in a very primitive way. A circular space is enclosed by large posts, very high and rather close together, and these posts are secured one to the other by a wooden border, running all round the fence. The corn is then placed on the ground and a troop of mares, which are bred in great numbers there, and are quite unbroken, are then driven in, and the gate being closed are driven round and round, treading out the corn. This is evidently a very old way of thrashing, as one of the commandments to the Israelites was, "Thou shalt not muzzle the ox that treadeth out the corn." The only difference from the commandment being mares instead of oxen. Oxen are also used for the purposes of draught, where heavy loads are required to be taken, being yoked to a cart running on two wheels, six oxen to a team. These carts, if possible, even more clumsy contrivances than a Dorsetshire waggon. The oxen will travel with these carts containing a ton and a half to a load, at a rate of 20 miles a day, for weeks together, resting, of course, on Sundays, and cross rivers and streams, and all descriptions, without bridges. I will now come to a more important branch of farming in that country, viz., cattle farming. A farmer there rents or buys his land by the square league, and, in order to stock it, buys any quantity of cattle he may require by the lot, consisting sometimes of several hundreds, or even thousands, which are worth, one with another, about sixteen shillings a head, the seller being allowed to draw off a certain portion of fat cattle for market. These cattle are all branded with a red hot iron, each farmer having his own particular brand, for which he had to take out a certificate, and on purchasing these cattle they are all shut into a large enclosure, or *corral*, as it is called in Spanish, the fence consisting either of wood or stone. Each animal is then lassoed by the horns by a native, another lassoing it by the legs, and throwing it down. It is then rebranded by the former owner. This is called "countermarking," and is equivalent to no mark at all. The purchaser then places his own brand on. When they are all branded they are generally left shut up all night, and the following morning are taken home, where, when they have fed a few hours, they are again shut up for the night, and let out in the morning to feed, being watched by men on horseback, to prevent their escaping. This is continued for two or three months; after that, instead of shutting them up at night, they are gathered every evening on the same spot, and watched until they lie down, and are then left

until the following morning, when they are again collected for a short time. After a few months they are considered sufficiently accustomed to the ground to stay without much further trouble, being gathered once or twice a week, at the option of the owner. A fat cow will fetch about 32s. and a fat ox 40s. They are either sold, if very fat, for market, or if only moderately so, are sold in large troops to make jerked beef, of a sample of which came to England a few years ago, and I heard it fetched 3d. a pound. It is very dry and hard; very like old shoe leather, with less flavour and far uglier to look at (much laughter). Beef in the towns is worth 14d. a pound. Mares are kept much in the same manner, but are never ridden, being kept entirely for breeding purposes, and moreover it is considered a disgrace to ride a mare. There is one curious fact I have often observed, and it has also been noticed by others, that a stallion will frequently drive all the fillies of his own getting out of the troop as soon as they are furnished, thereby instinctively preventing that in breeding so ruinous to all stock. I will now give you a short description of the manner in which sheep are fed. They are run in large flocks of from one to three thousand, and are taken care of by a man on horseback. They are gathered on one spot at night, and are, by constant watching for a month or so, taught to stay there, and are not allowed to go off to feed in the winter until the dew is quite off the grass, as it is supposed to make them very thin. The rams are put into these flocks (which generally have a considerable per centage of wethers) early in October, thereby bringing the lambing on in March and April. Forty per cent. of lambs to a mixed flock is considered very good, but a flock consisting entirely of breeding ewes will give from 70 to 90 per cent. The custom was to have two lambing in a year, one in March, being the autumn lambing, and one in September, being a spring lambing, the 25th of December corresponding to the 24th of June here, or in plainer terms summer here being winter there, but it is now generally allowed that one lambing is more advantageous, bringing as large an increase, in the long run, and the sheep keeping in better condition. The sheep are a cross of the original sheep of the country, a very loose long woolled sheep, something like the Black-faced sheep in Scotland, regarding the fibre of the wool, but I should say inferior in every other respect, being almost impossible to fatten. These sheep were crossed with the English Leicester and Southdown and the pure Merino, but the English blood being found so liable to scab, the Rambouillet took their place, producing a very fine, although not a very long wool, and plenty of it, an average flock, "shearing all the shears can be got into, both small and great," yielding an average of 4lb. a fleece. These sheep, ten years ago, were worth 12s. a head after shearing, but to-day would, I dare say, fetch 12 pence. Saxony rams have been introduced of late years, and have proved very remunerative, being very fine and close in their wool, and shearing up to 15lb. a fleece. Ten years ago fine wool was greatly in demand, and good mestizo wool ("Mestizo is half-bred merino") fetching in Monte Video 10d. to 1s. a pound, but this class of wool is not nearly so much in demand now, a longer staple being preferred, and consequently wool has fallen to 5d. per pound. Shearing costs about five farthings a sheep, a ram twopence, but the farmer has to keep the shearers during the shearing, and find men for catching, tying, and bagging or baling, as the case may be. A fat ewe will fetch 2s. 6d., and a fat wether about 3s. 4d., for market; a good average wether reaching to about 14lb. a quarter, I should say, although I have seen them reach 17lb.

Mr. Loggin then exhibited the plough to which he made reference in his paper, and illustrated the manner in which it was used.

STAINDROP FARMERS' CLUB.

At the last meeting, Mr. T. F. Scarth, the president, in the chair,

Mr. NEASHAM read a paper on "The Hiring of Farm Servants, and the mode of Paying them." He said: Most of you will, I think, agree with me that the time of changing our servants in this district—that is, at May-day, is attended with some inconvenience, as the turnip season is then at its height, and every hour lost at that season is of great consequence, not only in the labour of the man, but his wife also, who cannot be expected to leave her house and family just when they have removed into a strange neighbourhood, and have various wants to supply. In the Lothians, I believe, the 29th of May is the time at which the change is made, and in many parts of the country Michaelmas or Martinmas, which is not generally so busy a time, and when the labour of both man and wife can be better spared for a day or two. To change the custom of any country is always a matter of great difficulty, for farmers cannot at all times be brought to act together, when it is even for their interest that they should do so; and whether Chambers of Agriculture may not, after more important matters are disposed of, be the means of altering this state of things, and taking up such subjects as this is, I conceive, well-worthy the consideration of their members. There is another class of farm-servants—to the hiring of which I must allude—and that is of young unmarried men and women who are usually boarded and lodged in the farmer's house, and these, for the most part, are to be found at the ordinary statute hirings a few weeks before the term—a mode of hiring that has been strongly denounced by some people as tending to vice and immorality. I cannot, however, see how it could be otherwise arranged, so long as the changing from one master's service to another is at one and a fixed time in any district; for, if you adopt the plan of a register-office, which many recommend, their names should be put down some considerable time before the term-day, to admit of anything like adequate attention being given to the many applications that would have to be made, or for the masters to make inquiries as to their characters and qualifications. To many farmers, particularly those of a higher standing, this mode of lodging their men in the house cannot but be a source of constant annoyance and inconvenience, inasmuch as their house, under such circumstances, can scarcely be called their own. In many counties it is no uncommon practice in hiring their foremen, to require them to lodge so many young men in their houses, paying them a sum per week to be agreed upon; but this, of course, can only be carried out where the farms are large, and the dwellings on them sufficiently commodious. Much has been said and written of late on the subject of educating the farm labourer; and none of us, I presume will deny its great advantages so long as that education is directed to their moral and practical, as well as intellectual improvement. The mistake, I fear, is often made of confounding it with learning, and education proper is, for the most part, if not entirely, lost sight of; for if an agricultural labourer's boy is taught to read and write well, and to keep a correct and honest account in figures of what may be entrusted to him, that is, I maintain, in ninety-nine cases out of a hundred, all that will ever be required of or use to him. It cannot be doubted that in the present time, when new and improved implements, as well as steam, and machinery of various kinds, are annually introduced into the practice of agriculture, a few labourers are required possessing a more extended knowledge of mechanics and other sciences; but a boy whose mind takes a turn in this direction, will sooner or later show the bent of his inclination, and discover the means of improving himself therein. I will now pass on to the second part of my subject, viz., "The mode of Paying our Farm Servants," and in doing so would more particularly invite your discussion as to the relative merits of our own system, as regards the payment of our hinds in money (weekly or fortnightly, as the case may be), or of that adopted in other districts, of paying mostly in kind, and a part only in money. Our plan is doubtless attended with less trouble, and

affords the labourer the opportunity of going, money in hand, to supply his wants in the cheapest market; but I question very much whether it supplies us with as strong and healthy a servant as when he is paid monthly in kind. This year, certainly, on the score of economy, those districts which adopt the latter mode have had a decided advantage, seeing that all cereal produce, upon which they chiefly subsist, is selling at a low figure in the market. It will be admitted, I think, that farm wages have within the last 20 or 25 years advanced here something like fifty per cent.; and, with all this, we have not, it may be said, so contented, willing or industrious a class of men as formerly, nor one among which so much providence and self-denial is practised, for it is no uncommon thing now to find that, with wages averaging from 16s. to 18s. per week (including, I mean, such privileges as potatoes and a house, rent free), the chances are, the servant has to apply to the parish for relief if sickness or other casualty befall him for awhile, as there is seldom anything laid by, the whole of his wages having, in many instances, been spent, and that perhaps extravagantly, as soon as received; besides, when the men are earning so much hard cash, the wife cares little whether she goes out or not. I have made some inquiries respecting their system in Northumberland and other parts north of this, and really, in many respects, their hinds may be said to have little farms or menageries. But, with your leave, I will transcribe an instance or two. From the neighbourhood of Alnwick a friend of mine, who farms largely, writes: "The wages in this district are paid most in kind, with part money—a method preferred generally by both masters and men. The wages which a fair, good man receives in this neighbourhood are about as follows: 14 Winchester bushels of wheat, 24 bushels of barley, 12 of beans or peas, and 30 of oats; a cow kept on grass during summer, three single horse-loads of hay (two tons), with oat straw *ad libitum*; an outtake during the winter; in addition to these, men who have a cow get £4 in money; those who have no cow get 5s. per week without the £4; their house free, and coals led, but the coals themselves they pay for; a suitable garden and land provided to set 1,000 yards of potatoes; but since the disease most of them set only 500 yards, and receive £2 in money for the other half. A piggy provided to keep a pig, a privilege of which most of them avail themselves, by keeping two or three during the year. The hind is expected to find a worker, who is constantly employed (weather permitting), and generally a female, who gets 1s. a day throughout the year, except in harvest, when they receive from 2s. 6d. to 3s. per day. In instances where men prefer to be paid in money, they receive 15s. or 16s. a week, with house." With regard to the worker here mentioned, he, I presume, though my friend does not say so, paid the ordinary wages of a casual or "dotal" man. The money value of these privileges is something like equal to 16s. per week. Another correspondent, from Roxburghshire, where the labourer was paid in kind, stated that the sum total of what he received was equal to £33 8s. 4d. per year, or 13s. per week. One of the items was the keep of a cow, put down at £6, and 100 stones of oatmeal at £9 3s. 4d. Turning our attention southwards, we find in a late issue of the Royal Agricultural Society's Journal, from reports by Mr. H. M. Jenkins, that on Mr. Torr's farm, in Lincolnshire, the labourer gets from 13s. 6d. to 15s. per week in money, with the privilege of cropping a plot of potato ground; the superior workmen are paid equally well in proportion—a part of their emolument, however, being a good cottage, rent free, which may be valued at 2s. per week. Mr. Torr has three farms adjoining townships, and his foremen get from £32 to £33, with other privileges, such as cottage and garden, rent free, malt, pig, poultry, worth in all from £42 to £47 10s. per annum. The shepherds' wages are a little lower, being, I suppose, older men. Then again, in Norfolk, on Mr. Hudson's farm, at Castleacre, the bailiff, Mr. Jenkins reports, gets a guinea per week; the yard or cattle man 14s. 6d. per week; engine-driver 3s. per day; and the ordinary farm labourer

from 10s. to 12s. per week; lads 8s. to 9s.; and boys 4s. 6d. to 5s.; while women get from 10d. to 1s. per day. All these payments are made in money, there being no privileges in addition to the wages. Cottages with gardens are paid for by the men at the rate of from 1s. 3d. to 1s. 6d. per week. Mr. Jenkins adds, a considerable amount of field work is paid for by the piece. These wages appear somewhat the same as we are paying; but in Wiltshire, Dorset, and other counties, they are much lower. Mr. Jos. Whitwell Pease, in a letter of his I saw to the Editor of the *Northern Echo* (quoting from a Parliamentary return), says that in the Bedford and Woburn Union the wages are 11s. a-week; in Suffolk, in the Stowmarket Union, 9s. to 12s.; in the Sampford Union about 11s.; at Blything 10s.; in Devonshire in the Axminster Union, 8s. to 9s. a week; in Dorsetshire, 9s. 6d. a week; and, with these lower wages, longer hours are exacted and cheerfully given. Whether more work is done I have often heard it doubted; but, as far as my own observation goes, I don't see but what it is, and often of a better quality. There is no doubt that, as we approach nearer to the large manufacturing centres, wages are generally higher, though their work is not so certain or regular as that of the agricultural labourer. It has always struck me that the hours of our "datal" men are very short in comparison to their wages, or to the hours given in other districts, and that they should be required to give ten hours of absolute work at the least. With draughtmen it is different, they having other work to attend to after their horses are unyoked; and, if ploughs are kept going steadily from 7 a.m. to 5 p.m., with an hour or so for dinner and rest, it is quite as much as one can expect them to do and keep them up to their work. In busy times, such as the turnip season, hay time, and harvest, hours cannot be limited, though I know of a case, which occurred in this district a few years ago, where some of the men refused to load any more corn after five o'clock. Happily, we are not often troubled with "strikes," though it were well, I think, that the law of "master and servant" were somewhat altered, seeing that as it now stands, the remedy, in the case of a refractory servant, is worse than the disease.

Mr. W. T. SCARTH advocated labourers' children having all the educational advantages they could possibly obtain. The hiring at statutes he did not altogether approve of—though it was a difficult thing, perhaps, to substitute other means in a district where it had been habitually the practice to effect engagements in that manner. In reply to what Mr. Neasham had said, he regarded hinds as a very provident class of men. He thought they did wonderfully. Having large families it was surprising to see how they educated and clothed them, and got them out in the world. They were men who indulged in few luxuries; and he thought they would compare with any class of men in the country. He had been a great deal in the southern counties—Dorsetshire, Wiltshire, Bedfordshire, &c.—and in these places the men had mostly an allowance of drink besides the 9s. 6d., 10s., or 11s. in weekly wages which they received. The master found the man a small barrel of beer, which he took into the field with him, in Shropshire, and he was besides that receiving 10s. per week. They never heard here of a farming man drinking anything but water or milk whilst at work on the farm. He believed that our labourers in the North of England were equal in point of intelligence and ability to carry out the work entrusted to them even better than the labourers in the south, who, though able-bodied men who did their work, had no "head" in comparison with the north-country man.

Mr. BRODIE said the plan they had of paying farm servants in money was much better than payment in kind. With reference to "Bondagers," farmers in Northumberland, with 600 or 700 acres had nine or ten hinds on the farm. They were found all in kind. They were, however, obliged to keep a "bondager"—a woman, but their wives did not go out to work. Their wives were, he was told, obliged to stay at home to make butter for the cow they kept. He thought, therefore, that there was no advantage in the hinds having to keep a "bondager." He thought it would be better for the wives to go out to work.

The PRESIDENT: There is one thing, it allows the wife to take care of the family.

Mr. BRODIE remarked that these "bondagers" worked in the fields from six o'clock in the morning to six o'clock at night, and sometimes helped in the house at night,

Mr. BRUNSKILL thought the farm-servants very well cared for in the district, but was in favour of their being better educated.

Mr. SMURTHWAITE, jun., said his experience led him to think that hinds were better paid in this neighbourhood than further south. He approved of money payments to hinds. He thought the statute hirings falling in May was a very inconvenient time indeed. On the Yorkshire Wolds there was only one hiring at Martinmas. In Worcestershire he had found that labourers were generally paid 9s. to 10s. per week, and they had no house. Whether it was from drinking their cider that they did not spend so much money on beer as the men in the North he could not say, but they appeared respectable at church on the Sunday, and the wives of labourers did not work there as they did here.

Mr. HAWDON, jun., said that if a less busy time were selected for the period of hiring, it would be better. He thought the payment in kind tempted the men to take things on the farm.

Mr. MIDDLETON thought May-day the best time to hire married men, and Martinmas the unmarried. The tendency now was to pay in money and not in kind; but he did not think it so much to the advantage of the labourer. The southern labourers, he thought, could not push on at a busy time as they could here.

Mr. HODGSON thought the hiring longer before the term than should be the case; the later statute hirings would be better at Christmas, when there was less doing than at Martinmas.

Mr. SUTTON agreed that the hirings on the first Monday in March was too early. It would give great trouble to have to pay in kind. The men here were more active than in either the south or in Scotland.

Mr. HAWDON thought they ought always to require a character from the previous masters, which was not now done at the hirings. If they adopted this course, and each master gave an honest character, it would be a great advantage. House rent, estimated at £2 or £2 10s., was much too low. It stood the master, including taxes, at least as high as 2s. per week. The wages were 15s. per week, and perquisites of all sorts made nearly 20s. a week. They could not very well do without women labourers, though they could obtain Irish labour on the whole as cheap. It was an advantage to a labourer and his family that the woman should work. "Datal" men ought to work longer hours. They often did not work more than seven hours and a half.

Mr. BELL continued the discussion, referring to the Northumberland system, and the plan adopted in Scotland. He agreed that young men in the farmhouse were a great nuisance; and spoke of children being better brought up in isolated hinds' houses on a farm than in villages. He agreed that "datal" men worked too short hours.

Mr. KAY said he strongly objected to payment otherwise than in money. To have married men living on the farm was the most satisfactory to the master. He thought the children, as a rule, should not be sent to work till they were 12 years of age, but should be sent to school. Female labour was not half so much wanted, as they now got machinery instead. Men went off to the ironworks oftentimes; but it was, he thought, on the whole, not much better pay than farm-labourers got.

Mr. GRAHAM approved of payment of money for labour. He wished there were schools to educate girls how to conduct the house, and be careful, as many a good servant was brought to beggary by the improvidence of his wife. He did not agree with hinds keeping cows, but they should be paid in money. Writers in the south seemed to overlook the wages paid in Yorkshire and Durham.

Mr. NEASHAM in reply said that the opinion seemed pretty general against the system of payment in kind. He thought the Scotch labourer did better on oatmeal than ours did on slops and tea.

After votes of thanks to Mr. Neasham, and to the President, the meeting separated.

THE INGREDIENTS OF A TURNIP CROP.

At a meeting of the Stewartry Farmers' Club in Castle-Douglas, Mr. Skirling of Croy, president of the Club in the chair,

Mr. McMillan said: Of all the crops we cultivate in this Stewartry, turnips take the precedence. The improving of the quantity and quality of this class of roots may therefore be looked upon as the key stone of our system of husbandry; and as the whole rotation of our farms is, in a great measure, dependent on the success for this crop, it is consequently a matter of vast importance to us farmers to know what their natural constituents are, so that we may become masters of our profession. This can only be done by becoming acquainted with all the essential constituents of the plant, especially the inorganic. Whenever we acquire this knowledge, along with the relative quantities of each inorganic material an acre of turnips abstracts from the soil, we will then be in a better position to understand how their organic compounds are elaborated and converted into nutritious substances to support the organism of animals. *Brassica rapa* and *brassica campestris* belong to the order cruciferae. All parts of these plants contain inorganic matters, along with a pungent sulphurous volatile oil. Their seeds also yield a copious amount of fixed oil (Schöedler). Their leaves evolve both phosphuretted and sulphuretted hydrogen (Petzholdt); and it has been calculated that turnips, through the agencies of their spongioles and leaves, will abstract from the soil and atmosphere an amount of matter equal to one million times their own weight (Wilson). To enable them to achieve this end successfully, it is the farmers' interest to secure for them all those conditions that experience and science have found to be necessary. The principles that govern the chemical reactions taking place in the inorganic ingredients in soils to support the vitality of plant life should guide the agriculturist in the purchase and application of manure. And I say without hesitation that we, as farmers, have hitherto very imperfectly understood these principles; and it is to be feared that until agricultural education is more advanced and farmers become more intimately acquainted with the soils they cultivate and the crops they grow, the same random system will prevail. All that seems to have been necessary to be done for the furtherance of this object is to have, year after year, a number of experiments with different kinds of manures applied to root crops without relation to the soil; and hence there is seen, in the details of these competitions, very great variations as to results. You may see a manure that produced the largest crop of turnips on one kind of soil, that may be placed in the lowest scale of valuation when applied to another. This, to my mind, distinctly proves how fallacious, and I should say disastrous, such experiments are to the interests of agriculture, as manures applied indiscriminately. There is another very expensive practice prevalent in many localities, viz., that of purchasing several kinds of fertilisers, and then incorporating them so as to apply all the constituents required by this crop. I ask what kind of opinion would we form of men who follow other professions if they were to adopt the same policy? For instance, if we had occasion to consult our medical adviser, and that gentleman could only tell us that there were certain kinds of inorganic constituents which overruled the chemical powers of our bodies. He might say that he did not exactly know the one we required, and it would be necessary for him then to give us a mixture of all kinds of medicine. Might we not then consider that such a practitioner had rather soon left the portals of the class room? The inorganic ingredients that support the functions of turnips are fixed upon a sure and unalterable basis. It is, therefore, much better for the farmer to prefer accurate figures in estimating for the purchase of manures to supplement the deficient ingredients of the soil for the crop intended to be grown, than mere guess work. When we adopt such prudence, the farms of this county will not only be kept in good condition, but there will also be an increase in their fertility. All writers on agricultural science are as one in regard to the inorganic materials contained in each kind of farm crop, and it is wonderful how close

their estimates approximate to the practical results. When carefully taken it has been found that thirty tons of swede turnip bulbs have the following quantities of inorganic materials—viz.: 127 pounds potash, 100 pounds soda, 73 pounds lime and magnesia, 16 pounds oxide of iron and silica, 23 pounds chlorine, 86 pounds sulphuric acid, and 50 pounds phosphoric acid (Anderson); and if one-third more is found in the roots and tops, thus an acre, if producing a crop of thirty tons of turnips, will lose over 600 pounds of the mineral ingredients just named. Farmers, before they replace these constituents for future crops, should know what their soil contains, and a close approximation may be come to by knowing the mineralogy of the rocks that have formed them. For in some soils there are only two or three ingredients of the mine above named that are necessary to be returned to the land by the farmer, while on other soils overlying a different class of rocks it may be requisite to replace four or five of them. Thus soils disintegrated from plutonic rocks generally abound in potash, while many soils on the lower transition (Grywacke) formation contain only minute quantities of this alkali. Hence turnips have been classed as potash plants, because the alkaline earth forms their largest inorganic constituent. There is one important consideration to bear in mind—viz., that is the production of a turnip crop the growth and quality is not so much governed by the maximum proportions of their essential inorganic ingredients as by the minimum. Thus, nine constituents are required for their healthy development, eight of these may be in excess of their wants, and only one of them in less proportion than they require. The production and value of the crop will then be altogether determined by the producing powers of this minimum constituent. It is true that plants have an elastic and yielding constitution. For example, turnips can appropriate, to a limited extent, one kind of inorganic food material for another, such as soda for potash, and magnesia for lime, and an extra quantity of phosphoric has been taken up when nothing but Peruvian guano was applied. But I have never seen it recorded that they will absorb a phosphate in place of a sulphate. Whenever this class of plants is subjected to unnatural variations in their inorganic ingredients, they cannot assimilate and convert their carbonaceous substances into so valuable food as when properly constituted. For instance, when turnips are grown with a perfect manure, such as farmyard dung, they are found to contain one-half more oil and gum, with nearly four times as much sugar as turnips raised from the same seed and soil by means of Peruvian guano. There is also an important difference in the relative proportions of the valuable constituents of their ash. Thus, the dung turnips contained eleven per cent. more potash and soda, with one per cent. more sulphuric acid, while the ash of the guano turnips contained nearly twelve per cent. more phosphoric acid. The value of these turnips, when tested for feeding purposes, was found as follows: viz., 2½ tons of turnips grown with dung increased the weight of animals as much as 36½ tons of those raised with nothing but guano. When the same amount of nutritious substances contained in the 36½ tons is concentrated into 2½ tons of this root, the difference of weight is water, and other useless compounds, requiring to be raised at least fifty degrees in temperature, at the expense of the carbon and hydrogen of the animal system. This experiment shows the fallacy of comparative trials with different manures, and until these competitions have for their basis the supplementing of the soil with those essential ingredients that turnips require, the largest may be the most unprofitable crop for the feeding of stock. I have no doubt whatever that an application of undissolved ground coprolites would produce a fair crop of turnips on some kinds of virgin soils where the mineral bi-sulphide of iron predominates, and were not the effects of insoluble phosphates in ground bones wonderful when first applied to turnip crops in this Stewartry? If their efforts had continued it would have been an easy matter indeed for the husbandman of the present day, for we could purchase at present as much phosphoric acid in bone material as would supply all that 30

tons of turnip bulbs, and two crops of 40 bushels of oats and straw require for thirty-two shillings per acre. But circumstances have now much altered in regard to the removal of inorganic materials from the land. Formerly our principal crops were oats: they are now turnips. A crop of 50 bushels of oats, along with the straw of this cereal, requires only about 10 pounds of sulphuric acid to form the necessary sulphates; whereas a crop of turnips of 30 tons is estimated to take at least 140 pounds of this acid for all its requirements. Whenever it became apparent that crushed bones did not produce their former good effects on some stratas, it surprised and puzzled many farmers to know the cause of their inaction. But fortunately the chemist, by his researches, was enabled to make known that this class of roots removed from the soil several ingredients which are not again replaced by an application of insoluble bone material, and therefore recommended that they should be dissolved by means of sulphuric acid. This process alters them both chemically and mechanically in such a manner that a tender plant can be immediately supplied with its necessary food. It is also of importance for farmers to know the action of sulphuric acid with the organic matters of animal phosphates (Johnston). This acid not only dissolves and decomposes these matters, but also converts a portion of them into urea, and a sweet substance termed gelatine sugar, for the nourishment of the young turnip. And will not the lignine of decaying grass roots and other carbonaceous substances in the soil be converted into grape sugar for the same purposes by the catalytic action of this acid, as is brought out by experiments in the laboratory when applied to starch or the lignite of linen? When these chemical changes were established, experiments and trials followed, and the first I find recorded was with bones dissolved with muriatic acid. In 1841 they were applied to oats on a moss soil. The report was that the straw appeared stiff and shining, and the ears were as well filled as if they had been grown on a stiff loam. In 1842 10 cwt. of this superphosphate was tested against 16 cwt. of dry bone-dust for a turnip crop. The result was nearly 4 cwt. per acre in favour of those that were dissolved. And a Mr. Tennant, in Ayrshire, found that 2½ bushels bones prepared with sulphuric acid was equal to 3 cwt. Peruvian guano. In 1843 a premium was offered by the Morayshire Farmers' Club to test the value of dissolved bones, which led to numerous experiments, and the conclusion arrived at was—that 4 bushels bones dissolved with sulphuric acid will produce as good a crop of turnips as 16 or 20 bushels applied in the usual form. At Gordon Castle 2 bushels bones were dissolved with 83 pounds sulphuric acid, and then diluted with 400 gallons water, at a cost of 11s. 6d. per acre. These produced a better result than 3 cwt. of guano, at a cost of 87s. per acre. In consequence of the belief that the inorganic part of bones was alone useful to vegetation, several persons have been at the trouble to burn them. Thus, 600 pounds of burnt bones were reduced to a fine powder, afterwards moistened and dissolved with only 60 pounds sulphuric acid. A portion of this superphosphate was tested more than twenty years ago by a Kirkcudbrightshire farmer, who found it equal to its own weight of guano. A comparison was made in England with the same superphosphate as a top-dressing for wheat, when 6½ cwt. increased the yield 2½ bushels per acre, while 3½ cwt. Peruvian guano increased the yield only 1½ bushels per acre. In 1868 I was an eye-witness of the good effects produced by dissolved animal charcoal on a portion of a field of oats (Island of Arran), where the crop had been sickly and appeared as if affected with wireworm. The farmer had been advised to purchase refuse bone char and vitriol, and after mixing them, he applied them to that portion of the field. The result of this application was that it resuscitated the crop from its sickly state, and made it far superior to the other portions of the field. And to prove that sulphuric acid was a manorial agent, Colonel Lindsay of Balcarras applied this agent diluted with water to an experimental field on his home farm. Although the crop of turnips was inferior to those manured with both dung and guano, they were far superior to those on that portion of the field where nothing was applied. Tinmann, when experimenting in Silesia, found that barley steeped six hours in sulphuric acid diluted in forty waters gave one-fourth more grain and straw; and Prince Salm Florsmar found that when a soil was destitute of this acid to form the necessary sulphates, the plants remained feeble and produced no fruit. Whenever

sulphuric acid is applied to bone materials it changes their carbonates into sulphates, and appropriates two atoms of the lime held in combination by the phosphoric acid of the insoluble phosphate, and converts it into a useful salt, while the remaining atom of lime and phosphoric acid forms that bi-salt commonly designated bi-phosphate of lime. Whenever a superphosphate is applied to the soil a series of reactions takes place according to the nature of the soil. The unneutralised phosphoric acid contained in it being soluble will combine with the alkalis to form other salts by which the young plant soon finds all its necessary inorganic food. It is much to be regretted that there is a diversity of opinion among the members of this club as to the mechanical condition of our soils in regard to the application of manures in a soluble or insoluble condition. I ask, did not our chemist, in the paper he read to us last spring, state "that we need not be afraid of drainage water carrying off soluble manures, as the soil had the power of retaining them and parting with them only to the plant?" And such may be further confirmed when it appears that about 90 per cent. of the farms of this Stewartry overlie trap and syenite formations. Their soils may therefore be classified as argillaceous. The greater proportion of them are what may be termed cold with retentive subsoils, and it has been calculated that an acre of soil nine inches in depth, disintegrated from granite syenite and greenstone rocks, will contain at least forty tons alumina (Alonzo Gray), and if only one-fourth of this earth was soluble it would be capable of retaining for the use of plants double the quantity of salts that are applied in manures, although all their ingredients were in a soluble condition. The farmers of this Stewartry, therefore, require fertilizers that will supplement all the essential ingredients of their farms, so as to keep up their fertility. It is also requisite to have an immediate return from the land we cultivate, to enable us to fulfil our engagements with the landlord, and not those kinds of manures that are inert in their action, and require an indefinite period to dissolve in the soil—these being both uncertain and expensive. Therefore, in so far as either practical or theoretical investigations have gone in respect to the development of a crop of turnips, they are in favour of easily decomposed phosphates and sulphates as the proper kind of salts to apply to the soils of this Stewartry. The more correctly we supplement the loss created by the previous crops, the more profitably will we be able to conduct our farm operations, in the meantime. And until farmers become scientific agriculturists, they should be more especially guided by the disinterested investigations of the chemist than by the interested opinions and friendly suggestions of the manure maker. In conclusion, I may state that this paper has for its basis the experimental trials and minute calculations of the most advanced writers on agricultural science.

Mr. JAMES BIGGAR, jun. (Chapelon), asked—first, "Do I understand Mr. McMillan to say that most of the arable land of this county consists of a retentive soil, with a cold bottom, rather than of a light, friable, porous soil?" and, second, "Do I understand Mr. McMillan to say that the chemist, in his report last year, recommended soluble manures as more profitable for the soil of this county than insoluble ones?"

Mr. McMILLAN referred Mr. Biggar to the paper that Mr. Stewart read to this club, where he would find the statement he had made. He further said that soluble phosphates and sulphates were the most suitable application for all soils that contained a sufficient quantity of aluminous earth.

Mr. MACKIE (Dunjarg) said that it was a matter of little importance, as the farmer should know himself whether or not his soil was sandy or gravelly.

BREACH OF THE CATTLE PLAGUE REGULATIONS.—At the Dorchester Shire Hall, James Cake, of Brompton Farm, was charged with neglecting to report the existence of the foot-and-mouth disease at his dairy at Duddle. In a herd of 46, 17 were attacked by the complaint, which the police discovered. The defendant, who had rendered himself liable to £68 penalty, was fined £5 and cautioned.—Thomas Kingsbury, cattle dealer, was fined 50s., or in default two months' imprisonment, for gross cruelty to three calves.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MONTHLY COUNCIL: WEDNESDAY, May 4.—Present the Duke of Devonshire, K.G., President, in the chair; the Duke of Marlborough, K.G., the Earl of Lichfield, Viscount Hill, Lord Chesham, Lord Kesteven, Lord Tredegar, Lord Vernon, Lord Walsingham, the Hon. H. G. Liddell, M.P., Sir Watkin W. Wynn, Bart., M.P.; Mr. Amos, Mr. Baldwin, Mr. Barnett, Mr. Booth, Mr. Bowly, Mr. Cantrell, Colonel Challoner, Mr. Clayden, Mr. Davies, Mr. Dent, M.P.; Mr. Druce, Mr. Edmonds, Mr. Brandreth Gibbs, Mr. Hassall, Mr. Holland, Mr. Hornsby, Mr. Wren Hoskyns, M.P.; Mr. Jonas, Colonel Kingscote, M.P., Mr. Lawes, Mr. Leeds, Mr. Milward, Mr. Pain, Mr. M. White Ridley, M.P.; Mr. Rigden, Mr. Sanday, Mr. Shuttleworth, Mr. Stone, Mr. Thompson, Mr. Torr, Mr. Turner, Mr. Webb, Mr. Wells, M.P.; Mr. Whitehead, Mr. Jacob Wilson, and Dr. Voelcker.

The following members were elected :

Alcock, Thomas, Ratcliffe-on-Trent, Nottingham
 Armstrong, John Knight, Winsford, Chester
 Baskett, Nathaniel, Brames Hall, Wetheringsett
 Beeston, Thomas, Goldston Manor, Market Drayton
 Berridge, Samuel, Croughton, Brackley
 Berridge, Thomas Edward, Pimlico Farm, Tusmore, Bicester
 Bickerton, Samuel, Shotatton, Ruyton, Salop
 Birch, James, Pearse Hay, Penkridge
 Birchall, Edward, Willaston, Nantwich, Cheshire
 Chillingworth, John, Horspath, Oxford
 Chillingworth, William, Cuddesdon, Wheatley
 Crowthall, George, 4, Queen's Parade, Cheltenham
 Crompton, John George, Derby
 Decanville, M., Petit Bourg, Corbeil
 Decanville, M. Paul, Petit Bourg, Corbeil
 De Kergolay, Count, Camisy (Manche)
 De Moncault, Edouard, 127, Boulevard Hausman, Paris
 Derham, James, St. Thomas Road, Chorley
 Elwell, Charles James, Compton, Wolverhampton
 Fielden, John, Dobroyd Castle, Todmorden
 Fitton, Samuel, Willaston, Nantwich, Cheshire
 Fijlambe, Francis J. S., Osberton, Worksop
 Gammon, H. M., Frewin Court, Oxford
 Garne, Thomas, Broadmoor, Northleach
 Garside, Henry, Wharmton Tower, Greenfield, Saddleworth, Yorkshire
 Giles, F. Thresher, Marsh House, Bentley, Farnham
 Harcourt, Rev. W. Vernon, Nuneham Park, Abingdon
 Hargreaves, Edward Henry, Kirkham, Preston
 Hughes, James, Oxford
 Jones, William, Baschurch, Shrewsbury
 Lett, John, Stone Court, Kidderminster
 Lister, Edward, Cefn Ha, Usk
 Lloyd, John, Bod Lloyd, Raabon
 Mansell, Andrew, Little Ness, Baschurch, Salop
 Mather, Daniel, Chipping Norton, Oxford
 Milner, John, Myrescough, Preston
 Nelson, John, Wyham House, Louth
 Page, Francis, Uttoxeter
 Pennel, Charles, Westwell, Burford
 Roberts, John, Wellhouse, Saltney, Chester
 Rowland, Samuel, Grimsditch Hall, Whitley, Northwich
 Russell, John, Sutton, Dartford, Kent
 Scott, Lawrence, Moor End, Ruddington
 Seymour, Richard Arthur, Kinivarton Rectory, Alcester
 Sill, R. C., Parkfield, Swinton, Manchester
 Sollom, Francis, Pennfields, Wolverhampton
 Stapley, Frederick Arthur, East Lavant, Chichester
 Symonds, Frederick, 35, Beaumont-street, Oxford
 Symonds, Horatio F., Oxford
 Taunton, George, Oxford
 Tomlinson, J. H., The Parkey Farm, Wrexham

Vaughan, Edmund, Lapley, Penkridge
 Warner, Robert, 8, The Crescent, Cripplegate, London
 West, Richard Thornton, Streatham Hall, Exeter
 Wright, John, 30, Broad-street, Islington, Birmingham

FINANCES.—Colonel Kingscote, M.P., presented the report, from which it appeared that the Secretary's receipts during the past month had been examined by Messrs. Quilter and Ball, and were found correct. The balance in the hands of the bankers on April 30 was £3,583 Os. 10d., £3,800 remaining on deposit at interest.

JOURNAL.—Mr. Thompson (chairman) reported that the committee recommended the offer of a prize of £30 for the best account of the preparation, preservation, and use of sprouted grain as food for horses, cattle, and sheep, competing essays to be sent in to the secretary not later than the 15th of July. The committee also recommended that the invitation of the "Société des Agriculteurs de France" to the Royal Agricultural Society to take part in an International Congress to be held in Paris next year, be accepted; that the request to furnish a report on British Agriculture be complied with, such report to be prepared under the auspices of the Journal Committee; that it be suggested to the "Société des Agriculteurs de France" that the time of holding the Congress which would be most likely to secure a good attendance of representatives of British Agriculture, would be Whitsun week: and that in compliance with the invitation in one of the letters on the question, the following list of subjects for papers or discussion be suggested, viz.: Drainage, Implements and Machinery, Manures, Rotation of Crops, Fattening of Cattle and Sheep, and the Labourer. The committee also gave notice that at the next monthly Council they will move for a grant of £100 towards defraying the cost of an autumnal tour of inspections similar to that of last year. That report was adopted.

GENERAL OXFORD.—Lord Kesteven reported that the committee recommended that the Finance Committee be given power to obtain the assistance of some members of Council, in place of any Stewards of Finance who may be unable to attend the Oxford meeting. The arrangements for the supply of refreshments to the show-yard at Oxford, and the programme recommended for the Oxford meeting, were reported.—This report was adopted.

JUDGES SELECTION.—Mr. Milward (chairman) presented a list of gentlemen who had accepted the invitation of the Council to act as judges at the Oxford meeting, and reported the recommendation of the committee that they be now elected. This report was adopted.

EDUCATION.—Mr. Holland (chairman) reported that neither of the candidates who had entered to compete for the Society's certificates and prizes had satisfied the examiners, and that the committee, therefore, could not recommend any award. This report was adopted.

SELECTION.—Mr. Thompson (chairman) reported the recommendation of the committee that Lord Vernon be invited to accept the office of President of the Society for the ensuing year, and that the house list be printed in the usual manner. This report having been adopted, it was moved by Mr. Thompson, seconded by Mr. Dent, M.P., and carried unanimously, "That Lord Vernon be recommended to the general meeting as President for the ensuing year."

HOUSE LIST.—In conformity with the bye-laws the

Council then arranged by ballot the following election list, to be recommended by them for adoption at the ensuing general meeting on the 28rd inst :

ATTENDANCES (FROM THE AUGUST MEETING, IN 1869, TO THE PRESENT TIME).

Names.	Monthly Councils. Total 16.	Special Councils. Total 3.	Com- mittees.	
			Number of Meetings.	Attendances.
Amos, Charles Edwards, 5, Cedar's Road, Clapham Common, Surrey	1	...	24	12
Barthorpe, Nathaniel G., Hacheston, Wickham Market, Suffolk	7	2	4	1
Booth, Thomas Christopher, Warblay, Northallerton, Yorkshire	8	2	30	15
Bowly, Edward, Siddington House, Cirencester, Gloucestershire	9	2	22	8
Clive, George, Perrystone, Ross, Herefordshire	6
Davies, David Reynolds, Mere Old Hall, Knutsford, Cheshire	13	...	42	21
Druce, Joseph, Eynsham, Oxford	13	3	22	11
Edmonds, William John, Southrop, Lechlade, Gloucestershire	8	1	8	3
Gibbs, B. T. Brandreth, Halfmoon Street, Piccadilly, London, W.	14	3	54	52
Hassall, William, Bubney, Whitchurch, Salop	6	1	3	1
Hesketh, Sir T. G., Bart., M.P. (elected Feb. 3, 1869), Rufford Hall, Ormskirk, Lancashire	2
Holland, Edwd., Dumbledon Hall, Evesham, Worcestershire	9	2	74	25
Hornaby, Richard, Spittlegate, Grantham	11	3	34	15
Hoskyns, Chandos W., M.P., Harwood, Ross, Herefordshire	12	3	59	25
Kesteven, Lord, Caswick, Stamford, Lincolnshire	9	2	17	11
Laves, John Bennett, Rothamsted, St. Albans, Herts	5	...	8	1
Lichfield, Earl of (elected Aug. 4, 1869), Shugborough, Staffordshire	6	...	14	4
Macdonald, Sir Arch., Keppel, Bt., Woolmer Lodge, Lilphook, Hants	6	1	11	7
Randell, Charles, Cheshbury, Evesham, Worcestershire	8	1	64	22
Sandby, William, Radcliffe-on-Trent, Nottinghamshire	5	1	38	7
Shuttleworth, Joseph, Hartsholme Hall, Lincoln	9	...	34	17
Statton, Thomas (elected Feb. 3, 1869), Stand Hall, Whitefield, Manchester, Lancashire	7	1	11	8
Welby, William E., M.P., Newton House, Folkingham, Lincolnshire
Wells, William, M.P., Holmewood, Peterborough, Northamptonshire	11	1	56	35
Whitehead, Charles (elected Dec. 8, 1869), Barming House, Maidstone, Kent	3

COUNTY MEETING OF 1871.—The report of the committee appointed to inspect the sites offered to the Society by the local authorities of Shrewsbury, Stafford, and Wolverhampton, having been read, the Council were favoured by the attendance of the following gentlemen, as deputations from the competing towns :

Shrewsbury.—Introduced by the Right Hon. Viscount Hill: the Viscount Newport, M.P.; Gen. the Right Hon. Sir Percy Herbert, M.P.; J. R. Ormsby Gore, Esq., M.P.; the Mayor of Shrewsbury (Henry Fenton, Esq.), Edmund Wright, Esq.; Messrs. Thomas Groves, Thomas Southam, Thomas Mansel, William Brewster, and J. Bowen Jones (Town Clerk of Shrewsbury) Hon. Sec.

Stafford.—Introduced by the Right Hon. the Earl of Harrowby: Lord Sandon, M.P.; Captain the Hon. Re-

ginald Talbot, M.P.; Col. Dyott, M.P.; the Mayor of Stafford; W. Blount, Esq.; W. Sylvester, Esq., J.P.; J. Pilling, Esq., Stafford, J.P.; W. H. Gibson, Esq., J.P.; Captain Morgan, H. Woodhouse, Esq., C.E.; F. Greatrex, Esq.; R. Sylvester, Esq.; J. Darlington, Esq., and H. Gillard, Esq., Hon. Sec.

Wolverhampton.—Introduced by the Right Hon. C. P. Villiers, M.P.; the Mayor of Wolverhampton, the Town Clerk, T. M. Weguelin, Esq., M.P.; Sir Jon Morris, W. Fryer, Esq., J.P.; Alderman Ironmonger, Alderman G. L. Underhill, John Moreton, Esq., J.P.; R. H. Masfen, Esq.; Councillor John Lees, Councillor Sollom, and Mr. Barnett.

These gentlemen having laid before the Council the facts and arguments in favour of their respective districts, and having answered the inquiries made of them by the Council, the President expressed to them the thanks of himself and the Council for their interest in the Society, their anxiety to promote its objects, and their kindness in attending the meeting that day.

The deputations having withdrawn, and his Grace the President having vacated the chair on account of an important engagement elsewhere, Lord Tredegar was nominated to preside during the remainder of the meeting.

It was then proposed by Mr. Milward, and seconded by Mr. Jacob Wilson, "That the Council do first decide as between the counties of Salop and Stafford." An amendment was thereupon moved by Mr. Thompson, and seconded by Mr. Wren Hoskyns, "That the voting should be taken for the three towns, and that the decision between the two having the majority of votes should be decided by a second vote." After some discussion, the amendment having the greater number of supporters, the original proposition was withdrawn, and a division taken in accordance with the terms of the amendment, as follows: Shrewsbury (proposed by Lord Hill, and seconded by Sir W. W. Wynn), 17 votes; Stafford (proposed by Mr. Dent, and seconded by Lord Vernon), 1 vote; and Wolverhampton (proposed by Mr. Milward, and seconded by Mr. Baldwin), 22 votes. A second division having been then called for, it was decided, by 18 votes against 13, that the Society's country meeting for 1871 be held at Wolverhampton. It was then moved by Mr. Torr, seconded by Mr. Wren Hoskyns, M.P., and carried unanimously, after some discussion, that the Society's country meeting for the year 1872 be held in the district comprising South Wales and the counties of Gloucester, Worcester, and Hereford.

On the motion of Mr. Thompson, seconded by Mr. Turner, the question of the rotation of districts was referred to a committee, to consist of the Committee of Selection and Lord Tredegar, Mr. Wren Hoskyns, M.P., and Mr. Jacob Wilson.

The draft of the report to be presented to the general meeting was discussed, amended, and ordered to be printed.

Letters were received from Mr. A. Hansen on the cultivation of potatoes, and from the Rev. W. W. Jones, rector of Summerstown (Oxford), in reference to Divine service in the showyard at Oxford, and the latter was referred to the honorary director.

A communication from the Foreign Office, relating to the disease among cattle known as the "Mal de Rate," or splenic disease, which had been received from her Majesty's Minister at Copenhagen, and of which the following is a translation, was referred to Professor Symonds :

"The *mal de rate* is a disease which attacks man equally with other warm-blooded animals. It develops itself spontaneously in herbivores, and is communicated by contagion. The contagious principle is transmitted by the contact of either solid or liquid (blood) particles, or even by eating the

flesh of infected animals; but it is not communicated by the agency of the atmosphere. The malady is especially dangerous in warm climates, and in Southern Europe. In Denmark it is somewhat rare, and only exhibits itself under a mild form (erysipelas), the *anthrax*, or burning scabs (*charbon*), being there nearly unknown. It is there observed only occasionally, in isolated cases, amongst cattle, but is not propagated even in

the herd attacked, and it still more rarely acquires an epidemic character. Within the last few years it has shown itself in pigs, under the form of erysipelas, but without acquiring any great extension. The losses sustained by the country through the *mal de rale* are consequently very insignificant; but this result must be chiefly attributed to the excellence of the measures which have been taken to contend against it."

THE CENTRAL CHAMBER OF AGRICULTURE.

On Tuesday, May 3, the monthly meeting of the council was held, at the Salisbury Hotel, Salisbury-square, Colonel Tomline, M.P., presiding.

A communication was read from the East Kent Chamber, embodying a resolution in favour of assessing to the property and income-tax on the rateable instead of the gross estimated rental. This was referred to the Local Taxation Committee.

Sir MASSY LOPES read the following report from that committee: "The Local Taxation Committee, in presenting their report, beg to state that the executive committee have met regularly since the last general meeting on the 4th April. The committee cannot help expressing their great regret that, owing to the absorbing interest felt in Irish legislation which has hitherto during the session monopolized the time and attention of Parliament, many other important measures are in danger of being indefinitely postponed. They deem it their duty, under such circumstances, to urge upon the chambers the necessity of renewed efforts to obtain from the Legislature a ratification of its promises with respect to local taxation. A special committee of the House of Commons is at present engaged in investigating the subject of local taxation, but the very limited scope of their inquiry precludes your committee from anticipating any very material results from their deliberations. Meanwhile, they will carefully watch the proceedings, and neglect no opportunity of advancing the cause they have in view. Your committee most strongly deprecate the dealing with this important subject in a piecemeal, instead of a comprehensive and statesmanlike, manner. The committee feel that it is all-important that steps should be taken to sustain the public interest in this question, and to arouse a still stronger feeling in favour of a reform. They would, therefore, suggest that at the forthcoming meetings of the Royal Agricultural Society at Oxford, and of the Bath and West of England Society at Taunton, it might be advisable to hold meetings at which the present incidence of local taxation might be discussed, and opinions taken as to the best mode of inducing the Government as promptly as possible to fulfil the pledges which they have repeatedly given with reference to this important matter. The meetings of these societies are numerously attended, and any views expressed there are certain to be widely circulated and considered on their merits. The report went on to acknowledge subscriptions received or promised since the last general meeting.

The report was adopted, and ordered to be printed and circulated; and arrangements made for holding the meetings proposed. It was also agreed that meetings of the council and members of provincial institutions on the subject of local taxation should be held during the week of the Bath and West of England Agricultural Society's Show at Taunton in June, and at the Royal Agricultural Society's Show at Oxford in July, the arrangements with regard to each being left to the Executive Committee of the Council.

The following resolutions were submitted by the Business Committee:

"(1). That this Council repeats its protest against the present unjust Exemption of Personal Property from contributing towards the various objects for which funds are now raised by Local Rates, and challenges investigation into the truth of the assertion that Real Property is compensated for this grievance by bearing a much smaller share of Imperial burdens than Personality."

Mr. STANTIN said, in moving this, that exemptions from any kind of taxation were objectionable; for as Mr. Gladstone had once said the exemption of one man meant the taxation of another. It was also a remark of that right hon. gentleman, however, that it was exceedingly convenient

to be able to put your hand upon personal property, it being visible and easy to be got at. Well, it might no doubt be a convenient proceeding to put one's hand into his neighbour's pocket, but it was nevertheless contrary to all our notions of morality and justice. It was said that real property was compensated in some way or other for the exemptions which were at present given to personality. For example it was said that the farmers' houses were exempted from taxation, and that real property did not contribute its fair share towards the succession duties. These allegations might or might not be true, and if they were at all doubtful, let them be inquired into. If real property did not contribute its fair share towards the public burdens, by all means let additional taxation be placed upon it. If, on the other hand, there were no countervailing charges upon real property, it should be remembered that both in houses and lands, it paid upon the full rack rent value to the income tax, without taking into account the other charges upon that property. The fact was that real property was taxed to the utmost amount of the rack rental and the personal property under schedule D did not contribute upon £57,000,000 a year as stated in the report of the Inland Revenue Commissioners themselves. Again, when real property was transferred an enormous amount had to be paid for stamps; whereas in the case of a transference of personal property a penny stamp would cover any amount. In conclusion, he was of opinion that our system of taxation, imperial and local, was a bungling and complicated system, and that the whole subject required investigation.

Mr. HODGKIN seconded the resolution, and said that in a village in the county of Kent there resided a general shopkeeper, and in the same parish a farmer, both of whom were assessed at the same amount to the income-tax; but for the purposes of the poor-rate the farmer was assessed at £450, whilst the shopkeeper was assessed at only £18. This showed the immense difference there was between the valuation of the property of persons occupying shops and gentlemen employed in agriculture.

The resolution was put and carried unanimously.

Professor BUNN moved the next resolution: "(3) That the order in which the Government have indicated their intention of considering the subject of local taxation is irregular and inexpedient, and that no re-adjustment of the present system will be acceptable which is not preceded by a thorough inquiry to determine whether the objects now locally provided for, or in contemplation (such as the proposed charge for elementary education), are of local or national obligation." This motion, he remarked, came with peculiar force from a chamber which, like this, was constituted of both landlords and tenants. The Government admitted that local taxation pressed hardly upon the tenant, and then they said, "we will examine the question and see what portion of it we can remove from him and put on the landlord." That, however, was not what the Chamber required. What they wanted was that the whole subject of local taxation and of the burdens upon real property should be inquired into; and the question was not whether the owner or the occupier paid them, but whether they were placed upon real property. The fact was that the proposal of the Government was intended to create dissension amongst the classes interested in the land, and thereby to get the thing shelved and out of the way. The question who was to pay the rates, as between the owner and occupier, was one no doubt requiring adjustment, but in itself it was notwithstanding of secondary importance. When it had been settled what rates were to be paid would be time enough to decide who was to pay them.

Mr. TURNER, in seconding the resolution, urged that every

obstacle should be thrown in the way of the Government in imposing additional burdens upon real property that the Chamber could fairly resort to.

Captain CRAIGIE spoke in support of the resolution, and expressed his disappointment at the Chamber having to discuss, not a Government measure, but the absence of one, although they had been assured that Ministers would introduce a scheme for the amelioration of the present state of things. Without having a formal measure before them, however, the Chamber were fully aware of the Ministerial views from the declarations made by the Prime Minister and the President of the Poor Law Board in February last. But, first, what did the Chamber ask for, and how had they been met by the Government? What they wanted was a thorough inquiry into the whole incidence of local taxation before considering the measures necessary for the amendment of the system. In other words, they desired to show where the shoe pinched, and in what direction it would be most statesmen-like to effect reform. In the course of his election tour through Lancashire in October, 1868, Mr. Gladstone called particular attention to the question of local taxation, and admitted that the system of local rates was far from being symmetrical. In February, 1869, too, he told a deputation from this Chamber that he thought the subject entitled to the gravest consideration, and that he was very anxious to assure them that the Government were sensible of the imperative obligation which rested upon them to give their best attention to a matter of such importance. These declarations he had repeated on subsequent occasions. He had then evidently no intention to dismember the subject; and the question in his view was the whole question and not the petty branch of it which had been referred to a select committee of the House of Commons. In the Queen's Speech, moreover, at the opening of the session, the subject constituted the sixth "omnibus," but whilst the horses had been put to all the other "omnibuses" all that could be seen of this was the bare poles. What did the proposals of the Government thus far consist of? They declared that it was necessary to make inquiries, and a select committee had been appointed with the view of finding out some means of effecting legislation in the matter; but the situation was not at all satisfactory, for they had discovered that the question had two branches, a higher and a lower, and that the former was far too high to reach with the information they possessed. Consequently they only contemplated dealing with the latter. This included the extent and influence of rating, the collection of rates, the persons from whom they were to be collected, and the bodies who were to administer them. The last two points had been referred to a select committee. On the others the Government had undertaken to produce measures which, however, had not yet appeared; and he objected to and condemned the order in which these questions were to be treated.

Mr. CORBRANCE, M.P., did not often present himself in the character of a ministerial apology; at the same time he was scarcely able to concur in the remarks of the last speaker, because two years ago he himself had moved for the appointment of a committee similar to the one which was now sitting. He thought then, and still thought, that the first branch of the inquiry must be into the rates as they at present exist, and not as to how they ought to exist. For until they had some more accurate data than they now possessed with regard to what the rates were, on whom they fell, and how their readjustment could be effected, he did not see how a satisfactory conclusion was to be arrived at as to how they were to be arranged, and who ought to bear them. From that point of view, therefore, he thought the committee now sitting were effecting a useful object. He had always considered that the rates were far from being symmetrical, that they were in fact in a sad state of confusion, and the result of the committee inquiries so far had gone to confirm him in that opinion. There were two heads before them, the collection and the administration. The collection was dealt with by Mr. Ayrton's committee last year, so that the committee now sitting need not take evidence upon that point. When they came to the question of administration they would find themselves in some difficulties, for before they could decide who should administer it must be decided upon whom the entire burden should rest. If the rates were divided between owners and occupiers, some plan must be devised for their being equally represented in the administering body. Again, if any portion of the burden

were to be made an Imperial charge, another question which would arise was how far their proceedings should be submitted to the supervision of a Government officer. As to the resolution before the Chamber he could not say that the order in which the Government had indicated their intention to consider the matter was either irregular or inexpedient; but he agreed in thinking that it did not provide a sufficient inquiry into the large subject referred to in the latter part of the resolution.

Sir M. LOPES, M.P., said that the propositions of the Government had not, up to this time, fulfilled the ministerial pledges of last Session: and whatever might be decided with regard to the division of the rates between owners and occupiers, that would not settle the main question at issue, which was, whether or not many rates now local ought not to be treated as imperial; and whether, too, income arising from personal property should be exempted from liability to such rates. For himself he could not agree that the inquiries of the Government were regular. The first point to be investigated should be what rates they ought to pay; and next, who ought to pay them; but the Government had inverted this order of things, and put the cart before the horse. The appointment of the committee rather assumed that the agricultural community were satisfied with the present charges; but he took upon himself to enter his emphatic protest against that. He could not admit for a moment that there was not to be a very great alteration, whereas the appointment of the committee seemed to assume that things ought to be perpetuated in their present state. In his opinion the objects of the Government appeared to be to embarrass the advocates of a change, to postpone this higher branch of the inquiry indefinitely, and to rivet the fetters on agriculture more securely than ever (Hear, hear). They were trying to lead them off the scent. Their proposal was an insidious one, calculated to act detrimentally, and create dissensions between owners and occupiers. It could not effect any diminution of rates, and the same rates would have to be levied on the same property as heretofore (Hear, hear). The first effect of putting half the rates on landlords and half on tenants would be to disturb the existing arrangements between the two classes; and he doubted very much whether the change would be of any advantage to the occupiers. Whether, indeed, owners or occupiers paid, it would make little difference in the long run; it would be simply "Robbing Peter to pay Paul."

Mr. T. BAKER (Somersetshire), as a renting farmer, saw with much regret the proposal to divide the rates between landlord and tenant. The idea prevailed that an evil existed and that investigation was necessary. If as the result of that investigation it turned out that the occupiers did not pay enough, they would sit down and content themselves with being laughed at. But would it benefit them to divide the evil and create a number of squabbles? He did not believe there was a single renting farmer in the country whose opinion was worth anything, who considered that it would be of any advantage whatever. They did not want to see their landlords' burdens augmented, for if that were done the result would be increased rents. What they demanded was that, being taxed to excess, the saddle should be put on the right horse.

The second resolution was then put and agreed to.

Mr. WALKER (Nottinghamshire) proposed the concluding resolution as follows:—" (8) That, although in view of such taxation as must always remain strictly local, it may be advisable to widen the limits of the rateable area by including woods, mines, and Government property, or may be found expedient to charge some portion of the rates on the owner, this Council protests against any such measures being accepted as a settlement of the grievance to which both land and house property are now subjected." He contended that the care of the poor was the duty of the nation and not of the individual; that their support should, therefore, be treated as a national charge. Further, that the suppression of crime should be provided for out of the wealth of the nation. To place the burden entailed by these things upon one sort of property alone, or upon rental, was, therefore, an injustice which tended to increase the number of unemployed and lessen the wages of labour. The only remedy, in his view, was to tax the entire income of the country for these purposes. In no other way could they get a proper rate for the relief of the poor.

Mr. J. TURNER (West Kent) seconded the resolution, and spoke strongly in favour of assessing all personal as well as real property to local rates.

Mr. C. S. READ, M.P., observed that besides woods, mines, and Government property there was another description of property which escaped local taxation, and that was "game." He was quite aware that game itself could not be rated; but in the county of Norfolk, and no doubt in many others, the presence of game upon land depreciated the rent, and consequently the rateable value. He considered it to be essential, therefore, whenever a revision of taxation took place, that land should be assessed at its true value, irrespective of any reservation which the landlord might make, whether in the shape of timber or game. He proposed, then, to insert the words "right of sporting" after "mines."

Mr. SMYTHES seconded the amendment, and observed that when the game was in the hands of the landlord, nothing was paid for it; but if the tenant took it with the land, he was at once rated for it. Than that nothing could be more unfair; and if game were rated at all, the landlord ought to be liable as well as the tenant.

The amendment was supported by Mr. PELL, M.P., who gave the following illustration of the manner in which the present system of rating operated, in so far as it affected game: On a property with which he was acquainted, the shooting, with a small house, was let to an outsider, a gentleman who came from a considerable distance, for £270 a-year. The tenants on that estate had offered to pay £270 a-year extra rent if they might enjoy what attached to their holdings in the shape of the rights of sporting; but he would not say whether the offer had been refused or accepted. If accepted, however, the Assessment Committee could fairly set the hereditaments at a letting value of £270 more than they did when the rights of sporting were let to the stranger, and so the ratepayers of that union would benefit to that extent. But so long as these rights of sporting were let off to an outsider, and separate from the estate, the Assessment Committee could not put the value of the hereditaments at their full and natural amount; thus an additional charge was thrown upon the Union. If then, the amendment to the resolution had legislative force given to it, that anomaly would at once disappear.

Mr. BARROW, M.P., supported the amendment, although he believed that, as the reservation of the right to game was not one of the things that might be deducted, the Assessment Committee might now assess the tenant at the full value. That committee had nothing whatever to do with the arrangements between landlord and tenant; but to remove all doubt on the question he approved of the amendment that the Assessment Committee might assess the land and the rights of sporting separately.

After some remarks from Mr. Masfen, Mr. Startin, and Mr. Arkell, Sir M. LOPES, M.P., observed that he went further even than Mr. Read, and was of opinion that everything ought to be rated; that even Ragged Schools should not be exempted; for if everything were rated, there would be fewer grievances.

Mr. GEORGE ANDREWS spoke hopefully of the progress which the question of local taxation was making in public opinion, and took credit to the Chambers of Agriculture for the present position of the question. It was now upon everybody's lips. It was constantly talked of in every board of guardians. Thanks to the energy, ability, and perseverance of Sir Massey Lopes, it had also been introduced and debated in the House of Commons, where large admissions had been made, and the Premier on behalf of the Government had promised that it should be dealt with in the present session of Parliament; and any one who walked down the corridor of the House of Commons would see a door of one of the committee rooms labelled with the words, "Local Taxation Committee."

Mr. CORRANCE: "Limited" (Loud laughter).

Mr. ANDREWS: This showed, however, that an immense stride had been made by ministers since last year; they refused Sir Massey Lopes a Royal Commission (Hear, hear). Still it seemed to him as if the Government were endeavouring to solve the profound problem of "How not to do it." And they had partly succeeded by discovering that two halves do not make one whole, and that, if you pay your poor-rates, half out of one pocket and half out of the other, you must be greatly relieved. As to the proposal to divide the rates between the landlord and occupier, it was simply absurd; and he was confident that they would not find any number of

intelligent farmers whose opinions were worth anything who would accept the proposition as in any sense a measure of relief.

Mr. H. LINDELL avowed, on the other hand, that although inadequate, he should be prepared to accept such a measure. He was sorry to observe in the members of the Chamber a disposition to disparage the proposals of the Government. There were two distinct branches to the question—one related to the ratepayers as against the public generally, and the other affected peculiarly the ratepayers themselves. The subject had been discussed as if the rate fell entirely upon real property; but it did not. Mr. Andrews' illustration was, no doubt, a forcible one; but if he reflected, he would find that what he took out of one pocket he paid as occupier, and what he took out of the other he paid as owner. What the tenant paid, indeed, must be in respect of his personal property, his exhausted capital employed in cultivation—in short, his stock in trade. As to the question of inequalities amongst ratepayers, the tenant-farmer who paid upon his personal property was rated at his rent, which was very much in excess of—probably nearly double—his income. All other personal property was rated merely at the rent of the house or office occupied, therefore a small proportion of the income. Thus the tenant-farmer paid on twice his income, and the professional man on one-tenth of his. With respect to the division of the rate between owner and occupier, that he thought might be accepted, certainly as inadequate, but not altogether unsatisfactory. It tended to recognise the principle of spreading the rate over all descriptions of property, to define the interests of the landlord, and so far from separating owner and occupier, he believed it would rather bring them together, and conduce to a better and more judicious administration of the rates than at present. The Boards of Guardians were principally composed of occupiers; and the county finance was mainly administered by magistrates. If both funds were administered by magistrates, owners, and occupiers combined, he believed they would be better managed and more decided efforts would be made to reduce the expenditure. He hoped, therefore, the Chamber would not altogether reject the advantages which the Government were prepared to offer, but accept them, as, if inadequate, not utterly unsatisfactory.

Sir G. JENKINSON condemned Mr. Read's amendment respecting the assessment of sporting rights as a "monstrous proposition," because it would interdict the country gentlemen from living on his own estate and encourage absenteeism.

Major PAGET thought there was considerable danger of the Government proposal drawing away people's minds from the real question. It was like asking an architect to repair and alter windows in the top storey of a house of which the foundations were rotten. It began, in fact, at the wrong end. True it might prove on investigation that the division of the rates between owner and occupier would be absolutely light and advantageous; but at the present moment with the rate existing as it was, he deemed it unadvisable, and intended to check the useful agitation in which the Chambers of Agriculture were engaged, and which seemed to hold out some hope of realising good fruit. At all events any settlement until the area of the rate had been extended would not satisfy him.

The amendment of Mr. Read to insert the words "rights of sporting," was then put and negatived.

Sir G. JENKINSON proposed as an amendment "That, although in view of such taxation as must always remain strictly local taxation, it is undoubtedly advisable to widen the limits of the rateable area, by including woods, mines, and Government property, as proposed by the Government, and even supposing it to be not expedient also to charge some portions of the rates on the owner, nevertheless this Council still rules their protest against any such measures, taken alone, being accepted as a settlement of the grievance to which both land and house property are now subject, and which grievance will remain a standing injustice until all property is made to contribute a fair share towards local taxation."

The amendment, which Sir George admitted was in its essence an echo of the original motion, only "marking the sense of the Chamber a little more strongly," was seconded by Mr. WEBB, opposed by Mr. READ and Mr. PELL, and ultimately rejected.

The original resolution was then agreed to; and on the motion of Mr. D. LONG, seconded by Captain CRAIGIE, the resolutions adopted by the Chamber were directed to be submitted to the Government.

The discussion of the Education Bill, which stood adjourned from the last meeting of the Council was further adjourned until the meeting in June, at the instance of Professor BUND. Mr. C. S. READ proposed the following petition to the House of Commons on the subject of game certificates and game licences. "That your petitioners are extensively engaged and interested in agriculture, and are obliged to use guns for the protection of their crops from the ravages of birds and vermin; that your petitioners consider it undesirable to abolish the existing duty on game certification, and that the proposal to charge with the cost of a licence those who are compelled to use firearms in the prosecution of their important business on the same scale as those carrying guns for sporting purposes is unreasonable and unjust; and your petitioners, therefore, pray that the duty on game certificates may be retained, and that the contemplated exemption in favour of firearms kept within the house be extended to those used upon the land and premises in the occupation of the owner of such guns." The proposal of the Government to impose a duty on guns was, in his (Mr. Read's) opinion, an open question with which the Chamber need not meddle; but they might make a respectful protest against throwing away £150,000 a year which he had never yet heard anybody complain of. The game certificates were paid for by a class of men who could well afford it, and who did not complain of it as an unnecessary burden upon them. The exemption asked by the petition was precisely in the same direction as the exemption which the Chancellor of the Exchequer had submitted to the House; that was to say, when guns were kept in a house, and within the curtilage thereof; and if it was necessary to protect the house with these firearms, surely it was equally or even still more necessary for farmers to have a gun for the protection of their growing crops (Hear, hear). If they had this exemption, and there was also a tax upon guns, it would perhaps stop what it was supposed necessary to stop, the constant

popping at small birds upon roads by cockneys and other sportsmen, who, instead of hitting the birds, were more likely to hit themselves or somebody else; it would not only prevent accidents but might be the means of bringing in a considerable revenue. The Norfolk Chamber of Agriculture had submitted to the Chancellor of the Exchequer a memorial almost identical with this petition, except that it stated that if it should be thought right to impose a tax upon fire-arms they considered it would be better to charge so much per barrel of every gun and so much for chamber of every revolver. So far as this Chamber was concerned, however, he thought they should attend more especially to the subject as it affected them as farmers; and if possible get the exemption which Mr. Lowe had himself intimated it would be well to give extended still further in the direction now proposed.

Mr. T. WILLSON having seconded the motion, after a short conversation it was put and agreed to.

At the instance of Mr. T. HORLEY, junior, seconded by Mr. D. LONG, a petition was also adopted against the abolition of hawkers' licences; a measure which was condemned as a cloak for vagrancy, a temptation to servants to rob their employers, and a means of disposing of stolen property.

Mr. J. J. BURBERRY in calling attention to the Coroner's Bill introduced by Mr. Goldney, the member for Chippenham, which provides a superannuation allowance for coroners, stated the objection of the Warwickshire Chamber to the measure. That Chamber, he said, did not see the necessity for any such allowance, and particularly they objected to its being paid out of the county rate.

Mr. READ suggested that the chairman might take an opportunity of saying a word or two against the bill in the House of Commons, when it came on for discussion there; and

Col. TOMLINE having intimated that he would consult Mr. Goldney on the subject, the matter dropped, and the Chamber separated after passing a vote of thanks to the Chairman.

THE GAME LAWS.

At a meeting of the Hampshire Chamber of Agriculture at Fordingbridge, Mr. W. W. B. Beach, M.P., in the chair, Mr. Ridley read a paper on this subject. In the discussion that followed,

Mr. HANNEN, as neither a farmer nor sportsman, but an estate agent, thought the farmers in that parish had nothing to complain of in respect to game. The system adopted there worked very well, he thought, and to deprive gentlemen of sport would, he thought, be one of the greatest evils that could befall this country by driving the aristocracy out of it. If the farmers had the right to the ground game, he thought they would have little to complain of, nor did he think they would object to keep up a good amount of winged game for the enjoyment of their landlords, and if farmers pressed the matter a little more closely he thought they would secure the right to kill rabbits, and perhaps hares too. In that neighbourhood they reserved the game on the farms they let, and the landowner not being a sportsman, he let the shooting to the Most Noble the Marquis of Anglesey (loud cries of "oh"). He believed that all spoke well of him as a nobleman and a sportsman. If he allowed the tenant to be overstocked, the tenant had at once to complain to the speaker, and he gave the Marquis notice, and if he failed to reduce it the tenant had the right to kill. This had worked so satisfactorily that for ten years he had never a case of complaint from a tenant, and if that course was adopted more generally throughout the country he thought these questions would be avoided. He thought game should be assessed to the poor, and bear its fair share of the burdens on the land, and he thought proprietors would not object to it.

Mr. TRASK thought they must be in a peculiarly happy state in that neighbourhood. Although he was happy to bear testimony to the general high principle of land agents, he would not take the word of one of them in this matter of game (loud cheers). It was perfectly true that the law gave the game to the tenants, but what gentlemen owning large estates offered them without reserving to themselves the game, thus practically upsetting the law? As the Most Noble had

been mentioned, he could only say that he had had some experience respecting him, and he pitied any man who had a farm of which the Most Noble had the game (loud cheers). He had the shooting over about 2,000 acres which the speaker held, and he was obliged to go to the agent, and was bound to have permission and kill because the Most Noble would not.

Mr. HANNEN was glad that they were better off.

Mr. TRASK said he had already told them they were peculiarly happy. It appeared to him that the proposal to make game property would be found to be rather difficult in practice, and he fancied if the winged game were given to the landlord and the ground game to the tenant satisfaction might result. Without some such plan—the tenant having the sole right to do what he would with the hares and rabbits—he did not think they would arrive at a satisfactory solution of the question (cheers).

Mr. RIDLEY moved—"That, in the opinion of this Chamber, the time has arrived when, in consequence of the completely altered circumstances of the country, some means should be adopted for checking the great evil of the over-preservation of game."

This Mr. SPOONER seconded, and on its being put to the meeting it was carried.

Mr. TRASK proposed—"That this Chamber is further of opinion that in any future legislation ground game should be declared to be the property of the tenant, and winged game that of the landlord, any agreement to the contrary notwithstanding."

Mr. BENNET seconded this motion, and it was carried, three hands only being held up against it.

The CHAIRMAN confessed he could not quite accede to Mr. Trask's resolution, because, in his opinion, it was a violation of the contract entered into between landlord and tenant, though he was not surprised that there was a very strong expression of opinion on the subject, for the evil was very great, and required checking by some strong and authoritative means.

"SADDLE AND SIRLOIN."*

[FROM THE TIMES.]

Our agricultural and sporting readers will pardon us, we are sure, if before attempting to give a sketch of the contents of *Saddle and Sirloin*, we say a few words concerning the author, who quitted this world on the 16th of March last, at the age of 47, after a most laborious and indefatigable literary career. Mr. Henry Hall Dixon, better known under his pseudonym of "the Druid," was a native of Cumberland, and was educated at Rugby and Trinity College, Cambridge, at both of which places his natural genius and his untiring industry would have probably gained him high honours, but for the persistent ill-health which pursued him from childhood to the hour of dissolution. Upon quitting the University he read for the law, and was subsequently called to the Bar, but after receiving a few briefs he ceased to pursue the profession, although his book on the *Law of the Farm*, which is regarded, especially in the northern counties, as an invaluable compendium, sufficiently proves the solidity of his legal acquirements. From his earliest years he took an intense interest in all domestic animals, but his fondest worship was reserved for the noblest of all the creatures which are devoted to the service of man—namely, the horse. His enthusiasm in this direction is attested by the various scarlet-covered volumes which he published, such as the *Post and the Paddock*, *Silk and Scarlet*, *Scott and Setright*, in all of which the British horse appears as the grand central figure, surrounded by an attendant body of satellites, trainers and jockeys, huntmen and masters of hounds. As a proof of the purity of Mr. Dixon's equine enthusiasm, we may observe that he never made a bet in his life. Beside the above works, he wrote an immense variety of articles on sporting subjects in numerous magazines and newspapers. To the readers whom we are now addressing, "The Druid's" quaint, terse, original style is well known, and perhaps it was never better exemplified than in his biography of the Marquis of Hastings, transferred to these columns. Of late years Mr. Dixon's sporting enthusiasm somewhat cooled, and he devoted all his energies to subjects more exclusively agricultural. He wrote a series of articles on celebrated English herds in the *Mark Lane Express*, and then made a three years' tour in Scotland for a similar purpose. The greater part of this journey was performed on horseback, and often in the most inclement weather, and the hardships which he underwent induced the illness which terminated his laborious career. The volume now before us, *Saddle and Sirloin*, treats of similar experiences in Northern England.

Scattered up and down the pages, and especially in the footnotes of *Saddle and Sirloin* there is a large amount of technical information, which will be of much value to breeders of stock; but we shall refrain from looking at the book in this aspect; we shall regard it rather in the light of a picture gallery, abounding in faithfully-sketched portraits of quaint and interesting characters. At the opening of his volume, Mr. Dixon still lingers on the Scottish side of the Border, evidently reluctant to quit the Land o' Cakes, and pauses to tell us some new anecdotes of Mr. Campbell of Dalgig, famous for his coursing dogs, and for the strange names which he gave them. Being annoyed to find that other coursing men in various parts of the island unintentionally gave their dogs the same names as his, he determined to avoid all confusion by inventing an entirely original nomenclature, and such words as Coomerango, Canaradzo, and Coodareens attest his talent in this direction. He was wont to take much pains over the manufacture, and said that it often relieved him from severe fits of toothache. Mr. Campbell preserved an old-fashioned hospitality towards the beggars and tramps who wandered across the adjacent moors to Dalgig. They were always provided with a night's shelter and plenty of porridge and milk. The host made a point of asking each of them his name, and

strangely enough it always proved to be Campbell. His generosity caused him to be very popular among the traveling fraternity. A fellow was once overheard saying to his child behind a hedge, "Nab what you can, laddie, but no at Dalgig for yer life." On one occasion two married couples who had enjoyed his hospitality from Saturday till Monday, occupied their barn leisure in negotiating an exchange of wives. The arrangement was carried into effect, and "old Dalgig" was so scandalized when he heard of it that for a long time he housed no beggars but aged ones. Readers of *Field and Fern* have already met Dr. Grant of Hawick, the master of the Terriodale, so we will merely direct their attention to a spirited description of his encounter with an otter related in the present volume, and pass on to a characteristic sketch of the late Lord Glasgow. He went to sea at a tender age, and never lost the salt flavour. After he settled to life on shore he soon began to "plunge," winning or losing his tens of thousands with the utmost coolness. "Be the issue what it might, no one could tell by his features whether he had won or lost." This stoical indifference is always commended by turf memoir writers. "Combined with all his off-hand daring," says Mr. Dixon, "there was the fine simple faith of a Jack Tar, and the most rugged honesty." His personal appearance is amazingly described:—

"He never appeared in such modern knick-knacks as knickerbockers. To the last he stood by the side of the cork, with low shoes a world too wide, white trousers in which T.P. Cook himself could have conscientiously danced a hornpipe, and not unfrequently in a blue coat with gilt buttons. See him when you might there was the same nervous irritation which ruined all natural rest, and made his span of nearly 77 years, eked out as it was nightly by chloroform or laudanum, very little short of miraculous."

Mr. Dixon goes on to style his Lordship "a grand Turf patriarch whom no defeat could quench," and says that "he had spent hundreds of thousands during nearly half a century of racing life."

There can be no doubt that Lord Glasgow was one of those sportsmen who by his straightforward conduct tended to keep Turf morality from sinking into that abyss of degradation from which Sir Joseph Hawley is now striving to rescue it; but we hope that the improved aspirations of some future generation will regard such a career as utterly unworthy of a wealthy nobleman. A man with £60,000 a year might, without wasting a penny of his substance, do so much good among his fellow men that it excites, or ought to excite, a feeling of indignation to see him descending into a gambling arena, where, if he does not cheat, he is sure to be cheated. The best thing we read about Lord Glasgow is that he once fed half Paisley in a time of distress, and we commend the fact to the attention of those noblemen and gentlemen who, while emulating Mr. Wright in their gambling transactions at Tattersall's (without incurring Mr. Wright's punishment), never found time to drop a sixpence into the contribution-box of St. George's Hospital.

With far higher interest we turn to the portrait of the late Sir James Graham of Netherby, a fine specimen, both physically and mentally, of the old Border lineage. Mr. Dixon naturally views him rather as a country gentleman than as a Cabinet Minister. He was an enterprising landlord, road-making, draining, building, and tree-planting with great energy. As a significant fact of the change that has come over Border farming, Mr. Dixon tells us that in the old Netherby leases, dated before 1824, sheep were prohibited because they destroyed the fences. No county in England excels Cumberland in manly beauty, and few Cumbrians could compete in this respect with Sir James Graham. Mr. Dixon cannot recall a finer election sight than when Sir James and Mr. Blamire were borne, side by side, through Carlisle, one in a dark blue, and the other in a light-blue chair; and old Carlisle inhabitants still recollect how in a ball-room the dancers would cease their movements, and crowd round to look on at

* "Saddle and Sirloin; or, English Farm and Sporting Worthies," by "The Druid" (H. H. Dixon). London: Rogers and Tuxford. 1870.

quadrille in which Sir James and Lady Graham, Sir Frederick and Lady Vane, Mr. and Mrs. Johnson, of Walton House, Captain Campbell, and the present Duchess of Somerset formed a rare assemblage of comeliness.

Mr. Dixon's next reminiscence is of a cricket match in the old days at Carlisle, between the 34th Regiment and the county. He graphically narrates how Private Allen, a splendid batsman, but rather a disorderly soldier, was taken out of the Black Hole to play, and how Colonel Lowther delivered his slow round-handers. Colonel Lowther, who died in 1866, is another north-country worthy well deserving of commemoration. In his youth he saw active service in the Peninsula, under Sir John Moore and the Duke. During the retreat of Corunna he was exposed to sleet and snow for nearly 16 days without shelter, and on one occasion he rode a horse 80 miles with despatches without either change or rest. Afterwards he became field-master of the Cottesmore hounds. He was a rare sportsman, and never fell in with the modern style of hunting; loving, like Sir Charles Knightley, to see hounds puzzle it out without being over-ridden. Not the least wonderful of his achievements is the fact that he sat for fifty-five years in Parliament (he became father of the House after Lord Palmerston's death), and yet his speeches during the whole period would not fill two columns of an ordinary newspaper. Sir James Graham described his politics as of the "old long-horned breed."

Compensation is a law of nature: every improvement brings its drawbacks with it, and railways, in exchange for speed and comfort, have robbed us of a world of picturesque-ness. Mr. Dixon sadly contrasts the modern assizes in Carlisle, where the judges descend from their first-class carriages, and robe in the waiting-room, with the olden meeting of the judges, when they approached from Newcastle, heralded by a cloud of barristers in post-chaises, were met in state by the sheriffs and their *poore comitalus*, and lunched and robed at a farm-house six miles out of the city. This part of Mr. Dixon's book abounds in characteristic anecdotes. Speaking of the endurance of the postboys, he tells us how Jack Story of the Crown, at Penrith, once rode at a pinch 108 miles—twice to Carlisle and back, and once to Keswick—in a day, when he was past 70. Here is another reminiscence of the old Crown Inn. Some barristers dining there were shocked to discover that the wild ducks, contrary to all gastronomic precedent, had been stuffed with sage and onions. The ruler of the feast indignantly rang for a kettle of water, scooped out the birds' interiors, and sent them down to be re-dressed. The waiter afterwards bade the cook be of good cheer, informing her that the legal gentlemen, in spite of their delicate appetites, had eaten all the ejected stuffing and a small loaf of bread along with it. Jemmy Anderson was another character among the post-boys. He was once driving a carriage between Shap and Penrith, when the hirer roared out, "Postillion, I shan't give you a farthing for your horses or yourself; you've driven like a snail." Jemmy quietly replied, "You won't pay me a farthing, won't you? Then I've come far enough for now," and, swiftly descending, began to take out his horses. The offending passenger had to pay down a handsome *douceur* before Jemmy would consent to put them in again. A south-country postboy here deserves a word of remembrance—namely, Tom King, of Amerham, who once drove "Farmer George," after hunting with the Royal stag-hounds, from Amerham to Windsor. Tom always kept the anniversary of that day as a close holiday. And how do our readers suppose he kept holiday? By sitting all day in the very seat occupied by his sovereign in that identical yellow post-chaise, playing "God save the King" on his key bangle, and refreshing himself with occasional pulls at a pot of ale and a pipe of tobacco.

Mr. Dixon has some curious information on the subject of the Greta-green runaway marriages, the abolition of which, by the way, was a grievous blow to the sentimental novelists. As the post-horse tariff grew higher and higher the nearer the lovers approached the goal, the post-boys established a sort of private clearing-house, so that all who aided in conveying the happy pair were equally remunerated: A certain post-boy, named Jack Ainalie, stationed at Carlisle, was a famous ally to eloping couples. He was perpetually signing his name as witness to marriages; and "to have him," says Mr. Dixon, "in his yellow cord jacket, on the near-wheeler, was worth as many points to the lovers as it

was to an attorney for the plaintiff to retain Garrow or Pollett. If he was pushed hard, Jack knew of cunning by-lanes and woods to hide them in, and had lines of gates across farms, and all that sort of geography, in his eye, for an emergency."

Our author next indulges in some north-country coaching reminiscences. The new generation who fly from Preston to Carlisle in half-an-hour can have no conception of the wearisome journey by coach on a snowy winter's night across Shap Fells and Stainmoor. Coachman, guard, and passengers battled along in the blast, or bore a hand with the snow-shovels, and then looked out anxiously for that tavern sign of "Welcome into Cumberland," which told of deliverance from the wilds of Westmoreland, and that snug little Penrith was nigh. Here is a specimen of the ordinary misadventures of those days:—

"The coachman had not only to gallop at all the snow-drifts but to put a post-boy and pair on in front. The pole-hook broke, and the hand of Jim Burns, the guard, was almost frozen to the screw-wrench, when he brought out a spare pole-hook and fastened it on. The snow fell in flakes large enough to blind them, and the only comic bit was the voice of a heavy swell issuing from beneath a perfect tortoiseshell covering of capes and furs on the box-seat, 'What are you fellows keeping me here in the cold for, and warming your own hands at the lamp?'"

Then we are told of Parson Bird, a famous amateur driver, who was such a good-hearted fellow, that when the regular coachman from Keswick to Kendal broke his leg he took his place for six weeks, and collected the fees for him. A lady gave the parson half-a-crown, and going to a ball at Kendal that night, was introduced to her coachman of the morning, who at once asked her to dance. She was highly indignant, but on the matter being explained to her she grew so gracious over it that she ultimately became Mrs. Bird.

We must pass by a great deal of information about the coachmen, their incomes, their various idiosyncracies, and their mode of managing sulky horses, and content ourselves by alluding to another old-world source of excitement of which the electric telegraph has effectually deprived us—we mean the competition between the newspapers to supply the latest intelligence when exciting events were going on. For example, when Sir Robert Peel spoke at Glasgow, the outer form of the *Sun* was printed off and taken down to Kendal, where the reporters from Glasgow met it, with their speech notes all ready written out. The inner form was printed off there, and thus the people in Glasgow read the speech printed in a London paper before it had time to reach London. When Bolam was tried for murder, one London reporter left Newcastle by the rail without the verdict, while another waited for it, and caught up the mail by hard galloping, after bribing the post-boys to hold their tongues. The two reporters went on side by side all the way to London, but the last comer never disclosed his precious secret.

From feats of coachmanship Mr. Dixon turns to the Turf, and gives us some lively sketches of the race meetings in former days on Carlisle Swifts, when Mr. Daley, a good-natured Irishman, was clerk of the course. Mr. Daley had been a professional actor in his youth, and still "took to the hare-foot," as our author expresses it, when any good local cause required a benefit. In this connexion Mr. Dixon recalls a well-remembered Carlisle anecdote of a certain gentleman more devoted to sporting than polemics, who, after listening over his pipe for fully six weeks to discussions about Lord John's famous "Durham Letter," asked a friend in confidence "Whose this 'ere Colonel Wiseman they've been a talkin' about?" Next we have a careful account of Cumberland wrestling, with a list of the winners of the All Weights wrestling for the last 40 years. The catalogue opens with Robinson of Renwick, and closes with Jameson of Penrith, who has just been trying his conclusions with a famous French athlete at the Agricultural Hall. North-country wrestling is a much gentler and more scientific sport than the rude play of Devonshire and Cornwall, where kicking is permitted, and where the blood of the combatants is consequently apt to wax savage. Here is a specimen of a west-country challenge from Abraham Cann, a noted proficient:

"Polkinghorne, I will take off my stockings and play bare-legged with you, and you may have two of the hardest and heaviest shoes you like that can be made of leather in the county of Cornwall, and you shall be allowed to stuff yourself

as high as the armpits, to any extent not exceeding the size a Cornish pack of wool, and I will further engage not to kick you if you do not kick me."

There is a West Cumberland pig-enthusiast who nearly equals Campbell of Dalgig in his eccentric nomenclature. A prize pen of three sows at the Carlisle show were labelled "Faith, Hope, and Charity." "And pray which of these three is Charity?" asked an old lady. "Which is Charity, Marm?" said the attendant, "of course the biggest on 'em is Charity." "My dears," said the old lady, turning to her daughters, "I never saw it just put in that practical way before." Another trio were severally labelled "We—Shall—Win." An opponent lapsed into vulgarity when he christened his triplet of pork "Aint—We—Stunners?"

Next we have an interesting dissertation on a peculiar breed of sheep called the Herdwicks, which are confined to Cumberland, Westmoreland, and the northern extremity of Lancashire. Tradition reports that their progenitors swam ashore from a Spanish ship wrecked in Morecambe Bay. Their nimbleness and hardihood fit them admirably for the scant pastures of a wild rugged country, with a bleak and stormy climate. In spite of their agility many of them tumble over the crags, but when they survive such perils they have been known to live to eighteen, and even beyond. Their great merit lies in their ability to tide through the severest winters. "Sometimes they are so snowed up on the hill-side that it is impossible to get at them, and they can do little more than scratch for a bit of dead bracken. In a storm they are excellent generals, forming themselves into solid squares on the most exposed part of the hill until it sweeps past, and then trying to trample down the snow by a combined movement." They need to be hardy, for winter begins about Martinmas and it is often the middle of June before the first bite of grass is ready. On the higher fells the ewes have no lambs until they are three years old.

Mr. Dixon displays an amusing affection for the Newcastle and Carlisle Railway, on account of its venerable age and other peculiarities. It is one of the oldest lines in existence between two important towns; there are no express trains; every train, bar one, stops at every station, and does its punctual 20 miles an hour. For years its up and down trains ran on the reverse side to every other railway. Lastly, it engaged as its guards and porters the coachmen and guards whom it had thrown out of work, and allowed them to wear white hats and scarlet coats. "A neighbouring railway elected a policeman with a wooden leg, but our old friend was not to be outdone, as it had, years before, selected a man with no legs as station-master, and when the train arrived he rode about the Blaydon platform on a donkey collecting the tickets." Eccentric characters abound in this region. When John Hodgson, the parish clerk of Wetheral, applied to the railway directors for a gate-keeper's place, he took care to remind them of his professional *status* by writing thus, "I and my stout sons can not only keep, but carry the gates; yea, even the gates of Gaza."

Mr. Dixon supplies some interesting details concerning John Grey, of Dilston, of whose career a notice has recently appeared in this journal. "To sit with the fine old man," he says, "was indeed like 'converse with Old Time,' but we only once had that happiness, and although we often corresponded, we never met again. It was something even for that short space to quarry in such a rich mine of thought and experience." A vignette of John Grey's noble head fittingly adorns Mr. Dixon's title-page. Then we have an amusing sketch of Lord Althorpe, who cared nothing for politics in comparison with his shorthorns. Like John Law, of Mississippi notoriety, who kept a whole *posse* of Parisian notables in his ante-chamber while he dictated a letter to his gardener in Scotland about planting cabbages, Lord Althorpe always welcomed an agricultural visitor in Downing-street. Recognizing John Grey, of Dilston, the messenger said with a little dry laugh, "You've come about the cows, sir, so you'll not have to wait long." And sure enough he finds the Minister with his herdbook before him. "There's a letter from Carnegie," says his lordship, as Grey enters; "he admires my political course, and he writes from the Lothians to say I shall have the first refusal of his bull. I've written to thank him for his political confidence, but I've told him there's a flaw in his bull's pedigree." Of course Mr. Dixon pays a visit to the famous herd of wild cattle at Chillingham. He says:

"Their sense of smell is exceedingly acute, and a cow has been seen to run a man's foot like a sleuth hound, when he has run for his life to a tree. While Sir Edwin Landseer was taking sketches for his celebrated picture, the herd went into action, and he was glad to fly to the forest as they passed by."

We have not said a word about Shorthorns, although they form the main topic of Mr. Dixon's book, and when he is discussing famous breeders now departed, his style rises to a lofty yet chastened eloquence. Thus of Mr. Bates he writes:

"His heart was with horn and hoof to the last, and there was no 'cruel Phyllis' to cross him in *that* love. Those who have strolled with him in his pastures can recall how the cows and even the young heifers would lick his hand and seem to listen to every gentle word and keen comment, as if they penetrated its import; and even when the last struggle was nigh, and he could wander among them no more, he reclined on some straw in the cowhouse, that his eye might not lack its solace."

And how solemn are the enthusiastic breeder's words when, speaking of one of his best "Duchesses," he says to Lord Althorpe, "The destiny of Shorthorns depends on this calf—this slender thread of a calf." Lastly Mr. Dixon sums up his character with the dignified impartiality of a Hume:

"To dairy properties, a thing too often overlooked, he paid great attention, and very few of his cows were deficient in this respect. He was a man of warm feelings, and either a strong friend or a bitter enemy. Though most acute and observing, he was liable to prejudice, and a splendid dogmatizer, but none have left a more decided mark on our Shorthorn history."

We have not as yet got more than a third of the way through Mr. Dixon's portrait gallery, but our limits forbid us to travel any further. We can only tell our readers that they will find plenty of entertainment as well as solid information in his pages, and we especially recommend his life-like portraits of such men as John Osborne, John Jackson, Sir Tatton Sykes, Mr. Gully, and Thomas Godwin. Well worthy, too, of attention are his sketches of Mr. Waterton, the naturalist, at home; of Cheshire cheese-making, and the trials it has undergone through the cattle plague; and of the great agricultural implement factories at Boston and Lincoln. We shall look forward with interest to the succeeding volume on the southern division of the kingdom, which was being carefully prepared by its author within a few days of his death.

CULTIVATION OF BEET-ROOT IN IRELAND.—

A letter, giving the result of some experiments in beet-root cultivation, has been addressed to the *Kilkenny Moderator* by the Hon. L. Agar Ellis, M.P. Mr. Duncan, of Mincing-lane, London, having sent him some sugar-beet seed last spring, he had it sown in different localities in the county of Kilkenny, and the roots when grown were sent to Professor Voelcker, who made an analysis of their constituents. The crops were sown under unfavourable circumstances incidental to a first experiment. It is necessary that the soil should be heaped up to the top of the root in order to preserve its saccharine properties. A considerable portion of the sugar is lost by exposure to the atmosphere. The proper weight of the roots is from 2½ lbs. to 3 lbs. Some useful information upon this and other points connected with the treatment of the crop are given in the letter. Sugar-beet is pronounced to be the least exhaustive of all root crops, provided the refuse pulp is consumed by live stock on the farm. The white Silesian beet is considered the best for this country. The result of the experiments in Kilkenny establishes the fact that sugar-beet can be grown in the county of a quality which will remunerate the manufacturer. It is calculated that a proportion of 8·5 of crystallizable sugar will pay, and in some instances comprised within the range of experiments there was a yield of 10·91 and of 8·94. Mr. Ellis observes, that to make the crop worth growing, either the present sugar-refiners of Ireland must put up machinery for "converting" it, or different districts must erect the necessary works. The climate of the south-east of Ireland is suitable for the growth of such a crop. Some years ago the manufacture of beet-root sugar was attempted at Mountmellick, but, owing to explainable causes, the speculation failed. There is an opportunity now of renewing the effort to establish this branch of agricultural manufacture under more favourable conditions.

THE LORD ADVOCATE'S GAME BILL.

At a special general meeting of the Haddington Farmers' Club, Mr. SCOT-SKIRVING, the Chairman, stated that the meeting had been called for the purpose of discussing the Game-laws and the Game Bills before Parliament. Of the bills before Parliament, by far the most prominent was the bill brought before the House of Commons by the Lord Advocate. In regard to this bill, he felt no hesitation and no difficulty in expressing what he had to say, and he believed that the meeting would be unanimous on the subject. When he first saw that bill, which appeared alone in the congenial pages of the *Scotsman*, and read it, he became more and more convinced that he was reading a hoax. He did not know whether the editor was hoaxed, but he knew that the public were hoaxed, by one of the most ridiculous bills that ever was framed. There were some stories about old friends with new faces; but this was an old bill with an old face. It was Lord Elcho's bill—the bill which his friends so deeply regretted, but which had at least the excuse that it was a bill proposed by a private member—a bill to assimilate the laws of Scotland to those of England, and place the tenant in as auspicious circumstances as he could be in making a bargain with his landlord. Lord Elcho's bill had been before the country for a great many years; it had been discussed again and again by almost every agricultural society in Scotland, and he believed it had been unanimously condemned by the whole. This being the case, he confessed he was astonished on finding that this bill of the Lord Advocate, which appeared in the *Scotsman*, was no hoax. It appeared to him very much as if the Lord Advocate said something like this: "Here is a bill for you, and if you do not like the bill you may go to—he would not say the devil—but the law." And what way were they to go to law? not by arbitration to the Sheriff; but it seemed as if the Lord Advocate wished to show grace to the briefless barristers he had left behind him. If a large farmer suffered damages to the extent of £300 or £300, and chose to restrict it to £25, he might bring the matter before the Sheriff; but if the sum was £50, he must go to the House of Parliament at Edinburgh, and then, he presumed, to the House of Lords. He believed he might say that had as present circumstances were, the Lord Advocate's bill would make them worse should it come upon them, and he moved that the Club should petition against the bill *in toto*. Briefly referring to Mr. Loch's bill, he said he would not advocate it that day, but he thought it the best.

Mr. SHEPHERD (Gleghornie) seconded the motion, saying that he had no hesitation in agreeing with every word which had been uttered by the chairman in regard to the Lord Advocate's bill. He disagreed with that bill as cordially as their chairman could do. He thought that it was an extraordinary thing that the bill which was so unanimously rejected in Lord Elcho's name should have been introduced by this man, who had the vanity to suppose that it would be accepted in his name. He (the Lord Advocate) seemed to have got giddy with conceit at the height to which he had got up. He (Mr. Shepherd) had no doubt that over Scotland the bill would be disapproved. Lately they had received plenty of advice from the various departments of the press. From the editor of the *Scotsman* they received abundance of advice. No later than yesterday, he had stated distinctly that he did not see how landlords could tyrannise over tenants by means of the Game-laws. There was nobody so blind as those who would not see, and he thought the editor had been winking very hard yesterday when he wrote that. He (the editor) further told them that legislation could do nothing, and he begged leave to say that he agreed with the editor very much. He said that settlements and arrangements between landlords and tenants should be everything, and he agreed with him there. Mr. Russel of the *Scotsman* had long been telling them, as he had been saying, that legislation could do no good, and that the removal of the Game-laws could do no good. It might be invidious to quote the words which he had uttered years ago in criticising a pamphlet written by himself (Mr. Shepherd) upon the Game-laws; but he held

that since that time the editor had changed his opinions upon the subject. They had had a great deal of writing from him lately, but he thought it was a great pity they had to mourn over the change in Mr. Russel, who had taken up a position very much against the tenant-farmer.

Mr. ELDER (Bearford) thought there could be no doubt about the fact that there was a desire on the part of farmers in Scotland to see this game question settled, and if the landlords would only show a corresponding desire they would very soon see an end of this game agitation. But if there was to be a settlement of the game question at the present time, he thought it must be of the nature of a compromise. On the one hand they must not ask too much, because they would not get it; and, on the other hand, the landlords would not require to be too tenacious of their privileges, but give way to their reasonable demand. The farmers must recollect that the House of Commons was composed of men many of whom were game-preservers themselves. On the other hand, farmers must recollect that there was such a thing as public opinion, which sometimes could bring the House of Commons to reason. But what he thought would be a fair settlement of this game question would be for the tenant to get full control over the ground game, leaving the winged game to the landlord. It was hares and rabbits which did the damage, and if the tenant had the power to keep these animals in check, he did not think they would complain about partridges. What he would say was this: Get the landlords by all means to give the tenants some interest in game, and they would never have cause to rue it; not only would they find hares and rabbits enough to do their turn, but they would get plenty of partridges. If the tenant had an interest in the game it would go a long way to put an end to poaching. As to the Government Game Bill, he considered it would do them very little good, and he thought it did not deserve the support of the club. The bill proposed to assimilate the game laws of Scotland to those of England, but he thought it was the duty of any Legislature, when they sought to adopt a law from another country, to go into that country and inquire how the law they sought to adopt had wrought. If the English farmers were no worse, at least he thought they were no better, than the farmers of Scotland; but so great was the competition for land now-a-days that they would get men to sign almost anything, so that virtually they might put anything on the law; it was not worth one rap. As to the clauses of the Government bill relating to damages, he disapproved of them, and thought the bill was not one they should support.

Mr. HOPE (Fentonbarns) was very much disappointed and not a little ashamed of the Game bill which had been produced by the Lord Advocate of the Liberal Government. If their friend John Bright had been in his usual health, and able to take his seat, no such futile measure would have been before the House of Commons. It commenced by stating that it assimilated the law of Scotland to that of England, and as Mr. Scot-Skirving had remarked, this had been proposed before by Lord Elcho, and had been treated with scorn. Mr. Hope then proceeded to criticise the various clauses of the bill, and concluded by saying that he cordially agreed with the motion which had been made, that they utterly condemn the bill.

Mr. DUNN (Barney Mains), said that the total abolition of the Game-laws would be a great misfortune. There would not be the slightest protection to the farmers, and he would go dead against anything like their abolition. The chairman had stated that he preferred Mr. Loch's Game Bill, but he thought of all the Game Bills Mr. Loch's was the most ridiculous and absurd which had been heard of and he hoped it had been disposed of permanently (Cries of "No, no"). Noticing the Lord Advocate's bill, he said that in cases where damage was claimed he thought they should be confined to the Sheriff Court entirely, and not go to the Court of Session. He would say if the claim was for £500, that they should go before the Sheriff, and before the Sheriff alone; but he would ten times rather take the Lord Advocate's bill as it stood than the present law as it stood (Cries of "No, no"). The present law declared

that hares and every kind of game belonged entirely to the landlords, and that the tenants had no right to them. He thought this portion of the law was too bad, but he also was of opinion that the Lord Advocate's bill went too far. The landlord and tenant should have an equal right to the game. He moved—"That this Club think the Lord Advocate's bill is an improvement on the present law, but a bill giving the owner and the occupier equal right to the game would be better, and also transferring the trial of game offences from the justices to the Sheriff."

The CHAIRMAN asked if any one wished to second the motion, but as no one did so, it was rejected.

Mr. PATON (Standingstone), said that many were expecting to get a good bill from his Lordship, considering his practical knowledge and sound sense—a bill that would satisfy every reasonable man, though as for others, there was not a bill that would satisfy them. He was thoroughly disgusted with the Lord Advocate's bill. He was convinced it would not satisfy either landlord or tenant, and it would give a great deal of work for procurators, gentlemen of the long robe, and agents. He thought that was the most of it. He was convinced that all who said they wanted reform in the Game-laws did not desire it, but wished to carry on the game cry as an agitation. Many M.P.'s would be sorry to see it settled, he had no doubt; and many persons would like it for a hustings cry. But what had the Liberal Government offered them? He was convinced that had the bill been brought in by the Tories it would have been much more liberal. It was a pity that there should be any bad feeling between the landlord and the tenant, and he thought the first thing to allay that feeling was to give the tenant a large interest in the game. For himself, nothing would give him greater pleasure than to be allowed to have a little interest in the game, and to take care of it and keep off poachers.

Mr. STEVENS (Gallane) thought that the Lord Advocate had a sympathy with the farmers, but that the exigencies of the Government had compelled him to bring in a bill which the farmers could not accept. He considered the bill the sham of a bill, and said that the club should memorialize Government to go into the whole questions of the Game Laws, the Law of Lease, and the Law of Hypothec.

The chairman's motion was then agreed to.

Mr. HORN (Fentonbarns) said that from a Parliamentary return it appeared that 1,340 individuals had been convicted

of poaching under the game laws of England alone, and that all this had happened for the sake and the support of a few individuals, for it appeared that there were only 2150,000 collected for licences. He thought the club should express their opinion in favour of the principle of Mr. Macpherson's bill—that hares and rabbits should be taken out of the game laws; and he moved accordingly.

Mr. SHEPHERD seconded the motion, remarking that such a measure would be the very thing to diminish poaching.

The CHAIRMAN stated that the last deliverance of the club had been in favour of Mr. Loch's bill, and he moved the previous question.

Mr. WYLIE (Polton) seconded the motion.

A vote was then taken, when the previous question was carried by a majority of 10 to 9.

The meeting then adjourned.

PETITION TO THE HOUSE OF COMMONS ON THE GAME-LAWS.

The following is the text of a petition of the Haddington Farmers' Club to the House of Commons:—

"Unto the Honourable the Commons of the United Kingdom of Great Britain and Ireland in Parliament assembled, the petition of the Haddingtonshire Agricultural Club,

Humblly Sheweth—

"That a bill has been introduced into your honourable House by the Lord Advocate of Scotland, and Mr. Secretary Bruce, entitled 'A bill to amend and assimilate in certain respects the law of England and Scotland relating to game.'

"That your petitioners observe with regret that these objects are sought to be obtained by vesting in the occupants of land in Scotland the whole primary right of killing and taking game upon the lands they occupy, and by providing, *inter alia*, that in case of disputes between landlords and tenants all claims for damages on account of game exceeding £50 shall be carried to the Court of Session.

"That the competition for land in Scotland is such that occupants are not in a position to retain the right to game which the bill proposes to give them, and your petitioners do not see that the assimilations of the laws of Scotland to those of England in this respect could be of any advantage, whilst they look with dismay upon the prospect of litigation which several of the provisions of the bill open up.

"May it therefore please your honourable House not to pass this bill into law, and your petitioners will ever pray."

AYRSHIRE FARMERS' CLUB.

At the third annual general meeting of this club held at Ayr, Mr. Robert Dalgleish, Templeland Main, President, occupied the chair.

The SECRETARY said he had received from Sir David Wedderburn, M.P., a copy of the Lord Advocate's Game-law (Amendment) Bill. In answer to a question the Secretary said he had received a copy of Mr. Loch's Bill and others, but all these he thought would be laid aside till the Government measure was disposed of. He read the rubrics of the several clauses of the Government bill to indicate its provisions.

Mr. YOUNG, Kilhenzie, said he wished to make a few remarks in regard to this bill. He did so with considerable regret, as he was sorry to think the Lord Advocate had seen fit to bring in such a bill, and he would be surprised if it did not receive the united hostility of the farmers and people of Scotland. It appeared to him that the Lord Advocate Young was the only person in Scotland who did not know the amendments required on the Game-laws. His bill leaves it in the power of landlords to bind tenants to preserve all kinds of game as heretofore. In short it is worse than existing Game-laws, bad as these are. Under this bill a landlord will be enabled to put clauses in a lease and fine farmers £50, £100, or £500 for killing a rabbit, a hare, or a pheasant. In short game may be multiplied *ad infinitum*. That was sufficient to convince them that the bill should receive their warmest hostility. It appeared to him, and had long done so, to be a most iniquitous and unjustifiable law which prevents a man

from taking such measures to protect his property as he might think necessary. The present Game-laws amount to something like this: you may see your crops destroyed before your eyes from day to day, and yet you dare not lift your hand to protect them. Nothing short of this will satisfy not only farmers, but the people of Scotland: they must, under all circumstances, and at all times, have the right to defend their crops which are their property from ground game. If the bill of the Lord Advocate were passed, it would not stop the agitation for a single day. If Mr. Young had led the Government to believe that the bill would be a settlement of the question, they must be undeceived. He hoped that farmers everywhere, as he had no doubt would be the case with the farmers in the north of Scotland, would give him such a warning as he could not help acknowledging. He ventured to say there was not half-a-dozen members representing Scotch constituencies would find their seats safe if they supported such a bill as that. Next to the Irish Church question, there was none which excited more public feeling and interest at last election than the Game-laws. He was glad to say that the farmers of Ayrshire were so far advanced in opinion on the question that they did not consider it a question between landlord and tenant, but one affecting the whole community. One of the worst effects of the laws was their injurious and demoralising influence upon large sections of the working classes, inducing them to become poachers and then criminals. They were thus the means of filling our jails and poorhouses. He concluded by proposing that they petition the House of

ommous against the Lord Advocate's Bill, and that the petition was sent to Sir David Wedderburn for presentation. Mr. H. C. GRAY said it would not be difficult to show that in the town had as deep an interest in the question as the farmers in the country. He took it for granted that this would be admitted. He was astonished that the Lord Advocate should have introduced such a measure. Mr. Young used to want the tact, courtesy, and forethought of his learned predecessor, the Lord Justice Clerk; otherwise he has known that this measure, instead of being conciliatory, would evoke more hostility than the measures suggested by Mr. Loch and others. He greatly mistook the feelings of farmers if they did not wish the Legislature to give power to protect their crops. What they complained of was that their crops were eaten before their eyes; yet when they sought damages, they got no redress whatever. He thought the game fed by the crop of the tenant belonged to the tenant, and his landlord ought to remunerate him if he lost to have the privilege of shooting over his lands. He did not say whether Mr. McLagan's or Mr. Loch's bill was better of the two; but either of them is preferable to this Lord Advocate's. He quite concurred with Mr. Young's views, as from all he had heard, the bill would create a state of hostility; and that county members would not be their seats if they gave it their countenance.

MR. YOUNG seconded Mr. Young's motion.

MR. LILWORTH wished, when the subject was before the Chamber, to mention a case illustrative of the operation of the game laws, and which showed the utter inability of the law giving landlords the power to reserve game, to redress grievances. A farmer not very far from Ayr, on a lease of a farm along with his father. When the father died the farm there was very little game on it, and much of damage being done. There was a clause in the lease giving the game, which the present tenant's father

did not object to. During the currency of the lease, however, the game began to increase, and did increase to such an extent that it became a very great nuisance. The farmer suffered a heavy loss annually, and at last, unable longer to submit to the injury, he applied to the factor, who gave him no redress. Things went on without the grievance being attended to by the representative of the laird, till again the tenant went to him. The factor received him rather sharply, stamped and fumed, and asked him why he came there pestering him about game; that he had taken the farm with his eyes open, and must just abide the consequences. Determined not to suffer injury without adopting such remedies as he thought were within his reach, the tenant asked the factor to name a practical man, and he would name another to value the damage done, in order to allow of remuneration for loss being given. No attention was paid to this offer. The tenant got two persons of skill who went over the fields, and they assessed the damage at £40. He sent in an account for that amount. Then the factor sent one man who calculated the damage at £10. Nothing, however, was done; the arbitration did no good. Determined to protect his own property, the tenant then set traps and snares to kill the rabbits. Of course the game-keeper caught him, and word was sent to the factor next day. Letters passed between them, and the result was he was interdicted from killing. However, while they were greasing the wheels of the law-engine in Edinburgh to make it turn out an interdict, the tenant was busy killing the rabbits, and the result was that, though the case cost him £10, he made more than that out of the vermin, besides gaining considerable relief from the reduction of their overwhelming numbers.

The motion was unanimously agreed to.

Mr. YOUNG afterwards moved that the Club petition in favour of Mr. Loch's game bill, which was seconded by Mr. MURDOCH, and unanimously agreed to.

SCOTTISH CHAMBER OF AGRICULTURE.

THE GAME-LAWS.

At the general meeting of the Chamber held to consider the Game Bills now before Parliament, Mr. Paterson, a Vice-President, in the Chair, there was a large attendance.

MR. STARR, Mr. Curror, S.S.C., having stated that he had been specially called to consider the Bills now before Parliament, read the report on the subject from Mr. Wilson, President of the Chamber.

"Eddington Mains, 26th April, 1870.

Sir,—I regret that it is not in my power to be present at the meeting of the Chamber to-morrow, as I am still recovering from the house although convalescent.

I like to allow myself to think or say that this Lord Advocate's has been drawn with the view of settling the complaints of the farmers of Scotland with regard to the game laws. I do say that it seems to me to make it evident that the law has failed to appreciate the reality and grievance which give rise to these complaints. At present we are with respect to game, I would say, as things remain as they are than see this.

It will do nothing towards reducing the number of rabbits (the real cause of all the mischief), and it is to the farmer who shall seek redress in the way which it implies add law pleas and open feud with his game grievance. I trust that the Chamber will be petitioning for its total rejection; and I fall back on the ground which it first took up, that the hares and rabbits removed from the game as we held to that, our position was strong and as soon as we resume it the better.

The Chamber will also take action with regard to the change in the dog tax—viz., the wealthy farmer from a most legitimate tax at the expense of

"I have never yet been able to concur with those who seek for a total repeal of the Game-laws, but I know of nothing so likely to drive men into that course as the thrusting upon the country of such measures as the Lord Advocate's Game Bill, and this tax upon crow herds.—Yours most truly,

"JNO. WILSON."

The SECRETARY next read the following letter from Mr. Nicoll, Littleton, who had moved a resolution at the last special meeting of the Chamber on the subject:

"Littleton, Kirriemuir, 25th April, 1870.

"My Dear Sir,—I regret that an engagement previously entered into will prevent me from being present at the meeting on the 27th, when the Game Bills now before Parliament are to be discussed. The Lord Advocate appears to me as simply a burlesquer, and I regret that it should have been on any motion that the Chamber of Agriculture requested him to prepare a bill on the subject. I should, on the other hand, be sorry to think that there was occasion for such a sweeping measure as Mr. Taylor's. It would in many instances undermine, if not altogether destroy, the relationship presently subsisting between landlord and tenant.

"The Whigs at last election dangled the hare-and-rabbit question before our eyes, and under promise of a fair, reasonable, and equitable settlement brought about the almost total extinction of the Tory party in Scotland. We have been lamentably and treacherously deceived; but the day of reckoning will come, and this sham measure of theirs, were an election now to take place, would, I believe, be the foundation, so far as the agricultural constituencies are concerned, of a decided Conservative reaction.

"Failing help from the Tories, might we not hope that the Scotch landlords—our natural allies after all—would step forward and aid us in this emergency, in this deadlock, and proclaim that their eyes are now open to the fact that the preservation of ground game is incompatible with modern agriculture, and that for the future they would place it at the com-

mand of the tenantry? Had I been able to be present at your meeting, I should have availed myself of the opportunity of pleading, as a member of the Chamber of Agriculture, with the landlords of Scotland to do so.

"Failing that, so strongly am I convinced of the utter antagonism between high and liberal farming and the preservation of ground game, that I shall, however unwillingly, ally myself with the party which clamours for total abolition of all laws relating to game.—I am, believe me, yours sincerely,

"THOS. NICOLL.

"D. Curror, Esq., S.S.C."

The SECRETARY next read resolutions on the subject which had been passed by members of the Chamber residing in the county of Aberdeen, and the following communication from Ayrshire:

"Shields, Monkton, Ayrshire, 20th April, 1870.

"DEAR SIR,—The Counties' Committee of the Scottish Chamber of Agriculture for Ayrshire beg to request that the Chamber do petition the Commons' House of Parliament against the Lord Advocate's Game Bill, they being of opinion that it will prove a most unsatisfactory measure towards settling that sore grievance as it affects tenant-farmers.

"I am, dear sir, yours truly,

"R. M. CUNTINGHAME,

"D. Curror, Esq."

"Co. Representative.

Mr. A. E. MACKNIGHT (advocate) said he did not think there was any likelihood of their succeeding at the present time in successfully pressing the question of the total abolition of the game-laws. He did not think the state of public opinion was ripe for that; and there was no practical chance of their succeeding in the meantime, if they made the attempt. He asked them as practical men to view this question in a practical way, and he suggested that they should be content in the meantime if there was legislative effect given to a plan by which hares and rabbits might be altogether removed from the game list, and the tenants allowed to do with them what they choose. If the Chamber were adopting this course, they would do a wise thing, and a thing there would be some chance of carrying. If they could get a proper act passed, they could render it utterly incompetent, on the part of owners of land, to enter into contracts regarding hares and rabbits, and to make such agreements utterly null and void. He would go farther, and make it criminal, and in the case of any landlord who should attempt to make such a contract, he should be liable to a penalty. If they could carry that they would have a combination of both the game bills of last year. If a majority of this Chamber took that view of the question he thought it would have a great influence in the country. This bill of Mr. Young was an indication of how public opinion was running in high quarters. He could not support or approve of the bill in the least. He would propose the following resolutions on the subject, which he thought would effectually meet the grievance:

"1. That the over-preservation of game is absolutely inconsistent with modern high farming.

"2. That were hares and rabbits struck out of the game list, and Parliament to enact that all contracts preserving these animals are illegal, great benefit would arise to the agriculture of the nation.

"3. That the law of England gives no practical benefit to English farming, and would give as little to Scotland; and hence the bill of the Lord Advocate assimilating the Game-laws of England and Scotland does not ameliorate the existing grievances under which admittedly Scotch agriculture labours, but, on the contrary, would lead to litigation and disputes, and embitter the relations between landlord and tenant, and would result in a state of matters worse than the present, and therefore that the Chamber should petition against the bill of the Lord Advocate.

"4. That the other game bills, in so far as inconsistent with these resolutions, be also petitioned against." He thought the bill should be rejected entirely. It was a bill proposed apparently in the interests of the tenant, but in reality it was a landlord's bill. It did not remove the evils; at least it proposed to remove them in such a cumbrous and tedious and expensive mode that the remedy would be almost as bad as the disease. If they were satisfied that Government had failed in their attempt to remedy the grievance they ought

to point out to the Government what measure this Chamber considered would be a real and honest measure. He expressed his opinion that Mr. McLagan's Bill would not remedy the grievance; but he thought that if these resolutions were embodied they would be an effective mode of dealing with this grievance. He did not think that in the meantime they should insist upon any measure for the total abolition of the Game-laws.

Mr. RIDDELL (Houndlee) moved: "That this Chamber is of opinion that the Game-laws are most injurious to agriculture. That they tend to demoralise alike landlords, farmers, and labourers, being productive of crime, thereby adding to the heavy rates under which all classes suffer, and that every legitimate means should be taken to obtain a repeal of these laws." I do not intend to take up the valuable time of the meeting by entering into a discussion on any of the game bills at present before Parliament; neither do I mean to enter into a history of the Game-laws. I only crave the indulgence of the meeting for a very short time to say a few words in support of the resolution I humbly propose for your acceptance. The Game-laws are injurious to agriculture in many ways, on account of the food for the people being destroyed and consumed by game. In proof of this, I beg to refer to evidence taken before a committee of the House of Commons in the year 1846. A witness stated the injury to a field of 40 acres of wheat to be £150. Other witnesses assessed the damages at from £3 to £6 per acre. The damages on a farm of 200 acres at £105. On a farm of 1,100 acres, the wheat crop alone was damaged to the amount of £173. On another farm of 900 acres, rent £610, the game valuers gave the damages at £416 8s. These cases are all in England, and everyone knows that the injury to crops are not by any means diminished since 1846. I will only give one case in Scotland. On an estate in Fifeshire in 1844, the damages amounted to nearly £1,000. Number of acres about 1,060. I need not tell you how they act as a bar to the proper cultivation of arable land. Go where we will we find most enlightened and crack farmers saying that if they had known that game and rabbits would have been preserved to such an extent, they would not have taken their farms, or at least would not have improved them to same extent. The game laws are one of the main obstacles in preventing the breaking up, and otherwise improving of waste land. Of late years sheep and cattle, and even great numbers of human beings, have been forced, evicted, and depopulated to make room for deer, a quadruped of small national value. Game may justly be said to be a monopoly for the landed proprietor and the wealthy at the expense of the poor. Would an enlightened and equitable landlord require a tenant to subscribe to such conditions as the following? "Reserving to the proprietor all fish, game, including hares and rabbits, and game of every description; the tenant renouncing all claim of damages occasioned by hares and rabbits, or game of any sort. The tenant shall not break up any sheep pasture or meadow without the permission of the landlord in writing. By the infraction of this clause the tenant will incur a penalty of £10 per acre. No lurchers or greyhounds to be kept without the permission of the proprietor. There shall not be on any farm a greater number of dwelling-houses than are absolutely necessary for the accommodation of workers constantly employed on the farm; and the tenant shall not have power to let any house or cottage upon the lands to any person obnoxious to the proprietor; and the tenant binds himself to remove from of the farm any person who may be so reported at the first term after intimation is given them to that effect." There are leases entered into this present year, 1870, by tenants in Roxburghshire not materially different from these just referred to. As to the labourer, many an honest and industrious man has become a deep-dyed criminal in consequence of having been tempted to take a hare or rabbit on going to or returning from his employment, caught in the act, convicted on the evidence of a gamekeeper, sent to gaol from inability or unwillingness to pay the fine—there meeting with company anything but safe or conducive to improvement in either health or morals. Follow him a little further, and it will be found that the man released from prison cannot find employment, is forced deeper and deeper into the abyss of crime; and should he have a family, by and by they are thrown on the parish, making the already heavy rates more burdensome still. The temptation is so great to a working man to make a good day's wage in a

short time, the wonder is that greater numbers are not tempted and turned from honest labour to that of poaching. I make bold to say that the game laws do not prevent poaching, that they tend to make poaching almost a necessity. I notice that Sydney Smith quotes evidence given by a London salesman before a committee in 1823. He says: "I could supply the whole city of London any fixed day once a week all the year through, so that every person might have game for his table. I would be bound to procure ten thousand pheasants a week, and I would send to Scotland to say that every week the largest quantity that could be procured to be sent. Being but a petty salesman, I sell a very small quantity, but I have had about 400 head thrice direct from one man." By making game the property of the man who owns land when found there, and by allowing anybody to buy and sell what is now called game when lawfully come by—in other words, abolish the game-laws—there is no fear of the amusements of the rich being interfered with; but I feel satisfied that the temptations of the poor would be greatly diminished. "Do the country gentlemen imagine that it is in the power of human laws to deprive the 3 per cent. of pheasants; that there is upon earth, air, or sea, a single flavour (cost what it may) that mercantile opulence will not procure? Increase the difficulty, and you enlist vanity on the side of luxury, and make that to be sought for as a display of wealth which was before asked only for the gratification of the appetite. The law may multiply penalties by reams; squires may fret and justices commit, and gamekeepers and poachers continue their nocturnal wars—there must be game on Lord Mayor's table. You may multiply the crimes by which it is procured, but nothing can arrest its inevitable progress from the wood of the squire to the soil of the citizen" (S. Smith's Works). When we look to England we find there a growing desire to have the game-laws abolished. And let us turn to the north of Scotland; we find there also great progress making towards the views I have now expressed. I now humbly submit that nothing short of the absolute repeal of the game-laws will meet all the evils that the community suffer from. I now beg that every friend of humanity and every man who has the well-being of the great mass of the population of these lands at heart, unite and do what he can to have these laws removed from the Statute-Book. In conclusion, he might say in regard to the resolutions proposed by the previous speaker, and in reference to Mr. Loch's Bill, his opinion was that they would not answer the purpose they expected. The necessity of the case was not so great as in his opinion, to demand the interference of Parliament or the Legislature of this country between the tenant-farmer and his landlord in the matter of contract. If the Game-laws were just and equitable let them be continued, but if unjust and inequitable, depend upon it they could not be one moment too soon abolished. He had strong hopes that the repeal of these obnoxious laws was not far distant. He did not agree with Mr. Macknight that there was no hope for their repeal.

Mr. MACKNIGHT: I said in the meantime.

Mr. RIDDELL did not agree even with that, for he thought the day was not far distant, and he considered that the Lord Advocate's Bill and Mr. Loch's Bill would go far to convince men that there was no cure short of the total and unconditional repeal of the Game-laws.

Mr. BETHUNE (Blebo) agreed in the main with Mr. Macknight's motion. It was idle to waste words on the Lord Advocate's bill, as it looked very like killing a dead dog. The Bill was too clever by half, and would utterly fail to meet the wants of Scotland. He thought the game nuisance of Scotland was confined to a comparatively small number of estates. He was of opinion that Mr. McLagan's Bill, if it was ever to meet the real evils of Scotland, would require to be altered in the way pointed out by Mr. Macknight. The right to kill game, he held, was the inalienable right of the owners of the soil. He had great faith in the sound sense of the practical agriculturists of Scotland, and if the Chamber could induce them to come half way towards the settlement of the question he thought an amicable settlement would be arrived at. The great evils were the existence of over-preserved estates, which evils they could reach by Mr. McLagan's bill. So far from wishing to see the Game-laws done away with, he should like to see certain birds, which he believed to be the true friends of agriculture, more protected. From the over-preserving of game they had to a great extent destroyed the balance of nature. He

was of opinion that they should give up to the proprietors the right to the winged game, and entirely abolish their right to these pests of the farm—viz., hares and rabbits. He was certain that the opinion of this Chamber would be listened to some time or other on this subject, but he warned them against taking any action rashly. As to Mr. Loch's bill it might be that it was an honest bill, but, if so, it appeared to him that it was an honest bill introduced for the purpose of doing a dishonest thing. As to the bill of the Lord Advocate, he looked upon it as too clever by half; yet it was well enough seen through, and it betrayed a total want of knowledge of practical agriculture. The effect of its provisions would be to leave the tenant-farmer in as bad a position as he had ever been in, with reference to that subject. He believed it would yet be said of the Lord Advocate that he had made a grand mistake in his political career, in having introduced a bill on the game question before he brought in a bill for the abolition of the law of hypothec, for that was the thing that would have settled the whole game question. He concluded by seconding Mr. Macknight's motion.

Mr. SCOT SKIRVING said he believed the Chamber would be unanimous in condemning the bill of the Lord Advocate. Its leading provision put Scotland on an equality with England as a starting point, and already they had seen, from the example of the great country, how utterly inefficient the working of the law there had been. The people of Scotland would be worse with that provision, because it would become an imperative duty on every writer in Edinburgh to see that the tenant-farmer had a thoroughly stringent clause in his lease about the game; whereas at present, though some of the leases had bad clauses, some of them were lenient, and others had no clause at all. Since addressing the meeting recently at Haddington, he had thought over one of the clauses of the Lord Advocate's bill, which said that the tenant was not to be prosecuted as a poacher if, in spite of the clause in his lease, he killed hares, but that he might be prosecuted under his agreement. Now one part of that agreement was that whoever did not adhere to the terms of that lease, should be subject to pay a large sum of money—generally £500. Now, for his own part, he could see no reason why a man who had promised in his lease not to do a certain thing and did it, in violation of that condition, should not be held liable in a penalty of £500, under the Lord Advocate's Bill. In regard to the motion of Mr. Macknight, it seemed to him to be a union of the principles of Mr. McLagan's and Mr. Loch's bill; it was by such a combination that he seemed to be intending to attain his object. His learned friend was a bachelor, and as people changed after marriage, perhaps he thought if he made a union between Mr. Loch's bill and Mr. McLagan's bill they would agree better. Any little aversion might after marriage be done away with; but really there was too much aversion between these two bills to pull quietly through. He adverted to the paper by Mr. Riddell, and said it appeared to show that landlords were to be allowed to make such dreadful conditions in leases, that they would not allow dogs to be kept up, a gun to be kept, or too many hewes to be kept; and it struck him (Mr. Skirving) he was going to advocate Mr. Loch's bill, but he was astonished that in Mr. Riddell's concluding remarks it was said that the panacea for this dreadful thing was to do away with the game-laws, which would leave the landlord to make any bargain he liked. He would propose the resolutions of the Aberdeen Chamber, which were as follows: "That any attempt to redress the grievances suffered by game based on compensation for damages to crops cannot be satisfactory either to the public or to farmers, (1) because compensation for the direct damage (even if it could be satisfactorily ascertained) would not indemnify the farmer for the indirect loss arising from injury to his system of cultivation; (2) because claims for compensation would form a constant source of dispute, irritation, and discontent between landlord and tenant; and (3) because crops being still liable to damage by game, this insecurity would continue to deter farmers from investing in the soil the capital they otherwise would in the endeavour to increase the production of food. Second, that the Game Bill introduced by the Lord Advocate, proposing redress by increasing the facilities for obtaining compensation, is therefore unsatisfactory. Third, that any measure promising a settlement of the game question must at least confer on the tenant the inalienable right, either by himself and others having his authority, to

kill hares and rabbits on the land occupied by him." These resolutions embodied everything in the motion of Mr. Macknight, with the exception of the question of dropping hares from the list, which called in third parties to redress evils that they were quite able to redress themselves. Mr. Macknight, he believed was in error as to rabbits being in the game list. This was not the case, so far as the occupant was concerned; but they were in the list so far as the public were concerned. Unless there was a special clause to the contrary, rabbits were given to the tenant.

Mr. RIDDELL: By the Act of 1862 rabbits were put in. Mr. MACKNIGHT said that by the Act rabbits were smuggled in. By the law of Scotland rabbits were held as vermin, and but for the Act of 1862 they would have continued to be so regarded.

Mr. SKIRVING said that Mr. Macknight's resolutions combined Mr. Loch's and Mr. McLagan's bills, and he could not see how one man could support both, and he therefore begged to submit the Aberdeen resolutions to the Chamber.

Mr. DUN (Dunning, Perthshire) seconded the motion.

Mr. HOPE said he objected to that part of the resolutions proposed by Mr. Macknight which made contracts regarding hares and rabbits illegal. He was inclined to go almost the length with Mr. Riddell, but he did not think there was any likelihood at present of such a measure as that gentleman referred to being carried; and therefore he thought that they should return to the original motion, which was that hares and rabbits should be taken from the game list. He was not inclined to go any further at present, for he was afraid that they might have a very stringent trespass law, which would make matters worse than at present. He had no doubt that the time would come when it would no longer be seen that for the sport of a few individuals they should have ten thousand convictions, as they in England last year, for the infraction of these laws. He moved that no settlement of this question shall be considered satisfactory unless hares and rabbits were withdrawn from the game list.

Mr. DURIE proposed—"That no bill attempting a settlement of the question can be satisfactory unless it declares all game on let land be the mutual property of landlord and tenant, with mutual rights therein. That the jurisdiction in poaching cases should be removed from the justices to the Sheriffs, and that all questions arising out of the game damage be only competent before the Sheriff Court; and that the decision of the Court be final." The total abolition of the Game-laws, he held, was most undesirable, and it would prove particularly unfortunate to farmers living in the neighbourhood of large towns. Farmers in such circumstances would be inundated with poachers. At present he was very much annoyed by poachers, and was at considerable trouble in keeping them off. Mr. Macknight seemed to take Mr. Loch's Bill altogether. He objected to any proposal which would prevent bargains between landlord and tenant.

Mr. ELDER (Bereford) supported this motion.

Mr. BETHUNE suggested that Mr. Macknight should put into his motion a proposal that deer-forests should be fenced and taxed. They might depend upon it that that question would come up eventually.

Mr. MACKNIGHT said, if it were the general feeling of the

Chamber that that question should be taken up in his motion, he would be quite willing to include it.

Mr. RIDDELL (Howford) thought the motion of Mr. Macknight was a very reasonable one, and, if carried out, he believed it would satisfactorily settle the matter. Mr. Riddell's motion to do away with the game-laws was simply nonsense. For his part, he did not see anything wrong about the game-laws. The question should be one of arrangement between the landlords and the tenant-farmers. There were two classes the farmer wished to get rid of—the game-preserver and the poacher. The poacher did no good either to himself or any one else, but broke the laws of the country, and should be put down; while the game-preserver, on the other hand, was guilty of acts of meanness that even a poacher would despise. If the question were left as between the landlord and tenant, it would have the effect of doing away with both, because, without the game-preserver, the poacher could not exist. He thought Mr. Macknight's proposal was a sound one—that it should be rendered illegal to make any contract that would have the effect of preserving hares and rabbits. Mr. Scot Skirving was following in the right direction; but he hoped he would not press his motion so as to lead to a division in the camp. It was highly desirable that the Chamber should be unanimous.

Mr. MACKNIGHT, in reply, explained that if a bill was passed in the terms of Mr. McLagan's bill to-morrow, if there was nothing further said it would be utterly useless. It would not give them any relief, because all the landlords would take care to preserve the game; they would be just where they were. Mr. McLagan's bill would be an utter sham; but if a bill were passed in terms of his resolution it would be a vastly different thing, as it would give effectual relief. He thought that they were substantially as one in this Chamber upon both sides as to the grievance, and that some fair and honest measure should be taken to remedy that grievance. In some other remarks he pointed out that the Aberdeenshire resolutions and those he was proposing were virtually the same, and he showed that, even though Mr. Durie and his second were to support his resolution, they would still make a present of the game to the landlord.

Mr. SCOTT SKIRVING pointed out that the difference between Mr. Macknight's motion and the one he proposed was that Mr. Macknight unfortunately adopted the dropping of the hares. For his part, he meant to follow the county of Aberdeen rather than another Edinburgh lawyer. They had had enough of that in the Lord Advocate's bill (Hear, hear, and applause.)

Mr. SHEPHERD, Gleghornie (who now occupied the chair), in the course of a few remarks, expressed his opinion that the Chamber should just now be very much united in the object they had in view. He counselled that there should be no division, as then their opinion would carry ten thousand times more weight.

The vote was afterwards taken. There voted for Mr. Durie's amendment only 2 members; for Mr. Skirving's motion, 10; and for Mr. Macknight's motion, 12. Mr. Macknight's motion was therefore declared carried.

In a short conversation which followed it was endeavoured to get the meeting to be unanimous for Mr. Macknight's motion, but no practical result followed.

THE GAME LAWS AND GUN TAX.

A meeting of the Aberdeenshire members of the Scottish Chamber of Agriculture was held within the Corn Exchange, Aberdeen, to consider the Lord Advocate's Game Bill and the proposed Gun-tax. Mr. Copland (Ardlethen) acted as Chairman.

Mr. J. W. BARCLAY stated that he had received a letter from Mr. McCombie, M.P., expressing regret at his inability to attend the meeting in consequence of arrangements preparatory to his leaving for London to resume his Parliamentary duties, and declaring his approval of the resolutions, which he (Mr. Barclay) had drawn up in regard to the Lord Advocate's Game-law Bill. He took this opportunity of expressing, on the part of the agriculturists of Aberdeenshire, and of Scotland generally, their sense of obligation to Mr. McCombie for

the course which he had taken in the game question. He had no doubt but the views expressed by Mr. McCombie to the members of the House of Commons and several members of the Government went far to make the Government frame the Bill of the Lord Advocate in the way they did. It was of great importance that they should have a man with practical knowledge representing them in Parliament when such an important measure as this came up. The Lord Advocate's Bill was, he said, in theory an excellent measure, but when viewed practically it would come far short of removing the great grievances of which the farmers complain. The first provision in it began very satisfactorily by making hares and rabbits the property of the occupier of the soil; but then when the clause goes on to say

"unless the landlord reserves such right to himself," it nullifies the clause entirely, so far as the farmers were concerned. There was not an estate in Aberdeenshire, he believed, on which the game was not strictly reserved for the proprietor, and when the landlords had this still in their power would they not continue to do it? Though the game would thus be in theory the tenant's, they would in practice belong to the landlord. The conditions were entirely in the landlord's power. A tenant, it might be said, should demand his rights when he was taking his farm; but if a tenant made any such reference in regard to game when he was taking his farm, the chances were that he would forfeit all his prospects of it. One of the best features in the bill was the ostensible proposal to abolish the game laws so far as the farmers were concerned; but then, if the game were reserved by the proprietor, the tenant could not touch them without the landlord having recourse to prevent him by action of damages. Mr. Barclay then went on to condemn the compensation clauses of the bill as altogether unsatisfactory. No measure based on compensation for damages would be attended with a successful solution of the question. They all knew very well that a farmer need not go to his landlord in regard to any arbitrary question between them, unless he is prepared to dispute with his proprietor; and how many of them could afford to do that? The bill in practice proposed to hand the rabbits to the proprietor as well as the hares, and that was making matters worse. So long as these grievances existed farmers would not invest their capital fully in the soil, not knowing whether they were to reap the returns, or whether they were to go to feed the landlord's game. If the Game-laws were abolished a stringent Trespass Act would be necessary to secure the tenant against damages to crops through the trespassing of poachers. Of the two questions he should prefer the food of the people to the extermination of the game; but the latter was not necessary to bring about redress to the farmers.

Mr. CAMPBELL (Blairton) said the bill of the Lord Advocate did not touch at the root of the evil at all. The Government, he said, must surely have been regardless of the agitation going on for some time on this subject throughout the country when they introduced such a sham measure as they had done. Every grower of crops should have full liberty to protect the same. The remarks of Mr. Gladstone on the subject last

year led them to expect that some such measure as that proposed by Mr. Loch would be brought forward by the Government. If that had been done it would have been more satisfactory, as Mr. Loch's bill was the best measure that had yet been before them of the kind. The Lord Advocate's bill would practically be of no use to the farmers. The Government would find that the Scottish tenant-farmers were rather an acute class to be caught in such a slim trap. What was it but the effects of the Game-laws that was driving so many of the labouring classes in misery into the towns? In the interests of the community, as much as those of the farmers, he condemned the Lord Advocate's bill in even stronger language than Mr. Barclay did.

The CHAIRMAN agreed with what had been said by both speakers, except that he thought Mr. Barclay might withdraw his resolution calling for the entire abolition of the Game-laws, as it had nothing to do with the Lord Advocate's bill, to consider which the meeting was called. He condemned the clause compelling the farmer to raise only one action for damages in the year, and within three months of the date on which the acts were committed, while the landlord might raise 365 actions against the tenant. That showed how much the measure was one-sided.

Mr. BARCLAY, desiring complete unanimity, withdrew his last resolution, and the others were adopted unanimously, and ordered to be forwarded to the Secretary of the Scottish Chamber of Agriculture for submission at their next meeting.

Mr. BARCLAY then called attention to the Gun-tax proposed by the Chancellor of the Exchequer in lieu of game licences. That was like taxing tools of trade so far as the farmer was concerned, for he could not shoot a crow without a licence for himself and another for a servant, if he employed such to preserve his potatoes, wheat, and other crop from vermin. He thought a farmer should be permitted to use a gun on his own farm for shooting vermin to save his crops without being taxed; but if he went beyond his own boundaries he should be liable to pay the same as others. He thought they should call the attention of the county members to it, and also make a representation to the Chamber of Agriculture against the tax on farmers within their own farms.

This was seconded, and agreed to unanimously; and the meeting adjourned.

KELSO FARMERS' CLUB.

At the last monthly meeting, Mr. Usher, Stodrig, in the chair, the subject for discussion was "The Game Bills before Parliament."

Mr. PURVES (Lintonburnfoot) said it was a very difficult question, there being so many intricate points about it. There were no fewer than three or four different bills on the subject, which all differed from one another, and it was difficult to tell which was best. In some of these bills there was, in his opinion, a great deal of nonsense, as, for instance, in the Lord Advocate's bill, which proposed to assimilate the law of Scotland to that of England, so that the whole of the game would belong to the tenant, the landlord being allowed to bring it back. He did not agree with that provision. He thought no tenant in Scotland could complain of the landlords having some sport, and it was very aggravating to the landlord for the tenant to get the whole of the game. He thought the best way would be for hares, partridges, and pheasants to be divided equally between the landlord and tenant. Rabbits were not game, and they were by far the greatest nuisance that the farmer had to contend against. If the tenants got one-half of the game, it was as much as they were entitled to. There might be a difference as to the sharing of it, but he thought that might be settled by a regular account being kept of the game killed, and each receiving an equal share. He wished particularly to secure possession of the rabbits, because they multiplied so quickly and were so destructive. With regard to the other kinds of game, partridges were a harmless sort of bird, and did little ill on a farm; pheasants, when they got to excess, eat up a great quantity of corn, and destroyed a great deal with their feet; and hares, when they were unwar-

rantly numerous, became exceedingly destructive, and were not much better than rabbits. With regard to rabbits, they were not in the game list, but landlords took good care to insert a clause in the lease reserving to themselves the privilege of destroying them. He could give a number of instances where the tenants were not allowed to kill the rabbits, which were killed by the landlord and sold for his benefit. Now he thought that was a great hardship—that a tenant, after feeding all the rabbits, should be restricted by his lease from killing one of them. He held it was most rigid; and how were the tenants to pay their rents except by keeping stock? And it was a fact that on some farms rabbits were so destructive that a very small stock could be kept. He knew an instance where a great many sheep had died owing to the excess of rabbits. The Cheviot hills were swarming with them, and tenants dare not touch them because they are restricted in their leases. He knew another case equally as bad as the one he had mentioned, where the tenant was overrun with them, and many of his sheep died. He employed a man to destroy them, and the man killed upwards of 5,000 on a 600-acre farm in about a year and a-half. The tenant, thinking they were exterminated, gave over killing them, but in about a quarter of a year they again became so numerous that he had to employ another man, but the landlord then said that if he did not refrain from killing them he would take legal measures against him. He (Mr. Purves) thought that was the worst case he had ever heard of. He hoped the question would soon be settled, so that there might be peace. It was a very disagreeable thing when the landlord and tenant were at variance, and they could surely be united in the bonds of mutual trust and friendship. Rabbits were so prolific that a pair in less than a twelvemonth

bred at least forty young ones. Partridges and pheasants only bred once a year, and hares thrice.

Mr. SCOTT (Spylaw) said his idea of the question was that the game-laws should be abolished altogether, and he did not think that there would ever be a satisfactory understanding between landlord and tenant until that was done.

Mr. BORTHWICK (Cowbog) thought the tenants should have an equal right with the landlord to the game.

Mr. BURN (Ednam) thought the game was the landlord's and not the tenant's; and the question just came to be whether a person in taking a farm would like to have the game on his farm or not. If he wished the game, then he would just pay the more for his farm.

Mr. DOUGLAS (Riddlestonhill) approved of the proposition of the Aberdeen branch of the Chamber of Agriculture, that the tenants should have an inalienable right to the hares and rabbits, either solely by themselves or along with the landlord, but in such a way that the landlords could not deprive them of

that right; but he would by no means make hares and rabbits the property of the public.

Mr. JACK (Leith) thought the tenant should have the ground game, and the landlord the winged game.

The CHAIRMAN said he could not say very much for the Lord Advocate's bill, as the assimilation of the Scotch law to that of England did not seem to alter the case much, because at the present time tenants had a right to kill hares and rabbits on their farms by obtaining the consent of their landlords. If the game was handed over to the tenants just now, when they came to make a new lease the landlords would bargain so as to reserve the game to themselves, and they would be in much the same position as at present. The Lord Advocate's bill would make it a simpler matter for the tenants to get compensation for damages caused by game, and it was an advantage to be able to bring a case before the Sheriff. It would be an excellent settlement of the question for the landlords to reserve the winged game, and allow tenants the ground game.

ROTATION OF CROPS AND THE APPLICATION OF CAPITAL TO AGRICULTURE.

At a meeting, of the Banbury Chamber of Agriculture, the Rev. C. W. Holbeach in the chair, Mr. COTHER said: I proceed, in the first place, to give you my own experience and information on the subject of a light, sandy soil; secondly, to consider the better mode relative to the cultivation of retentive stone-brash; and thirdly, to make a few remarks on the kind of soil which prevails generally in this district. In the first place, I propose that the first-named soil, being sandy, shall be farmed on a five-course system; the second, or retentive stone-brash, on a three-course system; and the third on a five-course system, the details of which I propose to enumerate thus. The sandy soil to be cultivated on the following rotation: first, fallow; second, barley; third, peas; fourth, rye, seeds, mangolds and swedes, with a liberal dressing of manure previously supplied; fifth, barley. This is a course by which the land may be kept from tendril couch, by the occasional application of the fork, which can be best applied during the crop of mangolds and swedes, both before and after they are raised or consumed. The second or stone-brash soil to be formed on a three-course system; viz., first, wheat; second, barley or oats; third, every kind of green crop known, or to be known, as a preparation for wheat. What I mean by the green crops already known as a preparation for wheat are these: rye, beans, peas, trifolium, Italian ryegrass, or a mixture of Italian and trefoil, and the various kinds of clover, or any others that may be introduced. The third kind of soil already named, or that which generally abounds in this district, I propose should be farmed on a five-course system; viz., first, turnips; second, oats; third, barley; fourth, beans and seeds in equal proportions; and fifth, wheat. The reason for naming the oat crop after turnips is this. On the highest-farmed land in Norfolk, this is preferred, because the succeeding barley crop is not thrown or lodged; the barley is of superior quality, the seeds are not injured by lodging of the barley, and the seed crop is superior either for mowing or grazing. I shall now proceed to consider the summary of these courses on a farm of 350 acres. First, there will be 150 acres of corn, 60 acres of rye, and 50 acres of mangolds, and swedes on the sandy soil. Secondly, there will be 168 acres of corn and 83 acres of green crop; but by the addition of an indefinite number of acres of beans, the 168 acres may be increased. The third course will comprise 175 acres of corn and 75 acres of swedes and beans. This will give an idea; from the various courses I have named—at what rent the different soils should be taken; but the further consideration of this question may be better left for a future paper in detail, by some person more competent than myself to decide on such a question. There are still two other kinds of soil to be alluded to; but they do not abound in this immediate neighbourhood, and are of a directly opposite character to each other, viz.—a very thin brash soil, such as is found on the Cotswold hills; the other being a very heavy clay. The first of these, as I gather from the best authorities I have met with, should be farmed upon a six-course system, viz.: 1st, turnips; 2nd, barley; 3rd, seeds; 4th, seeds again; 5th, wheat; and 6th

oats. And here I should observe that preceding the oat crop there should be a liberal application of cart manure, and that the turnip crop succeeding should be thoroughly well manured with super-phosphate of lime. This is a system, as will be observed, by which each crop of corn will be kept at a considerable distance from the others of a like description. With regard to the clay, having lived in a clay district, the old system would perhaps be best adhered to, thorough draining having done much to improve such soils; and here from the most experienced farmers I gather that the better rotation as a preparation for wheat is vetches or clover consumed by sheep early in the summer, a fallow made, wheat succeeding the same year, to be followed in the next by beans, and in the following year by barley. I would here, as a rider, if I may be permitted the term, say that I recommend mangolds and swedes mixed, because I believe and feel almost certain that mangolds have the nature of taking that from the soil which is prejudicial to the successful growth of swedes, and inducing a healthy state, the swede crop being almost free from the dreadful disease known as "finger and toe." I would here remark that in using the drill for planting mangolds and swedes, the seed should be in proportion of 36 ounces of mangolds to 16 ounces of swedes, the seed to be thoroughly mixed in the box of the drill, in the proportion of 9 oz. of mangolds to 4 oz. of swedes, and that the hoe should be applied immediately on the appearance of the plants, as sandy land produces so many annual weeds. There now arises a very grave question, and one which requires very carefully handling. It is what is the most satisfactory arrangement that can be come to between landlord and tenant? My own opinion is that there is a very simple basis on which that conclusion may be come to, viz., to graft on the present agreements the customs of Lincolnshire, admitted to be not only the most improved, but one of the best cultivated counties in the kingdom, quite equal to Norfolk, where leases are prevalent. In the former county the tenants are protected by equitable tenants' compensation. This tenants' compensation in Lincolnshire is twenty-five per cent. upon the last two years' outlay for oilcake, to be paid by the in-coming to the out-going tenant, wholly irrespective of the landlord. This compensation from the in-coming to the out-going tenant is based upon the production of just bills; but in the event of erroneous or unjustly made-up accounts being introduced, the out-going tenant forfeits his claim to compensation under this head. In reference to other drawbacks, I am not sufficiently informed to place before this chamber any information, but I believe that it may be found that there are others, and to a considerable extent. With these observations, it is better for me to conclude that the improvement of agriculture may be unlimited under wise and careful provisions; and here allow me to say that this is no less an agricultural than a consumer's question, the well-being of every individual consumer of agricultural produce being concerned therein, and therefore the improvement and perfection of agricultural science and practice is a subject which concerns the interest of all. There still remains one of the

most tender subjects to be touched on that can possibly exist between landlord and tenant, viz., the question of game—a subject that I would not have interfered with had it not been that so many tenant-farmers are greatly injured by its over-preservation, which I am happy to say does not prevail in this neighbourhood to any great extent. At the same time I would wish to remark that the practice of letting manions with the right of game-preservation has frequently proved not only inimical to the interests of the tenantry on the estate, but has also led to the severance of the ties between landlord and tenant. This might be avoided by the adoption of such reasonable arrangements and concessions as are granted by such noblemen as Earl Ducie and the Earl of Jersey, and now to be added Lord Leigh, who have set an example well worthy of imitation, and one which has not only proved most satisfactory to the tenantry, but also protective of pheasants and partridges. I have now to thank this chamber for its patient consideration of the question which I have feebly brought before it, hoping that it may induce a liberal and not heart-burning discussion on the various topics to which I have but cursorily alluded. I hope, at the same time, that I have not in treating upon this or any other subject made a single enemy, and that none such is anywhere to be found. In consideration of these Lincolnshire customs, I would suggest that a committee be formed to take this subject into consideration, such committee to consist of the chairman, the vice-chairman, and secretary, three landed proprietors, and three tenant-farmers, as you will then have a preponderance of the landlord element in the committee; that they shall well consider the question and report to a future meeting of the chamber.

Mr. SCRIVEN said that there was one thing in which he had to differ with Mr. Cother, and it was this. He found that on his farm he could not grow wheat well after fallow, and he thought it was much better to have oats or beans.

Mr. COTHER: Your land is not old enough.

The CHAIRMAN: (to Mr. Scriven): How long is it since the land at Wormleighton was broken up?

Mr. SCRIVEN: About twenty-five years.

Mr. WESTOVER said his experience of stiff land was that a great deal depended on the seasons, over which, of course, they had no control. If the season was good, he sometimes found a very good crop after fallow, especially of vetches. If they had a succession of wet and frost, it injured the wheat; but he had had good barley from stiff land.

Mr. SCRIVEN: On strong land I have tried to grow barley, but it was only fit for pigs. It would never make malt, and the malsters would not buy it.

Mr. WESTOVER: Don't you find it affected by the seasons. On a retentive soil I have grown much better-priced barley than I have grown on other land.

Mr. SCRIVEN: It might be an exceptional year, like the last.

Mr. DUN said that in the management of thin, poor clay soil, which at present was the least paying portion of the area of this island, a great deal depended upon how it was treated. Its fertility could be raised very rapidly by a liberal growth of vetches. On the clays that lay down near Shipston and its neighbourhood, and also in a large portion of Staffordshire, vetches were cultivated, and they fertilised the soil, and kept it thoroughly clear for the growth of wheats of all kinds. From some little experience in the management of clay farms, he found that by growing vetches upon them for the feed of sheep—and allowing them cake and corn besides—it raised the fertility of the soil more rapidly and economically than by any other means that could be adopted (Hear, hear). In the cultivation of poor clay land it was the want of fertilising materials rather than the superabundance of them that they had to complain of.

Mr. GARRETT did not agree with Mr. Cother as to the stone-brash soil. He thought that a five-course system would be better than a three under such circumstances, and would conduce more to the fertility of the soil.

Mr. COTHER said that he had referred to this stone-brash, and he did not think that Mr. Garrett's soil was such.

Mr. S. BERRIDGE said that Mr. Cother had given them a very good idea of the rotation of cropping, but they could not get crops if their land was not in condition. He would have much preferred it, if Mr. Cother had gone a little further into the subject of the application of capital to agriculture. Certainly he should like to have heard from him what treatment

he thought would be best in the management of the different soils he had a knowledge of. It was certain that the application of artificial manures had a great deal to do with the treatment of the soil and the rotation of cropping—(Hear, hear)—and he thought it preposterous to think that they would have good crops if their land was not fit for them. A man might act on a certain system which might be very well and good on certain land; but they knew that there was land in that neighbourhood that required the application of lime, and it would be a great benefit to them if Mr. Cother would inform them as to the application of lime and the different kinds of artificial manures to be used, so that they might grow better crops by their application and secure the rotation of cropping most to be desired. He would be pleased if Mr. Cother would inform them what treatment the land had received from him to the benefit of himself and agriculture generally, and of his use of corn, cake, and artificial manures.

Mr. COTHER: I know nothing about science.

Mr. DUN said that the concluding portion of Mr. Cother's paper ought to have been diseased first, for, from the agreements between landlords and tenants, very often sprang the system of management of farms, and the rotation to be adopted. The details, such as the rotation of crops, had hitherto been left rather too much in the hands of landlords and agents and too little to the discretion of the intelligent tenant. He thought hitherto in a large portion of this country, that agriculture had languished owing to miserable interference on the part of landlords, and who, although singularly incompetent to give advice, had yet attempted to impart it to their tenants, who were very often bound down by the most absurd arrangements. Very often landlords introduced into their leases and covenants clauses which, if faithfully carried out, led to an uneconomical system of management. In many leases there were clauses which prevented the tenant from cropping up the land around his fences, which therefore afforded great harbourage not only for game, but also for weeds of all descriptions. Very often there were clauses which prevented the tenant from cultivating two successive good crops, and in Lincolnshire and elsewhere, although it would have been profitable enough to grow a barley crop after a wheat crop, tenants had had to grow roots. Then again, owing to prejudice, in many parts of the country there was an absurd embargo against the growth of potatoes, which might be made very profitable, and which he had known to realise from £30 to £40 per acre. Illustrations of that kind might be multiplied, and, if it was not for those restrictions, they would have a greater amount of capital applied to the cultivation of the soil. He believed that the reason tenants had not laid out very much capital hitherto was through these restrictions, and also that they had not that security which leases gave them. He was perhaps trenching on ground that was not quite prepared to be discussed; but matters of this kind must commend themselves to the common sense of practical agriculturists. If a farmer in ordinary circumstances invested a few thousand pounds on a farm of 250 acres, he did so entirely upon the faith of his landlord. This was so in most localities, and, if the tenant was without a lease, or some other form of agreement, he must entirely depend upon the landlord's good faith and fair dealing. Life they all knew was extremely uncertain, and a landlord's successor might not have the same feeling towards a tenant, and might not carry out arrangements in the precise manner that his predecessor had promised verbally to do. They would have a much better system of farming; they would have a greater amount of enterprise, industry, and energy; and they would have more capital applied to the cultivation of the soil, if a system of leases or tenant agreement, such as Mr. Cother had referred to, was more general amongst them. The land would be found much better cultivated if they had a tenant agreement, such as was the practice in Lincolnshire and Norfolk. It would encourage the tenants to lay out all their available capital, which they would never do under the existing arrangement of from year to year. The best farming, as a general rule, he did not say invariably, was to be found in localities where leases had been used for a number of years. He was quite aware that in some instances the landlords objected to give up their right to the soil for a considerable number of years, but it would only make landlords a little more careful in the selection of their tenants, and they would select only men

of approved education, skill, and intelligence. Looking at it from the landlord's point of view it would do a great deal of good, and not only raise the status of agriculturists, but bring a large amount of capital to the soil, and also eventually very materially improve the value of the soil, because at the end of the lease the land would be in a much better state of cultivation, and of more value, than at the commencement of such lease. If landlords selected the right men they would not require to bind them down in the matter of cultivation, except perhaps during the last year or two, when they might grow two green crops, or two white crops, or even three white crops, as was done in some parts of England. In a lease for eighteen or twenty years it would be necessary to introduce one or two clauses with reference to the system of cultivation during the last two or three years, to make sure that there would be a certain proportion of the land in condition to raise a crop, and that it be in such a condition that the in-coming tenant might enter upon it and be able to carry it on profitably. He quite agreed with what Mr. Cother said about the in-coming tenant paying so much for manure and artificial foods, but the difficulty in doing so was that it might increase very materially the cost of entry to the tenant, who generally required every available shilling that he had in his possession; but by paying for unexhausted improvements, the in-coming tenant got the benefit of them in the ordinary cultivation of his soil.

The CHAIRMAN observed, as had been said, the subject of landlord and tenant was a little tender, and had there been other landlords present perhaps they would have said more than he would on the matter. He was not bred a landlord, and only became one late in life, and it had never been other than his wish to be what a landlord ought to be to his tenants. These questions with regard to landlord and tenant were new, and therefore some allowance must be made to landlords who who had been brought up under the old system, which in many respects he hoped was not a bad system. That old system was looked back to with respect, as it had been the system of their father and grandfathers, but whatever the system was he was sure that they meant to do and wished to do a good part by their tenants. He hoped that never for a moment would anything exist between landlord and tenants there except the most cordial feelings, and rather than it should not be so he would leave the room and never enter it again. He hoped there would never be anything like estrangement between landlords and tenants, and if there was a right feeling on both sides, it appeared to him that all their differences might be fairly and amicably settled. There were one or two things mentioned by Mr. Dun that he would like to say a word or two about. Mr. Dun said that leases would make landlords more careful in the choice of tenants. But in many cases there was an old attachment existing between landlord and a family on his estate, and in the case of a tenant dying he might have sons that would be eligible to succeed him, and he must say that he never wished to break off the connection with an old family. Probably in such cases if he were to go farther, he might get a well-educated man, a more intelligent man, and a man who desired to go forward in the management of the farm, but still he preferred not to sever his connection with an old family. In the changes of tenants that had occurred with him, in the majority of cases he had carried on with the old families; although he might have gone further and found a tenant who would have done better for himself and better for him (the speaker) in the end. He thought the landlords should have a remedy against the neglect of tenants. If a landlord gave a lease for twenty-one years, as suggested by Mr. Dun, the man might be active and energetic enough the first half of the lease, and the other half he might let the land go down so as to be quite worthless, and he thought the landlord should be protected against such neglect.

Mr. DUN: Clearly, there must be a remedy on both sides.

Mr. WALTON said there must surely be some cause operating in this district that prevented the application of capital to agriculture, when the farmers of Scotland and Lincolnshire could give from £3 to £5 per acre for land, while they in the Midland Counties could only give from £3 to £3. If they compared the system of tenure adopted in Scotland with that of this locality, the comparison was greatly in favour of the former. In Lincolnshire they had the system of compensation for unexhausted improvements, and if a tenant increased

the value of his holding during his occupation he was compensated for it. He quite agreed with the Chairman that there should be protection for the landlords, for he knew that land had been robbed by out-going tenants; he maintained that the man who robbed the land robbed the landlord, as it was capital taken out of the land. The present system of rating discouraged the application of capital to agriculture, and if a landlord erected commodious farm buildings—which were certainly much wanted in the Midland Counties of England—the land was raised in value in consequence, the rateable value of the land was increased, and both the tenant and the landlord had more to pay (applause).

The CHAIRMAN asked if the land cultivated by landlords who were at perfect liberty in the matter of cultivation produced any better crops than that cultivated by tenant farmers?

Mr. COTHER: You have the advantage of the argument.

The CHAIRMAN: A landlord can lay out as much capital as he likes, but does he turn out better crops than his neighbours?

Mr. DUN: But does he lay out the capital? Does he not follow out the system that he finds practised at his own door.

The CHAIRMAN: Then he follows a bad example.

Mr. DUN: He follows in the groove of the locality. Probably it is his farm bailiff who manages his farm for him, and he follows out the system pursued in the locality.

Mr. C. SIMMONS (the Secretary) thought that as a rule they did not see much difference on farms occupied by owners and on those occupied by tenant farmers, unless on farms occupied by small enterprising owners. Of course a gentleman occupying his own farm could afford to spend more money on cake, corn, and artificial manures than a tenant would be expected to do. He considered that a great deal of difficulty arose from the want of some protection to the tenant, and in his opinion a Landlord and Tenant-right Bill would be much better than a system of leases—(Hear, hear). A bill protecting the interests of landlord and tenant would do more to encourage the application of capital to agriculture than leases would, and they could not shut their eyes to the fact that there were bad tenants as well as bad landlords, and the only way to guard against difficulties that might occur on both sides was by a Tenant-Right Bill. He did not think that leases would do, as tenants evaded some of the clauses of them, and he cited the case of a man who occupied a large farm in Wiltshire on lease and during the last two years of his occupation he did not keep a horse, sheep, or pig on the place, and left no manure or straw. A claim of £650 was made for breach of covenant. It was submitted to arbitration, and £350 were awarded; and the straw that was sold off the farm made more money than the whole amount received as compensation. When a man set to work to beggar a farm he could so reduce it that it would not be worth 6s. an acre to anybody. When a landlord once had a tenant of that description they could not be surprised if he was cautious as to the terms on which he let his land. He thought the best system was that pursued at Farnborough, where there had never been a lease granted. There were only yearly agreements there, and as long as a man did what was right he had no cause to fear.

Mr. HILL: That's the best way, where it can be carried out.

Mr. DUN: Doubtful.

Mr. SIMMONS: I certainly think a tenant ought to be paid for improvements in the soil. It is better for a man to pay £300 more when he goes into a farm in good condition, for many a man going into a poor farm has been ruined before he could turn round (Hear, hear). In reference to the rotation of crops, he must say that he was somewhat of a latitudinarian. They could not get good crops if the land was not in good condition, and he never sowed a crop on land unless he felt sure that it would bear a good one. There were times when the land wanted rest, and no man would ever get anything by taking three white crops in succession.

Mr. WESTOVER was in favour of a Tenant-right Bill, but he would be sorry to see the pressure put on here that had been put on on the other side of the Channel to secure it.

Mr. WALTON said that in Scotland, where there were leases, there was a greater amount of capital invested in land than there was in this part of England, and the difficulties that had been pointed out by the Secretary with regard to leases would be obviated if it was provided in the lease at the end of it

that the tenant should be compensated by the capital he left in the land. An enterprising tenant under a good landlord would endeavour to do his best and try and get another lease of the farm (Hear, hear). As to proprietors farming their own land, he believed they were the worst farmers in the country (laughter), and they did not see the man who farmed his own land invest more capital in it than the tenant-farmer did. If they wanted to see the best farming they must look for it amongst the tenant-farmers.

Mr. DUN : Quite right.

Mr. WALTON : I saw, in the report of the proceedings of one of the Chambers, it stated that the reason why tenant farmers did not invest more money in the land was because they had not got it. I consider that no argument at all. There are plenty of farmers who are investing capital in other ways, and why should they do so?

Mr. COTHER here urged the appointment of the committee mentioned in his paper, and

Mr. DUN said that the committee would need to sit a week and take evidence. They would need to examine landlords, agents, and tenant-farmers.

Mr. COTHER : Not at all. They would only make inquiries.

Mr. WALTON : What weight will your conclusions have if you don't do as Mr. Dun has said?

Mr. WESTOVER proposed that Mr. Cother's paper be printed and circulated amongst the members, and then they would be in a better position to appoint a committee after they had read it for themselves and given it their careful attention. The question altogether was rather a delicate one, and after they had considered it it might be brought up again and a com-

mittee appointed to endeavour to bring about a better state of matters between landlord and tenant.

The CHAIRMAN said that he did not think there was time for any legislative action just now, and for the present a good deal must be left to the good feeling of landlords and tenants, and such a discussion as they had had that day would help to promote that feeling. He had been informed that Mr. Cother's paper would appear in the *Banbury Guardian*, and perhaps that would meet Mr. Westover's suggestion.

Mr. WALTON suggested that they should pass a resolution to the effect that, in order to encourage the application of capital to agriculture there should be an agreement between landlords and tenants for a number of years, with compensation for unexhausted improvements.

The SECRETARY : That would be a lease.

Mr. S. BERRIDGE : We have leases now.

Mr. DUN : You have no leases.

Mr. SIMMONS : They are going out.

Mr. DUN : They are coming in, and are being adopted all over the North of England.

Mr. WALTON : When a man has a lease he has got some security for money that he may lay out.

Mr. DUN : If a man goes into a farm for twenty years does it not stand to reason that he will bring all the money he can to improve it?

The following resolution was ultimately agreed to—"That in order to encourage the application of capital to agriculture, tenants be allowed greater security and permanency of tenure, with compensation for unexhausted improvements."

A vote of thanks was given to Mr. Cother for his paper, and a similar compliment was awarded to the Chairman.

THE LABOURER AND HIS HOME.

At the last meeting of the Newbury Farmers' Club the Rev. C. W. EVERETT, Vicar of Woolhampton, read the following paper :

We have read a good deal about the agricultural labourer, and both he and his employer have received many hard knocks from those who assume to be well versed in the subject on which they undertake to treat. We have at different times, at our own meetings in this room, considered the question of education, and the moral and industrial training of the labourer, as well as the responsibility of his master to see to his well-being and comfort. Nor has the cottage accommodation been forgotten, and the necessity of providing good and sufficient dwellings for those on whose conduct and efficiency your own success, in the path of life you have chosen, so much depends. But I do not think the subject has been exhausted. At all events, I am sure that you will agree with me that it is one of absorbing interest, and of immense importance; and if I can add but little that is new, the short time now at my command will not, I hope, be wasted, if I stir up again some half-formed, but, it may be, dormant resolution to exert yourselves actively in a cause so well deserving the attention of the philanthropist and the Christian. I have joined together "the labourer and his home" because it is, I believe, through home influences that he can be made to assume that position in society which will render him happy in himself, exemplary in his social duties, a real help and useful servant to his employer, and a valuable member of the community. But how often is his cottage not his home! How little does it, in too many instances, deserve that sacred name, which awakens in the minds of those who have tasted of its sweets so many and such pleasing recollections! The labourer's cottage is too often only his nominal abode, but scarcely his home. After spending his evening at the public-house, he comes there to sleep off the effects of his intemperance; and with the early dawn returns only half-rested to his daily work. He knows but little of his children, and from the slight experience they have of a father's fostering care, they derive but small advantage. Sometime, alas! the mother's example is no better; her presence at home is unfrequent, and the hungry children cry themselves to sleep, as the only comfort which their untidy, crowded resting-place affords. This, I am thankful to say, is not always the case; nor so much the case as it

was some years ago; but it ought never to be the case. It is, however, no over-stained picture of what was once very common, and is now not in some places unusual. The labourers' dwellings within my recollection are vastly improved. I remember some in the early years of my ministry that were really not fit for human beings to dwell in. One bedroom was a maximum provision for a family to sleep in, where persons of all ages, and of either sex, were huddled together, sometimes the bedsteads having not only beds on them, but under them too. Nor had those who occupied these dormitories always the ties of blood relationship to lessen the evils (if indeed this can be said) of such close contiguity. Sometimes a place was found for a lodger, and a flimsy curtain across a portion of the room was rather an excess of decency and refinement. That typhus fever should have been very commonly prevalent at the time, and in the places I speak of, you will not be surprised to hear; nor that the morals of the labouring classes were at a very low ebb. Whatever may be said of the improvement still required in labourers' cottages, there can be no doubt but that within the last thirty years a great deal has been done, and a great deal is still doing. The great object now is to improve the feelings and habits of the labourers, that they may appreciate and thankfully avail themselves of what has been done for their good. I need scarcely tell you that all care is thrown away, and a decent home provided in vain when the only use made of increased accommodation is to let out what are considered as extra and spare rooms, to strangers, and where the family are satisfied with their old crowded style of occupying one sleeping room. Indeed, the intrusion of lodgers into the family circle increases the evils of over-crowding; and in the common sitting room, around the common supper table, intimacies are formed, and an opening to temptation exists, which often lead to disastrous consequences. The farmers have been held answerable for a great deal of the drunkenness and sensuality that prevails amongst the poor, because they do not, it is said, sufficiently provide for the decent lodging of the young lads they employ, and do not keep them enough under control during those evening hours when their services are not required. Now I believe that masters may do much to improve the moral training of their servants. But to say that they are the sole cause of their turning out ill

is, as a rule, neither true nor fair. I believe that some give themselves a great deal of trouble, often in vain, to reclaim those who come under their charge. There are others, no doubt, who are too careless in this particular. But it must be acknowledged that very many of those who come fresh from their homes, have been breathing a morally vitiated atmosphere from early childhood. If religion were excluded from our village schools, you would in too many cases find no high sense of duty, no thought of responsibility to God, to which you could appeal with any prospect of being understood, much less of making an impression; and what is very sad to reflect upon is this, that the lesson taught to the child at school, is too often practically untaught at home. With the not very promising material brought together under your roof, it is not to be wondered at that even with the best intentions, you often fail of doing the good you would wish; that you become disheartened, then callous, and at length suffer the torrent of evil to rush on its way unheeded that you fancy you cannot stem; and yet, if the lower stratum of society is to be regenerated, it is with these young persons that you must begin. By them is a higher tone of morals to be initiated, and in time, I hope, perfected. Towards effecting this, mere secular education will do but little, whilst a good Christian example will do much. But example will not do everything, and, indeed, will effect nothing if it is immediately counteracted by the evil influence of companions, who are perhaps hardened in vice; and, therefore, I cannot insist too strongly upon what I have heard advocated in this room—the necessity and the advantage of a farmer always requiring a character when he hires a servant. If this were insisted upon, a young man would know that he must behave himself with propriety, or else be thrown out of employ. I think too, that much influence for good might be exercised over these earlier lads by making them feel that they form a part of a well-conducted family; that they are not external to their master's household, but for the time blended with it; that if they are lodged in the house, they are in fact as much a part of the family as the domestic servants are; and that from them the same amount of decorum is required. I may mention, I hope without offence, that where the habit of family prayers prevails, it would be very desirable that these lads should join before retiring to rest. In those cases where they are not taken into the house, a decent and comfortable lodging should be considered a necessary adjunct to the requisite farm buildings; it should be required by the tenant, and provided by the landlord, and this should be presided over by a thoroughly steady man and his wife, who should be required to enforce rules, an infringement of which will bring punishment, and eventually dismissal. A common reading-room, and a place for healthful recreation in parishes, I have on a former occasion mentioned as most desirable, to establish and to keep a sound mind in a sound body. I think that one great mistake in the management of the poor, which law and custom have established, is the treating in them those faults as crimes, which in their superiors in education are looked upon as mere pardonable breaches of good manners. Thus the son of a labourer is sent to prison for that breach of discipline which would bring upon the young man at the University some trifling imposition, or perhaps only a reprimand from the tribunal to which he is amenable. I have taken the two extreme ends of the social scale, to show you that the same remedy which is found effectual in the one case, might, I believe, be applied with equal success in the other. I would introduce into our country villages, something of the proctorial authority—a court that should take notice of moral delinquencies, and treat them as such. It seems hard to send a young man of the labouring class to prison for an offence which, if committed by his betters, would be termed a lark; and harder still, that a mark should be affixed to his name, which will stick to him through life, and which may be brought against him to invalidate his testimony, even should he, on some future occasion (perhaps a reformed and respectable character), appear simply as a witness in a court of justice. A prison is, and should be, a place of punishment, but it is not often, I fear, a place that leads to reformation. When a young man is sent there for a trifling offence he is quite as likely to come out hardened and careless about his future character, as he is to come out a better man. I believe that by a somewhat different course there would be more probability of reclaiming him. The tribunal that I would propose, before which I would in

the first instance bring breaches of morality and good manners—cases which are an annoyance to the peaceable, and disgraceful to the perpetrators of them, but which have nothing strictly criminal in them—might, I think, be composed of the clergyman and churchwardens of the parish. They should have power to admonish, and to fine to a limited amount proportionate to the nature of the offence, and if this fails of effect, or the fine is not paid, the case must then go, as at present, to the bench of magistrates. But I believe that in a majority of cases, the course that I have ventured to recommend would be effectual. I am aware that the composition of my tribunal may by many, in these days, be objected to. I answer, let such recommend a better. I may add that I would have no costs (beyond the fine inflicted), no fees, no counsel employed in these village courts; the attendance of the offender should be voluntary. If he prefers going to the Petty Sessions, let him go. An evil arising from the present mode of punishing trivial offences, is, I think, this: the expenses of going into a magistrates' court are considerable. These are very generally and kindly taken into the account in awarding the penalty, and a lighter fine than would otherwise be imposed; and it not unfrequently happens that a young man goes to prison for the costs of his prosecution, and not for his offence. This irritates his mind, and prejudices him against the law. I believe that by attending to the religious and moral training of the young, by accustoming them to decency and comfort, by making them feel the advantages of a home, you will raise in them a desire for something better than the dwellings with which their forefathers were satisfied, and which I believe have tended more than anything else to produce the low morality which we have had so much reason to deplore. Nor need the wish for an improved dwelling be an illusory one. Both landlords and tenants appear to be awakening up to the importance of the subject, and certainly in all the parishes with which I am acquainted (or nearly all) I see a marked advance in the right direction. There are some miserable hovels built by squatters on wastes, and by the road side, in which the residents claim an ownership, and others built solely as an investment, that it may be difficult to know how to deal with. But the cottages that are attached to the estates of landed proprietors are very much better than they formerly were, and from the general feeling that now prevails, will, I have no doubt, go on improving. But when I speak of the desire of a young man to settle respectably, we must not forget that according to the original law of nature that "it is not good for man to be alone," he will have to seek out an help meet for himself, and that on the training, the discretion, the good sense, and the piety of the partner he may choose will mainly depend whether his cottage becomes his home, or whether he is driven from family comforts to seek for society and excitement at the public-house. If the overcrowding of former days has been detrimental to the character of our male population, how much more has it been so to that of the female. With a greater share of naturally implanted delicacy of feeling, when that delicacy becomes by circumstances blunted, and at length subdued, its recovery is more hopeless, and its loss more detrimental to the interests of society. For after all, the first impressions in good or evil are generally imbibed from the mother. Now let us consider what is the training of our country girls, and what are the expectations for good that we may form from it? They, generally speaking, get more school education than the boys do, unless it is in the case of the eldest girl remaining at home in a large family, who is often wanted to mind the younger children whilst the mother is at work in the field. They are not, as a rule, required to go to work so early as their brothers are. I cannot here enter at any length into the assumed demoralizing effects of field work as compared with other employments for women. I can only say that, with care, this need not be so. I fear that in most cases, whatever may be the after-employment, the seed of mischief is sown at home, and that the crowded dwellings are answerable for much of the evil which occurs afterwards. For this reason it certainly seems desirable that young girls should be got out to household service so soon as they are of a sufficient age to make themselves useful. But here again it must be remembered that they often enter a respectable family with the mind already tainted to an extent, which those who have been brought up apart from the evil influences to which they have been exposed,

cannot easily image. A pretty long residence in country places—a knowledge of the blots which our parish registers reveal, does not enable me to give that pre-eminence in virtue to household servants, over those who seem to be less advantageously situated, that I would wish to do, and in some respect this may be accounted for with a feeling of pity rather than of censure. They are, no doubt, more commonly the prey of the heartless and the profligate. If we consider the advantages enjoyed by female servants in the present day, we cannot but regret that so little real benefit is derived from them. Look at the wages they receive. These are from 50 to 100 per cent., and in some cases even more, above what the same places were worth some 30 years ago. They might lay by from half to three-fourths of their earnings, and yet be able to dress themselves with the quiet neatness which so became the servants who lived with our fathers till they seemed to become a portion of the family: and who loved Master Tommy, Master Richard, and sweet Miss Mary as dearly as if they really were their own kin, and continued to address them as children even after they had perhaps themselves become parents. But what use is made of the larger wages which our female servants now receive? The close imitation of their betters in the frivolities of a luxurious age too plainly declares. And then this finery must be seen and admired. This leads to Sundays out; to a craving for amusement, to a restless discontent with and neglect of duties, to impatience of reproof, however mild, and to a fondness for perpetual change. We cannot look to these, I fear, to regenerate the class from which they spring, to be the wives of an improving peasantry, the mothers of a socially better race; and yet the question I would wish to propose is. Cannot we make them so? Are not we, are not the masters and mistresses of England very much to blame for those errors which in our servants we see and deplore? Are we not too easy and careless, and too little thoughtful of our responsibilities? The higher we ascend in the social scale, the greater is, I believe, this carelessness. The under-servants in a large household are left to the management and control of the upper ones, who too seldom, perhaps, think of anything beyond their efficiency in their particular departments. Even where there is a sense of responsibility, and a real desire to do what is right, there is often much mistaken, and an erring kindness. Now, I should like to see opportunities for the healthful and harmless recreation of the labouring classes multiplied. But when we remember that most of their revels, as at present constituted, end at the public-house, if they do not commence there, it becomes a serious question whether masters and mistresses standing for the time in the place of parents, are not bound to exercise the same controlling influence over the young women in their employ, which natural affection points out as their duty towards their own daughters. We know the education and home training that these servant girls have for the most part received, and surely we should try to elevate their feelings, and not throw them back on that pollution from which a little care of ours may perhaps rescue them. I have dwelt, you may some of you think, at undue length, and entered with unnecessary minuteness into this subject, but when I consider the immense influence for good that may and must be exercised by a virtuous woman; the utter deterioration of character to all who associate with her, of either sex, that follows from the example of a depraved one, I feel that the education and training of the women of the labouring class are chief ingredients in establishing virtuous homes. I will only further add on this subject, that I think a great deal of good might be done, and provident habits established if it was insisted upon at hiring, that a certain sum out of the wages agreed to be given, should be put every year into the savings' bank. If this was not at first very readily acquiesced in, I believe that as the bank book showed the small increasing fortune, the advantage would be acknowledged, and the rule become generally acceptable. I had intended to have entered with some minuteness into the construction and arrangement of labourers' cottages, but time will scarcely admit of this; and, perhaps it is more a question to be laid before landlords, than those who are, for the most part, tenants. I will only say that where a tenant is willing to pay a fair interest upon the outlay for improved dwellings, a landlord ought, as a rule, to be willing to build them; at the same time, it is no advantage to any one to over-build in a rural parish, it is more likely to lead to poverty, and to increased burthen upon the poor's-rate, than to any beneficial result. It is better, in my opinion, either

to enlarge existing cottages, or entirely to remove them, and build others in what may be a more convenient situation, utilizing, as far as possible, the materials that are obtained from the houses that are pulled down. Wherever there is a large family there should be three bedrooms; but as less accommodation may be sufficient for those who are recently married, and for the aged and single people, and may better suit their income, I would have some cottages with two, and a few with only one bedroom, taking care to insist on the removal of a family to a larger dwelling who have outgrown the one which might previously have been sufficient. Gardens or allotments are essential to the well-doing of the labourers, and for these I have always found them thankful. I should put the size of these at from ten to forty poles, according to the means of attending to the required work that each individual may possess. I have necessarily touched upon the dark side of the labourer's character in much that I have advanced in this paper; but I have not lived for nearly a lifetime in country villages without being able to say, with thankfulness, that there is a bright side, and one that will repay the trouble of drawing it out and improving it. Where the character has not been deteriorated by that curse of the labourer, the beer-shop, and the whole temper soured and changed by straitened circumstances, too often caused by his own vice and improvidence, the labourer who has been well brought up possesses qualities which are as genuine and as honourable to him as any which distinguish his betters in rank and education. He becomes much attached to a master who treats him well, and is as careful of his property as if it were his own. He is loyal to his Queen, a lover of his country, and a respecter of order. He has very generally a religious bias, and is more likely to become a fanatic than an infidel. I have hardly ever read a letter written by one of this class to his friends at home from some distant colony to which he may have emigrated without finding a distinct recognition of a superintending Providence. With respect to the honesty of the labouring class, when we consider the immense amount of property which is left unprotected, and sometimes very carelessly, at the mercy of our indoor and outdoor servants, it is really doing them but justice to say that they are, as a class, particularly honest. Nor should I omit among their distinguishing characteristics, their charity to those who are worse off than themselves. Most of their faults may be traced to the brutalizing effects of overcrowded dwellings and abounding beer-shops. Until this last evil is removed, I despair of any decided benefit being effected by any other remedial measure. But, whilst denouncing in the strongest terms the low beer-houses, I should be glad to see the day when a jug of wholesome beer was the general accompaniment to the supper-table of every labouring man. This last subject to which I have referred, and perhaps a few others, are the only ones on which legislative interference is required in order to introduce a higher state of morality among the poor. On most other points, individual exertion and individual determination to do what is right, combined in one long, strong pull together, will, I believe, effect what we all so much wish to see, an improved tone of feeling in the labouring classes. We have a higher code of morals to refer to than was ever propounded by the greatest wisdom of a national Parliament or the most paternal government. The one short and simple rule, to do to others as you would they should do to you, will, if carried out in its true and honest sense, secure all that is required to make us a happy, united, and a prosperous nation.

HEREFORDSHIRE AGRICULTURAL SOCIETY.—

The adjourned general meeting of the members of this Society was held at Hereford, to receive the report of the committee and to arrange generally for the annual show to be held in October next. Mr. J. Janey presided. The report of the committee states "That the season is too far advanced to contemplate any alteration in the time for holding the show for the present year; the show to be held on the day before and day of the Hereford October fair; and that, looking to the finances and other matters connected with the Society, the salary of the secretary shall be considered as a full remuneration for his services, and no extra payment be made to him that is not sanctioned by the committee. The city authorities have given a free grant of the Cattle Market for the annual show; for which a vote of thanks was passed to the Mayor and Corporation.

THE CENTRAL FARMERS' CLUB.

ENGLISH TENANT-RIGHT.

The concluding monthly meeting of the Farmers' Club for the present season took place on Monday evening, May 2nd, in Salisbury Square; the chairman for the year, Mr. James Howard, M.P., presiding. The attendance was very good. The subject fixed for consideration was "English Tenant-Right," the introducer being Mr. Henry Corbet.

The CHAIRMAN said: When the Committee selected the subjects for the present year, the month of May was purposely left open, on the supposition that some measure might be introduced by the Government affecting the interests of agriculture, which it might be desirable for the Club to discuss. Up to the last monthly meeting no measure had been proposed which the Committee thought it necessary that the Club should discuss. At this juncture it was somewhat singular that Mr. Clare Sewell Read and himself, without communicating with each other, wrote to the Secretary, urging the desirableness of introducing the subject of English Tenant-right to the notice of the Club, and asking the Secretary himself to introduce it (Hear, hear). Their respected Secretary at first demurred to take this course, urging that it might be thought he had been, of late, sufficiently often before the Club; but when they reminded him that he was the author of the prize essay upon Tenant Right, which to this day remained the standard work, if not the only work upon the subject, and that therefore, he, above all others, was the man to bring the matter forward, he at once consented to prepare a Paper (cheers).

Mr. HENRY CORBET then read the following paper:—

At our last annual dinner in December, I ventured to say that many of the members did not appear to know what the Club had really done in times past. I said so much when referring to the discussion of the previous evening, which had brought the relations of landlord and tenant once more under consideration. Indeed, during the last half year or so the duties of landlords and the rights of tenants have been continually cropping up again all over the country. It is probable that the introduction of the Irish Land Bill has tended to direct more general attention to the question; and, at any rate, this affords me an opportunity, in the outset, of drawing the strongest possible distinction between Irish and ENGLISH TENANT-RIGHT. I profess to speak with no especial authority on the Irish claim, but it seems to me to work very commonly something in this way: In the first place, the outgoing tenant expects to be paid very liberally for every improvement he has made; in the next, to receive a very handsome sum as "goodwill" for giving up possession; and then—he thinks it a very great shame that he should have to leave his farm! ENGLISH TENANT-RIGHT does not go quite so far as this; and if I now attempt to define to you what this English right actually aims at, and in so doing, necessarily travel over some well-worn ground, my reason for doing so must be the misapprehension which still continues to exist on the subject. At that very meeting in December one of our members stated that "this question suffered through being overshadowed by a cloud of vague generalities. They constantly heard such phrases as 'unexhausted improvements'—'custom of the country'—'duties of landlords,' and so on. What did they mean?" It will be my object to endeavour to answer that question, and to show what unexhausted improvements, customs, and duties do mean. In setting about this, I shall have to take you back to the earlier history of the Club, and to something of what it has done, as I have said, in past times.

The first year, then, in which the Club held any regular series of discussion meetings was in 1845, and in the December of that same year the following subject stood in the name of my much valued friend the late Mr. Wm. Shaw, of the Strand: "Tenants' Rights as between Landlord and Tenant." In introducing this, Mr. Shaw said: "I should define Tenant-Right to be the right of the tenant to require compensation legally for outlay in the improvement of the soil or buildings when the period of his occupation has not been of sufficient duration to enable him to reimburse that outlay. I need scarcely remark that

the portion of the outlay which should be reimbursed is that which remains after making due allowance for the benefit he has derived. I consider Tenant-Right as a question purely between landlord and tenant, and wholly distinct from the rights between incoming and outgoing tenants, commonly called 'tenants' rights,' or dues. The payments made by the incoming to the outgoing tenant vary according to custom, and although embracing certain other items, are little more than payments for labour, frequently used as a means of drawing heavily upon the purse of the incomer, absorbing his capital, crippling his means, and preventing him from managing his farm to advantage." This passage embodies not only a very good definition, but a very nice distinction between acts of improvements and acts of husbandry. The meeting, which may be said to have gone altogether with Mr. Shaw, concluded by adopting his opinion, that "A system of Tenant-Right would promote the interests of both landlord and tenant, and must materially conduce to the advancement of practical agriculture." In the succeeding month another or an adjourned discussion on the same subject followed, when a Tenant-Right committee of the Club was appointed. In the January of 1847 Mr. Shaw took up the subject from the landlords' point of view, when the Club went with him in declaring "That a well regulated system of Tenant-Right would be beneficial to the landlords of this country." Upon this Mr. Pusey brought in his Bill, on which he specially asked the opinion of the committee of the Club, which was given accordingly in the following report:—"The committee of the Farmers' Club on Tenant-Right have perused the draft of a Bill for the improvement of agricultural Tenant-Right in England and Wales, forwarded to them by the kindness of Mr. Pusey; and, after suggesting some alterations in the various clauses, do recommend that all items respecting buildings, roads, and fences, be left out of this Bill, and that a clause be added on a supplementary Bill be prepared to afford tenant farmers those privileges in the removal of buildings erected by themselves which manufacturers and tradesmen now enjoy, the landlord having, in the first place, the option of taking all or any by valuation." Then we prepared and presented petitions in favour of the Tenant-Right Bill, and a deputation from the Club waited on Lord John Russell, the Prime Minister of the time, who, in answer, said that inquiry would be the best means of showing the justice of the cause, and of diffusing information on the subject. In the summer of this same year, 1847, a local Farmers' Club offered a prize for the best essay "On the necessity of some legislative enactment to secure the tenant farmer the benefit of his improvements, and the great national advantages that would accrue therefrom." Being by that time tolerably familiar with the question, I was in the face of some competition fortunate enough to write the prize paper. As I said in the preface to this when I published it as a pamphlet: "When it is remembered that the Tenant-Right claim, if not entirely originating with, has been mainly supported by, the proceedings of the London Farmers' Club, the advantage of being associated with the business of that institution is at once apparent. The effect of this connection has been, to induce the writer to give his arguments with more force and decision than he might, perhaps, have ventured to do on his own unsupported liability. As it is, there is not a case assumed, nor an opinion broached, but for which he could name the very highest authority and example." I feel that I am thus relieved of any charge of egotism when referring to this Essay, which has been quoted or read again and again, with and without acknowledgment; while I am happy to add, that in a review of its proceedings, as taken two or three years since, the Wenlock Farmers' Club considers their Prize Essay on Tenant Right to be "standard authority to this day."

In the spring of the following year, 1848, the Premier fulfilled his promise, and a Committee of the House of Commons was appointed to take evidence on,

and inquire into the Agricultural Customs of England and Wales in respect to Tenant Right. And after some very careful study of the evidence thus collected, I have no hesitation in saying, that the Tenant-right Blue Book contains more valuable and more reliable information on the practice of agriculture than any work that ever was published in our time. Of course we had a hand in it. Mr. Philip Pusey, the Chairman of the Committee, came again to the Farmers' Club for witnesses, and we called for him some fifty or so of the picked men of all England—landowners and land agents, tenant-farmers, members of the Club, and others, whose reputations had reached us. It was, however, by no means a one-sided inquiry, at least half of the members of the Commons' Committee were dead again at the principle, and everything that could be urged against it was brought up. Nevertheless, a Blue Book is at best but dry reading, while this was kept back in a somewhat suspicious manner, after having been partly circulated; and at the request of Mr. Pusey, Mr. Shaw and myself undertook to prepare a Digest or proper arrangement of the evidence. I was in those days a very sanguine energetic young man, and I may tell you, what was then no secret, that I had the lion's share of the labour, and hard work it was, too; although, as is generally the case with hard work, when you are in a condition to stand it, this did me a deal of good. Mr. Clement Cadle, I see, in his prize essay on Farming Customs and Covenants, states, handsomely enough, that he is something indebted in the compilation of his Customs to the "Law of the Farm," a work in which not merely the general arrangement but actually some of my introductory remarks are taken, without any such acknowledgment, from the Tenant-right Digest. And it is from this Digest, or like Hercules by the aid of his own Club, that I propose to clear off the cloud of vague generalities, and to interpret those hitherto mystic phrases known as "unexhausted improvement," "custom of country," and "duties of landlords."

There is, then, in certain parts of Lincolnshire more especially, a certain custom which recognises payment for unexhausted improvement; or, in the words of the Report of the House of Commons' Committee, "In some parts of the country a modern usage has sprung up, which confers a right on the outgoing tenant to be reimbursed certain expenses, incurred by him in cultivation, other than those of ordinary husbandry.—That among such expenses are included the purchase of food for stock, the purchase of certain kinds of manure, and the draining, chalking, and marling of the soil; the result of all which outlay is, to effect an improvement of the soil, more or less lasting, and requiring more or less time to elapse before the increased productiveness, thereby obtained, reimburses the expenditure incurred.—That this modern usage appears to have grown out of improved and spirited systems of farming, involving a large outlay of capital, and to have been promoted by forms of agreement between landlord and tenant, whereby the former covenanted to give compensation for such outlay; which forms have been from time to time altered and enlarged, and are still extending themselves with the continued advancement of agriculture.—That these uses have gradually grown into general acceptance in certain districts until they have ultimately become recognised there as the custom of the country.—That, in practice, the compensation agreed to be paid by the landlord to the outgoing tenant, is paid by the incoming one.—That its amount is found by valuers, who ascertain the cost of the several improvements, spread that cost over a certain number of years, within which each kind of improvement respectively is supposed to repay itself, and then deduct from that number the time during which the tenant has enjoyed the benefit of the improvement." This usage is distinguished in the Commons' Report from the more ordinary practice of paying the outgoing tenant for "the preparation of the soil for crops by tillage, for the straw, hay, and dung left on the farm," and so forth. We then come to see which are properly the landlord's duties, and which the tenant's, in this good work of improvement. Briefly then the *permanent*, such as building and draining more particularly, should properly be the duty of the landlord, while the *temporary*, such as the due use of lime, bones, guano, oil cake, and ashes should be the business of the tenant. With regard to buildings, the House of Commons' Committee reported very much as the Farmers' Club Committee had done: "The law, with respect to things affixed to the freehold is different and more beneficial as regards those annexations made for the purposes of trade, than those made

for the purposes of agriculture, an outgoing tenant being permitted, in many cases, to remove the former, when erected by himself, but not the latter.—That this distinction does not appear to be supported by any sound reason, and your Committee are of opinion that the tenant's privilege of removal, with respect to fixtures set up for trading purposes, should be extended to those erected for agricultural objects." This recommendation has been carried into effect, and by an Act passed in July 1851, a tenant has now the power to remove buildings which he has erected with the landlord's consent, if the latter decline to take them at a valuation. In fact his right so far is secured by law, but no further. The Report of the Commons' Committee admits "That the improvements (already mentioned) which are very generally required throughout the country, in order to develop the full powers of the soil, are greatly promoted by this system of compensation, and therefore it is highly important that all difficulties should be removed which stand in the way of its extension by the voluntary act of landlord and tenants." This is encouraging enough. The next clause, however, declares "That any attempt to make its general introduction compulsory would be met by great practical difficulties, and your Committee rely for the general and successful adoption of the system on mutual arrangements between landlords and tenants." Although this was only carried on a division, still the feeling against legislation has been very strong at times and places; and the landlords of Lincolnshire actually petitioned against the custom being enforced by law on the very good but rather selfish showing that in their own case the custom had the force of law already. Then Mr. Caird went further still, and as *The Times'* Commissioner could hardly say anything too bad about Tenant Right, as towards the end of his book he thus sums-up against it: "It must be plain that it is not the interests of the landlords, if the decision is left with them, to adopt this system. To legalize it by Act of Parliament, so as to render its operation general over the kingdom, it would be necessary to prove that it would promote the public welfare. We have seen in the counties where it exists that *the Agriculture is on the whole inferior to that of other districts* (the Italics are his own), and in no cases, even under the most favourable circumstances, superior to other well-conditioned counties which do not possess this TENANT RIGHT. In every county it has led to fraud in a greater or less degree. It perpetuates bad husbandry, by stereotyping costly practices which modern improvements have rendered obsolete. It absorbs the capital of the entering tenant, thus limiting his means for future improvement. It unfairly depresses the letting-value of the land. Perhaps it may be urged that we dwell on the abuses rather than on the fair and legitimate uses of the system. But it is not easy to see where the line of demarcation is to be drawn."

It is easy enough here to see what it is the writer does not wish to see. Instead of attempting to draw any demarcation line, he is, on the contrary, very careful throughout the whole of this passage to confuse the payment for acts of husbandry with that of the payment for acts of improvement. Holding him to the latter—to the Tenant Right we go in for, payment, that is, for unexhausted improvements—I am prepared to contradict on evidence every one of his statements. I say that *it would be* to the interests of the landlords generally to adopt this system. I say that where it already exists the agriculture is on the whole not inferior but *superior* to other districts and to other well-conditioned counties which do not possess this Tenant Right. I say emphatically that its effect is to *perpetuate*—the word of all others—not bad but *good* husbandry, by stereotyping not *obsolete* but *modern* improvements; and I say that it *raises* not depresses the letting-value of the land. I have promised that this contradiction should be made on evidence, and the first witness I will call shall be Mr. Caird himself. It is thus, writing in 1850, and still as a *Times'* Commissioner, that he speaks of Lincolnshire: "Till the reign of George III. the county remained in a neglected state, the fee simple of the now cultivated wolds and heaths worth little more than their present annual rent; the fen districts an unwholesome reedy waste, prolific of ague and aquatic birds. Till even a more recent period the improvement was slow. In the parish of Limber, sixty years ago, four tenants renting 4,000 acres of land at £125 each, or 2s. 6d. an acre, became bankrupts. The same land is now yielding its owner upwards of £4,000 a year, paid by prosperous tenants. Lincoln Heath, whose improve-

ment had begun in Arthur Young's time, excited his astonishment that farmers in prosperous circumstances could afford to pay 10s. an acre for land which a few years before had yielded nothing, or next to nothing to its owner. For the same land they now pay double, and at Blankney several thousand acres were let as rabbit-warrens in his time at 2s. to 3s. 6d. an acre, for which Mr. Chaplin now receives 20s., the increasing rent being accompanied in both cases with the increasing wealth of the tenants. The transition has therefore been very rapid and striking, perhaps more so than in any other county in England. It was very fortunate that when the time for this transition arrived, the leading landlords were liberal and enlightened men. Among these may be named the late Earl of Yarborough and Mr. Chaplin of Blankney. They saw the advantage of encouraging their tenants to embark their capital freely, and as leases were not the fashion of the county, they gave them that security for their invested capital which is termed TENANT RIGHT, or compensation for unexhausted improvements. Though this Tenant Right may not be strictly a legal claim, it is universally admitted in Lincolnshire, the landlord paying it when the farm falls into his own hands, and refusing to accept a tenant who declines to comply with the custom. It varies, however, considerably in different parts of the county, and appears to have enlarged in its obligations with the greater development of agricultural improvement. In North Lincolnshire the usual allowances claimed by the out-going from the in-coming tenant include draining, marling, chalking, claying, lime, bone, guano, rape-dust, and oil-cake. The following is the scale," &c., &c.

Why what in the face of this, his own testimony, does Mr. Caird mean by saying that it is not, or has not been to the interests of the landlords to adopt the system! That where it exists the agriculture is inferior, and that it depresses the letting value of the land! Why every line he writes, every figure he gives, proves that the system *has* raised the value of the land and bettered the condition of owner and occupier. This extraordinary and unwarranted antipathy would be altogether inexplicable but for one significant fact—Mr. Caird is a Scotchman; and so surely as a Scotchman comes to teach us farming, so surely does he start with the infallible dogma that there can be no good farming without a lease. In concluding his labours as a Commissioner, Mr. Caird says prophetically of the English farmer that "The wishes for leases will increase when the tenant-at-will discovers that security for his capital by Tenant Right is neither possible nor desirable"—so far about the very worst prophecy that ever was made.

Mr. Caird, in his description of Lincolnshire, as just quoted, makes mention of the Chaplins of Blankney. Let me, then, call the present owner of those fertile lands as my next witness. It was thus that Mr. Henry Chaplin spoke in the House of Commons but a few weeks since, not merely as one of the members for, but as one of the landlords of Mid Lincolnshire: "In England, especially in those parts of the country where agriculture was carried to the highest perfection, there was something which was entirely wanting in Ireland—namely, a marked, distinct, and accurate system, capable of being enforced at law, assuring the tenant that he would be amply repaid for everything that he had laid out in the cultivation of the soil in the event of his being ejected from his farm. He would take as an instance the custom that prevailed in the county which he had the honour of representing—and he did not think he should be accused of undue partiality when he asserted that his county stood pre-eminent for the excellence of its cultivation. In no county was the science of farming carried to such perfection, or capital more liberally expended upon the soil, and nowhere was the identity of interest between landlord and tenant more fully recognised, or were more cordial and kindly feelings entertained between them. And yet this was a county where leases for a term of years were practically unknown, or, at all events, were very rare. It would merely weary the House were he to enter into details with respect to the various arrangements. They were many, and necessarily so, because in themselves the operations of farming were of a very multitudinous character. Under those arrangements compensation was amply provided for everything that could be laid out in fair farming, the amount of compensation to be paid being fixed by a valuer or valuers, and a third party being called in to act as umpire if necessary. So simple was that operation, and so well known its results, that an appeal to law or a dispute scarcely ever arose; and

not the least advantage of the system was that it applied with equal effect to small or large farms. By this means security of tenure and its attendant beneficial results were attained; and, although no man could more heartily acknowledge than he did the cordial and kindly feelings mutually entertained with respect to each other by the landlords and the tenants, yet in his judgment those feelings were mainly due to the uniform operation of the just and effectual system of Tenant Right to which he had referred." Mr. Chaplin is known to be a rising man in the House, but this speech alone might make him a reputation. It will be observed that he does not depend upon cordial and kindly feelings between landlord and tenant—very good things, no doubt, as far as they go and as long as they last—but he looks at the matter in a really business-like light, and speaks to a system, marked, distinct, and accurate, capable of being enforced by law, and assuring to the tenant ample repayment for everything he has laid out. And against this, and such results, how can Mr. Caird, I say, maintain his monstrous assertion that it is not to the interests of the landlords to adopt such a system? Only go to the heart of the landlord's interest in the question, and see how his rents would rise or fall by the establishment of Tenant Right. According to the too prevalent custom, a tenant, if only duly and fairly forewarned of his going, does all in his power to leave the land as low and exhausted as, without directly infringing on any rule or covenant, he possibly can. Let TENANT RIGHT have the sanction of the Legislature; let the good farmer work under its protection, and it would be his interest to farm well well up to the day of his departure, for this very simple reason—Instead of, as in an unprotected state, gradually drawing in the use of his money, and staying the force of his ability, he would have confidence to make the most of every minute on every acre as long as he held it, knowing that just compensation would await him for what he left behind. Now take the matter of rent here. Ask any agent or any tenant what difference is made in rent to a man entering on land in a good or in a bad state of cultivation? Hear how the incomer will, in the one case plead the time he will have to wait, and the sums he will have to find before he can count on the least return. Attend to this, and only mark the effect it must of course have on the estimate. In the other case the talk is all the other way. Here is the land in a condition fit to repay as readily as that of the oldest inhabitant on the estate; and if one hesitates at the price per annum, depend upon it there are plenty of others more than anxious to take it at almost any rate of rent a man of business could put upon it. Keep up the cultivation and you keep up the rents. Lower the one, and there will be a *sequitur* in the other as inevitable as unprofitable. The time spent by a tenant in enriching at his entry, and in impoverishing at his exit, is so much time lost to himself, so much income lost to his landlord, and so much food and wealth lost to the country.

I will call but one witness more to clear up any "vague generalities," and this shall be as appropriately following a Lincolnshire landlord, a Lincolnshire tenant who has himself often been engaged in making these valuations according to custom. I quote from a letter by "Lincoln," who says: "The great interest felt at the present time in farm agreements, leases, and Tenant Right, and the frequent mention of the Lincolnshire Tenant Right system induces me to give you the leading features of that system, which has made those parts of Lincolnshire where it is adopted one of the best, if not the very best farmed district in England. Let me first mention that tenancies, as a rule, commence and expire on the 6th of April, six months' notice being required, and that leases are quite the exception. When a tenant quits his farm (and I now speak of the custom where no private agreement exists) he will be allowed for all under-draining done with tiles on the five years', and, in some cases, on the seven years' principle, including labour of leading tiles and putting in; on liming he will be allowed on the five years' principle, including carriage; half the last year's linseed and cotton cake bill will be allowed him, or one-sixth of the last three years; the whole of his last year's artificial manure bill will be allowed if used for roots; and all buildings made of wood and resting on brick or stone will be taken at their full value. The manure and the straw are the property of the landlord. These are the foundations of a system which, in Lincolnshire, has in one generation raised the rental of hundreds of acres of land from 5s. per acre to 30s., and the fee

simple from £10 per acre to £50 and £55." There is one sentence in this letter to which I would call your especial attention. This is where the writer speaks to a custom under which compensation can be claimed where no private agreement exists. There is no doubt but that the continued discussion of the TENANT RIGHT principle and the gradual spread of information on the subject have done immense good, as more than anything else to root out the frowy fusty old form of agreement that too long held something like sovereign sway in agents' and solicitors' offices. Landlords and land-stewards, as they come to be more enlightened, come more readily to introduce liberal or compensation clauses which encourage the tenant's exertions, and recognize his right to his own.

And here some would stop; but I would not. Like the Lincolnshire landlords, men who have the sense to see the advantage in, and avail themselves of the custom, need, of course, no Act of Parliament to induce them to do so. But any such argument as this is offered in defiance to the first principles of legislation. Laws are made not so much to bind over the good as to keep in order the bad, and to mete out equal justice to all; as it is clear enough that if tenants holding only under liberal landlords or enlightened agents can feel secure in this way, that equal justice is not meted out to all. In fact, we propose to stop just where and when the pressure is most required. Moreover, the elaborate agreement which minutely defines what improvements the tenant shall make and what rotation of crops he shall take, is fast going out of fashion. If a man be only to lime, bone, or chalk his land after a special contract to that effect with the owner or agent, he might just as well turn farm-bailiff forthwith, or hold under the last model Welsh agreement, which directs him how to burn his weeds and how to ask permission of his landlord if he should think of leaving home for a month or two. But then it is urged, further, that the law has no right to interfere in any private bargain made between man and man, or to put it more directly between owner and occupier. Why the law is always interfering in the bargains made between man and man. The law ratifies the agreement between the citizen and his apprentice; the law looks jealously enough to the hiring between master and servant, and the law is ready enough to throw its protection over any unfortunate man who, in any private transaction with his fellow man, has made a bad bargain in buying a horse, a house or a business. Why should it not afford its protection to the tenant-farmer?

Again, the relative positions here of the two contracting parties are, as Mr. Weller said of his grog, "neekal, and that's just the fault of it." Let the agreement run as it will, let there be agreement or no agreement, a landlord has always "a case" against an outgoing tenant for dilapidations, should the man have not acted fairly by the land. But, on the other hand, should the tenant have laid out capital on the land without full opportunity of reaping the benefit of it, he, as any lawyer will tell him, has "no case," unless this be in the bond. Thus, you see, there is a sense of equity for the one side and not for the other. But, it is said, it would be difficult or dangerous to attempt to legalise any particular custom. Why, half the statutes in the law books are little more than legalised customs, which, having been found to work well merely from force of custom, have been further emphasised by the force of law. And this is what I ask here; as against this the Tenant-Right Committee of the House of Commons says, "any attempt to make these allowances compulsory would be met by great practical difficulties," and so would not recommend it. Now if it were proposed to pass a law of details by which compensation, say for the use of bones, should be made to extend over so many years in this district, and so many the less in another, then I say with the House of Commons' Committee there would be great practical difficulties in the way. One might as well attempt to draw up an agreement that should suit all the world over. But I would propose to do nothing of the kind. I would simply have the law recognise and support the justice of the principle, which would enable a man to claim his rights, even where, as "Lincoln" puts it, no private agreement exists.

Mr. Caird said twenty years back that the wishes for leases amongst English farmers would increase; since when, I believe, there has been scarcely any perceptible increase in such a direction. I will not say why it is, but so it is,

neither landlords nor tenants in England would seem to care about leases, as some of the best farmed land in England is cultivated without any such security of tenure. But I care not which it may be, a lease like a shorter agreement cannot stand alone. In the evidence taken before the Parliamentary Committee the advocate for leases invariably stipulated for some provision towards the end of the term, as he was always ready to admit that without a proper system of compensation for unexhausted improvement even this most orthodox system of tenure could not be properly carried out.

One word more and I have done. Often as this subject has been previously discussed by the Club, I cannot but think that it comes on very opportunely just now. If I tried to read the signs of the times, I should say it was by no means improbable that the present Government took up in turn the Land Question in England; and I feel very confident that much good might follow from further inquiry. Mr. Philip Fusey, our steadfast champion, has long since departed from amongst us; but I look with even greater hope to a Parliament wherein I can find men like our present chairman, Mr. Howard, and our past chairman, Mr. Sewell Read. When that first inquiry into Agricultural Customs came on, one of the witnesses called was Mr. Chandos Wren Hoskyns, then described as a barrister-at-law, but now more distinguished as one of the members for the bucolic city of Hereford. And we have a promise of further aid here, for it was thus that Mr. Wren Hoskyns, as a witness, answered one of the chief questions put to him as an agricultural lawyer: "Do you think that legislation could compulsorily direct compensation to be given by the landlord to the tenant for those improvements? —It would be very difficult to make it an act of direct legislation; but it appears to me that powers might be intrusted to those who should direct the arm of legislation in enforcing the claim of the tenant for improvements of that kind, that had been made; not that legislation should dictate what the allowance or compensation should be, but merely that there should be a power given by the legislature, in order to authorize their decision upon such a subject, whether it be the arbitration of a single referee or umpire, or the arbitration of a board or court." I am happy to be able to agree so much with so distinguished an authority as "TALPA," who, I trust, will have an early opportunity of saying again in the House that which he said so well in the committee-room. Customs vary very much—Yes. There are some customs that are very pernicious in their effects—Yes. Customs are often hazardous or uncertain in their action—Yes. But suppose from all this variety, uncertainty, and mediocrity, we are able to cull out some custom that is particularly good, what shall we do with it? Why, make the most of it, of course; as this I contend we should best do by sanctioning its extension. In the claim we urge, as I hope I have in some degree succeeded in showing, there is nothing obnoxious, nothing impertinent, and nothing encroaching. It is an argument grounded and maintained on those wholesome ethics REASON and RIGHT (cheers).

Mr. B. LEAMON (Whitwell) said that there was no question more important than the one under discussion, and he was certain it would have weighed considerably more with them and with the public at large if the paper had been read by any other person than Mr. Corbet, the editor of the *Mark Lane Express*. That a body of members connected with the Club, after reading the various articles in that paper, should think Mr. Corbet a fit and proper person—

The CHAIRMAN: I must protect Mr. Corbet from any personal remarks.

Mr. LEAMON: I have said all I wish to say (hisses and laughter). Mr. J. SMYTH, jun. (Baldock), thought they were in duty bound, if they liked, to express their feelings.

The CHAIRMAN: But not to descend to personalities.

Mr. SMYTH: There was not the slightest personality in any way; but so long as he was an Englishman he should support his rights. He wanted Mr. Corbet to tell them how they could grow corn at 6s. a bushel, and behave loyally towards their Queen and Constitution? He asked for information from their worthy friend Mr. Corbet how they were to do it?

The CHAIRMAN: Mr. Corbet didn't rise to give any such information.

Mr. SMYTH owned he was wrong there, but he asked for information.

Mr. THOMAS (Bletsoe), who said he felt very much indebted to Mr. Corbet for coming forward in the handsome

manner he had done with so able a paper. As a tenant-farmer he entirely agreed with it. Land agents might object to the opinions which had been expressed; but the paper contained nothing that should be objectionable to a tenant-farmer. You could not expect a tenant of capital and skill to embark in a farm, and make a considerable outlay upon it, unless he had a Tenant-right agreement or a lease. A lease, no doubt, was preferable, notwithstanding what the reader of the paper had said; but some objected to a lease, and in that case Tenant Right should be supplied. He could fully endorse Mr. Corbet's views as to the payment of the farmer for unexhausted improvements made upon the farm. The land would then be farmed at the end as at the beginning of the agreement, which would, of course, be a benefit to the incoming tenant, the owner, and the community at large. It might be all very well to lay down some sort of covenant, as was often done by the land agent; but while there were many good men amongst these agents, there were a great many who had no business to presume as they did to dictate to the tenantry of the country (Hear, hear). Many land agents presumed to lay down clauses of which they knew absolutely nothing, and when this was the case, it was impossible that satisfactory agreements could be made for the tenant (Hear, hear).

The Rev. E. SMYTHIES said Mr. Corbet began his paper by some disparaging terms as to some remarks made at the Club last December, and reference was made to the question suffering from being overshadowed by a cloud of vague generalities. The original expression, he begged to say, was "vague and vapid generalities," and he did not at the present time see any necessity to withdraw that second epithet, because the generalities from which the question suffered were as vague and vapid as ever. The Club had been told that due allowance should be made to the out-going tenant, and that an alteration should be made in the present system. He maintained these expressions were of no good whatever. What farming men wanted was to know exactly what the out-going tenant was to receive—what proportion of the whole. The first departure from vague and vapid generalities which he had heard was the Lincolnshire tenant's letter, wherein was sketched out the money proportion and value of certain practical things to be allowed to the out-going tenant. Let the Club be told whether the out-going tenant was to have the whole of the last year's bill for artificial manure, half of the last year's bill for oilcake and other artificial foods, a third for the preceding year, and a certain proportion precisely defined for lime, &c. These statements would be valuable, and would guide landlord, tenant, and agent in coming to a satisfactory conclusion; but when we were told time after time that "what is right between man and man must be done," and that "due allowances must be made," and so on, nothing whatever was said that would assist two men in coming to an agreement upon a matter where agreement was desirable. One man would consider "right" and "due allowance" to be very different from the views of another, and the custom of the country, though defined enough in one part, was very undefined if we took the whole country through. Let proportions and figures be placed before them, and all that remained would be a simple question of arithmetic which the landlord and tenant could settle between themselves without any alteration or need to call in a third party. Supposing it were possible to make an agreement, it would be very difficult to frame it so that it would suit all parts of the kingdom, for even Acts of Parliament would be of no use if they merely embodied vague expressions.

Mr. WILLIAMS (Baydon, Hungerford) quite agreed with Mr. Corbet that, taking all circumstances into consideration, the Lincolnshire Tenant-right was the best that could be adopted for the tenant farmers of England. This opinion was founded upon practical observation of the working of the system. Tenant Right, admitting there were certain interests in the soil, should define what was occupation as distinct from ownership. No doubt this was an intricate subject, because, except in Lincolnshire, there were very few landlords who would take the subject in hand. In the county he had named there was no objection, but in the West of England the landlords looked several times before they would have anything to do with Tenant Right. In his neighbourhood they said that Tenant Right would be landlord wrong. They could not yet be brought to see that they would suffer no injury by granting to the tenantry that which he believed every English farmer had the right of demanding. He, himself, held that a great good

would be done if the law were simply altered on the matter of notice to quit. The law of the land at present was that six months' notice would send any tenant about his business, let him spend whatever he might in improvements. A strict Tenant Right would alter this law so that no man should be turned out of his occupation without two years' notice to quit. Nothing short of that would do, and that was a very good idea of Tenant Right. The tenant had to pay all the local burdens imposed upon the country, and it was an agreement between landlord and tenant that this should be so, and the consequence was the tenant never knew what he had to pay. Carrying his memory back 40 or 50 years he could remember a continual accumulation of burdens upon their shoulders—county police, lunatic asylums, military stores, and a host of other things. Was that Tenant Right? These local burdens were about to be increased again by an educational rate, and no man can see an end of what the tenant-farmer would be called upon to pay, and to which he never gave his consent. He suggested that the tenant-farmer should pay a proper amount of rent for the occupation of the soil, and then, in addition to that, in the same way as he paid the income and land-tax, he should be annually called upon to pay for his landlord all the other local taxes, the landlord reimbursing him as in the case of the income-tax. This was his definition of Tenant Right.

Mr. HAMILTON (Acton), as a new member of the Club, attending his first meeting, wished to join in the thanks that had been expressed to Mr. Corbet for his paper. As a small owner of property in Hertfordshire, he had for 32 years adopted the Lincolnshire system of Tenant Right. He had only had two tenants during the whole of that time, and the second paid the outgoing tenant what the custom required, so that as landlord he had no trouble whatever in the business, and he had every reason to believe that the tenants had been satisfied with the whole arrangements. The compensation clause he agreed to was that unexhausted improvement was paid for by the landlord or incoming tenant. The result was that the land was kept in perfect condition always. The first tenant had a 21 years' lease; but he unfortunately did not carry on the farm as well as he ought to have done, and he (the landlord) gave him notice to quit at the end of 14 years, and the tenant then went on for seven years as a yearly tenant. The present tenancy was yearly with six months' notice to quit. The tenant was perfectly satisfied, because if he hid out ever so much money upon the land it must come back to him in accordance with the Lincolnshire compensation clause. If this system, or a system modelled upon its principle, could be carried out throughout the entire country, it would be much better for the land and there would not be that six years' loss which was now suffered by the outgoing tenant neglecting it for three years before he left, and the incoming having to wait three years before he got it back to its proper condition. The adoption of Tenant Right in England, would therefore, not only improve the relations between landlord and tenant, but would increase our produce, and thereby tend to the welfare of the general community (Hear, hear).

Mr. LEEDS (Castle-Acre), differed from the last speaker, who thought six months' notice to quit was sufficient. Suppose a person had occupied his farm for twenty years, and had spent a good deal of money for improvements, which the landlord repaid him, no doubt during that time he had formed friendly connections, and to be called upon in six months to sever all the ties he had formed would be a hardship which it would be difficult to satisfy by compensation.

Mr. MECH thought the question before the Club was the very simple and distinct one—whether it was for the advantage of the landlord and tenant and the country at large that there should be a Tenant-right for improvements. All were no doubt agreed that on the question of leases Government could not interfere; and that if Tenant Right be for the national good our legislature had the power, if it had the will, to enact that unexhausted improvements by the tenant should be paid for to him. It was equally plain that it would be impossible for the legislature to define exactly all the circumstances of compensation according to the various soils and necessities of particular counties in England. Once let the main principle be asserted, and there would be very little difficulty in ultimately arriving, through a proper commission, at a clear notion of what agricultural improvements in this country meant. The necessity for legislation was important indeed, because, while

much had been said about Lincolnshire, and the liberality of arrangements made there, and the custom which had now become a basis accepted as law, in the county of Essex, and many others, such a system was not in operation, and could not be with present discrepant views of the various valuers in different parts. A man might spend £5 or £8 an acre in draining his stiff clay, and another £5 in chalking it—two very essential elements of improvement, and if he went out or died to-morrow, not a shilling would be allowed by the custom of Essex for that ten pounds of valuable farm improvement. This state of things, to his knowledge, could be multiplied all over the country. Therefore he wanted the Government by Act of Parliament to define and lay down the general principle, and that, as Mr. Corbet had pointed out, should include remuneration to the tenant for unexhausted improvements. Much as he admired the intelligent paper Mr. Corbet had read, he (Mr. Mechi) agreed with Mr. Caird, that for the comfort and happiness of the farmer the lease must be the first consideration. When a man took a farm with capital and means to stay upon it he did not merely give his attention to the improvement of his land, but he improved his premises, added to the minor comforts of his home and grounds. Were they to be told that farming was merely to be a blundering occupation, and that there were to be none of the refinements of comfort and society as was the case with manufacturers and traders? The lease must be the basis of all confidence in the investment of capital, and without it, except under certain exceptional circumstances, capital would not flow into the land. With the 19 years' lease in Scotland enormous sums had been invested in draining the land, erecting buildings, &c., the tenant knowing that at the end of 19 years his rent would be raised or his farm pass to another. No man, however, should be compelled to grant a lease against his will. There were many noble owners who made it a point of honour to regard fixity of tenure, and succeeding generations in one family reaped the benefits of their improvements. But men with capital, and men with strong feelings with regard to politics did not feel comfortable on going into a farm and investing money without the security of a lease. The lease therefore should be the basis of agreement, and that could not be enforced by legislative enactment. Unfortunately the liberal arrangements of Lincolnshire were the exception and not the rule, and throughout the 36 counties of England there was a lamentable want of improvement—an enormous scope for it, and there was on the part of both landlord and tenant a comfortable attachment to old and very imperfect customs very far from approaching anything like the Lincolnshire practice, which was so much to be admired, and which was so good to the country and to agriculture.

Mr. HARPER (Bury, Lancashire) also could testify from experience that the Lincolnshire custom was a good one, but it would not be good unless it were founded upon reason and truth. The great difficulty in dealing with the question of Tenant Right was the correctly ascertaining the difference between the value of the farm when the tenant entered upon it, and the condition in which he left it when he gave up his tenancy. Whatever an outgoing tenant expended in the due course of his husbandry of which the incoming received the benefit, was in his opinion Tenant Right, unless on his original entering the tenant received a like benefit without paying for it. On some farms it was the custom for an outgoing tenant to leave all the manure without any payment, and in that case when the incoming tenant came to an end of his occupation he ought to leave his manure in the same manner. This was not a satisfactory arrangement perhaps, but it was based upon the sound principle that as a tenant entered upon land, so ought he to leave it. The Lincolnshire Tenant Right had simply arisen from a long course of practice and observance of the old rule of giving and taking—of doing unto others as you would that men do unto you. It was very desirable that this most excellent custom should be better known in various parts of the country where Tenant Right was most required. He would like to ask Mr. Mechi *apropos* of his remarks upon leases whether he was really well acquainted with what was done in Scotland, and whether he was not aware that with all our difficulties of tenancy, and defective Tenant-rights in England, and rabbits, and hares, and game, we had not on the whole longer tenancies and a greater number of generations living upon the same estates than in Scotland? In Scotland they had universally the 19 years'

lease, and in the best parts of Scotland one rule which prevailed was, that about three years before the expiration of the tenancy, the tenant, unless he could make a satisfactory bargain with his landlord, began to take out of his farm all he could, which certainly was neither satisfactory nor beneficial. Possibly the law of hypothec, which gave the landlord a prior claim upon all the property of his tenant for payment of rent, might give an undue advantage and be an encouragement to the landlord to take an inferior set of, and not quite solvent tenants. He did not like to hear leases compared with a satisfactory Tenant-right like that existing in Lincolnshire and the south-east parts of Yorkshire. Let people once understand the difference between the two and he was sure this satisfactory Tenant-right custom would be carried out by agents and valuers, to the great benefit of agriculture and to improved relations between landlord and tenant. It would certainly be more beneficial to agriculture than when a lot of leases are put up to auction ("No, no.") Yes, in Scotland they were put up to auction. The landlord was protected by the law of hypothec, and he could tell them of some friends of his who had been lately dispossessed and turned out by strangers from a distance who offered a few more shillings rent per acre.

Mr. MANSELL said he thought a well-digested lease should contain covenants for the protection both of the landlord and tenant—covenants which would protect the landlord at the end of the tenancy and the tenant at the beginning of the tenancy. No reasonable man, whether farming 1,000 or 500 acres, would lay out his money unless he had some such protection for improvements for being recouped the money laid out. The basis of such a lease should be some well defined clauses to carry out a mutual arrangement between landlord and tenant. Such clauses could be as well defined in the lease of a farm as in the lease of a house. Therefore there ought to be no difficulty about it. Under a liberally constructed lease, a tenant taking a farm for twenty-one years, should feel himself free to make any number of reasonable improvements he might think proper. If he did so in the form of drainage, or manure, clauses protecting the tenant at the expiration of the lease ought to be inserted, and the landlord should be bound to recoup the tenant at the expiration of the lease for any outlay he might make for such improvements. He submitted that the mutual arrangement spoken of by Mr. Corbet between landlord and tenant would be better defined in a lease by a clause giving Tenant Right.

Mr. S. SIDNEY said if he took the opinions of the farmers of England from the feeling he saw displayed, he should come to the conclusion that the farmers thought themselves exceedingly ill-used, and that they thought they ought to have security of tenure and compensation for unexhausted improvements (Hear, hear). But he confessed he did not think that these were the opinions of the farmers at all. He did not mean that that was not what they said, but he did not think that it was what the farmers meant. The farmers of England were a numerous and powerful body, and if they chose to make up their minds as to what they wanted there would not be the slightest difficulty in obtaining it; but the fact was—and here he expected to be received with a howl of indignation—the farms of England were under-let, and let exceedingly cheap (laughter and "Oh!")—and there was an implied bargain between the landlord and tenant in those counties where there was no compensation for unexhausted improvements—where there were no leases at all—those leases which some people thought so much of. The real meaning was that the landlord said: "You take my farm. I can turn you out at six months' notice. You won't trouble me about my game. When there is a general election you will vote in my favour. If my wife's health is proposed at dinner, though you don't exactly like her, you will drink it with cheers. If you do that I will not disturb you (laughter)—you shall not be troubled about the way in which you farm your land." That was the plain truth. The farmers might shuffle here and there, but that was the real thing. When he was young he attended a farmers' dinner, and he heard one toast with great indignation. It was proposed and received with great cheers. It was "Liberal landlords and grateful tenants." As long as there were grateful tenants they would not be able to make a bargain with their landlords. If they were now discussing whether or not farmers ought to have security of tenure, there could be no two opinions about it. It was perfectly absurd to suppose that a farmer should expend a large amount of capital unless he

know that whether he lived or died, whether he remained on the farm or left it, he should have restored to him the money that he had put into it. It was no use disguising the fact; the farmer was no different from the shopkeepers and tradesmen of London: unless they have confidence in laying out their money, it would come back to them; and if they were disappointed, they had only themselves to blame, because they would place confidence without having sufficient security for so doing. Comparisons had been made between the farmers of England and those of Ireland. There was no comparison at all. Unless a man in Ireland could get land, he could get no living at all. Then in Ireland they were not in a position to make a bargain, but in England the farmers were in that position, because 20 years ago they said they were all going to be ruined, but they were still existing, and yet they had accepted terms of their landlords. Under these circumstances Mr. Corbet had rendered an essential service by describing exactly the legislative course of events since that period and if there had been a series of grievances, the farmers would long since have banded themselves together to redress them. He was astonished that one of the first speakers objected to the manner in which Mr. Corbet put the subject forward. Why, Mr. Corbet ought to be treated as the Prodigal Son—the fattened calf ought to be killed for him (laughter); for this was the first time he had heard him read a paper in which there was not some exceedingly ill-natured remark made about somebody (renewed laughter). The Chairman had, as a professional matter, to watch the course of public opinion; and he thought the Chairman would agree with him in thinking that the present was a time of great change—a time when the farmers would not feel themselves bound to follow the opinions of their landlords so much as they were at present. Whenever that time came—whenever the votes of the farmers were not the property of the landlords, they would be able to carry compensation for improvements, or establish leases—whichever they pleased.

Mr. L. A. COUSMAKER said he remembered hearing in that room that the man who farmed his own land had a fool for his landlord. If so, he must be a fool himself, for he had farmed his own farm for thirty years (laughter). His remarks at the Club had always been made, not in the interest of landlord or tenant, but in the interest of agriculture; and he hoped the observations he might in future make would always be to that effect. The question of tenant-right appears to be a very simple one. No doubt tenant-right, properly defined, would be most useful in this country, and might supersede, to a certain extent, what was generally called "the custom of the country." He did not think it could supersede the custom entirely, because custom differed so much in different localities that certain customs at one place would not be applicable at another place; but it would be a most useful thing if a good tenant-right could be established in combination with the customs of the country, so as to form a basis upon which all future leases should be granted. To upset existing leases would be unfair and unjust. All improvements made by the tenant might not be considered improvements by the landlord, and it would be very hard for the landlord to be pledged to a Tenant Right in respect of them. The landlord should have fair play as well as the tenant. If any tenant wished to have any improvements carried out the landlord should give his consent in writing; and when that had been done the improvements should be made, and the tenant paid; but the tenant ought not to be entitled to compensation on leaving the farm in respect of improvements to which the landlord had not consented. Those were his notions, and he spoke for both parties—landlord and tenant. As the basis of an agreement, he thought it would be a most useful thing; but at the same time no Tenant Right ought to upset an agreement between two parties. Before an agreement was made both parties were free—the landlord to let his land to the best tenant he could get, and the tenant was free to get the best farm he could obtain. Let them be careful in making an agreement, but after it was made no Tenant Right in the world ought to upset it. What he asked for was, make a fair Tenant-right, define properly what the Tenant Right was, and then let the agreement take place between the two parties, the Tenant Right being the basis of the agreement; then after that both parties should keep to their agreement.

Mr. W. J. EDMONDS (Lechlade) said it would be natural

for landlords to ask why they were discussing a subject which thirty or forty years ago would not have been considered of any consequence. He would remind them that thirty years ago the farm implements used were only ploughs, harrows, and rollers, but that now the farmer spends £100 where he formerly spent £1 on implements. It was the same with manure, where the farmer formerly spent pounds he now spent hundreds of pounds; and with regard to oil-cake also, years ago the farmer only spent £10, where now he would spend £100. It was for these reasons that they thought it necessary that the farmers should have Tenant Right, but if they did not get Tenant Right they must have instead of six months' notice a two years' notice. They might be laughed at for talking of two years' notice, but gentlemen who had leases had practically twelve or fifteen years' notice. If instead of taking a lease for twelve or fifteen years, they took it for three years, with two years' notice, the farmer would go on in his occupation probably his whole lifetime at the very same rent; but with a fifteen years' lease they might expect, at the end of that time, that the landlords would call upon them for increased rent, on the ground that the land had considerably increased in value to what it was fifteen years before; so that he considered the three years' lease with two years' notice preferable. He certainly was in favour of leases. With their present machinery, with the outlay farmers were called upon in the present day to make, there ought to be leases, because though a common year's tenancy with six months' notice to quit might be very convenient under a good landlord as long as he lived, there might be a death, or a change of circumstances; and he, therefore, did not think it businesslike to have a yearly tenancy with six months' notice. He thought a Tenant Right might be preferable to a two years' notice to quit, because there would then be no temptation to run out the farm at any time.

Mr. MASSEN (Pendeford) said that, referring to the last speeches, a two months' notice to quit would be called by the lawyers a two years' lease. Mr. Sidney appeared to come to the meeting as their catechiser, chastiser, and adviser; and he quite agreed with a good deal he had said, but he thought he began rather upon the wrong tack. He said it was the farmers' own faults, but he (Mr. Masfen) said it was not so. The area of Great Britain was limited, and there were more applicants for farms than there were farms for them. That was the same in most agricultural districts, but the farmers had not only to contend against that, but they also found that gentlemen who had made fortunes in business, and who could afford to lose money over farming, occupied many farms because farming was a gentlemanly occupation. Mr. Harper said that a man might go on living on his farm on the same terms. That was just the very point they were discussing that evening. It was from the very fact of men going into bad farms and leaving them in a good state, that made the English farmers dissatisfied. A farmer on going in might probably find two-thirds of his straw in stacks or heaps about the field and not worth 5s. an acre, and he would have to provide his manure which ought already to have been in the ground. How did that arise? From the fact of the introduction into the agreement of clauses providing for the retention of the straw, so that when it came upon the land as manure it was not worth 1s. 6d. a ton. He believed that was really the system that had been pursued from the ignorance of men in many districts who had had the management of estates entrusted to them. An old member of the Club made the very trite remark at a recent meeting that those gentlemen ought to undergo an examination before they were allowed to manage an estate, just the same as the learned professions. He thought so too. Mr. Sidney had made some wholesome remarks. It was not pleasant, however, to be condemned. It was more pleasant to be flattered; but he cared not for that. He (Mr. Masfen) did not look upon Tenant Right as a tenant's question, but as a landlord's and a national question too. A Tenant Right would increase the produce of the country, and give to the landlord a class of tenantry we did not see now where liberal covenants did not exist. He believed they were doing that which would be to the farmers a great security, and to the landlords an additional security, and to the community an advantage. It was one of those questions in which the whole community were directly interested. The tenant farmers were not more interested than the community generally. It was ridiculous to suppose that a landlord was going to have his

rights infringed upon when he was asked by the tenant for an agreement. If any idea of that sort was in existence, Mr. Corbet had dispelled the illusion by his reference to Mr. Chaplin's speech in the House of Commons on the 12th of March last, in which it was shown in as plain language as was ever used that the Lincolnshire custom had as greatly benefited the landlords as the tenants and the community at large. So well was that custom defined, that very seldom were the services of an umpire required; and the landlord had rarely very little to do with the arrangement, except that he secured to himself a better class of tenant; and, as regarded putting his hand in his pocket to pay for it, he did not do so. That was what the farmers wanted the landlords and the community at large to know thoroughly. He did not think there was any fear of the farmers complaining that they should be ruined. Mr. Sidney, he knew, referred to the repeal of the corn laws; but the farmers had struggled through that, though only with their necks just above water. He did not believe that the ear which had appeared so deaf to the farmers would be held in the same position as it had been heretofore. In his own neighbourhood there was a greater determination of the landlords to listen to the entreaty, and in several cases agreements have been brought forward and accepted by the landlord of a nature bearing very favourably upon those of some fifteen or twenty years ago.

Mr. F. SHERBORN (Bedford) said Mr. Corbet had come forward in a handsome manner on the subject of Tenant Right, for which the Club were all indebted to him. He was very much pained to hear such unseemly dissension as was exhibited in the early part of the meeting. Discussions of this sort should be of a friendly character. As regarded Tenant Right, he looked upon it as the right of the tenant to fulfil his engagement to the landlord, and the right of the landlord to fulfil his engagement to the tenant. He thought the law would be a sufficient protection to all parties to such a bargain.

The CHAIRMAN: The time has now come when we must draw this discussion to a close. I really think, gentlemen, that some of the speakers in the early part of the evening could not have heard distinctly the remarks of Mr. Corbet, or they would not have accused him of dealing in vague generalities, such as "the custom of the country," "due compensation," and other such phrases. Mr. Corbet, whilst alluding to the stock phrases and, as I understood, condemned them, wound up with a description of the Lincolnshire tenant-right, which he strenuously, as I understood him, advocated for adoption throughout the country. I believe, gentlemen, that his paper delivered here to-night will live as long, and will do as much good, as his prize essay on the same subject. Mr. Corbet has not, to my mind, mis-read the signs of the times when he gave expression to the opinion that the time is not far distant when the Legislature of this country will entertain the question of English Tenant-right. I know that there is a very growing impression amongst the members of the House of Commons that the Irish Land Bill must be followed by an English Land Bill—indeed, that the one is a corollary of the other. Mr. Corbet, however, drew a distinction between the Irish Tenant-right and the English Tenant-right; and he fell into one error, or, at all events, there was one serious omission in his description of the two systems. The English law recognizes the established custom of any county in England, and the Courts enforce those customs; but in Ireland the law takes no cognizance whatever of such customs. The Irish tenant, however he may have improved his farm, notwithstanding it may be the custom of the country to give compensation, cannot go into a court of law and enforce the custom; even the Ulster custom cannot at present be enforced in any court of law. It was this broad distinction between the two countries which led to so much animosity on the other side of the Channel, and finally to the Legislature undertaking to deal with the question. When a custom is established in England, like the Lincolnshire Tenant-right for instance, the Lincolnshire tenant can go to our English Law Courts, and those Law Courts will enforce that custom. Therefore there is that very palpable difference between tenant-right in the two countries. I believe, gentlemen, we are not very far, it may be some years, but no very long time will elapse before the legislature must be called upon to deal with this question of Tenant Right in England. Things cannot remain in their present unsatisfactory position. A landlord may sue his tenant for dilapidations, but the tenant,

no matter how great the improvements he may have made, cannot sue his landlord for compensation. The law, therefore, is one-sided. Mr. Edmonds has referred to the great change of circumstances which high farming, and other considerations have produced. High farming alone must eventually compel the recognition of the rights of the tenant-farmers in England. It has been said by some speakers that the compensation to be given to the tenants should be defined. Now, I think this Club, or the legislature, would find it difficult to define the amount of compensation to be paid to a tenant. A uniform scale applicable to the variable conditions and circumstances of the various parts of England is impossible. Mr. Mechi alluded to this difficulty. The Government in drawing up the Irish Land Bill had also experienced the difficulty in fixing any uniform scale of compensation, and they wisely left it to be decided by local arbitrators. Mr. Cousmaker raised a very important question, and that is the right of a tenant to make improvements without the consent of his landlord, and he advocated that the landlord should not be called upon to make compensation for such improvements. In the interests of the public, it would be intolerable that the tenant should have no claim for compensation under those circumstances, because a landlord may be a very ignorant person. He may not only not know what is to the interest of his tenant, but he may be ignorant of his own interests; and what the public is most concerned with is that he should not stand in the way of the general advancement of the country. It is one of the fundamental principles of law to afford protection to the weak against any undue exercise of power on the part of the strong; and, I think, seeing the circumstances of this country, as alluded to by Mr. Masfen, where three tenants are looking for one farm, the State is perfectly justified, in the interests of the public, in stepping in to protect the interests of the tenants. I have often heard it remarked of late, that the rights of property are not held so sacred as they were in times past, and great evils are foreboded of that growing feeling. Now I believe that the rights of property in this country were never better understood or more fully recognised than they are at present. Time was when it was an accepted doctrine in this country that a man had a right to do as he liked with his own; but I believe we have outgrown that, and the people of England now take a very much broader view of the rights of property. They believe that there are certain duties attaching to property, as well as rights to be exercised. If a man, or a class of men, so manage or control their property that the full benefits are not derived from it by the community—if, for instance, a landlord stocks his tenants' farms with game, or avails himself of improvements made by a tenant without recognising the right of the tenant to the advantages which he has created himself, or if for insufficient reasons he evicts the tenant from his holding—I say, then, that the State is perfectly justified in stepping in, and putting the law in such a form that the tenants and the public shall not be damaged by such arbitrary course of conduct on the part of any owners of property. I believe, gentlemen, that nothing would tend more to the advancement of agriculture in this country, and that nothing would tend more to the benefit of the landlords than a well-considered Tenant-right; and I believe that the paper we have heard read to-night, and the discussion that has taken place, will hasten that desirable end.

Mr. CORBET, in reply, said it had been alleged in the outset that he was not the proper person to bring this subject forward. He had introduced it at the urgent request of two of the chief members of the Club—the Chairman, Mr. Howard, and Mr. S. Read. He wrote and asked Mr. Read to bring it on, and Mr. Read replied, in a letter, that he considered he (Mr. Corbet) was the proper person of all others to bring it forward. He might go further and say with regard to the paper, as it would go to the country, that if ever he did his duty to the Club he had done that night. He had told them what the Club had done towards obtaining Tenant Right in times past, and he had told them how they had worked and gone before the Government. One of the speakers said that he (Mr. Corbet) could not define those vague generalities—that he could not say what the "custom of the country" was, the "duties of the landlord," and "unexhausted improvement." He would refer again not only to his paper but to the book which he held in his hand, which enabled him to define any custom in England. He could tell all the varieties and forms of custom and valuation, where custom was recognised, &c., but he did not go into all those questions, he took one—

pecial custom—that custom had been defined by Mr. Caird, who objected to it—it had been defined by Mr. Chaplin, a landlord, who had advocated it—it was defended by Mr. Pusey. Then did they mean to say that Tenant Right was wrong, and that he (Mr. Corbet) was not a proper man to speak to it? He would speak to it in the face of any man in England (applause). He might pass over three or more speeches, and come to an essential point raised by Mr. Mechi, who said that leases were very good things, and defended Mr. Caird. He (Mr. Corbet) had been particularly careful to say nothing against leases, the agitation for which had been going on for the last thirty or forty years, although little had come of it. There might be many reasons, as Mr. Sidney had said, the farmers should be willing to take whatever the landlords chose to give them. They must do this and do that, and drink the health of the landlord's wife, and so on; but even at the end of Mr. Sidney's speech he came to admit that there was something coming—some change looming in the future. Why,

if the paper he had read had anything in it, it spoke to that change. The whole tone of the speeches was also to that effect, and he believed they were on the advent of a change. As regarded the Chairman's observation as to his omission in drawing a distinction between the Tenant Right in Ireland and England, he would only remark that the Irish Land Bill if passed would sanction the Ulster principle; and it was assuming thus much that he drew his definition (applause).

Mr. BRADSHAW proposed a vote of thanks to Mr. Corbet.

Mr. T. HORLEY (The Fosse) in seconding the resolution, said the meeting was very thankful to Mr. Corbet for his paper; and however some of them might differ from Mr. Corbet, yet they all knew that whatever he said was said honestly and straight forwardly.

The resolution was carried unanimously.

A vote of thanks to the Chairman concluded the business.

THE TENANT-RIGHT QUESTION IN ENGLAND.

At a recent meeting of the Institution of Surveyors a paper was read on Farming Covenants, and at the May meeting of the Farmers' Club a discussion took place on English Tenant Right. It may be interesting to compare these demonstrations the one with the other, the more particularly as the two Societies may be assumed to represent two classes in the State. A surveyor, as we take it, if properly qualified to speak to the nature of Farm Covenants, should be something of a land valuer or agent; and at the Farmers' Club on Monday evening Mr. Thomas, of Bletsoe, said: "It might be all very well to lay down some sort of covenant, as was often done with the land agent; but while there were many good men amongst these agents, there were a great many who had no business to presume as they did to the tenantry of the country. Many land agents presumed to lay down clauses of which they knew absolutely nothing, and when this was the case, it was impossible that satisfactory agreements could be made for the tenant." This brings us at once to the point; but Mr. Squarey, for the engineers or agents, had in some measure anticipated an answer, as the opening sentence of his address sounds sufficiently encouraging: "The principle which ought to govern farming covenants would seem to be, that the tenant should have the freest and most unrestricted use of the lands and premises, consistent with the maintenance and yielding up of the freehold at the end of his tenancy in an unimpaired and uninjured condition." Here we see that the most desirable system of Farming Covenants is that in which there are as few covenants as possible. Something of the same kind was advanced at the Farmers' Club, when it was declared that "the elaborate agreement which minutely defines what improvements the tenant shall make, and what rotation of crops he shall take, is fast going out of fashion." Still, however, with any such liberty of action, the Institution of Surveyors stipulates for something that shall insure the freehold being yielded up at the end of a tenancy in uninjured if not, indeed, in improved condition. And how is this to be arrived at? At the Farmers' Club, as might have been expected, there was an almost unanimous expression in favour of the English Tenant-right principle; and it is satisfactory to say that the Institution of Surveyors goes very much in the same direction. Mr. Squarey "thinks that the cultivation and production of farms under these shorter tenancies may be greatly improved by the concession of a Tenant Right for oilcake and artificial manures applied to green crops within a reasonable period of the termination of a tenancy: I do not suggest the details of such Tenant Right, but the experience of Lincoln-

shire and other counties would be a valuable reliable foundation for the extension of the practice over the country."

This is precisely in accordance with the preponderance of opinion at the Farmers' Club, where the opening paper was against going into details; whilst Mr. James Howard, the chairman of the evening, said: "I think this Club, or the legislature, would find it difficult to define the amount of compensation to be paid to a tenant. A uniform scale, applicable to the variable conditions and circumstances of the various parts of England, is impossible." And Mr. Mechi maintained, "It was plain that it would be impossible for the legislature to define exactly all the circumstances of compensation according to the various soils and necessities of particular counties in England. Once let the main principle be asserted, and there would be very little difficulty in ultimately arriving, through a proper commission, at a clear notion of what agricultural improvements in this country meant."

A more "tender" question or phase of the question is that which would broach broad legislation to establish the principle. A Lincolnshire landlord, when upholding Tenant Right in the House of Commons recently, defined this as "a marked, distinct, and accurate system, capable of being enforced by law;" while a Lincolnshire tenant has lately in our own columns referred to the custom by which the tenant is repaid for his outlay "where no agreement exists;" and the Institution of Surveyors, with Mr. Squarey for its mouthpiece, is manifestly in favour of making custom as strong as possible, altogether independent of agreement: "Where the land on which a crop of turnips has been consumed is given up to an incoming tenant, as an entry for his wheat crop, custom has, during the last few years, established the payment of half the value of the tillages and artificial manure of such preceding crop to be paid by the incoming tenant. It is a matter of regret that the value of oilcake, or other artificial food, does not, without special agreement, come into the same category." Mr. Squarey adds that custom in this direction is being quietly but certainly established; but is it extending as fast as it should do? To epitomise the argument as offered to the Institution of Surveyors it comes to something of this. There should be covenants, if any, so liberal as to afford the tenant full liberty of action until towards the close of his term, when restrictions as to cropping and so forth should be balanced by allowances for improvements not worked out. And so Mr. Squarey is "certain of great general increased production of all farm produce, from the conviction that, with perfect liberty of action, a farmer will only sow his land

when it is in the fittest and ripest condition for perfecting a crop; the conditions incident to such fitness involving the growth of large proportions of green crop, and the consequent maintenance of a great stock of sheep or cattle." Whereas, at the Farmers' Club, the Chairman thus summed up the case: "I say that nothing would tend more to the advancement of agriculture in this country, and that nothing would tend more to the benefit of the landlords than a well-considered Tenant Right."

All this we say is sufficiently encouraging. For many years now we have continued to advocate a principle with which this Journal, we are proud to say, is and has been especially identified. Through evil and through good report, in the face of impotent abuse or cold neglect, we have maintained the justice of a claim that is at length coming to be generally admitted. The proceedings at the Farmers' Club speak significantly to this; but the proceedings at the Institution of Surveyors more

significantly still. There was a time when Societies of land-agents and others met together rather to retard than advance the English Tenant Right principle. Their attitude was then one of opposition, while it is now one of co-operation. But we may go further still. Much good, no doubt, has already been done by discussing the subject; but it will not end now in the mere talk of tenants one with another, or, as Mr. Thomas would put it, in teaching agents their business. "I know," said the Chairman of the Farmers' Club the other evening, "that there is a very growing impression amongst the members of the House of Commons that the Irish Land Bill must be followed by an English Land Bill; indeed, that the one is the corollary of the other." We have ourselves more than once of late ventured to hint at what was coming as a step for which the country was quite prepared. There is no matter that needs more looking into, and there is none, where from improving the condition of the tenant-farmer, more general good would follow.

THE LAW OF HYPOTHEC.

The monthly meeting and dinner of the East Lothian Agricultural Club took place at Haddington. There was a good attendance, with Mr. Scot Skirving, Campton, in the chair.

The CHAIRMAN said that the motion of Mr. Harvey, of Whittingham Mains, authorising the standing committee to call a special meeting of the club, if they thought that necessary, with reference to the game laws and the promised measures in Parliament in reference thereto, should remain in force until the Bill of the Lord Advocate was brought before Parliament, which he thought would be very shortly. He thought it would be unnecessary to go into a discussion on the subject at present. It was no doubt true that, if they did, the Lord Advocate would get a good deal of information from the reports of the discussion. But he doubted his lordship had been studying the discussions of the club very carefully for the past year; and it would therefore be unjust in them to think that he had not framed his Bill in accordance with the opinions of the East Lothian Agricultural Club, especially as he could not have a better opinion on which to found it. In these circumstances, he (the Chairman) proposed that they should postpone the discussion of this subject till next monthly meeting, by which time the Government measure would be before the country.

The suggestion was adopted.

Mr. HORN (Fentonbarns) said there was another question in which he felt even a deeper interest than he took in the question of the game laws—that was, in reference to the law of hypothec. In regard to the legislation that should take place on that subject, the East Lothian Agricultural Club was unanimous; and he regretted that there was so little prospect of anything being done in Parliament this session in regard to it. The fact was that Parliament seemed so intent on doing justice to those that made the greatest noise, that there was no likelihood of any measure on that subject being introduced this session. He had, however, a letter in reference to it, which he thought it would be right to read to the meeting, from the Hon. Charles Carnegie, M.P. for Forfarshire, with whom he had had frequent communications. The letter was in the following terms:

"House of Commons, March 28, 1870.

"My dear Sir,—You will observe by the papers that, in reply to a question of mine, the Lord Advocate has stated that 'Government are not prepared to bring in a bill on the subject of the law of hypothec in this session of Parliament, but have promised to consider the subject in the course of the autumn, and on an early day next session to announce whether they are prepared to legislate upon it.' I regret much that they have come to this decision, as I had sooner that they had prepared and brought in their measure this session, even had it avowedly been only in order that it might be printed and discussed during the recess. It is quite impossible, in the

present state of public business, for me to have any chance of carrying our measure in this session. Such is not only my own opinion, but that of all those members known to hold opinions similar to ours on this subject that I have had an opportunity of consulting. I therefore do not mean to attempt it. Had I not been informed on good authority that the Government had it in contemplation to deal with this subject in this session, I should have introduced my bill on the first possible day after the meeting of Parliament; and I had even prepared a notice to that effect, but was induced not to go on with it on the ground that to do so might be injurious to the cause. I have some hope, however, that the discussion of land questions in the two Houses of Parliament will rather clear the ground for us, and that the delay may prove beneficial to the ultimate success of the measures that you and I have advocated on this most important subject.—Believe me yours very sincerely,

(Signed)

"CHARLES CARNEGIE."

He (Mr. Hope) could only add that he very much regretted that no measure had been introduced on the subject, while he could not see that they could do anything to obviate that in present circumstances.

Mr. HARPER (Shawden) thought that they could not do less than express their cordial thanks to Mr. Carnegie for the trouble he had taken in connection with this question, and for the information he communicated regarding it, through Mr. Hope, to this club (loud applause). He hoped that the Scotch members of Parliament would not forget that there were two great questions which agitated the minds of the farmers of the country during the last election, and on which a large number of their members were pledged to urge the Government to introduce measures with a view to legislation—he meant the amendment of the game-laws and the law of hypothec—

Mr. HORN: The abolition of the law of hypothec?

Mr. HARPER: Yes; the abolition of that obnoxious law. The Scotch members were remaining remarkably quiet on these subjects at present; but he hoped that they and the Government would not forget that the representatives of the agricultural interest in Scotland were just as earnest and anxious to have these laws considered and dealt with as they were during the last election (applause). Many of the farmers had made great sacrifices in returning Liberal members to Parliament ("Hear, hear" from the Chairman). He hoped the meeting would not misunderstand the ironical "Hear, hear" of Mr. Scot Skirving (cries of "Hear, hear"). If the Chairman had been in Perthshire or in Dumfriesshire during the election contests in these counties, he could not have failed to become aware of the fact that there were many farmers there who had made great sacrifices in returning Liberal members to Parliament. While they desired to see justice done to Ire-

land, they at the same time expected to see justice done to themselves in regard to the operation of these laws; and if that were not done, he believed the country would cry "shame" to those Scotch members who were remaining quiescent in Parliament on the subject.

Mr. DURIE asked what was the nature of the justice to Ireland to which Mr. Harper referred? He would ask what had the Irish done more than the English or Scotch that the landlords in Ireland were to be deprived of the management

and control of their property? He could not see that; but if that were regarded as giving justice to Ireland, they might soon have the same justice extended to Scotland.

Mr. HARPER: At the time of the last election contest, the great question before the constituencies was that of the Irish Church. It was the measure on that subject to which I referred.

The vote of thanks to Mr. Carnegie was then passed unanimously.

THE CARRIAGE OF SHEEP.

LINCOLN COUNTY COURT, MONDAY, May 8th.

WILLIAMS v. M. S. AND L. RAILWAY COMPANY.—This was an action to recover the sum of £49 10s. 2d. for loss sustained by the non-performance of a contract of certain sheep from Lincoln to Dublin. A jury was empanelled to try the case. Mr. Toynbee, in opening the case, said the plaintiff was Mr. Charles Williams, of Salisbury, who also had a farm at Carlton-le-Moorland, near Lincoln. The defendants were the Manchester, Sheffield, and Lincolnshire Railway Company. The action was to recover £49 10s. 2d., the loss alleged to have been sustained in consequence of the defendants not having fulfilled a contract made on the 3rd September last, for carrying twenty rams from Lincoln to Dublin. Mr. Williams was a ram breeder of great eminence, his sheep having attained a great reputation, not only in England, but in Ireland. On the 3rd September, he had twenty rams which he was anxious should be sent to Dublin as soon as possible, and he contracted with the Manchester, Sheffield, and Lincolnshire Railway Company for them to be carried from Lincoln station to Dublin, by way of Brunswick station at Liverpool, and for their carriage he paid £7 5s. 9d. The contract, which was in writing, did not say anything about the conveyance of the sheep from Liverpool to Dublin, but it was for the defendants to provide for the same. The shepherd brought the sheep to Lincoln on Friday, the 3rd September, and they were sent off by the first train. They reached Liverpool at half-past four o'clock in the afternoon, and then one of the Company's servants went with the shepherd to within one hundred yards of the Dublin Steam Packet Company's boat, the Manchester, Sheffield, and Lincolnshire Company being connected with that Packet Company. The shepherd tendered the sheep to the Packet Company, who refused to forward them. The sheep had had to walk three miles from the Brunswick Station to the Dock, and in consequence of the refusal by the Packet Company to take them, the shepherd was obliged to take them back and provide a place for them. They had to be kept at Liverpool until the shepherd could communicate with the auctioneer in Dublin, who was going to sell them. In consequence of the Company's refusal to take the sheep, the shepherd was compelled to take them round from Liverpool to Holyhead, where they were put on board a vessel and sent to Dublin. Instead of the sheep being only twenty-four hours on the journey, they were ninety-six hours, and when they arrived at Dublin they were perfectly exhausted, it being impossible to get sheep to eat while in a railway carriage or on such a journey. The consequence was the animals only fetched from £11 to £13 a-head. The plaintiff now claimed under the following heads: £4 13s. 8d. for extra carriage from Liverpool to Dublin, via Holyhead; £1 5s. for extra expenses incurred by the shepherd; £3 for extra food required for the sheep; a loss of £2 a head; and his (Mr. Williams') expenses attendant on the delay; making a total of £49 10s. 2d.—Richard Simms, shepherd for Mr. Williams, was then called. He said: I have been in the habit of taking his sheep to Dublin. On the 3rd September I brought twenty rams to Lincoln station. They were to be carried from Lincoln to Dublin, and I paid £7 5s. 9d. for the carriage. The conditions on the note were read over to me.—The note was handed in, and the Judge pointed out that the restriction as to damage to sheep was £1 a-head, unless a declaration was signed as to their value and an insurance paid upon them.—Mr. Toynbee submitted that the Railway Company must satisfy the jury

that the conditions named were reasonable.—The Judge said that was a point for the court and not for the jury.—Simms was further examined and said: We went by the first passenger train on the Friday morning, and we reached Liverpool at 4.30 the same day. I was then three miles from the wharf where the Dublin steamer was going from. I travelled the sheep down there. One of the Railway Company's servants went with me to within 100 yards of the steamer. He pointed out to me where I was to go, and I then told him I could find my way. I went to the Captain of the steamer, but he refused to take the sheep. I was there half-an-hour before the time of the packet's departure. The only reason the Captain gave for refusing to take the sheep was that the foot-and-mouth disease was bad in England and cattle were not allowed to go over. When I found I could not get the sheep taken, I spoke to a man who was going over to Dublin, and asked him to name the matter to Mr. Gryan, the auctioneer. I then got a place for the sheep as soon as I could, but it was 10.30 before I found one. The next day I took train for Holyhead, and went from thence to Dublin in a vessel. I did not get into Dublin until Tuesday afternoon, and the sheep were then in bad condition. I paid £4 13s. 8d. for their carriage from Liverpool to Dublin, and the food I had to give them was worth £3. I was kept on the road three days. When I brought the sheep to Lincoln, they were sound and active, and in good health. If I had got them over to Dublin in 24 hours, they would have been all right.—By Mr. Hayward: I had not been on the direct route from Liverpool to Dublin before. I had before gone round by Holyhead.—Mr. Williams, the plaintiff, said: I live at Salisbury, and also occupy a farm at Carlton-le-Moorland. I have twice sent sheep to Dublin. The sheep in dispute were active and in very good condition when they left my place. I sent them on Friday, the 3rd September, and they were advertised to be sold on the following Friday. Had they been properly forwarded they would have had six days' rest. They had only three days to recover from a journey of 96 hours, instead of six days for 24 hours. I saw them in Ireland on the Wednesday morning. They were then in an exhausted state, and I could scarcely recognise them.—Mr. Charles Clarke, of Scopwick, a celebrated breeder of rams, said he had heard the evidence given, and in his opinion the sheep would deteriorate at least £3 a-head.—Mr. Toynbee said he had further similar evidence.—Mr. Hayward thought it was not necessary.—Mr. Toynbee, on being pressed by the Judge, admitted that he could not obtain the £1 10s. 6d. claimed by the plaintiff as personal expenses.—Mr. Hayward said he would submit to a verdict for the expenses incurred, but not for the deterioration, as he held there was a determination of the contract by the plaintiff's shepherd taking the sheep away from the Company and forwarding them by Holyhead.—On Simms being interrogated, he said that the officials at Brunswick station told him they could not forward the sheep to Dublin by their route.—The Judge suggested that a verdict for £27 18s. 8d. should be taken on the ground of the condition of the note.—Mr. Toynbee argued against the same, but his Honour held that the condition was not unreasonable, and he therefore directed the jury to return a verdict for the plaintiff for £27 18s. 8d., being at the rate of £1 a-head for the deterioration of the sheep, and £7 18s. 8d. for the extra costs incurred.

THE PRICE OF WHEAT IN AMERICA.

Letters from New York complaining of the low price of wheat continue to be received here, lamenting the almost fatal influence this depression exercises upon the agriculture of the United States. We have on various occasions endeavoured to show the farmers of that country that the principle on which they are acting must necessarily produce a fall of prices on the markets to the supply of which their shipments of wheat are destined; and although the exaggerated estimates of both what they do and what they could do for that purpose are little to be depended on, we see enough to be convinced that any extraordinary efforts on their parts or any superabundant produce of the land under culture must seriously affect the European markets. The farmers have no other outlet for the excess over the home demand, and the sale of the surplus is what they look to as the only source of the remuneration of the year's work. Some of their statisticians assure us they would be able to supply the whole of Europe with bread-corn; and we will agree with them if they will allow us to add the word *if* to the boast, there being two impediments to its fulfilment, under which anything approaching to this is simply impossible. The first is the want of hands to cultivate the soil; the second, that whilst the expense of production would indefinitely increase, the return price would in an inverse proportion decrease as indefinitely. These two obstacles would effectually frustrate the object of raising the produce—namely, a living profit—which is the only aim of the producer.

We have had a small taste of what any operation of the kind would have, both here and in America; but small (comparatively) as the experiment is, it is quite sufficient to justify us in saying that the farmers of the United States cannot increase their wheat culture to any considerable extent without so reducing the price in Europe, and consequently in their own markets as well, as to render its culture impossible. The entire amount of wheat and flour imported here in 1869 was 10,416,159 quarters, of which 8,588,984 quarters, or upwards of one-third, was from the United States, being more than double what was shipped thence to the United Kingdom in 1868. A large proportion, too, of this was sent during the last four months of the year, which, coupled with increasing shipments from other countries, caused the unnatural depression on the corn markets, both here and in all foreign countries. In the United States the effect was felt more powerfully than even with us. The price of wheat at Chicago, on the third Monday in April, 1869, was 1 dol. 47c. per bushel (or 6s. 1½d.), and in January, 1870, it had fallen to 76c. per bushel (or 8s. 9d.). "It would be useless," says one writer on the subject, "to seek for the causes that have concurred to produce such a reduction; but I ought to point out at least the influence that the exchange of gold, which has fallen to 120 (114½), has exercised upon the movement by destroying the confidence of the holders, and rendering loans difficult to those merchants who, having hope in the future, wish to continue holding their wheats. Thus, they were compelled, under the most unfavourable circumstances, to overstock the markets with large quantities of wheat and flour; but the principal cause of the decline is 'speculation for a rise,' in which they engaged on the ground of the very deficient returns of the previous harvest in Europe. We must no longer charge speculation with producing the price of 8 dols, 10c. (12s, 1½d.) per

bushel, paid in April, 1867; but with reducing the price to 1 dol. 30c. (5s.) per bushel, which lately has been the price of the same wheat."

Former speculation may have had something to do with the very high price of 1867; and a similar operation has certainly contributed to the present very low one; but, on the other hand, the American writers wholly ignore the fact that it is on account of the over-supply of the European markets that in both countries the farmers are complaining that the price of wheat is unremunerative. There is a third reason for this result, which, indeed, we have too frequently urged for the reader to be ignorant of it. Taking Chicago for our stand-point, the expense of getting grain to the eastern seaboard cannot be reduced. On the contrary, every mile the cultivation is driven farther westward increases the expense both of cultivation and of transit; whilst the sparseness of the population renders the local demand so small as to make it a mere trifle in comparison with the production. The growers, therefore, must depend almost wholly on the exportation to Europe, to get rid of the surplus of their wheat; and should the increase with which the markets of Europe are threatened take place, it will very soon destroy itself, for to a certainty such an increase would produce, while it lasted, a permanent depression in prices in Europe. This would, in turn, react upon America, and thus the only object of such over-production would be defeated, namely, a living profit; and if this is rendered permanently impossible, production must necessarily cease beyond the extent of supplying a legitimate demand.

A French gentleman, Count Fouchet de Careil, has recently returned from the United States, and brought with him some alarming ideas on this subject. From what he has seen and heard, he thinks that the European markets are threatened with a future inundation of wheat, to the utter ruin of the agriculture of France and England in particular, and low prices in the exporting countries of the continent. He speaks of new settlements in the Far West threaded with railways, which facilitate and expedite the conveyance of agricultural produce to the eastern shipping ports. This is all very true; but it is equally true, in America as in England, that railways are expensive modes of conveying merchandise when they have a monopoly, and no competition. All the efforts of the merchants of Chicago and the other lake ports of the north-west have failed in prevailing on the railway authorities to lower the charges on wheat from thence to New York, which are found to be too heavy, to enable the merchants to ship at that port to advantage. The consequence is that no wheat is forwarded thither by rail, except on an emergency, when the price at New York is so much above that at Chicago, as to make it remunerative.

After all, so far as regards the immediate future, the stocks of wheat at the two depôts—New York and Chicago—are not so overwhelming as to threaten Europe with a surfeit. It appears that on the sixth of March last there was certainly not more than 7,000,000 bushels, or 875,000 quarters of wheat in stock at both places. A large portion of this will be required for home consumption. That portion of it at Chicago destined for the United Kingdom will not reach us before June, at which time our stocks will begin to run short, as they do at the present moment. For it must be taken into account that the crops of wheat of 1869 were very def-

cient, and would require an importation for the season of not less than ten million quarters to meet the consumption. There is a considerable amount of wheat daily expected from San Francisco, which, however, cannot much affect prices in the present state of the trade, although, if the shipments are large, it is probable that, for the moment, it may produce a depression on the market. What may come from New York when the supplies from Chicago have arrived there it is impossible to say; but it is stated by some correspondents that the financial difficulties of many of the holders of wheat, who accepted bills, or borrowed money otherwise, upon the security of their stocks, and are now called upon to refund, will probably compel them to send considerable supplies to Europe.

There is another circumstance, relating to the season, that will have some influence on prices, namely, the lateness of the harvest here, which, in consequence of the ungenial weather of the spring up to the present moment, accompanied, as it is, with a severe drought, cannot be but backward, even if no accident otherwise happens to the crops. This will add probably nearly a month to the requirements of the consumption between harvest and harvest, by which the stocks of both native and foreign wheat will be proportionately reduced. Both, in fact, have already been considerably trenched upon during the first four months of the present year. The deliveries of English wheat were much greater than in the corresponding period of last year; and the stocks of foreign wheat are also largely reduced. In fact, the price of wheat has for some time been

lower in Mark Lane than at most of the country markets, so that the millers have found an advantage in purchasing here, of which they have availed themselves to an unusual extent, and this in spite of the larger delivery of English wheat at the country markets. It appears that at 150 markets (about one-tenth of the kingdom) the return of sales of wheat from the 5th March to the 16th April 1870, exceeded those for the same period in 1869 by 75,500 quarters; so that, if this be a fair estimate of all the markets, by multiplying it by ten, it gives an aggregate excess of delivery for the whole kingdom of 755,000 qrs. over that of 1869 in six weeks.

Returning again to the American side of the question, we would say, that we have no fear that the shipments from that country will persistently exceed our requirements. For the present, perhaps, the embarrassments of the speculators will compel them to force the market at any price, in order to meet their engagements. "But," says one writer from New York, "the serious losses sustained during the last few months have destroyed the spirit of speculation, and this circumstance is unfavorable to an advance in price, and besides, we expect large arrivals (at New York) in the spring, as well as financial difficulties, in consequence of the largeness of the stocks on hand. All this renders the future of the trade very doubtful, and it is impossible to form a safe conclusion." But whatever may be the *present* result, if the American farmers are wise they will take warning from this misadventure, not to extend their production beyond the probable demand. The merchants know how to take care of themselves.

THE CENTRAL CHAMBER OF AGRICULTURE.

TO THE EDITOR.

SIR,—I am surprised to see that there are some few farmers who appear annoyed at the course you have taken in reference to the proceedings of the Central Chamber of Agriculture.

Permit me to say a few words on the one question above all others which that body so persistently advocates, viz., the great injustice, as they allege, of the exemption of personal property from contributing towards the relief of the poor, &c.

I need not, I am sure, remind your readers of the innumerable resolutions that the Central Chamber has passed on this subject; but, at their last meeting, finding the Government does not accede to their demands, they pass a number of protests:

(1). "This Council repeats its protests against the present unjust exemption of personal property from contributing," &c., &c.

(2). "That the order in which the Government have indicated their intention of considering the subject of local taxation is irregular and inexpedient," &c., &c.

The third winds up thus:

"This Council protests against any such measures being accepted," &c.

Now, it is a very sorry thing to be driven to protesting after this fashion; but I am astonished that any tenant-farmer will give his time and money in supporting the Central Chamber on this question.

See what Mr. Andrews himself says in his evidence before the Committee now sitting on the matter. To Mr. Pell: "It (the Rate) has diminished the profits in pro-

portion, and many a man has gone down to ruin quietly through the increased burden of the poor-rate." In answer to the Chairman, Mr. Andrews said that "he should think the rates represented quite one-third of the profits;" and in reply to this further question, "And still you hold that if you paid only £90 instead of £180, you would not be able to get more rent from anyone bidding for the farm?" A. "Certainly I should: I should get £90 a year more; that is very clear."

Notwithstanding, therefore, many a tenant "has gone down to ruin quietly through the increased burden of the poor-rate," by whatever amount his rate is to be reduced, by so much is his rent to be increased. "That is very clear," says Mr. Andrews, the grand mover in this matter at the Council of the Central Chamber of Agriculture. I trust the eyes of the tenants will soon be opened to the way in which they are being befooled by that body.

In conclusion allow me to thank you for the course you have taken, and, at the same time, to record my "protest" against any idea that the Central Chamber of Agriculture may be taken as representing the

TENANT FARMER.

P.S. I am pleased to see that the Government has taken up the inquiry from the point of view which Mr. Dashwood brought forward in his excellent paper on local taxation, read at the Farmers' Club in April, 1869.

[Mr. Dashwood has recently been called as a witness before the Local Taxation Committee.]

THE CONDITION OF THE LABOURER ON THE CONTINENT.

The official reports as to the tenure of land, in foreign countries, to which we have already alluded, furnish some interesting details as to the condition and usages of the agricultural labourers on the Continent, which may be usefully cited for comparison with the condition of our own labourers, and which will go far to prove that there are many advantages here in favour of our own agricultural labourers, as regards food, wages, and dwellings. We pass over some of the less important countries of Europe, considered in an agricultural point of view, confining ourselves to those which may be considered the most prominent and noteworthy.

If we take first the Prussian monarchy, out of a purely agricultural population of about 9,500,000, fully 2,000,000 are agricultural labourers, and their families and dependants more than another 2,000,000. A very considerable portion of these are either owners or tenants of land, who work as day labourers at harvest and other times. The day wages are apparently higher than the wages of the farm and field labourers who are employed by the year; but if allowance be made for the risk of want of work, and for other incidents of the day labourers' earnings, they are not really higher, but, on the contrary, he probably is in a worse position than the regularly engaged farm labourer. This difference is his payment for his independence and family life. It is seldom the custom to pay all the wages in money; very frequently the farm-servants are boarded at the farm-house. In other cases the payment is chiefly made in kind.

The rate of a day labourer's wages is of great economical importance. In Prussia the wages of the farm labourer by the year are, for a man, as a rule, 60s. to 90s. up to, in some manufacturing districts, 105s.; for a girl 36s. to 60s. a-year, and in better neighbourhoods 75s., and even 90s. In the smaller peasant farms the general farm-servant has a smaller wage, but an allowance in clothing and linen. The board of a general farm-servant consists usually of four meals in summer and three in winter; in the morning, milk, flour-porridge or groats, and dried peas and potatoes; at midday vegetables and dumplings, sometimes with meat, and sometimes without; at vesper-time, milk-porridge, or clotted milk, with bread, and a little brandy; in the evening, potatoes with herrings, and porridge, and on fete days roast meat, with white or fancy bread. Half-a-pound or three-quarters of a pound of meat is given at dinner two or three times a week; on the larger farms it is not unusual to substitute for board a payment in kind. Thus for a man, 10½ bushels of rye, the same of barley, 3 of peas, 18 of potatoes, 3½ bushels of corn, one-quarter of an ox as meat, or 21s., half a lean pig, or 15s., and 12s. for herrings, salt, and pot-money. In winter a pint, and in summer a quart, of milk, daily, firing free, and on fete days beer and brandy. The varieties of this plan are numerous.

Free labour is taking the place of contract labourers bound to the farm, and paid in kind for the most part. The labourer now receives a house free, potato-land, pasture for a pig, and medical attendance. The man is bound to work throughout the year at a daily wage of 6d. to 1s., the women in the summer at 5d. to 7d. For piece-work the pay is, mowing 13d. to 21d. the acre, for digging potatoes 0½d. to 1½d. per bushel; dressing with manure 13s. 6d. per acre, with mould 27s. per acre.

In Pomerania the wages vary much, the lowest rates for a man are 54s. to 75s. the year, the highest 120s. to 150s., with board. The instances cited will suffice to indicate the modes and details of paying the agricultural labourer, but a few striking variations may be cited as regards other provinces. In Posen the farm servant receives a computed annual value of £10 10s. to £13 10s. Meat is seldom allowed. The married farm man receives £18 to £20 a year. In Silesia the man receives a computed annual value at the lower rates of £9 to £10 up to £15 the highest, half a pound of meat is allowed twice a week. In Westphalia the wage is high, and the board very good. Meat is generally allowed every day, and on many farms beer is given. Coffee is allowed on morning and afternoon. Men's wages are from £3 to £7 10s. a year, and women's £3 to £4 10s. On the smaller peasant properties the wage is rather less, but the man gets a pair of boots and three shirts, and the woman a pair of shoes and linen for two or three chemises. As it is the local custom to wash linen only two or three times a year, each person requires a good stock. Hence also this is a reason for payment in kind taking the form of shirts.

In all parts the agricultural labourer appears to be contented. Often two or three families live in the same small dwelling—sometimes with only one small room for sleeping, living, and cooking in. The labourers are seldom thrifty. They live from hand to mouth. The humble prosperity of the family depends upon the kind of wife, other things being equal. If she be not a good manager, the wolf is always at the door.

In the Duchy of Saxe-Coburg Gotha, the day labourer, who lives in the house and is fed, receives £5 5s. to £7 10s. a year; a woman £2 14s. to £3 15s. Some day labourers also live with and are fed by the landowners, in which case a man receives 6d. a day, a female 3d. to 4d. If not fed, 11d. to 1s. 2d., and females 7d. to 9d. Generally speaking, a day labourer with a family is far from well off, if he does not possess a house and sufficient garden, or hired ground to enable him to grow potatoes enough for his family, and for feeding a pig. Notwithstanding the pitiful state of such people, it is seldom that they blame or reproach their employers; their only wish is to give up agricultural life, and find work in some other branch of industry.

The labourer in Denmark receives from 7s. 6d. to 9s. a week, the hours of labour being twelve or thirteen in the summer, and while daylight lasts in winter. When the employer provides the food, the wages may run from 2s. 6d. to 5s. a week. He is not much worse fed than the Somersetshire labourer, although wheaten bread and bacon must in themselves be more nutritious than rye-bread and cold salt pork. The Danish master is far worse clothed than the English peasant, and above all far worse housed. The charges for the relief of the agricultural poor are on the increase in Denmark, being about 2s. per head for the country population.

In Belgium the day labourer earns about 1s. per day, and pays about 10d. a week rent for a cottage. In some parts of the kingdom the wages of the agricultural labourer reaches 1s. 8d. a day, without food. When fed by his employer, he is content with rye-bread, potatoes, and curds, with occasionally a bit of bacon or salt meat. At his own cottage his food is still worse.

In France the farm-servant mostly lives under the same roof and eats with the master, and in fact forms part

of his family. They are, however, comparatively few in number. Their wages now average from £10 to £12 a year for men, and from £5 to £7 for women, lodged and fed at a cost of about £10 a year per head. The hired day labourers receive from 1s. to 2s. per day, and women from 6d. to 1s. They are fed at a cost of about 8d. per head per day. Female labour is much employed, more especially in the northern departments, and this would seem to be a natural consequence of small holdings. On an average the wages of the female labourer are one-half those of the male. The emigration of the country population to the great towns is daily increasing, and has advanced the price of day labour. It may be said that the wages of the day labourer have increased one-third within the last thirty years, and he can earn on an average 2s. 6d. to 3s. a day.

We conclude with a few words on the condition of the agricultural labourer in Portugal. Here, the vigour and

growth of the rural population are stated to be stunted by the large quantities of vegetable food (especially pulse) which they are compelled to consume, in order to obtain the quantum of nitrogenous substances essential to life. Pot-herbs, a little rice, chestnuts, and scanty rations of fish constitute, with the vegetables, the maintenance and sustenance of the rural classes. Meat is never eaten, except perhaps on a few holidays of the year. The people live and labour—or it may be more correctly said that in many parts of the country they only vegetate—and are too weak and too little energetic for the physical efforts demanded of them. The average wages of hired labourers throughout the country may be stated at 1s. 3d. a day for men, and 5d. for women.

The data we have cited from this Parliamentary Report will serve to convey a fair average idea of the condition of the agricultural labourer in the chief countries of Europe, as compared with England and Wales.

THE TRANSIT OF STOCK.

At a meeting of the Council of the Central Chamber of Agriculture, in the autumn of last year, a circular letter from the Privy Council office, on the transit of animals, came under consideration. In reply certain points were taken up which Colonel Tomline, M.P., the Chairman, characterized as "very good resolutions," although "in his opinion they would not have the slightest effect upon the Government or upon railway companies." But then this gallant gentleman has clearly not formed any very high estimate of any "effects" that may follow from the proceedings at his Chamber, as only a month or so since in opening the business he declared with all sufficient emphasis that "practically they had done nothing," and "that they had not advanced one step." We confess that we are inclined to give the Central Chamber more credit than is allowed by its own President, if only in this matter of the transit of stock. As we showed at the time the resolutions of the Chamber came in support of, as they were in fact but an echo of the answer agreed to at the Farmers' Club on the previous day. Some original notions of some of the members of Council were very dutifully struck out, as in the end nothing could well be more unanimous than the replies sent in to Mr. Tennant from the two Societies. Now, we are by no means here prepared to maintain that the Chamber of Agriculture was, as its Chairman would have it, working "without the slightest effects." In backing the opinion of the Farmers' Club it is probable enough the demonstration from the Central Chamber really had some weight with the Government, however little inclined a Minister may be to pay any attention to its curious complications over the adjustment of local burdens, its impractical substitutes for the malt tax, or its do-nothing policy as regards the game abuse.

But we differ even further with the Chairman of the Central Chamber. From the first we have maintained that the present Government, liberal though it might be, was not altogether indifferent to the claims of agriculture; as we have repeatedly expressed our conviction that more might be expected of it in certain directions than even from our own County Party. Over such questions as the cattle plague, or the rabbit evil, the farmer looked to be in good hands, although it has been the fashion in some quarters to say otherwise. In dealing, in fact, with the diseases of stock, we felt that Mr. Forster was as much to be trusted as Lord Robert Montagu himself, even if he had not bound him-

self down to any one very particular spot as the site for a foreign market. At the solution of this difficulty we have not yet arrived, although the business is fast ripening; but in the interim something has been done in other ways. Colonel Tomline said, as Chairman of his Chamber, that any representation to the Government on improving the carriage of stock would not have the slightest effect, and it may be interesting to see how far this impression has been confirmed.

As a merely second-hand Society, at least in this business, we may set aside the Central Chamber of Agriculture, and compare the new Orders as they appear in *The Gazette* with the resolutions forwarded from the Farmers' Club to the Privy Council Office in October. The first recommendation from the Club ran thus: "That, all trucks for the conveyance of animals upon railways should be fitted with spring buffers." And the Lords of the Council now order, as the first condition for the better transit of animals by railway that, "From and after the thirty-first day of December, one thousand eight hundred and seventy, every truck used for carrying animals on a railway shall be provided with spring buffers, and the floor thereof shall have proper battens or other foot-holds thereon." The second point taken by the Club was, "That, in order to prevent the injurious effects upon the animals by the shunting of the trains and from other causes, the trucks should be divisible into compartments;" and, "That the vessels should be divided or divisible into compartments in the same way the Committee has recommended for railway trucks." It is right to say that some members of the Committee of the Club were not so clear as to the advantage which would follow from such divisible compartments; and the recommendation is only adopted so far as regards vessels where, in the places used for animals, the following regulations shall have effect: "Every such place shall be divided into pens by substantial divisions.—Each pen shall not exceed nine feet in breadth, or fifteen feet in length.—The floor of each pen shall have proper battens or other foot-holds thereon." The Committee of the Farmers' Club proceeds to advise "That, animals should not be upon a railway for more than twelve hours without water; and that railway companies should be compelled to provide means for the proper watering of cattle before loading."—And "That, any appliances for the watering of animals should be attached either to the carriages, or troughs should be so placed at

the stations, that animals travelling for more than twelve consecutive hours can drink from such troughs without being removed from the trucks." And the Lords of Her Majesty's most honourable Privy Council "do hereby direct that the Railway Companies working the railways named in the Schedule to this Order shall, at each of their respective stations named in that Schedule, provide water for animals carried or about to be or having been carried on the railway of the Company." The list of these watering stations, which we give in another part of our Paper, runs already to over three hundred. With respect to the feeding of cattle travelling by railway, the Committee of the Club was "of opinion that there are great difficulties in the adoption of any plan, and is not sure that the feeding is necessary or desirable;" and no mention or Order is given for providing food for beasts moving inland. The Club report says, "That, all vessels for the conveyance of cattle should be licensed for the purpose; and that the number of animals such vessels should be laden with be defined on the same principle as is adopted with emigrant ships;" and the new Orders that, "From and after the thirty-first day of October, one thousand eight hundred and seventy, animals landed from a vessel shall, on a certificate of an Inspector appointed by the Privy Council in that behalf certifying," &c. Finally, the Club states "That pleuro-pneumonia and other diseases are no doubt engendered by the exposure to which animals are subjected on landing, and that sheltered accommodation should be provided on their disembarking;" and the new Orders provide that "At every place where animals are landed from vessels, provision shall be made, to the satisfaction of the Privy Council, for the speedy and convenient unshipment of animals, and for a supply of food for them." It will be thus seen that there is not a single recommendation emanating from the Farmers' Club but that has had its weight with the Council, while some further provision is made for the cleansing and disinfecting of vessels, pens, and vehicles. If the new Orders show any want or weakness, it is that the overcrowding, as the Club puts it, is not sufficiently defined, as this would seem to be a matter left almost altogether to the judgment and discretion of the Inspector.

"The action of the Irish Government has probably saved those who are engaged in exporting cattle from Ireland from the possibility of being placed in a very disagreeable dilemma; and it is to be hoped therefore that all concerned will unite in assisting the Government to carry out the provisions of the recent order in the most effectual manner. It is in this way we shall give our customers on the other side of the Channel the best guarantee of our earnestness, and there is no doubt but that in a very short time the beneficial results of such a course will be sufficiently evident." So says the *Irish Farmers' Gazette* of only Saturday last, when referring to the orders recently issued for the suppression of pleuro-pneumonia in the Sister Kingdom. We would thus seem to be making some progress in every way; and yet to what continual misrepresentation, if not something worse, has the present Government been subjected! The Chairman of the Central Chamber of Agriculture, although sitting on the same side of the House, has no confidence in the Ministry as regards the claims of Agriculture; while the Home Cattle Defence Association is always indignantly protesting about something which the Government has, or has not done. But a foreign cattle market may follow, and then even that curiously-constituted body should be satisfied. There are, however, some Societies that have been inclined to give the Government credit for better intentions. On introducing a deputation from the Farmers' Club, in the spring of last year, Mr. James Howard, M.P., said,

addressing the Vice-President of the Council, "The deputation, sir, does not come before you with any hostile feelings towards the measure which you have introduced in Parliament; on the contrary, they see in it much that is wise and good. I feel, and I believe the members of the Club generally feel, that the Government has acted wisely in bringing in a measure of consolidation. We also think you have acted wisely in introducing clauses dealing with other diseases besides rinderpest, whether they be of home growth or of foreign production." Whereas the month-pieces of the Chamber of Agriculture have put it all the other way. They would have led the country to believe that Mr. Lowe was going to repeal the malt tax, and that the Government would pay no heed to any suggestions on the carriage of stock. Surely such cross-readings as these are calculated to do a deal more harm than good.

[From the *London Gazette*, Friday, May 13.]

At the Council Chamber, Whitehall, the 12th day of May, 1870, present, Lord President, Mr. Secretary Bruce, Mr. Forster,

The Lords and others of Her Majesty's most honourable Privy Council, by virtue and in exercise of the powers in them vested under the Contagious Diseases (Animals) Act, 1869, and of every other power enabling them in this behalf, do order, and it is hereby ordered, as follows:—

Preliminary.—1. This order may be cited as the Transit of Animals Order of May, 1870. 2. This order extends to Great Britain only. 3. In this order words have the same meaning as in the Contagious Diseases (Animals) Act, 1869, save that the term "animal" extends to all ruminating animals and to horses. 4. Article 21 of the Contagious Diseases (Animals) Order of August, 1869, is hereby revoked.

Transit of Animals by Sea.—5. With respect to places used for animals on board vessels, the following regulations shall have effect from and after the thirty-first day of July, one thousand eight hundred and seventy:—(1.) Every such place shall be divided into pens by substantial divisions. (2.) Each pen shall not exceed nine feet in breadth, or fifteen feet in length. (3.) The floor of each pen shall have proper battens or other foot-holds thereon. (4.) Every such place, if inclosed, shall be ventilated by means of separate inlet and outlet openings, of such size and position as will secure a proper supply of air to the place in all states of weather. 6. Between each first day of November and the next following thirtieth day of April (both days inclusive), freshly shorn sheep shall not be carried on the deck of a vessel. 7. When sheep are carried on the deck of a vessel, proper gangways shall be provided either between or above the pens in which the sheep are carried. 8. From and after the thirty-first day of October, one thousand eight hundred and seventy, animals landed from a vessel shall, on a certificate of an inspector appointed by the Privy Council in that behalf, certifying to the effect that the foregoing regulations, or some or one of them, have not or has not been observed in the vessel, be detained, under the supervision of the Commissioners of Her Majesty's Customs, at the landing-place, or in lairs adjacent thereto, until the Privy Council otherwise direct.

Cleaning and Disinfecting of Vessels.—9. Every vessel used for carrying animals shall, after the close of each voyage, and before any fresh cargo is taken on board, be cleaned and disinfected in manner following: (1.) By the sweeping out of the hold and every other part of the vessel used for animals, and the effectual removal therefrom of all dung and litter, and of all ashes, sand, sawdust, and other matter with which animals or their droppings have come in contact: (2.) Then by the thorough washing of the same parts of the vessel with water: (3.) Then by the application to the sides, floor, and ceiling of the hold and to every other part of the vessel with which animals or their droppings have come in contact, of a coating of limewash made by mixing good freshly-burnt lime with water, and containing in each gallon of limewash either one-fifth of a pint of commercial carbolic acid, or one-fifth of a pint of commercial cresylic acid, or four ounces of fresh dry chloride of lime, such lime-

wash to be prepared immediately before use. The sweepings of the vessel shall be well mixed with quicklime, and effectually removed from contact with animals.

Shipping and Unshipping Places.—10. At every place where animals are put on board of or landed from vessels, provision shall be made, to the satisfaction of the Privy Council, for a supply of water for animals; and water shall be supplied there gratuitously, on request of any person in charge of any animals. 11. At every place where animals are landed from vessels, provision shall be made, to the satisfaction of the Privy Council, for the speedy and convenient unshipping of animals, and for a supply of food for them; and food shall be supplied there, on request of any person in charge of any animals, at such price as the Privy Council, from time to time, approve.

Transit of Animals by Railway.—12. From and after the thirty-first day of December, one thousand eight hundred and seventy, every truck used for carrying animals on a railway shall be provided with spring buffers, and the floor thereof shall have proper battens or other foot-holds thereon. 13. From and after the thirtieth day of June, one thousand eight hundred and seventy, a railway company shall not allow any truck used for carrying animals on their railway to be overcrowded so as to cause unnecessary suffering to the animals therein. 14. Between each first day of November and the next following thirtieth day of April (both days inclusive), trucks used for carrying on a railway sheep freshly shorn and unclothed shall be covered and inclosed so as to protect the sheep from the weather, but shall be properly ventilated.

Cleaning and Disinfecting of Pens and Vehicles.—15. Every pen, carriage, truck, horse-box, or vehicle used for carrying animals on land shall, on every occasion after any animal is taken out of the same, and before any other animal is placed therein, be cleaned and disinfected in manner following: (1.) By the sweeping out of the pen, carriage, truck, horse-box, or vehicle, and the effectual removal therefrom of all dung, sawdust, litter, and other matter: (2.) Then by the thorough washing of the pen, carriage, truck, horse-box, or vehicle with water: (3.) Then in case of a pen, carriage, or truck, by the application to the floor and to all parts above the floor with which animals or their droppings have come in contact, of a coating of limewash made by mixing good freshly burnt lime with water, and containing in each gallon of limewash either one-fifth of a pint of commercial carbolic acid, or one-fifth of a pint of commercial creosylic acid, or four ounces of fresh dry chloride of lime, such limewash to be prepared immediately before use. The sweepings of the pen, carriage, truck, horse-box, or vehicle shall be well mixed with quicklime and effectually removed from contact with animals.

Penalties.—16. If anything is done or omitted to be done in contravention of any of the regulations of this Order, the owner and the master or person having charge or command of the vessel in which, — and the owner and the occupier of the place where animals are put on board of or landed from vessels at which, — and the company carrying animals on or owning or working a railway on which, — and also in case of the overcrowding of a truck on a railway, or of the carrying on a railway of sheep freshly shorn and unclothed, the consignor of the animals in respect of which, — (as the case may be,) such thing is done or omitted, shall severally be deemed guilty of an offence against this Order. 17. Provided, that no person shall be liable to a penalty under this Order in respect of sheep as freshly shorn, where it is proved that the sheep have not been shorn within sixty days before the time of the commission of the alleged offence.

ARTHUR HELPS.

At the Council Chamber, Whitehall, the 19th day of May, 1870; by the Lords of Her Majesty's Most Honourable Privy Council. The Lords and others of Her Majesty's most Honourable Privy Council, by virtue and in exercise of the powers in them vested under the Contagious Diseases (Animals) Act, 1869, and of every other power enabling them in this behalf, do hereby direct that the railway companies working the railways named in the Schedule to this order shall, at each of their respective stations named in that Schedule, provide water for animals carried or about to be or having been carried on the railway of the company.

This Order may be cited as the Transit of Animal (Water) Order of May, 1870.

ARTHUR HELPS.

SCHEDULE.

Name of Station.	Name of Railway.
Aberdeen	Caledonian
Accrington	Lancashire and Yorkshire
Alford	Great Northern
Almond Bank	Caledonian
Alyth	Caledonian

THE STATE OF THE VETERINARY PROFESSION IN THE UNITED KINGDOM.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR.—As the state of the veterinary profession is a subject of general interest to agriculturists, perhaps you will have no objection to insert the enclosed, which forms the Appendix to my pamphlet on Medical Reform, just published for private circulation.

Yours obediently,

EDWARDS CRISP, M.D.

29, Beaufort-street, Chelsea, May 10, 1870.

This question is so intimately connected with everything that concerns the progress of medical science and the good of the profession, as I hope to show hereafter, that I make no apology for introducing it as an Appendix to this essay. We can scarcely be said to have any efficient mode of instruction for our veterinary students in the United Kingdom. Up to a late period those who examined them were members of the medical profession, and at the present time, to use the language of one of the few reformers among the veterinarians, Mr. Fenwick ("Veterinarian," July, 1829): "A joint-stock company where gentlemen send their horses at the cheapest rate, and where human surgeons, ignorant of the anatomy and diseases of horses, are the examiners."

For thirty-seven years, only one member of the veterinary profession was allowed to be on the examining board. The college receives £200 a-year from the Royal Agricultural Society, the members of which society and other subscribers have the liberty of sending diseased animals free of cost.

There is one advantage this college has over our medical corporations, viz., that the representative system is fully adopted; ladies and members of Parliament being allowed to vote by proxy, a kind of constituency not becoming a scientific body. I am unwilling to make an ill-natured remark, but it must be apparent to all that, like many of our medical corporations, this body is very far behind similar institutions on the Continent—that the system of education and instruction is very inefficient. A new charter is now prayed for, one object of which is to prevent those calling themselves veterinary surgeons who are not members of the college. If this charter is granted it will only add another piece to the patchwork, and effect but little scientific good. The members of this college are about 1,000; a very inadequate number for the supply of the United Kingdom, as was fully shown during the late outbreak of cattle plague. In Scotland, the veterinary college, under the Highland Society, is in a more unsatisfactory state; and in Ireland there is no veterinary instruction of any kind. A friend in Dublin tells me "that Mr. Peale was the last veterinary professor in Ireland, 1827."

The Government should at once establish a veterinary college in Dublin upon a liberal basis, with an annual grant of money

to make the institution entirely independent of annual subscribers. The same should be done in England and Scotland; there is no other means of making this body efficient and respectable. A college so instituted might, as in France, Austria, and Germany, go hand-in-hand with our medical and surgical institutions, and thus effect great good.

THE STATE OF THE VETERINARY PROFESSION IN FRANCE.
—I will now place before the reader, by way of contrast, the state of the veterinary profession in France. Here, there are three veterinary colleges, as there are three schools of human medicine—Alfort, founded in 1765; Lyons, 1762; and Toulouse, 1761. During three recent visits to Paris, I have made it my duty to visit the school of Alfort, and to inquire into the course of study and mode of examination of the students of this college. The regulations are the same at Lyons and Toulouse.

All appointments, as at the medical schools, up to the grade of *aggrégé* are competitive (by *concours*). The student is boarded and partly provided for by the Government. At the present time (October, 1867), there are about 260 students at this school, besides those of Lyons and Toulouse. Each student on admission must be between 17 and 25 years of age; he must produce certificates of birth and good conduct. Those only are admitted who can pass a satisfactory examination in the French language, arithmetic, geometry, geography, with a written narrative of some subject treating of geography and history. For his board, the student pays 450 francs yearly; he remains at the school for four years, the only holidays being Sundays and fête days. In addition to his board, he finds his dress (blue clothes, with gilt buttons), and his under-clothing. The diploma is fixed at 100 francs. Besides the ordinary students, 40 military students are maintained by the Government, who must be the sons of persons in the army, and recommended by the Ministers of War. No student leaves the establishment, which is surrounded by extensive grounds, without permission from the director.

At the three veterinary schools, 178 rewards (*démobonnes*) are yearly given to the most deserving students, and the half-yearly reports (*notes semestrielles*) of progress, are the only documents consulted by the minister for the distribution of these rewards.

The course of study is as follows: First year, anatomy, natural philosophy, mechanics, chemistry, botany, and histology; second year, anatomy, physiology, zoology, chemistry, materia medica, botany, histology, and the structure of the different domesticated animals; third, pathology, hygiene, and agriculture; fourth year, breeding of animals, anatomy, physiology, and pathology (theoretical and practical).

Several lectures are given daily by the professors (paid by the Government), who have obtained their appointments by

CONCERN, and who have distinguished themselves by their various writings and discoveries. I need scarcely say that the examiners at the medical and veterinary schools have no pecuniary interest in the examination.

I will not offend the reader by asking him to contrast this state of things in France with that which I have described in the United Kingdom, but I ask him if a veterinary surgeon in France is required to be examined in botany, zoology, and hygiene, why should these important subjects not of necessity form a part of the examination of medical students in England?

It must be observed that these students are educated at the expense of the Government. They pay nothing for attendance upon lectures, as the professors are remunerated by the State, and that when time is taken into account, the period, compared with that of the medical students in England is one year longer; for our medical session is only about nine months. When I passed the London College of Surgeons, it was necessary that a student should be *twenty-two* years of age, and that he should have been engaged for *six years* in the acquirement of professional knowledge; but now the age is twenty-one years, and the period of acquiring professional knowledge limited to *four years*, so much for the progress of science in England in this the 19th century! 2,173 persons in the United Kingdom, in the army, navy, and in the colonies, are practicing with this non-medical diploma only, although more than nineteen-twentieths of the practice of every medical man, civil, military, or naval, is medical.

But let me return from this vital digression to the state of the veterinary profession in the United Kingdom. As I have recently said in Ireland there is not a single teacher of veterinary science; let us suppose cattle plague appears in Ireland (a very likely circumstance), and is undiscovered until the poison is disseminated in various parts of the country, where are the veterinary surgeons to carry out the requirements of the Privy Council? During our late visitation in England, the want of proper inspectors (from the neglect of veterinary science by the Government) was fearfully felt, but what would be the condition of things in Ireland with the horse-leech and the cow-doctor? I have good reason to believe that if Ire-

land had been provided with an efficient class of veterinary practitioners, pleuro-pneumonia would not have made the ravages it has done among cattle in many parts of Ireland, and that the importations of the disease to England would have been less extensive. This is a question that concerns every well-wisher of his country, and the sooner the Irish people begin to stir in the matter the better. It is one of the many grievances of this part of her Majesty's dominions.

I have, however, another motive for introducing this question of the state of the veterinary profession in the United Kingdom in this appendix, viz., the great bearing it has upon the progress of medical science. In France, Belgium, Germany, and Austria, where veterinary surgeons are well instructed, many subjects of great physiological and pathological importance are referred to certain professors of the veterinary profession, who, from their greater knowledge of the structure of our domesticated animals, are better able to decide. Many of these veterinary professors, too, have made important discoveries in anatomy, physiology, and pathology. To give a practical illustration, let me quote an investigation now going on at the Academy of Medicine in Paris. M. Villemin, as shown in his work, "*Etudes sur la Tuberculose, Preuves Rationnelles, Experimentales, de sa Specificité, et de son Inoculabilité, 1867*," has shown that tubercle, or something very much allied to it, may be conveyed from man to the rabbit and to other animals; he believes that "tubercle is a symptomatic and contagious disease." His book is now before the Academy of Medicine, and for the proper investigation of this important matter—one of the most important as regards human mortality that could come before a body of scientific men—the Academy appoints certain persons who are thought to be most competent to investigate the subject and make their report. Among these is the well-known and laborious experimentalist, M. Colin, the Professor of Pathology at Alfort, the school I have just described.

When will a Faculty of Medicine of England, Ireland, or Scotland appoint a veterinary professor to investigate any subject connected with human pathology? When will all our medical students be examined upon subjects that are thought necessary for a horse-doctor in France?

THE INTERNATIONAL DECIMAL ASSOCIATION.

A conference on international measures, weights, and coins, was held at the Society of Arts, Earl Fortescue in the chair.

Professor LEONE LEVI read the twelfth annual report of the Council, in which the following resolutions were reproduced:

1. That it is advisable for international purposes that a single standard for coins should be adopted in all countries, and that that standard should be gold.

2. That, for facilities of exchange, the degree of fineness in the standard should in all countries be nine-tenths.

3. That considering the extensive and growing use of the decimal system, and the time and labour which it saves in computations of money value, and in all commercial transactions, the unit of money value in every country should be decimally subdivided.

4. That, in the opinion of this association, the greatest advantages would result to the country if Great Britain were to join the Monetary Convention, concluded the 28th December, 1865, between France, Italy, Switzerland, and Belgium, by Art. 12 of which convention the right of accession is, under certain conditions, reserved for other States.

5. That, in the opinion of the association, in order to make the sovereign interchangeable for international purposes, it is desirable that the quantity of pure gold contained in it should be reduced to the precise equivalent of the gold piece of 25 francs.

6. That in order to bring the British system and the system of the convention into closer contact, it is desirable that the sovereign so altered should be divided into 250 new pence.

7. That whilst recognising the increased facilities which would result by the establishment of a simple and clear relation between such leading units as the sovereign, the dollar reduced to the level of five francs, and the franc, the Council of the International Decimal Association, anxious to promote one

common universal unit of money, strongly recommend to Her Majesty's government to consider the advantage of adopting the ten-franc piece in gold, consisting of 100 new pence as before defined, as an international unit, and to submit the same for the adoption of the nations parties to the Monetary Convention of December, 1865.

8. That it be recommended to her Majesty's government to take the necessary steps for convening or joining another international monetary conference for the purpose of settling the details of a complete system of international coinage.

The report ran on thus:

Your council are convinced that the establishment of a uniform decimal system of weights and measures based on the metric system, and a system of coinage likewise simple, decimal, and international, would confer a decided boon on all classes of society; that the economy of time and labour which it would introduce would greatly promote the increase of wealth; whilst any system which shortens the processes of elementary instruction must tend to advance the education of the people, and give greater opportunities for the teaching of physical and natural science in the schools of the United Kingdom. For the last ten years we have seen one country after another introducing measures for realising the desired uniformity in these most practical instruments of exchange; and as it is given to Great Britain to exercise a commanding influence, not only by her internal legislation, but by the action of her colonies and dependencies, your council earnestly trust that that influence will be exercised in the direction of promoting the object of this association—one uniform decimal system of measures, weights, and coins in all countries.

Sir CHARLES ADDERLEY, M.P., moved the following resolution:—"That the great inconvenience to agriculture, manufactures, and commerce, as well as to science, resulting from the numerous complicated and anomalous weights and mea-

tures now in use, whether by law or custom, in the British empire, demands the attention of the legislature at the earliest practicable time, with a view to the establishment of some convenient uniform decimal system throughout the United Kingdom."

Capt. CRAIGIE said he attended from the Central Chamber of Agriculture, and he had to apologise for the absence of the chairman and vice-chairman. His principal duty was to state how the Central Chamber of Agriculture had regarded this question, and how they stood in relation to it, rather than to make any remarks of his own. The council of that associa-

tion, in November last, past resolutions to the effect that all agricultural productions should be sold by the decimal system, the cental of 100 lb. being the standard. This resolution had been submitted all over the country to various provincial chambers, from a great many of which replies have been received, stating that they were favourable to such a proposed change; and at the request of the Central Chamber, Colonel Tomline had just presented a petition praying for a select committee to inquire into the subject.

The resolution was seconded by Mr. BAINES, M.P., and adopted.

SALE OF THE LATE MR. G. S. FOLJAMBE'S SHORTHORNS,

AT OSBERTON, WORKSOP, ON APRIL 27TH,

BY MR. JOHN THORNTON.

This event, which had been anticipated for some time past in the North and Midland counties, came off with great success on Wednesday. The high honours that had attended the Osberton Shorthorns at the Royal and Yorkshire meetings for the past few years, drew many visitors to see the herd before the sale took place. On the sale morning, however, the popularity of the late owner, Mr. George S. Foljambe, and the fame of the stock attracted an enormous number of people, from Yorkshire, Lincolnshire, and Nottinghamshire. It was computed at the beginning of the sale that between twelve and fifteen hundred people were present. Before luncheon it was a difficult thing to get near the cows at all, which, being tied up in a cowhouse, allowed only a limited number to move in and out. The yearlings and calves were in small straw-yards, and could be much better seen; several of them received the greatest praise for their fine hair and symmetry and splendid condition. Goody-two-shoes, out of the first cow, undoubtedly one of the best animals sold, and a roan heifer calf, out of Lily of Windsor, with an immense back and well-packed quarters, were first favourites all along. Soon after twelve a large floral tent, in which luncheon for 250 was set out, began to fill. Lord Galway, M.P., took the chair, and Mr. Torr, of Ayleby, acted as vice-chairman. On certain tables the prize cups were displayed, and the medals and portraits of several prize animals were hung on the tent just behind the chairman, who, as soon as the hungry were filled, proposed that the health of his late friend, George Savile Foljambe, should be drunk in solemn silence. The health of Mr. Francis Foljambe, with success to the sale, was afterwards given, the chairman saying that he hoped he would walk in his father's footsteps and keep up an excellent herd of Shorthorns. Mr. Foljambe, in responding, hoped to see a new herd rise up from the remnant which he proposed reserving. Mr. Torr gave Lord Galway's health, who in responding proposed Mr. Woods, the farm bailiff. Mr. Hodgkinson replied, in Mr. Woods' absence; and as soon as the auctioneer's health was given, and responded to, the company adjourned to the ring. The tent was immediately refilled, and everything eatable demolished. Whilst the second party were at lunch, the three Knights were paraded; and, soon after two o'clock, Mr. Thornton in opening the proceedings, spoke to the condition in which the animals were brought out, which was highly creditable to Mr. Woods and the herdsman, John George. Lady's Slipper, rising eleven years old and descended from Mr. Booth's Farewell, paced round the large oval ring, and was a splendid lot to begin with. Of great size, in fine condition, a lovely roan colour, full of fine hair, and beautiful quality, she walked as gaily as a heifer, and was put up at 50 gs. Several bids were made, and ultimately Mr. Brierley, of "Bolivar" fame, and Mr. Robinson, an old breeder, near Leyburn, closed and fought it out from 75 gs. to 100 gs., at which price she was sold to Mr. Robinson. The next lot, newly calved, did not look so blooming; nor did the third, a white one, elicit many bids. Gipsy Queen, the first prize yearling at Newcastle Royal was more in demand; although in fine trim her slack back and bad horns were against her as a show cow, though she had bred some capital

heifers, and she went cheap to Mr. Chaloner, Ireland, at 62 gs. Lily of Windsor and Rose of Windsor, own sisters and both remarkably fine cows, were only newly served and sold accordingly; whilst May Fly, dam of the reserved bull, Knight of the Bath, was a doubtful breeder. Mrs. Page, however, was one of the most level and stylish-looking cows, and was admired as much as any lot offered. Although newly calved she was soon up at 80 gs., and then Capt. Fryer, Lord Bolton's agent, and Mr. Oliver opposed up to 165 gs., at which, amidst much cheering, she was sold to Mr. Oliver. Queen Oak, a roan, was a very inferior looking animal, and Flageolet, a better and larger cow. Glee, with two crosses of Booth bulls, not three years old, had been served at a very early age, and produced a heifer calf before she was two years old: this had not detracted from her appearance, though many thought her a little small. A young Cumbrian, Captain Fryer, went at 5 guinea bids in a very short time to a hundred; and directly the glass went up the opposition ceased, and she goes to Bolton Hall. The prize heifer Flora did not come out so handsome as she had done in the Show-yard, and Lord Bolton got her cheap enough at 74 gs. Queen Bee had died a fortnight before the sale from a hair ball, and the young heifers next came on. As in most sales these went very high, and there was great competition for them. Mr. Murray, Lord Fitzwilliam's agent, and Mr. Locke, of Hall, bid for Castanet at single guinea bids from 40 to 90 gs., when Mr. Locke got in, amidst roars of laughter, but no persuasion would induce Mr. Murray to give 100 gs., and she was sold at 79 gs. Mistress Ford was a very thick longheifer, small of her age, and tremendously fat; she was bought by Mr. Gibson for Messrs. Walcot and Campbell, New York, U.S.A. The next lot, quite the gem of the young things—a beautiful deep red, with a good skin, fine head, and a thorough-bred look—was eagerly sought, and eventually secured for Mr. Cochrane, Canada. The calves were let loose and galloped round the ring, selling remarkably high. Red Ribbon, the only calf by Knight of the Bath, was quite fit to enter a showyard, and although only six months old, made almost double the cost of her dam, only just over six years. As soon as the cows and heifers were sold, the prize cups went round filled with claret, and there was a little delay in this and also in getting in Robin, who had to be blinded. Although a good bull, and not in very high condition, he only made a few guineas over market price; and the White Knight of the Thistle, a very tall bull, went lower. Knight of the Whisk, third at Wetherby and Manchester, was fancied the most, but the competition was very languid, and he was at last bought by Mr. Cruickshank for his huge herd at Settyton. Knight of the Crescent, the second prize calf at Leicester, and cup bull at the Yorkshire show in 1888, went very badly on his forelegs and was immensely fat; although warranted serviceable he made but 61 gs. Bardolph, a five months good-coated calf out of the reserved cow Mrs. Quickly, was full of promise, and many wanted him—he made 81 gs.; and the last calf, a very good deep roan, sold for a guinea over half that price.

The site of the sale could not have been better; situated on Scofton Green, and what with the yard and buildings on one side, the neat cottages and trim hedges on the other, the large gay-looking tent in front, and the neat stacks in the rear,

it formed quite a picturesque scene, and a local photographer endeavoured to turn it to a profitable account. The average for bulls and cows were—unusually enough—within a few shillings of each other; and considering that 13 out of the 35 head were calves under a year old, the £66 average may well be considered a very excellent result.

COWS AND HEIFERS.

Lady's Slipper, roan, calved June 3, 1869, by May Duke (18553), out of Canerentola by Foig-a-Ballagh (8032)—H. Robinson, Leyburn, Yorkshire, 100 gs.

Concertina, red and white, calved April 26, 1861, by May Duke (16553), out of Seraphine by Monarch (13347)—E. Paddison, Ingleby, Lincoln, 43 gs.

Florence, white, calved Sept. 9, 1863, by Imperial Windsor (18086), out of Mrs. Fry by Man Friday (14993)—P. Browne, Gteworth, Lincoln, 51 gs.

SALE OF MR. CHARLES HOWARD'S SHORTHORN HERD,

AT BIDDENHAM, BEDFORD, MAY 3RD.

BY MR. HENRY STRAFFORD.

The Shorthorn sales of the season had, so far, gone off with such comparative tameness, that a dull trade, in commercial phrase, threatened "to rule." Neither averages nor attendances have been up to high water mark; and, at the first flush, it did not look as if the dispersion of the Biddenham herd would go to mend matters in this way. The very day, that of the race for the great 2,000 gs. Stakes in a neighbouring county, was thought to be injudiciously selected; while, beyond entries at his own local meeting, Mr. Charles Howard

has not attempted much of late by any advertisement of show stock. Nevertheless, as himself a good judge of a Shorthorn, Mr. Howard was known to have been cultivating very carefully some of the best strains of blood, and the Gwynnes, the Spencers, and the Sweethearts, stood out conspicuously in his catalogue. Moreover, any inspection of it conveyed the assurance that never had a herd been offered for sale in better condition, and we say so much in the first sense of the phrase. There was not a pampered beast amongst them; but, the

several lots were sent into the ring, wholesome and useful to the eye, and really fit for breeding purposes. Some of the old cows, like the sweet stylish Fatima Gwynne, had worn wonderfully well, and if some of the figures sounded high for such dowagers, they came out so fresh that the biddings looked to be thoroughly justified. Every now and then an announcement would be made as to how much milk this or that one was giving; and they had all promise of dairy cows, what with their kindly heads, light necks, good bags, and store order. Here then was an opportunity not always available—the foundation was very orthodox, the crossing with more modern tribes quite in fashion, and the quality about as good as it could be; while associated with such recommendations there was the most satisfactory warranty, as offered by the animals themselves, that the purchase of a lot would be not so much of a speculation as a certainty of fulfilling the object for which it was intended. Some knowledge of all this must have got about, as there was as good a company assembled together at Biddenham, on Tuesday, as has been met with for many a long day. In saying so much we would not infer the largest, but rather the most business-like. A glance round the ring, on the occasional announcement of “the buyer,” served to show how strongly the Shorthorn fancy was represented. Mr. Booth, of Warlaby, returned thanks at the luncheon for the breeders; Lord Dunmore bid in person, and exchanged civilities with the auctioneer; Captain Oliver drew his hunting-cart alongside, with a spare seat for Colonel Kingscote, while Mr. McIntosh steadily watched the proceedings from an adjoining waggon. Mr. Clayden, too, would seem to be fast replacing his herd at Littlebury; and Mr. Lynn, of Stroxtan, ever on the look out for something substantial, was thought to have “the bargain” of the day in Gipsy Gwynne, a heavily fleshed heifer. Then Mr. Foster, of Kilhow, was prompt enough with his biddings from the box, and Mr. Gibson, from the United States, of course gave the top price, as our American cousins will do. This was 250 gs. for Orange Gwynne, a three-year-old heifer, neat enough in her character, but that scarcely looked her worth, and the pedigree, no doubt, went far to sell her. Lord Skelmerdale from the north, and Lord Longford, from Ireland, were also entered as purchasers, and at every other turn you encountered such well known men as Mr. Ladda, of Ellington, Mr. Gamble, or Mr. Aylmer from the east, or Mr. J. K. Fowler, who took a spicy keepsake back with him into the Vale. Mr. Bowley looked to be acting as vice-chairman in the tent; Mr. Pawlett and Mr. Wythes were handy home for anything they fancied; and the Masters of the Oakley and the Cambridgeshire, with a member for the county and a brother member for the borough, gave their countenance to the proceedings. The Thomas, the Taylors, the Higgins, and almost all the best men “hereabouts” mustered in force; and Mr. Thornton, with a critical eye on his old tutor, saw the glass run out, so far, to the best average of the year. This, however, was mainly due to the great merits of the cows and heifers, as the bulls were but a plain lot of animals, and the prices were, with an exception or so, in no ways remarkable; but of the two which reached to over a hundred the bull-calf Famous Gwynne is outward bound as far as Australia.

Deservedly successful as the sale went this was not altogether without hitch or hindrance. There were, as there will be, two or three disputes, and of these Mr. Strafford, with some want of tact, made the most rather than the least. He entered into arguments or made speeches, when it would have been far better to have put the lot up again, or have ordered it out of the ring. When a sale is going well there is nothing like keeping it going. “I am come here,” said Mr. Pain, from Messrs. Tattersalls, the other day, when opening business in the Midlands, “not to make long speeches, but to sell some hounds and horses. What will anybody give for lot 1?” From the gossip going on by the ring-side, we gathered that Mr. Booth has just sold his famous cow Patricia for a thousand guineas, the buyer being Mr. Gibson, and her destination the States. It will be remembered that, as two-year-olds at the Leicester Royal Meeting, and further on, there was continual difference of opinion amongst the judges and others as to whether Patricia or Lady Gaiety, both from Warlaby, were the better; but their rivalry has now ended, for the Lady is dead, and Patricia about to become a banished maid. Then the bull-calf which Lord Dunmore recently purchased from the Duke of Devonshire for five hundred guineas was not, it

now appears, really taken at a day or a week old, but on the condition that he is to be delivered in six months’ time—of course, a very material modification of the terms.

COWS AND HELFERS.

Orphan Gwynne, red and white, calved May 2, 1855, by Duke of Gloucester (11382), out of Daphne Gwynne by Conservative (3472).—Mr. Slye, 45 gs.
Grace Howard, red and white, calved April 1, 1859, by Mar-maduke (14897), out of Graceland by Loyalist (10470).—Mr. Holland, 31 gs.
Golden Gwynne, roan, calved November 1, 1860, by May Duke (13320), out of Sylvia Gwynne by Duke of Cambridge (13747).—Withdrawn by leave.
Faustina Gwynne, roan, calved December 16, 1860, by May Duke (13320), out of Flora Gwynne by Young Benedict (15641).—Mr. Dormer, 95 gs.
Fatima Gwynne, white, calved July 20, 1862, by Second Duke of Thorndale (17748), out of Frances Gwynne by Captain Hardings (10093).—Mr. Foster (Kilhow), 86 gs.
Lady Sophia Spencer, roan, calved February 15, 1863, by Second Duke of Thorndale (17748), out of Lady Selma Spencer by Harry of Gloucester (14674).—Mr. Barnard, 52 gs.
Fanny Gwynne, roan, calved January 12, 1864, by Fifth Grand Duke (19875), out of Faustina Gwynne by May Duke (13320).—Mr. Hetherington, 100 gs.
Goody Gwynne, roan, calved June 6, 1864, by Fifth Grand Duke (19875), out of Golden Gwynne, by May Duke (13320).—Mr. Dormer, 65 gs.
The Sort, roan, calved March 10, 1864, by Fifth Grand Duke (19875), out of Specimen by Mameluke (13239).—Captain Oliver, 50 gs.
Day Lily, roan, calved December 18, 1863, by Second Duke of Thorndale (17748), out of Day’s Eye by Young Fourth Duke (9037).—Mr. Fenton, 33 gs.
Lady Susan Spencer, roan, calved October 16, 1864, by Second Duke of Airdrie (18600), out of Lady Selma Spencer by Second Duke of Cambridge (19743).—Mr. Dormer, 61 gs.
Fawley Fourth, red and a little white, calved March 4, 1865, by Fourth Grand Duke (19874), out of Archduchess of Cambridge by Archduke 2nd (15589).—Lord Dunmore, 160 gs.
Fairy Gwynne, roan, calved September 3, 1865, by Fifth Grand Duke (19875), out of Fortuna Gwynne by Duke of Leinster (17794).—Mr. Sharpley, 57 gs.
Syrup, red, calved November 4, 1865, by Fifth Grand Duke (19875), out of Sylph by Londonderry (13169).—Mr. Adkins, 51 gs.
Oleander Gwynne, red and white, calved May 10, 1866, by Fifth Grand Duke (19875), out of Ophelia Gwynne by May Duke (13320).—Mr. Foster, 100 gs.
Floxy Gwynne, roan, calved July 4, 1866, by Twelfth Duke of Oxford (19633), out of Fanny Gwynne by Fifth Grand Duke (19875).—Mr. Blundell, 71 gs.
Fancy Gwynne, roan, calved March 13, 1867, by Fifth Grand Duke (19875), out of Fatima Gwynne by Second Duke of Thorndale (17748).—Mr. Sharpley, 54 gs.
Fawley 7th, red and a little white, calved December 8, 1866, by Fourth Grand Duke (19874), out of Coquelicot by Duke of Cambridge (18742).—Not offered.
Orange Gwynne, roan, calved May 9, 1867, by Fifth Grand Duke (19875), out of Ophelia Gwynne by May Duke (13320).—Mr. Gibson (United States), 250 gs.
Fawley McIntosh, red, calved July 20, 1867, by Baron Oxford (24375), out of Fawley 4th by Fourth Grand Duke (19874).—Lord Dunmore, 185 gs.
Fanna Gwynne, roan, calved July 25, 1867, by Fifth Grand Duke (19875), out of Faustina Gwynne by May Duke (13320).—Mr. Hardy, M.P., 61 gs.
Fleda Gwynne, red, calved August 3, 1867, by Lord Clare (24376), out of Fanny Gwynne by Fifth Grand Duke (19875).—Mr. G. Pain, 66 gs.
Lady Semple Spencer, red, calved August 18, 1867, by Lord Clare (24376), out of Lady Sylvia Spencer by Fifth Grand Duke (19875).—Mr. Fenton, 61 gs.
Lady Selma Spencer, red and white, calved September 23, 1867, by Lord Clare (24376), out of Lady Sophia Spencer by Second Duke of Thorndale (17748).—Mr. Martin, 33 gs.
Grace Darling, red, calved October 28, 1867, by Lord Clare

(24876), out of Grace Howard by Marmaduke (14897).—Mr. Booth (Barnet), 32 gs.

Lady Sonora Spencer, red, calved December 18, 1867, by Lord Claret (24876), out of Lady Susan Spencer by Second Duke of Airdrie (19600).—Mr. Dormer, 43 gs.

Daisy, roan, calved January 24, 1868, by Lord Claret (24876), out of Day Lily by Second Duke of Thorndale (17748).—Mr. Barnard, 36 gs.

Florence Gwynne, roan, calved June 19, 1868, by Fifth Grand Duke (19875), out of Faustina Gwynne by May Duke (18320).—Lord Skalmersdale, 155 gs.

Frisky Gwynne, roan, calved August 15, 1868, by Thorndale Knightley (23065), out of Fanny Gwynne by Fifth Grand Duke (19875).—Mr. Pain, 80 gs.

Lady Sonnie Spencer, red and white, calved October 12, 1868, by Fifth Grand Duke (19875), out of Lady Sophia Spencer by Second Duke of Thorndale (17748).—Mr. Barnard, 61 gs.

Flavia Gwynne, roan, calved October 22, 1868, by Oxford Gwynne (24711), out of Flossy Gwynne by Twelfth Duke of Oxford (19633).—Mr. Fenton, 57 gs.

Flora Gwynne, red, calved January 3, 1869, by Oxford Gwynne (24711), out of Fairy Gwynne by Fifth Grand Duke (19875).—Mr. Pain, 50 gs.

Fama Gwynne, red and a little white, calved June 12, 1869, by Grand Duke of Lightburne (26290), out of Fanny Gwynne by Fifth Grand Duke (19875).—Mr. Foster, 43 gs.

Ora Gwynne, red and a little white, calved July 9, 1869, by Grand Duke of Lightburne (26290), out of Orange Gwynne by Fifth Grand Duke (19875).—Mr. Foster, 110 gs.

Gipsy Gwynne, red and a little white, calved July 24, 1869, by Grand Duke of Lightburne (26290), out of Goody Gwynne by Fifth Grand Duke (19875).—Mr. Lynn (Stroxtion), 35 gs.

Spicy Lightburne, roan, calved August 16, 1869, by Grand Duke of Lightburne (26290), out of The Sort by 5th Grand Duke (19875).—Mr. J. K. Fowler, 47 gs.

Fawley Belle, red and a little white, calved Nov. 2, 1869, by Fifth Grand Duke (19875), out of Fawley 4th by Fourth Grand Duke (19874).—Dr. McIntosh, 155 gs.

Lady Sylvia Spencer, red, calved December 30, 1869, by Grand Duke of Lightburne (26290), out of Lady Susan Spencer by 2nd Duke of Airdrie (19600).—Mr. Bearle, 30 gs.

Flossy Gwynne, red, calved November 9, 1869, by Spectre (27545), out of Fleda Gwynne by Lord Claret (24876).—Mr. Dickers, 26 gs.

Mighty Gwynne, roan, calved February 2, 1870, by Grand Duke of Lightburne (26290), out of Fairy Gwynne by 5th Grand Duke (19875).—Mr. Foster, 45 gs.

BULLS.

SALE OF MR. MURTON TRACY'S SHORTHORN HERD.

AT EDEN BRIDGE, KENT, MAY 5.

BY MR. H. STRAFFORD.

A sale of a fashionable bred herd of Shorthorns, when within a easy reach of London, never comes to the hammer at a better time than on a May morning, and Mr. Tracy had a most successful sale. The catalogue was unique in its way, containing forty-seven animals, fourteen of which were bulls. It consisted of only three tribes, and the bull Patrician (24728), but of these three tribes, one, the Sweethearts, the great attraction of the sale, numbered 39 animals; four were Cleopatras, and three Surmises. The rapid growth of the Sweetheart family is something wonderful. Mr. Tracy bought the first lot, Sweetheart 3rd, when seven years old, at the Milcote sale in 1860, for 91 gs, and she was the "herd matron" of the whole thirty-nine, of which nine were her own daughters and sons; in all she had produced seventeen calves, several being twins. Some of these twins had also produced twins, and al-

together the cattle had been so fruitful that Mr. Tracy's small farm was overstocked, so he cleared them all out. Only one female had been sold privately, and that was a heifer purchased last year by Mr. Thornton to go to Australia, indeed two were selected, but one, Sweetheart 19th, being too far gone in calf, had to be left, and this same heifer now brought 220 gs.!

It may not be uninteresting to relate how these Sweethearts were bred. It is supposed that Colonel Trotter bought the family originally from Mr. Robert Colling, and after adding two or three generations it was sold into Northamptonshire, probably to Mr. Tibbets; from him it passed to the Right Hon. Charles Arbutnot, whom it is said bred Sylph by Sir Walter (2637) in 1831. This cow was sold to Sir Charles Knightley, and afterwards to Earl Spencer, who thought very highly of her.

Mr. Arbuthnot bred a heifer, Graceful from Sylph, and she produced Charmer by Little John, which Mr. Adkins, of Milcote, bought in 1843, and bred Sweetheart, a white, by Accordion (5708) the dam of Mr. Tracy's cow Sweetheart 3rd in 1847.

It is the custom to call these animals Knightley's, but in truth Sir Charles Knightley bred neither male nor female in the pedigree; moreover it has been considered that Bates blood is the only cross suitable to them, but in all Mr. Tracy's Sweethearts there was scarcely a drop of Bates blood; in fact, they are full of Booth. Accordion (sire of Sweetheart) was by a son of Mr. Booth's Cossack, out of Lady Fairfax, by Snowball, who was out of Mr. Booth's Lady Sarah. Then Daybreak (11338), sire of Sweetheart 3rd, was by Earl of Dublin, a bull of pure Princess blood, from Starlight by the same Snowball, so that the same strain of blood flowed through the veins of both dam and sire. Sweetheart 3rd was bought in calf and produced twins, Sweethearts 5th and 6th, by Mameluke (13289), which is the only animal bred by Sir Chas. Knightley. These two cows were lots 3 and 4 in the sale and certainly remarkably fine animals, especially the 5th, whose portrait Mr. Strafford gave in vol. xvi. of the *Herd Book*. Mr. Tracy used, in order to preserve the fine loin, ribs, and shoulders The Baron (13833), got by Mr. Booth's Baron Waraby, from Bon Bon, a daughter of Sylph, bred by Karl Spencer. Mr. Barnes's Duke of Leinster (17794), from the noted Mantalini family, was hired a short time, and then the sons of these bulls, from Cleopatra and Sweetheart cows, followed until 1868, when he purchased Patrician, of Sylph and Princess blood, at Mr. Adkin's sale for 170 gs. Thus in selecting sires Mr. Tracy has always gone on an in-and-in principle, though not too closely combining the Sylph tribe with an admixture of fresh blood either through the sire or the dam. The result was a most prolific race of cattle, of great excellence and singular uniformity. Although Sweetheart and Sweetheart the 3rd, and her sire too, were white, not another animal was white; indeed, they were all remarkably fine deep roans, or reds with a very little white; they had a sweet docile expression of countenance, with very small "snail" horns, frequently inclining different ways; neat shoulders falling well on to the ribs, which were deep and round like barrels, loins broad and well covered, but hind-quarters often short and thin, and very patchy. Still, there was the unmistakable likeness and fine rich quality of flesh all through the stock. Sweetheart 3rd was led in first, and, although so old, was almost a model of good form, and a heavy milker also. At Mr. Tracy's special request she was allowed to pass without competition; the second lot, Cleopatra 3rd, was dead, and then entered what many considered the finest cow in the herd—Sweetheart 5th, who, although ten years old and down calving, realized the enormous sum of 245 gs. She was put up at 50 gs. Mr. Thornton bid a hundred, then Mr. Foljambe and Mr. Hetherington, on the part of some Cambrians, opposed each other up to 240 gs., which was bidden by Mr. Foljambe, and instantly covered by Lord Danmore's five. The quality and sweet looks of this cow, with her fine form and rich pile of roan hair, was beautiful to see, and some foreigners present seemed never willing to come away from her. Her twin-sister, not nearly so good in her loin, nor so large, nor so handsome, still made 120 gs. Then came a deep massive cow of the Cleopatra tribe, which went into Lincolnshire, and she was followed by four daughters of the Baron. The youngest, the 11th, was the best, but had a swollen knee, and went lame. The eldest, a red, in-calf, was next best, and went cheap enough at 51 guineas. She was purchased, with two other heifers, by Mr. Thornton, for Mr. Chaloner, in Ireland, who bred the Baron. A succession of high prices followed, until two Sweethearts by Baron of Rathcool (21233) entered; although these animals were so closely related to the rest, they had none of their good looks, and sold accordingly.

Hebe, descended from the Surmise or Secret family, was of pure Bates blood, and consequently was bought by Mr. Leney for 260 guineas. Although a fine rich roan, and with good handling, she had neither the size nor the good shoulders of the Sweethearts; nor was her back covered so well with flesh. Sweetheart 19th, by Count Leinster out of the 5th, was by many thought the plum of the sale. There was great competition between Mr. Oliver, Mr. Foljambe, Mr. White of Australia, and Mr. Foster, of Killhow, who eventually got her

at 220 guineas. A pair of beautiful in-calf twin two-year-olds were also great favourites. Mr. White bid strongly for both these, and got the last, considered the better of the two, at 200 gs. A very fine red heifer, by Count Leinster, out of the 11th, a Baron cow, went to Mr. Foljambe at 160 gs. Hebe's daughter, a red yearling by Patrician, was a great favourite, and Sir Curtis Lampon, who bred her dam, secured her after some strong competition. One blackwood calf would have been better kept out of the sale, but it made 23 gs., and some of the younger ones sold well.

There was a great falling off in the bulls, the tribe being clearly far from a bull breeding family. Patrician, a fine headed bull, with rather strong upright horns and deep body, brought but a little over butcher's price; and the best young bull, a very nice roan yearling, Reginald, fetched but 65 gs. Hebe's bull calf, a red hairy little fellow of great promise, went for 52 gs., and concluded this extraordinary sale, the prices of which are subjoined. The company, however was not large, but composed of men, many of whom have hitherto been associated with Bates' stock, but who were evidently disposed not to let fine animals of good blood go without purchase, and we hail this excellent sale as a healthier state of things, a beginning of the end of that prejudice for a "favourite sort," and the demand that there is likely to be for fine-looking thorough-bred cattle of any strain.

COWS AND HEIFERS.

Sweetheart 5th, rich roan, calved Oct. 1, 1860, by Mameluke (13289), out of Sweetheart 3rd by Daybreak (11338).—Earl of Danmore, 245 gs.

SALES OF STOCK.

THE LATE MR. WILLIAM SHIPMAN'S AND MR. SNODIN'S SHORTHORNS.—These herds came to the hammer on the 11th inst., in the midst of a delightful rain. Although several of the pedigrees were ineligible for the Herd Book, yet good prices were obtained. Perseverance, a seven-year-old cow, sold for 41 gs. (Mr. W. Gentle, Bede.); Adeline, six years old, 42 gs. (Mr. W. Cox); Michaelmas Maid and Folly, both young cows, went (to Mr. Sutton, Derby) at 30 gs. each; Industry, a prize winner, fetched 70 gs. (Mr. W. Gentle); Melody, three years old, 60 gs. (Mr. G. Murray); Julia 10th, a yearling, 60 gs. went to the hon. H. Littleton, for Australia; Melodious, a calf, was bought for 36 gs., by Mr. J. H. Casswell, who also gave 70 gs. for Royalist (27370), the red three-year-old stock bull. The 39 cows and heifers averaged £27 6s., and the bulls, mostly calves, £23 12s. The combined herds realised a general average of £26 7s. 8d. Mr. John Thornton was the auctioneer.

MR. J. ANGELL JAMES' SHORTHORNS, AT BRIDGETOWN, STRATFORD-ON-AVON.—This herd was sold on Wednesday, May 18th, when a large company assembled. The cattle were of the Knightley and Charmer blood, and those of full pedigree had been bred from Mr. Adkins' Rosamond and Mr. Harris' Snowdrop. They were brought out in very nice condition, and the arrangements were everything that could be wished. After a luncheon in the barn, the company went to the ring-side, and paid the following as the chief prices: Strawberry, 8-years-old cow, 33 gs. (Mr. J. N. Norman); Rosemary, 8 years, 40 gs. (Mr. Cottrell Corbet); Rosalind, 6 years, 47 gs. (Mr. H. Moore); Spangle, 5 years, 35 gs. (Mr. Lett); Rosalie 2nd, 31 gs. (Mr. W. Strickland); Rosa, 3 years, 40 gs. (Rev. H. Beckwith); Sunshine, 3 years, 37 gs. (Mr. T. Harris); Sarah, 2 years old, 47 gs. (Mr. Jas. Webb); Sprightly, a yearling, 37 gs. (Mr. J. Baldwin); Rosebud, 12 months old, 35 gs. (Mr. Furlay Dun). The young stock were mostly after the white aged bull Lackey, who went to Mr. Harris at 31 gs. A large proportion of the animals were white. The entire herd of 46 head averaged £25 15s., and the 27 full pedigrees £28 2s. Mr. Thornton was the auctioneer.

THE LATE COUNTESS DE LA WARR'S SOUTHOWNS.—This flock, brought into the market out of season, and low in condition, realized nevertheless some good prices at Knole Park, Seven Oaks, on Friday, May 20. Some of the ewe tegs sold as high as 65s. each, and the ewes ranged from 50s. to 63s.

each. The sum total of the sale was about £1,500 for 590 sheep. Mr. Thornton was the auctioneer.

SALE OF STOCK TO GO ABROAD.—We stated a fortnight since that Mr. Booth had sold his prize cow, Patricia, for 1,000 guineas. Messrs. Walcott & Campbell, of New York, who are the buyers, also purchased Bride of the Vale for 1,000 gs., from Warlaby, and have now taken the heifer-calf, Minaret, as a companion for Patricia, at 250 gs. Col. Towneley's Baron Oxford's Beauty accompanies them, at 500 gs.; as also two heifers from Mr. Torr, of the Waterloo tribe, at 250 gs.; with Orange Gwynne and Goody Two Shoes, recently bought at the Biddenham and Osberton Sales, and Charming Rose from Stroxtan. An Ayrahire bull and a cow and a heifer, winners at the Glasgow meeting, go out with these Shorthorns, as well as some longwoolled sheep from Mr. Marshall, and Berkshire pigs from Mr. Bailey, of Swindon. They left the Thames on Tuesday last by the "Daniel Webster," a sailing vessel, and, with them, Mr. Thornton sent out two pure-bred young bulls from Capt. Aveling and Mr. Pawlett, and two in-calf heifers from Mr. Blundell and Mr. Gamble, as well as some longwoolled Cotswold and Southdown sheep from Mr. Bell, of Colorado.

EDINBURGH TOWN COUNCIL.

At a meeting of the Edinburgh Town Council, the CLERK submitted a report from the Lord Provost's Committee, recommending the Council to take no action with reference to (1) the Game Laws Abolition Bill, brought in by Mr. Taylor, and (2) the Poaching Prevention Act Repeal Bill.

MR. HOWDEN moved the adoption of the committee's recommendation, which was duly seconded.

MR. ROMANS moved, as an amendment, that the Council petition the House of Commons in favour of Mr. Taylor's bill. He held that every man who was a tenant of land—whether it was merely a "kail-yard" or a tract of ten thousand acres—if he paid a rent for it, should have a perfect right, without let or hindrance, to kill every wild animal that was on or above it. Anything short of that, he held, would not put an end to the immorality that arose out of the operation of the present Game-laws.

MR. WILSON seconded Mr. Romans' amendment. While admitting that much might be said in favour of the Game-laws, on the ground that there must be some pastime afforded to country gentlemen, he held that the operation of the Game-laws was the cause of many evils, and he believed that the country would be much the better of their being entirely abolished.

MR. WORMALD, in supporting the amendment, said he regarded Mr. Taylor's bill as being more in accordance with the popular wishes of the country than any that had ever yet been introduced into the House of Commons. All previous bills had been of the nature of a compromise; and though they might yet require to agree to a compromise on this as they had just done in regard to the famous Annuity-tax question, he thought their best course in the meantime would be to petition generally in favour of that bill.

MR. ROWATT said he would be in favour of a compromise that would exclude hares and rabbits from the game list. That was the only means by which he thought a settlement satisfactory to the members of the agricultural interest could be effected.

MR. MACKNIGHT supported the recommendation of the committee.

Baillie LEWIS held that it was unfair that the proprietors of land should have the power of diverting it so much from the great purpose which it should serve—that of producing food for the people. He agreed with Mr. Rowatt that the winged game should be separated from the hares and rabbits, which were the principal cause of destruction to the farmers' property. He thought to put hares and rabbits out of the game list would be the most practicable compromise at present, and one that would be most satisfactory to the agricultural community (Hear, hear).

MR. ROMANS then agreed to modify his amendment, leaving it as follows: "That the Council petition in favour of Mr. Taylor's bill so far as it applies to hares and rabbits."

On a division, the amendment was carried by a majority of 90 to 7.

THE GAME LAWS AND GAME BILLS.

At a special meeting of the Kincardineshire Farmers' Club, Mr. TAYLOR (Gushnie), the President, in the chair, said: I shall only make a few remarks, and take the Bills in the order they have been introduced and ordered by the House of Commons to be printed. Mr. Loch's bears date 10th February, and would confer the inalienable right on the tenant to protect his crops from destruction by hares and rabbits, without which any game reform would be of no value to the farmer. I think the 4th clause in Mr. Loch's Bill, conferring this right, might be better expressed, as it is objectionable that a contract or covenant should be entered into with the knowledge that it is illegal and may be broken. It also provides for compensation for damage done to crops by game coming from neighbouring preserves, and for the abolition of cumulative penalties—for the transfer of all game cases from justices to the sheriffs. These provisions will commend themselves to your sense of justice and the demands of necessity. Mr. Taylor and Mr. McCombie's Bill, printed by order 16th March, is a very short and simple one, and provides for the total abolition of the Game Laws, on and after 14th February 1871. I know that many of you have come slowly to the conclusion that total repeal is the only solution of the difficulty; but although the Game Laws we abolished to-morrow, the farmers would have no protection against the reservation of hares and rabbits by the landlord. And our legislators make no secret that, if the Game Laws were abolished, the abolition would be accompanied by a stringent Trespass Act, which would shut up Scotland not from the poacher, but from the mass of the people. Perhaps the most important, because backed by the might and influence of Government, is the Lord Advocate's Bill, printed 11th April. That Bill has been received with great favour generally at all the county meetings over Scotland, except at our own in Kincardineshire, where a disapproval of it was carried by nearly three to one. But just in proportion to its welcome acceptance by the landowners has been its all but unanimous and emphatic condemnation by the tenantry. Its provisions appear fair and plausible to the landowner, or the inexperienced reader, but would be utterly ineffective in giving protection. To assimilate the Game Laws of Scotland to those of England and call that reform is a sham, and discreditable to Government; and I warn our rulers that, if they attempt to pass such a Bill, they will endanger the Liberal interest in half the counties of Scotland. The battle was fought and won at last election on the questions of game and hypothee, in the faith that a Liberal Government would redeem the pledges given by its members and supporters on the hustings; but, so far as the Government Bill is concerned, the farmers of Scotland are in the meantime doomed to bitter disappointment; but there is one good it has done—it has for once produced union among them, for it has been received from one end of Scotland to the other with one universal burst of indignation and disapproval. The other remaining Bill—that introduced by Mr. Hardcastle and Sir Wilfred Lawson, and printed on 2nd May, the last and worst of the series—adds rabbits and foxes to the game list, makes game property, and the party intermeddling with it a thief and felon, subject to imprisonment with hard labour, or to a fine of £20. At the banquet to Mr. Parker at Perth, I heard Mr. Hardcastle say he had nothing to say personally against Sir William Stirling Maxwell, "but his politics I abhor." I would say the same of his Game Bill, that "I abhor" it. These provisions are so repugnant to common sense, and in the opposite direction of the reform that is required and demanded, that I cannot believe the House of Commons—or, at all events, its leaders—will seriously entertain them; but, be that as it may, our duty to-day is to give a clear expression of opinion as to what we approve and what we disapprove of. My late worthy proprietor, Captain Burnett of Monboddie, had inserted in some of his leases a game clause, which is worthy of imitation, and I shall read it to you—"You are to protect the woods, and keep down rabbits and all other vermin which destroy the crops." Mr. Taylor here read the resolutions, and it was agreed that the meeting consider them *seriatim*.

The first resolution was:

"That the Game Laws as they at present exist are iniquitous in principle, tyrannical in administration, and in all parts of the country lead to increase of local taxation, impoverishment

of tenant-farmers, demoralisation of the people, and debasement of the aristocracy, landowners, and game tenants."

Mr. GREIG (Harristown) said he quite agreed with this resolution, and moved its adoption.

Mr. ALEXANDER (Bent) seconded, and the resolution was agreed to.

The second resolution was:

"That the Bill introduced into the House of Commons by the Lord Advocate will not mitigate any of those evils, but will greatly add to the already tremendous power of the landlord by increased inducement to litigation in the higher Courts; and the owner being the richer party, such litigation, without limit except the Court of last resort, would often be more ruinous to the tenant claiming compensation than the original loss; therefore, this meeting is of opinion that the Bill is altogether unworthy of a Liberal Government, and ought to be opposed by every legitimate means."

Mr. GREIG said he lately came in contact with a good many English farmers, and had had conversations with them on the Game Laws, and he found that the abuse existed as much there as in Scotland. An assimilation of the laws of the two countries would not give relief.

Mr. MITCHELL (Burnton) moved, and Mr. KINNAR (Milton or Mathers) seconded, the adoption of the resolution, which was unanimously agreed to.

The terms of the third resolution were:

"That tenant-farmers ought to have the inalienable right of defending their crops from destruction by wild animals, whether known by the designation of game or by any other term; and such inalienable right would be no greater interference with the liberty of contract than contained in the Irish Land Bill now under consideration of Parliament, or, with the rights of private property than under the Cattle Diseases Act, which authorizes the slaughter of the farmer's stock for the public good."

The resolution was agreed to.

The fourth was in the following terms:

"The Game Laws are a fertile source of crime, pauperism, and of increase of local taxation. By a Parliamentary return for 1869 it appears there were 10,346 convictions under these laws in England and Wales alone, which must have been the means of reducing at least 20,000 individuals to pauperism, to be supported at the public expense; and in a previous period of ten years there were 42 convictions for homicide and murder, representing 68 lives lost: therefore, this meeting is of opinion that these laws ought to be made less sanguinary, less oppressive, and more in accordance with the spirit of the age."

Mr. ALEXANDER thought the last clause should be left out, and the words "The Game Laws ought to be abolished" inserted.

The CHAIRMAN did not agree with this proposal, as he did not go the length of total abolition.

The vote was then taken for Mr. Alexander's proposal of total abolition, as against the Chairman's resolution for modification, when the amendment was lost by two votes—the numbers being 11 and 13.

The fifth resolution was in the following terms:

"That a Liberal Government, fully aware of the deplorable amount of pauperism, homicide, and murder caused by the Game Laws in England and Wales, and also of the enormous destruction and check to production of the food of the people, the impoverishment and ruin of tenant farmers, from the ravages of game, ought not to have cast contempt on the just complaints of the tenant farmers and people of Scotland by proposing to assimilate the Game Laws of this country to those of England."

Mr. MIDDLETON (Bainakettle) proposed that the word "Liberal" be deleted (laughter).

The CHAIRMAN said he wanted to make a strong condemnation of the Government.

Mr. MIDDLETON.—Just strike out that one word (laughter).

Mr. GREIG.—Put it in Italics (laughter).

The resolution was agreed to as proposed.

The sixth resolution was as follows:

"That Mr. Loch's Bill would confer on tenant farmers the inalienable right of defending their crops from destruction by hares and rabbits, provides for compensation for injury done to crops by vermin coming from neighbouring estates, for

transfer of all Game Law cases from the Justices to Sheriff Courts, for abolition of cumulative penalties for the same offence, and in so far this meeting approves of the Bill, and resolves to petition in its favour; but it does not give protection to the Highland farmer against the vast herds of deer and packs of grouse which in late seasons come down from the higher grounds and devour their crops, and in that, and other respects, might be amended."

Mr. ALEXANDER decidedly objected to this resolution, and suggested that consideration of it be delayed till the eighth resolution was read.

This was agreed to.

The seventh resolution, which was agreed to, was in the following terms:

"That were farmers enabled to protect their crops from injury by game, the Land Laws amended, the 'false and evil Law' of Hypothec and the oppressive Law of Distraint abolished, so as to render it safe for farmers and those who deal with them to lend their capital more liberally to landowners in the cultivation of their estates, there is good reason to believe that in a few years, instead of the 11 millions quarters of grain now grown in the United Kingdom, the 23 millions required annually for consumption could easily be produced at home."

The eighth resolution was thereafter read, and was as follows:

"That seeing almost all landowners are preparing to set legislation at defiance, by the insertion of stringent clauses, new leases for reservation, including rabbits, notwithstanding any change in the law which may take place, the total abolition of the Game Laws, as proposed by Mr. Taylor, Mr. Jacob Bright, and Mr. McCombie's Bill, would fail to give relief from the evils complained of, unless a provision be introduced rendering it illegal for parties to enter into covenants for the reservation of ground game."

Mr. ALEXANDER proposed the following amendment, which, he said, was more consistent with the general tenor of all the resolutions put together:

"That, as no satisfactory amendment of the Game Laws has hitherto been devised, this meeting approve of the Bill introduced by Mr. P. Taylor, Mr. Jacob Bright, and Mr. McCombie for their total repeal; but, seeing that certain landowners are already preparing to set legislation at defiance by insertion of stringent clauses in new leases for reservation of game, including rabbits, notwithstanding any change in the law which may take place, this meeting instruct their Committee to correspond with Mr. Taylor to have such clauses made illegal by his Bill."

Mr. DUNN seconded.

Mr. KINNAR moved that it remain.

Mr. GREIG seconded.

On a division, six voted for and twelve against striking out the resolution.

The resolution as proposed was therefore agreed to.

The eighth resolution was also agreed to.

The ninth resolution was as follows:

"That the Bill introduced into Parliament by Mr. Hardcastle and Mr. Wilfred Lawson is both tyrannical and jesuitical. By making foxes game the highland farmer defending his flock would be branded as a felon; it declares that no one shall be criminally prosecuted for killing game, and in a subsequent clause makes game to be private property, and all who intermeddle with it thieves and felons. Any child within the kingdom who may put its hand into a bird's nest to break or take an egg, or school boy who may catch a wild rabbit or kill a tame one of his own, would be liable to six months' imprisonment with hard labour, or to a fine of £20. Therefore, this meeting look upon the Bill as brutalising, and 'abhor' it."

Mr. GREIG thought the meeting should agree to say that the Bill was too ludicrous to be worthy of consideration.

Mr. DUNN proposed that the meeting petition against Mr. Hardcastle's Bill altogether, and said he would not send out a resolution to the public in the form proposed.

The meeting agreed to strike out the words "brutalizing" and "abhor," and to add "the meeting consider the Bill so absurd as to be unworthy consideration."

The Chairman was authorised to sign a petition in terms of the resolutions adopted; and, after he had been thanked for presiding, the proceedings terminated.

THE GAME LAWS. TESTIMONIAL TO LORD LEIGH.

The following address has been presented:—

"To the Right Honourable the Lord Leigh.

"We, the undersigned tenants of your Lordship's Stoneleigh Estate, take this opportunity of tendering our grateful recognition of your Lordship's liberality in granting to us the privilege of killing hares on our respective farms—a privilege the more valued because it has been unsolicited. Ever ready to perform all the duties of a landlord, your Lordship has again been foremost in discouraging the preservation of game to the injury of the tenant. The example which your Lordship has set will, we earnestly hope, be extensively followed by other landowners, and will remove a frequent source of irritation and discontent. We fully appreciate your Lordship's kind consideration, and wishing you many years of health and happiness, we subscribe ourselves your Lordship's obedient servants,

William Campbell
William T. Wakefield
Jos. W. Jenaway
Edward Swinnerton
John Lee
Thomas Hands
Thomas Harris
William Norman
Joseph Jaggard
Richard Robbins
Thomas L. Umbers
Samuel L. Simpson
A. M. Harborne

William Jones
Geo. Darlinson
James Dormer
James Harris
John Burbery
William Jaggard
John Hiorns
Henry Judd
Edward Judd
William Sammons
Thomas Jones

TENANT RIGHT.

We last week had the pleasure of recording that our highly respected neighbour, the Lord Lieutenant of the county (Lord Leigh), had practically abolished the Game Laws on his estates, by allowing his tenants to kill the hares and rabbits on their respective holdings. We have now to chronicle another instance of discernment of the signs of the times on the part of his Lordship, which is worthy of imitation throughout the land. We believe the following circular has just been distributed among the tenantry on Lord Leigh's estates by Mr. Geo. Jones, his Lordship's steward:—

Estate Office,
Stoneleigh Abbey, Kenilworth.

27th April, 1870.

Dear sir,—I am directed by Lord Leigh to draw your attention to the fact that should you, from any cause whatever, quit the farm you now hold under him, every unexhausted improvement, made at your expense, on the farm will be paid to you—the value to be ascertained by two persons, one chosen by you and one by his Lordship, they appointing an umpire, whose decision (in case they differ) shall be final and conclusive.

Of course you will see that before you commence improvements they must be sanctioned by Lord Leigh (through the agent), to whom applications, stating the nature, cost, situation, &c., of the work (with plans when necessary) must be made. When sanctioned, a written authority will be given by the agent. This must be carefully preserved; it will evidence your claim and prove the date of permission.

So few changes of tenants have taken place on the estates (except from deaths, when relations have succeeded) that hardly a case has arisen (indeed I do not know one) during his Lordship's possession of the estates that this dealing with a just claim could be recognized.

Your very obedient servant,
GEORGE JONES.

—*Coventry Standard.*

DEATH OF STOCKWELL.—The *Sporting Gazette* announces the death of the celebrated racing sire Stockwell, whose success at the stud obtained for him the title of "The Emperor of Stallions." The cause of death was inflammation of the inner coating of the intestines. With a view of having his skeleton set up hereafter, Stockwell has been buried in lime in Hooton Park.

BATH AND WEST OF ENGLAND SOCIETY AND SOUTHERN COUNTIES ASSOCIATION.

A meeting of the Council was held on Tuesday, the 26th April, at the White Lion, Bristol, E. S. Drewe, Esq., Vice-President in the chair. There were also present: The Hon. and Rev. S. Best, Colonel R. Brant, Colonel H. A. F. Luttrell, Major R. Trood, Rev. T. Phillpotts, Rev. A. C. T. yane, Messrs. R. Bembridge, C. Bush, R. H. Bush, Thomas Danger, J. Daw, C. Edwards, M. Farrant, H. Fookes, John Gray, Jonathan Gray, J. D. Hancock, J. H. Holley, J. H. Kennaway, M.P., J. Webb King, Meade King, J. E. Knollys, J. Lush, H. St. John Maule, H. Middleton, J. C. Moore Stevens, R. Stratton, W. Thompson, H. Williams, W. Wippell, H. Spackman (Official Superintendent), W. Smith (Official Accountant), and J. Goodwin (Secretary and Editor).

It was reported that the entries of Stock and Implements for the Taunton meeting were numerous, ranking next to Bristol and Southampton, and exceeding those at any other meeting of the Society, notwithstanding the absence of local prizes. The annual meeting of members was announced for 12 o'clock on the Wednesday in the show week.

Messrs. Gibbs and Hine, the Society's contractors, were authorised to supply refreshments in the implement trial fields, under the direction of the stewards.

It was ordered that for the future only one number of the Society's Journal be published annually, but that the reports of the Taunton meeting be brought out in a separate form as soon as possible after the Show.

The Earl of Cork was nominated President of the Society for the year 1870-1.

Mr. E. B. Willems, M.P., was nominated a vice-president of the Society.

The new members elected were: W. Brock, Temple Meads, Bristol; Chilcott and Gardiner, 5 and 6, Nelson-street, Bristol; H. Denton, St. Peter's Works, Wolverhampton; J. Dredge, Holt Farm, Pilton, Shepton Mallet; A. R. C. Drewe, The Grange, Honiton; G. Garas, Churchill Heath, Chipping Norton; C. Hodge, Burleigh, Devonport; J. C. King, Exeter; Rev. G. Lamb, Moss Cottage, St. Austell; E. Legg, Coombe Down, Beaminster; A. Malet, Pyrland Hall, Taunton; A. Mason, Dorchester; J. Pope, Pennsylvania-road, Exeter; W. E. Surtees, Tainfield, Taunton; C. B. Stiby, Tylfield, Pewsey; R. Sawanick, College Farm, Cirencester; Wallis and Stevens, Basingstoke; R. Woodman, Southeast, Lewes, Sussex.

THE BATH AND WEST OF ENGLAND SOCIETY.—

It will be seen that at the last meeting of the Council it was very judiciously determined to revert to the plan of issuing only one number of the Society's Journal during the year. This will, no doubt, enable the Editor to bring the work again up to its previous worth. Reports of the Shows are, however, to be published in a separate form immediately after the Meetings.

THE REPEAL OF THE MALT TAX.

PROPOSAL FOR A NATIONAL ASSOCIATION.

Mr. Joshua Fielden, M.P., unable from Parliamentary duty to take part in the agitation commenced by the Yorkshire Association, has addressed the president, Mr. E. S. Cayley, of Wydale Hall, on the subject. Mr. Fielden says, "If the farmers and landed gentry would take this matter up and form a National Association for the repeal of the Malt Tax, to be composed of delegates from every Chamber of Agriculture in the country, I am sanguine in my belief that the Malt Tax would soon be repealed, and a licence to brew substituted. The gradual reduction of the duty would then be a matter which we may fairly look forward to. If you will look through the recent debate in the House of Commons you will find it was admitted that the tax is 70 per cent. on the price of barley in the first instance, and even Mr. Gladstone himself dared not contradict my statement that the consumer of public-house beer pays a tax of at least 140 per cent. The subject is now, therefore, in a very different state to what it was when we had our Anti-Malt-tax Association in existence. The recent reduction in the sugar duties makes the injustice of the Malt

Tax still more apparent. It cannot too often be repeated that sugar is now taxed about 25 per cent., tea 25 per cent., champagne 5 per cent., while malt is taxed 70 per cent., and in such a way that before the beverage, which malt is made into, reaches the consumer, he has to pay a tax of 140 per cent. at least, and often much more. The tax, too, is taken off when malt or beer is exported, so that the foreigner gets malt and beer duty free, while the Englishman has to pay this heavy duty on a product of his native land. Can anything be more monstrous? I need not, I am sure, tell you how glad I shall be to take part in any national movement for the repeal of this unjust and inquisitorial tax." At Malton, on Monday, the executive of the Yorkshire Anti-Malt-tax Association agreed upon the following form of petition to Parliament:

To the Honourable the Commons of Great Britain and Ireland in Parliament assembled.

The petition of the undersigned inhabitants of ———, in the county of ———, humbly sheweth,

That your petitioners grow barley and other grain in the said county. That they have heard with amazement that it is proposed to reduce the duty on sugar, and not to touch the duty on malt. That the value of malt depends on the sugar it will produce. That one cwt. of sugar, a foreign production, which is equal for brewing purposes to one quarter of malt, is to be taxed 5s. That one quarter of malt is to be taxed 21s. 8d. That this is a protective duty of 16s. 8d. in favour of the foreign article as against the British production. That champagne, a foreign production, and the rich man's drink, is taxed at 5 per cent., and that beer, a home production, and the drink of the people, is taxed at least 70 per cent. Your petitioners therefore pray your honourable House to repeal or reduce the duty on malt, the home-grown article.

And your petitioners will ever pray, &c.

A public meeting was held at Malton on Saturday afternoon on this subject.

THE DUMBARTONSHIRE AGRICULTURAL SOCIETY.

The annual show of the Dumbartonshire Agricultural Society was held at East Bridge-end, Dumbarton. The day was fine, although a rather chilly wind blew from the west. Dumbartonshire has for many years been notable for the excellence of the Ayrshires reared on the southern slopes of the county; and these were the principal attraction on Tuesday. There were upwards of a dozen classes for the breed. The competition was lively, and the animals shown were of excellent quality. The cows in milk were particularly good, as were the aged bulls. The first and second prizes in the class for the best cow in milk, were secured by Mr. Martin, Auchenfroe, with the pair of animals which were awarded similar honours at the Glasgow Show last week. The whole competing were a more than average lot; but some judges thought that Mr. Martin's second cow had a decidedly Highland look, especially about the horns. In the next class, for three-year-old cows in calf, or near calving, the premium for the three best cows in milk was awarded to Mr. Martin. The two-year-old queys in milk or calf were below the average. The first prize was awarded to Messrs. Turnbull, Bonhill Place. There were six entries for aged bulls. Mr. McFarlane, Torr, was placed first with a brown-and-white bull of great substance. The second prize was awarded to Mr. Leckie, Gooseholm; while the third honours went to Mrs. Mather, Crossleith. In the two-year-old bulls Mr. Snodgrass secured the first award. Mr. Howie, Middleton, stood second, with a brown-and-white bull. The third prize was won by Mr. McLachan with a small, lively, dark-brown bull of great symmetry. The yearling bulls were a very good class, as were also the two-year-old heifers. The show of horses was capital. The four brood mares competing for first honours would have held their places at larger shows. The three prizes given were accorded to Mr. Yuille, of Darleith. The blackfaced sheep were a numerous show, but they were lean in condition. There were very few Leicesters, the yearling tup which was awarded the prize belonging to Mr. P. Lennox, Kirkton. The judges were—Cattle and Horses: J. McAdam, Blairrow, Drymen; G. Pendar, Dumbreck, Kilsyth; J. Pollock, Raws, Kilmarnock. Sheep: B. Begg, Blarnyle, Luss; and A. Jardine, Fintry.

THE HIGHLAND AND AGRICULTURAL SOCIETY.

The monthly meeting of the directors of this Society was held in Edinburgh. Mr. Russell (Pilmuir), occupied the chair. The half-yearly general meeting of the Society was fixed for Wednesday June 22nd.

Mr. F. N. Menzies was instructed to visit Dumfries, with a view to making arrangements for the erection of the showyard; to secure the accommodation required for the deputation of directors, judges, &c.; and to ascertain whether suitable parties can be found in the district to undertake the refreshment rooms.

The Committee of Superintendence was appointed.

Mr. MENZIES reported as to the show of 1871, that he had attended the county meeting at Perth on Saturday, when the subject of the auxiliary subscription was brought forward, and a voluntary assessment proposed. All assessments in the county being laid on at the Michaelmas meeting, the matter was delayed. He also reported a letter from Mr. Young of Cleish, convener of the county of Kinross, to the same effect; and stated that he understood that the counties of Forfar and Fife would also give the Society the usual support.

The report of the annual examination of the students attending the Edinburgh Veterinary College was submitted. Out of thirty-six candidates who presented themselves for the Society's veterinary diploma, thirty-one were successful. The usual silver medals given by the Society were awarded to those students who passed the best examinations in the various departments.

The reports lodged in competition for premiums offered for the reclamation of waste land by tillage, and on the improvement of natural pasture without tillage, were remitted to a committee to read and report on their merits before the general meeting in June.

A letter was read from Mr. G. St. Clair Stevenson, the secretary acting consul for France, stating the intention of his Government of holding an international show at Lille (departement du Nord), from the 18th to the 26th of June, 1870. Mr. Stevenson forwards some copies of the regulations for admission to the show, which comprise—1st, agricultural instruments, machinery; 2nd, agricultural produce and matters applied to the culture; 3rd, horses.

Mr. MENZIES laid before the meeting a pamphlet, entitled "Suggestions for Increasing the Supply of Spring Water at Malta, and Improving its Climate," by David Milne Home, LL.D., chairman of the Council of the Scottish Meteorological Society.

THE GAME LAWS.

At the adjourned discussion of the East Suffolk Chamber of Agriculture, Mr. M. Biddell in the chair.

Mr. Everitt re-opened the proceedings in a lengthy speech, and he was followed by Messrs. W. Kersey, T. Hawkins, R. Haward, N. Garrett, and others.

The CHAIRMAN then proceeded to take a show of hands on the various resolutions. The first was No. 1 of Mr. Garrett's:

"That the present game laws are injurious to the best interests of landlords, tenant-farmers, and the country at large; and that their influence is demoralizing to all classes."

To this Mr. Deck moved an amendment—

"That the over-preservation of game is injurious to the best interests of the landlords, tenant-farmers, and country at large."

On a show of hands the amendment was carried unanimously.

Mr. Garrett's second resolution was—

"That the game laws add greatly to the heavy rates, the payment of which is yearly becoming more irksome and distasteful to the whole community, and to the judicious reduction of which each government in its turn professes to accord its most hearty approbation."

To this Mr. Deck's amendment was—

"That all lands and hereditaments should be assessed at their proper lettable value."

The amendment was carried unanimously.

The next resolution of Mr. Garrett's was—

"That hares and rabbits ought to be excluded from the operations of the game laws; that their preservation, being incompatible with good farming, is contrary to the public good, and that, therefore, all contracts, having for their object the preservation of hares and rabbits, ought to be declared illegal."

The resolution was lost by a narrow majority.

Mr. Garrett withdrew his fourth resolution, and his fifth, which ran thus—"That this Chamber of Agriculture is unanimous in hoping that the hon. members for East Suffolk will use their influence both in the House of Commons and out of it for the thorough investigation and for the reform of these laws," was carried.

Mr. Everett's motion, "That this chamber desires to see game efficiently protected from poachers, and as far as practicable by the same means as are used for the protection of ordinary property," which was seconded by Mr. Hawkins, was carried, as was Mr. Everett's further motion, "That in all cases where the tenant cedes the right to game to his landlord he should be compensated—otherwise than by rent—for all injuries which the excessive preservation of game may cause."

ENGLISH TENANT RIGHT.—The paper on "English Tenant," which is given in another page, was received by the Farmers' Club on Monday evening with much applause. Mr. Corbet is familiar with the subject in all its local variety of details, and did well to select the Lincolnshire system as a practical illustration of the question.—*The Gardener's Chronicle and Agricultural Gazette*, May 7. The introduction of the Irish Land Bill has drawn more general attention to the rights of tenants and the duties of landlords in England than the subject has hitherto received; and the paper lately read by the Secretary of the Central Farmers' Club before that Society has embodied what seems to be the fair view of this vexed question.—*The Field*, May 7.

A SUGGESTIVE FACT.—It will be seen from our report that at the meeting of the Farmers' Club Mr. Leamon attempted to make an attack on this Journal, when he was at once stopped by the Chairman. A distinguished Norfolk agriculturist has recently forwarded to us a circular letter addressed to him, asking support for another agricultural journal, so that "fuller reports may be given," and so forth. This circular is signed Robert Leamon, who in a postscript would be much obliged by your "forwarding me your name as a subscriber." Is this the same Mr. Leamon who was stopped by the Chairman at the Farmers' Club on Monday?—*Mark Lane Express*.

ANOTHER SIGNIFICANT FACT.—At the last monthly meeting of the members of the North of England Chamber of Agriculture, at Newcastle-on-Tyne, Mr. Bell, of Hedley Hall, in the chair, Mr. Lawson, of Longhirst, moved that "The mixed Council of the Central Chamber might now be beneficially transformed into an Association, constituted solely of delegated members from the Provincial Chambers;" and this motion was carried unanimously. *The Sussex Express*, in reporting a meeting of the West Kent Chamber, "thinks it right to state in reference to the Central Chamber, that gentlemen subscribing a guinea can attend and vote, and are thus in a position to swamp those who represent the tenant-farmers elected by the country Chambers."

DEATH OF MR. THOMAS TWITCHELL, OF WILLINGTON.—It is with regret we announce that a well-known agriculturist, Mr. Thomas Twitchell, of Willington, Bedfordshire, died on Friday, April 25. Mr. Twitchell was in the prime of life, about 48 years of age; he had been in his usual health until a fortnight ago, when he was seized with apoplexy, and never spoke afterwards. The deceased gentleman was a member of the Council of the Smithfield Club, at the shows of which he had often acted as a judge. He learned farming under that eminent agriculturist, the late Samuel Bennett, of Bickering's Park, with whom he lived many years, and from whom he acquired a taste for well-bred stock, particularly Leicester sheep, of which breed he was for many years the most successful exhibitor at the Smithfield Club shows. Mr. Twitchell was regarded by his brother tenants upon the Duke of Bedford's estate as one of the very best farmers in that highly cultivated county; in the management of sheep he has for 25 years past been looked upon as an authority. The deceased was a director of Bedfordshire Middle-class School, founded for the education of the sons of farmers; and last year the Bedfordshire Agricultural Society did him the honour of appointing him its vice-president. Being a public-spirited, wealthy, and liberal man, he was held in high respect, and his premature death will be universally regretted. The deceased has left a widow, but no family.

CALENDAR OF AGRICULTURE.

This month introduces the general sowing of turnips over the kingdom, except in the eastern counties, where a later season is less exposed to the fly, and less liable to the mildew of the plants. Sow seeds till the 12th of the month, then use the green rounds, or any semi-round varieties, and finish with globes and the red tankards. These and similar sorts will afford a succession of quality for use.

The land having been thoroughly pulverized by repeated workings by the plough, the harrow, and the roll, and all weeds and stones removed by hand-picking, a straight furrow is drawn on the level surface by the common plough provided with a main tree of five feet in length to allow the horses to walk widely apart. The plough returns in the same furrow, throwing a width in the opposite direction, the horses walking one on each side of the first furrow at the extremity of the five feet main tree. The plough moves in succession up and down the sides of the last furrows at the distance of 28 inches, making a drill with each passage with a deep furrow of soil, and thrown widely as possible. This method forms a drill by a single furrow of the plough on the turnip lands of the finest alluvium; in other cases, of more harsh soils, that are cloddy and crumbling, the drills are made by a "boat" of the plough, or by the implement passing twice in the same furrow and thus moving the land into a degree of pulverization, and raising a greater freshness. The farm-yard dung in a semi-putrescent condition, from a heap in the corner of the field, is placed in heaps in the middle hollow of three drills, and is immediately spread along the hollows of the drills by handforks, and must cover the bottoms evenly with dung without any bare spots left uncovered. One person manages each drill in spreading the dung, which is supplied to afford a constancy of work. The time will soon arrive when the dung will be brought from the homestead by light carriages on moveable railways, and in a fresh condition of solid and urinary pieces mixed with the litter of straws cut short by the steam thrashing machinery. Ploughs in succession split the ridglets of land to cover the dung, the right hand horse walking in the last made hollow, and the left hand animal on the top of the drill next the one to be split, of which the largest half is thrown over the dung on the right hand. The plough returns, moving in the central hole, one of two drills, throwing a furrow of fresh soil over the dung from the opposite side of the first split. The dung being covered by two furrows of fresh soil from opposite sides, deeply done as possible, the turnip seeds are sown as the work is done by double drill machine, and the drills rolled by a weight of 5 or 6 cwt. of cast-iron, according as the season is dry or moist with showers. The large arrangement of two ploughs opening the drills with one furrow, five or six one-horse carts bringing forward the dung—a man pulling the dung from the carts into heaps—three persons spreading three drills of dung with a superintendent, three ploughs covering the dung with two furrows over a drill, with a sowing machine drawn by a horse and guided by a man, will finish nine or ten acres in a day of ten hours, provided the arrangement be duly combined and upheld in all its parts. The system can be modified and reduced for any extent of land, when the performance will be proportionally more lax and reduced than in the combined bodies of execution.

Another mode of sowing turnips in drills employs a double mould-board plough with a two-winged share,

which opens and covers a drill with one furrow passing up and down on one side, and splitting the ridglet over the dung in half to each side. The point of the two-winged share is unable to penetrate any hardness of ground, slides along the under stratum as on flagstones, and in making the drills the mould-boards push together the surface of the dry and scorched alluvium from the operations of working, in which the seeds do not readily vegetate. The narrow-pointed share of the common plough will penetrate to any depth, and raises fresh soil in every movement of forming the drills, and in covering the dung with two-furrows, though sometimes done with one in cases of very fine lands in moist seasons. This advantage gives the superiority to the common plough in penetrating the ground and raising a fresh tilth, in which the seeds will vegetate over the dung. The value is inestimable of moisture and freshness for the growth of young turnips.

These two modes of sowing turnips have been contrived and very steadily practised on the fine turnip soils of North Britain, which are wholly composed of fresh-water alluvium over the primitive and secondary rocks with interruptions of the igneous formations. The intervening beds are all of the fresh-water kinds, in clays and gravels. These lands occupy the whole of Scotland, with about one-third part of England, forming a most favourable cultivation of the turnip, along with a climate of which the peculiar frigidity permits the formation of heavy dews, and where the hills and mountains attract the clouds for the discharge of frequent and abundant rains. In these countries the climate and alluvial soils permit the growth of turnips in a very high degree, and exhibit the cultivation of the plant in the largest extent of mixed farming.

Southward from the Humber and the Mersey an entirely different constitution begins, both of soil and climate; the marine formations of clays and sands commence the formation of the surface ground, and the climate gradually changes into a dry aridity rather than of violent heats, and forming by its continuance a heavy obstacle to the cultivation of turnips along with soils of clays, sands, and chalks too nearly allied to, and not far enough removed from, the parent sterility of the marine constitution.

Under these circumstances, the twice drilling of the land in the driest time of the year exposes the soil too much to evaporation, or the escape of moisture, and accordingly it is more advantageous to sow the turnips on the flat ground that has been wrought into the usual pulverization, dunged over the surface in broadcast spreading, and ploughed under with one furrow into convenient breadths of ground. The straws of litter having been cut into short lengths by the steam-thrashing machinery, as is often recommended, will place the farm-yard dung in a condition that will very much facilitate the covering in the land and prevent the catching of any straw by the coulters of the sowing machine. The land levelled by a light harrowing, the seeds are sown by a machine with two coulters, which penetrate the ground into ruts to receive any auxiliary manures along with the seeds. A bush-harrowing, and a rolling in dry seasons finishes the process. The common corn drill will answer the purpose, by using the coulters of the proper width.

The sowing of turnips in rows on the flat ground or in broadcast better secures the moisture than by drilling,

and very especially in the case of cloddy, crumbling soils of arid viscous clays. With the scorching sands of the southern counties, a very strong objection is found in the want of the convenience of destroying the weeds and fallowing the land in the intervals without damage to the young plants. The horse-hoe wants the freedom for its work, by going deeply into the ground, the earth is thrown over the plants, and in the wet seasons of a profusion of weeds the accumulation of rubbish becomes higher in the intervals than the growing plants, causing much damage and inconvenience, and if the cultivation be wholly confined to the light operations of the hand-hoe the process will be most imperfect and wanting in effect. In hollow intervals of the ridglet system the loose and the weeds are fallowed wholly apart from the young plants, causing no disturbance, and forming a very chief part of the benefit from the turnip crop.

Where auxiliary or artificial manures, or bones and guano, with mixtures of mechanical composition are used singly to raise a crop of turnips, it may be suggested to form drills by a single furrow of the common plough 28 inches apart, and deeply and widely done. The manure and seeds in mixture are deposited by the coulters of double drill machine, splitting the drills deeply into ruts, which are closed and pressed by roll into a level surface as before being raised into ridglets. In this way the turnips will grow on the flat ground, and derive the benefit of a fresh tilth raised by moving the ground in which the seeds will germinate and repose.

The retention of the winter moisture in the land for the use of the turnip season is the grand consideration of turnip farming—to obtain a crop of vegetables so truly valuable, not only in itself as food for animals and the produce of dung, but for the benefits arising from its growth by the tap root piercing and dividing the ground, by the leaves shading the ground to retain moisture and prevent waste, and by the exudations from the fleshy bulbous root.

Plough with a shallow furrow the parched and burned lands on which the ashes have been spread, harrow the surface into a fine tilth, sow the turnip seed by hand in broadcast, about the end of the month, and cover by a light harrowing, and with a rolling on rough grounds. Deep and loamy lands are wrought into pulverization by the common processes of plough and harrow, and formed into drills and sown with seeds. Clay lands are sown with one furrow of ploughing. Plough the intervals of the drills, horse and hand-hoe potatoes, beet, carrots, and parsnips. Plough potatoes deeply, especially on stiff soils, with the miniature plough drawn by one horse, the best scarifier yet found.

Shear sheep and mark by distinctive signs the different ages and condition of the animals. Wean the lambs of the year, and place them on the best pastures, and be-

yond the reach of the ewes. Put mares to the stallions regularly.

Cut and destroy all weeds on pastures; pull any tall weeds among grain crops, and destroy all weeds on the sides of roads, ditches, and hedges. Many seeds are winged, and are carried by the wind to a distance, and propagate very rapidly.

Continue the feeding in the yards of horses and cows with clovers and vetches, in ample quantity, with a sufficient littering of wheat straw, and convey to the tank any excess of moisture. Manure equal to the dung of winter can be made throughout the summer by forming the bottoms of the yards into a shallow basin, and giving the animals an abundant supply of green meat, with frequent littering of short straws, cut as has been recommended, thinly and regularly over the area in alternation with the solid faeces, and the surface of the yard kept level with mixtures of the wet and dry materials in a regular condition.

In the last half of the month the meadows of natural grasses will be mown for hay, and are best cut when the plants are in full bloom, as the saccharine juice is at that time most abundant in the herbage. Ted the grass by spreading the swathes quickly behind the mowers, each of which will require six hands for making the hay. Place the grass in small cocks at night, spread it out thinly in the morning, cock and spread it again during two or three sunny days, and carry it to the rick at the homestead. In gloomy weather more days will be required. Place the dried herbage lightly on the rick to be consolidated by its own weight by daily additions from the field, and if rain threatens a tarpaulin cloth can be raised on posts to slope to the sides, and raised above the rick to escape the gaseous sweating of the herbage. When the round rick or oblong stack is finished, the top and sides can be pulled and dressed into any shape that is desired.

In early localities the cutting for hay of artificial grasses will commence in the end of the month, when the herbage is repeatedly turned over in the swathes without being thinly spread abroad, as the handling tends to shake off the leaves of the clover, which are the best parts of the plants, turning over the grass instead of tedding. The cocks are used as for natural grasses, and the carrying of the crop and the stacking of it are done as has been described.

Tedding machines are used with a good purpose in the case of large extent of natural meadows of which the herbage is light and of easy management, but the heavy herbage of clovers and of similar plants impedes the action of the machine, and the shaking motion of the implement tends to shake off the leaves, as has been objected to the tedding of the herbage.

CALENDAR OF GARDENING.

KITCHEN GARDEN.

In the first part of the month sow peas of the second early varieties, as Veitch's Perfection and Ne Plus Ultra, and in the latter part of the month introduce the tall growers, as Abergavenny, Waterloo, and Victoria Marrows, which will produce largely for weeks. Dig the ground deeply; manure with moist vegetable compost six inches under the seed drills; soak the soil over that; make the drills three inches deep; sow the seed, water it, return the covering earth, and put it down. By this treatment, with waterings in the lower ground on each side of the ridge, peas will succeed in the driest summers. Peas sown late rarely escape mildew.

Sow carrots for drawing young and for standing the winter.

Repeat the sowing about the close of the month with onions for drawing or standing, and small salads, lettuces, and a few turnips.

Sow kidney beans and runners at least twice, as a succession with round spinach every week or ten days.

Sow cabbage. The early quick growers to come in speedily for summer and autumn. Aithkens' Matchless and Hill's Dwarf are suitable varieties.

In the fourth week of the month sow again Dutch turnips for autumn, and salads and lettuce.

About the middle of the month transplant Cape

broccoli, cauliflower for August, making the ground rich with compost. Also transplant borecole, Scotch kale, asparagus, and Brussels sprouts.

Stick and earth up peas. Hoe between crops.

Plant out cucumbers and vegetable marrows: Moore's Vegetable Cream, as now called.

Asparagus beds still yield, but should not be cut beyond the 10th. Beds and row are mutilated by too close cutting; one shoot should always be left untouched to each crown. Scatter rich earth with droppings over the beds, but avoid salt, as any particle falling on a wet leaf will decompose the tissue, and the plant dies; better to mix two ounces of salt in a bushel of compost, and it will be washed into the ground.

Plant young lemon thyme, savory, sweet marjoram, basil, and also slips of lavender, rosemary, rue, and other handy sweet herbs in cool, shady beds, for subsequent transplantation.

Cut the aromatic herbs for drying, when they begin to flower.

Thin out onions by degrees for use, leaving the bulbing stock from four to six inches asunder. If the weather be very dry frequent light hoeings to prevent the surface from cracking will also cause the attraction of moisture and bring on the plants.

Cut all tall leafy and succulent weeds into short lengths to fill the liquid tank, and with grass earths from sides of roads and ditches, along with vegetable matters of all kinds. The urinary and soapy liquids of the dwelling house, placed in the tank, will be imbibed by the earthy mixtures, which must be applied in quantity to form a saponaceous mass of a consistency to be handled by the spade without any liquid droppings. This preparation affords a manure for the stronger vegetables, as cabbages and beet, and is applied in a fresh state without any fermentation. Vegetable substances surcharged with liquids are the best application of both bodies yet known.

The scrapings of roads, the droppings of animals with all kinds of fine earths makes every good compost along with a mixture of effete lime, for the purpose already mentioned of the lighter vegetable crops and for flower-beds. An ample supply of both kinds of manure must be provided for the garden. The expense is small, requires some attention, and is essential to any cultivation of land.

FRUIT DEPARTMENT.

The dwarf and espalier trees, the apple and pear, may have produced many young shoots; the ill-placed ought to be removed to the bottom, the others should be left for a month longer. Many persons foreshorten yearly and repeat the operation, but it may be preferable to wait till near the close of the summer growth. Lay in the best shoots of cherry and plum trees upon walls.

In dry weather water strawberry beds and rows daily, if possible, being the only security. Rows should be stringed on each side, the twine fastened to the short sticks so as to support the entire ranks of trusses. Net over the ripening fruit if small birds, particularly black-birds abound.

Cucumbers in frames must be always stopped at a fruit. Melons first, at the second or third joint, to secure side laterals, and then as fruit appears, but not so rigidly as cucumbers, taking care to impregnate the fruitful flowers.

FLOWER GARDEN.

Arrange any green-house plants now brought out in a neat order under some fence facing the north. Place flowering shrubs, and also herbaceous plants in situations where the sizes may graduate from low ones in front to high ones at back; attend to order in displacing the colours whenever the collection is miscellaneous.

At the end of the month pipe and layer pinks, cloves, carnations and picotees; succeed last by layers alit carefully through two joints, pegged down an inch deep with fern pegs, and covered with sifted earth containing one-third of chalk or lime rubbish from old mortar, one-third of sharp sand, and the same of old dung.

Attend to any beds of geraniums, verbenas, &c., to keep all free from weeds, dead leaves, and every unsightly object. Earwigs are best destroyed by pots with hay or tow in them, inverted upon sticks a foot or more high.

Raise bulbs of tulip, narcissus, hyacinth, and other plants of that order when the green parts change colour and become dry. Dry the bulbs in the air.

Routine culture consists in hoeing, raking, cleaning, and sweeping walks and lawns, with the removal of all litter to manure compost grounds, where every jot of vegetable matter if deposited in a sunk excavation or liquid pit, and watered as is constantly directed with soapy and urinary liquids, will soon be converted into a most useful manure.

AGRICULTURAL REPORTS.

GENERAL AGRICULTURAL REPORT FOR MAY.

Owing to the heavy depletion of the stock of foreign grain on hand, and the inroads made on the quantity of English wheat in the hands of farmers, there was considerable firmness in the grain trade at the opening of the month, and the quotations had an upward tendency. This movement was strengthened by the fact that the accounts received from abroad were not uniformly satisfactory, while our own crop was decidedly backward. The reopening of the navigation has been followed by the resumption of shipments; and a considerable addition has been made to the quantity of wheat on passage. Nevertheless, the proportion of really choice wheat on hand is small, the arrivals from the Baltic having been limited. During the last week, however, our receipts from that quarter have been more limited. The supplies of grain, on sale, have been small throughout the month, but fully adequate to the demand, as millers have

adhered to the cautious policy which has characterised their dealings for some time past, and have operated only as necessity demanded. The produce which has changed hands has, therefore, gone direct into consumption, and millers' stocks are still very low. With the return of genial forcing weather, the wheat trade became very inanimate, and prices tended unmistakably downwards. After a few refreshing rains, not so general as could have been desired; we experienced a spell of brilliant sunshine and fine open weather, by which the wheat plant greatly profited. Much progress has been made accordingly, but the plant is still backward for the time of year. The course of prices will now be chiefly regulated by the accounts received of the growing crops, both here and abroad, and there appears to be little to fear under this head at present.

Spring corn has ruled fair throughout the month, and good feeding stuffs have been rather dearer. The supplies coming forwards have not been heavy, so there has been a steady in-

quiry for both maize and oats. Annexed is our usual table of imports of grain, &c., into the United Kingdom :

FOR THE WEEK ENDED MAY 21.

	Imports.	Exports.	Imports.	Exports.
	Cwt.	Cwt.	Cwt.	Cwt.
Wheat	485,520	6,071	355,876	—
Barley	106,089	—	60,586	3
Oats	175,900	1,491	75,403	6,952
Peas	54,810	606	4,207	32
Beans	37,329	—	26,093	—
Indian Corn ..	154,813	—	195,973	45
Flour	96,670	875	24,498	825

SINCE SEPTEMBER 1.

	1869-70.	1868-9.
Wheat	29,955,924	20,432,949
Barley	6,067,566	8,112,543
Oats	7,280,778	4,462,899
Peas	1,045,773	881,560
Beans	1,367,402	2,028,371
Indian Corn ..	13,572,244	9,952,147
Flour	4,687,333	2,885,771

Potatoes are turning out fairly well, but would derive much benefit from more moisture, if that were forthcoming; which remark applies to the root crops generally. At the same time, considering the little rain that has fallen, roots have done well. Hay and clover continue to come freely to hand at the metropolitan markets, and values have been sustained.

In the hop market there is no feature to notice. Trade has been almost suspended, and prices have been altogether nominal. Some sales of American have been effected at a considerable reduction.

Wool has ruled firm, and the London public sales have passed off very satisfactorily, though just now there is little animation in the English wool market, owing to the appearance of the new clip.

REVIEW OF THE CATTLE TRADE DURING THE MONTH OF MAY.

Devoid of any feature of importance, the cattle trade during the month has been in a quiet state. The warm weather has engendered much caution on the part of butchers in concluding transactions, owing to the difficulty of disposing of the stock after slaughtering. Any permanent reduction in prices, however, has been prevented by the falling-off in the receipts. The quality of the beasts has continued quite equal to the average; but the scarcity of grass in the pastures, the result of the recent drought, augurs ill for the condition of future receipts, as it will necessitate a strong inquiry for feeding stuffs. From our own grazing districts, the arrivals of stock have been only moderate. From abroad, a fair number has come to hand; but, with the exception of some of the French stock, the quality generally has been indifferent. As regards the demand, there has been an entire absence of briskness, and the fluctuations have been altogether unimportant. At the commencement of the month the best Scots were making 5s. per 8lbs., and, with the exception of a temporary relapse, to 4s. 10d., which has since been recovered; the quotation has been firm thereat throughout.

In respect to sheep, the supply has been tolerably good so far as number is concerned, but the quality has not been prime, really fine English breeds being comparatively scarce. The month opened steadily, at an advance of 2d. to 4d. per 8lbs., the best Downs and half-breeds selling at 5s. 2d. to 5s. 4d. The top price subsequently receded to 5s. 2d. per 8lbs.; but the relapse proved to be quite temporary, as at the close of the month the reduction had been well recovered.

The show of lambs has been good, and the trade has been quiet, at from 6s. 6d. to 7s. 6d. per 8lbs.

Calves have been in moderate supply and fair request, at from 3s. 10d. to 5s. 8d. per 8lbs.

For pigs the demand has been heavy, but prices have been without change, ranging from 4s. 6d. to 5s. 8d. per 8lbs.

The total supplies of stock exhibited and disposed of in the Metropolitan Market have been as under :

Beasts	16,185
Sheep and Lambs	156,085
Calves	2,764
Pigs	380

COMPARISON OF SUPPLIES.

	Beasts.	Sheep and Lambs.	Calves.	Pigs.
May 1869	20,112	164,969	2,056	671
1868	17,810	176,000	2,192	1,350
1867	19,860	160,370	1,709	2,260
1866	16,275	125,490	695	2,185
1865	23,030	129,140	3,199	2,117
1864	23,240	122,210	2,063	3,080
1863	20,444	126,040	2,129	3,120
1862	19,273	132,450	1,527	3,022
1861	19,600	113,750	1,178	2,950
1860	19,040	124,580	2,059	2,920
1859	17,980	113,512	1,012	2,260
1858	18,722	113,886	1,671	2,760
1857	18,741	104,990	1,415	2,530
1856	18,732	119,640	1,280	2,545

The total imports of foreign stock into London during the past month have been as follows :

Beasts	5,600
Sheep and Lambs	26,258
Calves	2,845
Pigs	1,578

Total 36,281

Imports at corresponding periods :

Total in	1869	64,333
"	1868	24,627
"	1867	53,455
"	1866	43,930
"	1865	40,739
"	1864	28,833
"	1863	22,161
"	1862	11,206
"	1861	18,978
"	1860	18,910
"	1859	10,713
"	1858	6,703
"	1857	7,243
"	1856	3,556

The arrivals of beasts from our own grazing districts, as well as from Scotland and Ireland, thus compare with the three previous years :

From—	1870.	1869.	1868.	1867.
Norfolk, Suffolk, &c.	6,640	4,530	9,200	7,480
Other parts of England	2,104	2,660	2,200	2,600
Scotland	1,086	663	554	950
Ireland	80	229	426	—

Beasts have sold at from 3s. to 5s., sheep 3s. to 5s. 4d., lambs 6s. 6d. to 7s. 6d., calves 3s. 10d. to 5s. 8d., and pigs 4s. 6d. to 5s. 8d. per 8lbs. to sink the offal.

COMPARISON OF PRICES.

	May, 1866.	May, 1867.
	s. d. s. d.	s. d. s. d.
Beef from	8 10 to 5 2	3 4 to 5 2
Mutton	4 4 to 6 0	3 6 to 5 2
Lamb	6 8 to 9 0	6 6 to 8 0
Veal	5 4 to 6 4	4 4 to 6 0
Pork	4 0 to 5 0	3 0 to 5 4
	May, 1868.	May, 1869.
	s. d. s. d.	s. d. s. d.
Beef from	3 2 to 5 2	3 0 to 5 10
Mutton	3 4 to 5 0	3 0 to 6 0
Lamb	6 6 to 7 4	5 8 to 7 4
Veal	4 4 to 5 4	4 6 to 6 2
Pork	3 4 to 4 4	3 6 to 5 2

The dead-meat markets have been only moderately supplied with meat. The trade has been quiet, on the whole, as follows: Beef from 3s. 2d. to 4s. 8d., mutton 3s. 4d. to 5s. 2d., lamb 5s. 8d. to 6s. 8d., veal 4s. to 4s. 8d., and pork 3s. 8d. to 5s. 8d. per 8lbs. by the carcase.

AGRICULTURAL INTELLIGENCE, FAIRS, &c.

ALYTH WHITSUNDAY MARKET.—There was a numerous display of fat cows and three-year-old bullocks. Of lean one and two-year-olds there was an abundant supply, especially of the former. For all sorts of cattle prices were lower compared to last year's market. On good two-year-olds the reduction averaged £1 10s. to £2; on three-year-olds, about £3 per head. Business opened and continued stiff and slow, with no indications of improvement on the last Glasgow market quotations. The best three and four-year-old bullocks ranged in price from £20 to £23 and £25 per head; do., in forward condition, £16 to £18; fat cows £14 to £16 and £18—some of this class sold at £11 each; fat two-year-olds, £10 to £12; lean two-year-old stots and queys, £7 to £8 10s.; yearlings £2 5s. to £2 15s. and £3 10s. per head. The best beef did not succeed 10s.; second-class 8s. to 9s. per Dutch stone. There was a larger number of sheep than usual, with several lots of ewes with lambs at foot. There was a good inquiry for all classes, and the most of the lots were sold. Greyfaced hogs sold at 13s. to 15s. per head, cross hogs 20s. to 25s. blackfaced ewes, with lambs, 30s. to 35s. Fat English sheep, from 40s. to 42s. per head. Mutton, 7d. to 8½d. per lb.

BEMUDIN FAIR, (Monday last).—The number of sheep and lambs penned were about an average, but they were not quickly sold, sellers asking prices beyond the views of buyers, ultimately some inclination to effect sales was evinced when a fair clearance was made. Tegs were from 26s. to 35s. per head.

BOSTON FAT SHEEP MARKET.—From 7,000 to 8,000 sheep penned to-day. Hogs were in slow demand, at a reduction of from 1s. to 2s. a head on the prices obtained at the fair on the 4th inst. A fair amount of business was done in fat sheep, at 7d. to 7½d. per lb.

BOURN MAY FAIR.—At this fair, held on the 12th instant, there was a slow trade, and only a limited amount of business was done.

BUNGAY FAIR.—This fair, on Monday, was more numerous attended, and the show of stock of all kinds and classes was larger than has been known for many years. The trade progressed very slowly during the earlier part of the day, but as time advanced it became brisker, and we believe that a fair amount of business was transacted at satisfactory prices.

CHERTSEY CATTLE FAIR.—On Saturday there was a thin supply of horned stock at Chertsey, and good steers, heifers, and barreners for grazing out sold at £8 to £14, milch cows £14 to £20, and cows to calve down £9 to £15. The horse show was of inferior character; cart horses fetched 14 to 24 guineas, nags 18 to 25 gs., and light harness horses and cobs 15 to 21 gs. The sheep fair was small and trade dull.

COCKERMOUTH FAIR.—There was a fair show of cattle, and a quick sale was experienced, most of the animals changing hands before mid-day. Three-year-old heifers, £10 to £16; two-year-olds, £10 to £12; yearling bullocks, £6 to £9. Milch and calving cows were scarce, and the prices realized ranged from £17 to £19 and £22 per head. There was only a limited show of Irish cattle, and those on offer sold quickly at good prices—say, from £6 10s. to £10 per head.

DUNFERMLINE MONTHLY MARKET.—The stock was scarcely up to the average, and consisted chiefly of fat and grazing cattle and milk cows. The best class of cattle sold at prices ranging between £15 and £20, or from 10s. to 10s. 6d. per Dutch stone; milk cows brought from £10 to £17; several other milk cows and queys from £9 to £10; two-year-old cattle from £8 to £12 10s.; and one-year-olds from £4 to £8.

FALKIRK MAY FAIR.—This market, which is the largest of those held in the Callander Riggs throughout the year, took place on Thursday, and though the weather proved most unfavourable, there was a good attendance of farmers and dealers from the neighbouring districts, and also a number from a distance. The show of stock was smaller than last year; but it included all the classes generally found at this market. The falling off in quantity is to be attributed to the establishment of the monthly trysts at Stenhousemuir and to local influences. The cattle on offer were of very fair quality, and for the more promising lots of grazing stock there was a good healthy demand, at prices considerably in advance of those current at the

same time last year. Cattle in value of from £7 to £9 would be up £1 a-head, while those giving less money were relatively dearer. The milch cow department was most inactive, and prices were a shade easier than they were a few weeks since. The Irish stock were not easily sold, and some of the lots had no bidders. The supply of horses was limited and of a secondary quality. For the most part the animals were only suited for farm purposes, and the demand was stiff. A good many dealers were present both from Edinburgh and Glasgow, but they were prevented from doing much business by the smallness of the show. Mr. Rennie, Craigburn, Falkirk, quoted horses at from £20 to £25. Ponies sold at from £4 to £7 each.

HANFORD HALL FAIR.—This annual fair, which was held at Ipswich, on Tuesday, attracted, as usual, a goodly number of Essex exhibitors and Essex buyers. The fair was scarcely up to that of last year; and trade, on the whole, could not be called active. In the former part of the day the business done was limited; but in the afternoon sales were pushed, and a fair clearance was effected, at recent prices.

HIGHBRIDGE FORTNIGHTLY MARKET was tolerably well supplied with cows and calves, but the number of fat beasts was limited. Fat sheep and lambs were in fair supply. There was a moderate attendance of dealers. For fat beasts 13s. per score was asked, but little or no business was done. Cows and calves sold at £16 to £18 each. Springers (inferior quality) sold at £10 each. Fat sheep 8d. to 8½d. per lb. Lamb 9d. to 9½d. per lb. Pigs were in good supply, and former prices were sustained.

INVERNESS MONTHLY MARKET.—Generally the stock was of an inferior description, there being almost an entire absence of Highland cattle and strong grazing beasts, which were in good demand. The prices realised were about the same as those current at the Muir of Ord on the previous day, from which the market principally took its tone. The market was considered to be stiff and dull, and several lots were unsold. The following are some of the transactions; cross stirks at £8; two-year-old cross queys from £10 to £12; two-year-old cross stots at £16; cross stirks at £11; cross stirks at £6; Highland stirks at £3 16s.; two-year-old cross heifers at £10 10s.; two-year-old cross stots and heifers at £12; a farrow cross cow at £9, a two-year old cross heifer £8.

LINCOLN FAT STOCK MARKET.—A large show of sheep and beasts. Mutton a ready sale at about 7½d. per lb., and beef sold at 9s. per stone. The greater part were sold by auction. Messrs. Tate and Richardson sold 445 sheep and 12 beasts.

NEWARK MAY FAIR.—This fair was held on Saturday last. The show of cattle was satisfactory, though not what could be termed a very large one. Two years old steers realised £10 to £12, three years old steers £14 to £18, two years old heifers £10 to £14, three years old heifers £14 to £20, milch cows £16 to £18, superior class £20 to £23. Only 1,024 sheep were penned. Grazing hogs 50s. to 57s., ewes with single lambs 10s. more. The horse fair was not extensive, but all animals of good quality were readily sold at good prices. Cart horses £40 to £60, light harness £30 to £40, cobs £25 to £30 each.

PENISTONE FAIR.—There was a good supply, principally milch, in-calf cows, barren heifers, stirks, and Irish. There was a large attendance of farmers and dealers from Sheffield, Barnsley, Huddersfield, and also from Derbyshire. A fair trade was done in milch cows at from £18 to £22, heifers £16 to £18, and stirks, from one to two years old, at £6 to £10. Barren stock were offered at £14 to £15 per head. There was a good show of sheep and lambs; sheep at 30s. to 40s., and lambs may be quoted at late rates. The trade in calves was brisk, and the highest quotations of this day week were fully realized. The pig pens were quite full, and there was a good inquiry, sales being effected at previous rates.

SALISBURY FORTNIGHTLY MARKET.—Although there was not a very large number of beasts, the supply included many good and useful descriptions. The best made late rates, but trade ruled dull, and a general clearance was not effected. In the sheep department some excellent qualities were penned, but the demand was quiet and prices easier, the whole not meeting with purchasers. Best oxen realised 12s. to 13s. per score, and heifers from 11s. to 12s. Cows, with their calves, from £10 to £18. Best wether mutton made from 7d. to 8d., ewe ditto from 6½d. per lb. out of the wool,

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

The fall of rain in the month of May has not nearly made up for the deficiencies of April, and its commencement was more like March than itself, there being frequent and severe frosts at night which cut off many pieces of potatoes, as well as nipping and delaying vegetation generally. But after a fortnight had thus passed, we had a sudden outburst of sultry weather, which had it only been attended with showers, would have done much to make up for the lateness and delay. As it is Nature has been freshened, the foliage has thoroughly expanded, the fruit buds which escaped the frost will have had an opportunity to set and rapidly form, and our general prospects have greatly improved. But the grass, though green, has made little growth. The pulse and oats, as well as barley, are all short in the haulm or straw, and without the needed supply the crops of all spring corn must be small. The wheat has, however, greatly improved and may yet produce an average yield, though, after a few days of great heat, the return of the east wind again brought cold with it. The ungenial aspect of the commencement of the month, the regularly small supplies to the London market, with much less foreign arrived than expected, and much more delivered from granary than contemplated, have somewhat changed the aspect of the wheat trade, as shown by a comparison of the London averages, which note a positive gain of 5s. 7d., though some, foreboding evil to the farming interest, predicted a certain and speedy decline of 2s. Such gloomy prophecies being often suicidal to their authors—we are by no means disposed to return a verdict of "felo de se," but rather would put them down charitably to an insufficient acquaintance with the corn trade, or to mental delusion. But while the London averages very fairly represent the rise that has taken place, it must be remembered that the returns are made about a fortnight after the sales, and so we cannot report as much for the open market rise of the month. Indeed the last two Mondays hung fire, as the consequence of the change in the weather, and some of the advance was lost. But France has very well maintained the rise, and so scanty have been the supplies hitherto at the Baltic ports, and so active the general and consumptive demand there, that no foreign port has evinced any sort of depression, and our last week's supplies, which consisted of two-thirds American and were but moderate as a whole, proved previous reports to be correct. We would now simply suggest the following questions as to the probability of any serious decline from present rates. Have not our weekly sales in the country been much larger than they were last year? Must these not have greatly reduced farmers' stocks? Have not our granaries been still more freely relieved? Is not our consumption rapidly increasing? Are not our future supplies mainly dependant on America and the Black Sea, and are not France, Belgium, and Holland likely to be our competitors in the receipt of these shipments? And, further, does our own growing crop warrant sales at unremunerating rates? The prices quoted below were those of the places noted by last accounts. White wheat at Paris 52s. 6d., red to 50s.; red in Belgium 48s. to 51s.; weak white Zealand wheat at Rotterdam 46s.; Polish at Amsterdam 52s.; new white at Danzig 48s.; wheat at Hambro' 46s. 3d. to 47s. 9d.; red at Stettin 42s. to 44s.; wheat at Porrentruy, Switzerland, 46s.; Ghirkaat Taganroc 42s. per qr., cost, freight, and insurance included; soft

wheat at Genoa 51s.; at San Francisco 47s. 6d. to Liverpool, cost, freight, and insurance included; No. 2 spring wheat at New York 39s. per 480lbs. free on board.

The first Monday in Mark Lane opened in moderate supplies of wheat both English and foreign. The show of samples during the morning from Kent and Essex was short, and factors were enabled to realise an advance of 1s. to 2s. per qr., though it was not very freely paid by millers. There was a good demand for American at an improvement of 2s. per qr., and other descriptions moved off slowly at an advance of 1s. Quite one shilling more was paid in floating cargoes also. The country markets this week very readily responded to the London reports. The smallest advance noted anywhere was as much as 1s. per qr., more were up 1s. to 2s., and the following places quoted a rise of fully 2s.: viz., Boston, Gainsboro', Gloucester, Lynn, Louth, Newcastle, Sleaford, and Stockton. Liverpool, however, only noted an upward movement of 1d. to 2d. per cental on Tuesday which was confirmed on Friday. In Scotland there was also some advance, Glasgow being 6d. to 9d. per boll higher, and Edinburgh was up 2s. per qr. Native wheat at Dublin brought 6d. per barrel more money, but no advance could be realised on foreign samples.

On the second Monday the English supply of wheat was moderate, with a good increase in the foreign arrivals. The show of samples during the morning from the near counties was unusually short, and with cold ungenial weather factors endeavoured to obtain 1s. above the rates of the previous week, but to this millers declined to submit, and prices were unaltered. The foreign trade was on a small scale, the demand being only retail, but factors were very firm and the prices paid rather above the previous week in some cases. Floating cargoes were without change of value, though the arrivals were but few. This week there was more quiet in the country, and quotations generally were the same as on the week previous, but at some places there was a further rise of 1s., as at Birmingham, Boston, Sheffield, Sleaford, and Wolverhampton. At Liverpool the gain for the week was only 2d. to 3d. per cental. Wheat in Scotland was only firm, without much passing. Dublin also was quiet and unaltered both for native qualities and foreign.

On the third Monday's market there was less than the average quantity of home growth, with some reduction in the foreign supply, though it was still good. There was another very limited display of fresh samples from Essex and Kent, but the weather having been more favourable, with some fine showers, buyers were disinclined to operate without obtaining some concession on the previous rates. The offers of 1s. per qr. less were, however, declined, and millers remaining firm scarcely any business was done. The activity too of the foreign trade was entirely lost, and to have made any sales, especially of red American, fully 1s. reduction must have been conceded, and indeed it was much the same with other qualities. The floating trade too felt the change in the weather, and though arrivals were limited almost nothing was done, holders only asking previous rates. With a summer-like temperature in the country and the dull report from town the markets could hardly fail to show some reaction in prices, and the universal tendency this week was moderately towards decline, several places

quoting a reduction of 1s. per qr. Among these were Lynn, Birmingham, Bristol, Wolverhampton, Worcester, Chelmsford, Bury St. Edmunds, Rotherham, and Stockton. Newark and Norwich noted a reduction of 1s. to 2s., and Liverpool was 1d. to 2d. cheaper per cental on Tuesday, and as much also on Friday. The Scotch markets showed the same tendency, Edinburgh and Glasgow being down 1s. per qr. Irish wheat at Dublin was rather lower, and foreign difficult to sell on former terms.

On the fourth Monday the supply of English wheat was small, the foreign being liberal from New York, but scanty from European ports, with a change to east wind and much colder weather. Factors on a small supply from the near counties were asking the previous rates, but as part of the show was made up of the overleft samples of the previous week millers would not buy, unless at a decline of 1s. per qr. from the nominal rates of the former Monday. With a good supply of American red this sort was fully 1s. per qr. down as well as all the lower descriptions of foreign, but fine Baltic from its scarcity was quite as dear, though but little inquired for. Floating cargoes were 1s. to 2s. lower.

The imports into London for four weeks were 21,775 qrs. English, 76,375 qrs. foreign, against 22,573 qrs. English, 61,071 qrs. foreign for the same period in 1869. London exports 5,655 qrs., consisting of low qualities. The imports into the United Kingdom for four weeks ending May 14 were 2,011,562 cwt. wheat, 374,629 cwt. flour, against 1,784,987 cwt. wheat, 228,965 cwt. flour for the same period in 1869. The general averages commenced at 42s. 7d. and closed at 44s. 5d., those of London commenced at 45s. 1d. and ended at 50s. 8d. per qr. The general improvement would therefore appear only 1s. 10d. per qr., while in London it was 5s. 7d.

With good supplies of country flour and fair arrivals of foreign in barrels the trade has generally been steady, with but slight variations. On the first Monday town millers raised their top price from 40s. to 43s., at which it has since stood. The only difference in the value of country made samples being 1s. per sack in sellers' favour, while barrels gaining 6d. on the first Monday and losing it on the last have left rates unaltered, say to 22s. for extra state, and choice about 23s., or according to superior excellence. The imports into London for four weeks were 88,610 sacks English, 2,777 sacks 30,059 barrels foreign, against 96,470 sacks English, 8,829 sacks 100 barrels for the same period in 1869.

The supply of English barley through the month has been very limited from the apparent exhaustion of stocks in the country, and the foreign arrivals have been quite on a small scale. The malting season being virtually over, the demand has been quite exceptional, and prices little more than nominal, though there has been no quotable reduction; foreign, on the contrary, has somewhat improved in value, the little French coming to hand having been used for malting at fully 1s. per qr. more money from the deficiency of the English supplies, and grinding sorts have also increased in value from 6d. to 1s., being worth from 23s. to 26s. per qr. The imports during four weeks were 2,371 qrs. British, 25,602 qrs. foreign, against 2,926 qrs. British, 9,823 qrs. foreign, for the same period last year. The want of rain is calculated still further to harden values, more especially as maize has lately been advancing.

The malt trade has been very limited, all through the month, but prices have kept nominally at the previous range.

The very short supply of maize all through the month has increased its value 1s. 6d. to 2s. per qr., as nothing comes from America, nor is likely to come. The value at New York is 37s., while in London its extreme price for

white sorts is about 32s., or 31s. for yellow. As a substantial food, and substitute for oats, barley, and beans, all of which are getting in very short supply from British sources, we think this grain more likely further to improve than decline, though much is coming from the Mediterranean and Black Sea.

Notwithstanding heavy supplies of foreign oats, this grain has about maintained its value, as nothing has come from Scotland or Ireland this month, and the average weekly returns of English have barely reached 900 qrs. The great want of rain has kept up a good demand; and though prices have much improved from the lowest point, they are still moderate, after the partial failure of our own crop and the large weekly consumption of London. 38lbs. per bushel fresh Swedish corn has been only bringing 19s. 3d. to 20s. per qr., and fine sweet Russian of the like weight about the same; while the drought in France has raised prices at Paris to 24s.; so, should rain still be wanting, rates are capable of a further increase. The imports in four weeks into London have been 8,598 qrs., English 189,026 qrs. foreign, against 1,847 qrs. English, 21 qrs. Scotch, 2,500 qrs. Irish, 93,231 qrs. foreign, in 1869. Our foreign imports, therefore, are double what they were a year ago.

The supply of Linseed for a month has scarcely exceeded an ordinary week, and the consequence has been a rise of 1s. to 2s. per qr., cakes having risen 10s. per ton, with a lively demand, from the great want of feeding stuffs, through the absence of rain.

Beans have been in short supply, and seem likely to be so, stocks being nearly used up, and actually wanted in the country for stock; so values have improved 2s. per qr., ticks and Mazagans having become worth 40s. Foreign arrivals, too, have been limited, though the last accounts from Egypt noted better arrivals at Alexandria and receding values. The imports into London for four weeks were 1,607 qrs. English, 3,539 qrs. foreign, against 2,095 qrs. English, 3,584 qrs. foreign, in 1869.

Of peas the arrivals have been still more scanty, both English and foreign; and though the demand has not been lively, prices have also risen 2s. per qr. The imports into London for four weeks were 777 qrs. English, 2,557 qrs. foreign, against 335 qrs. English, 2,483 qrs. foreign, in 1869.

Since the seed season has closed, some speculative demand has been experienced for trefoil, at daily improving rates. The crop seems a failure in France.

SOUTHWARK WATERSIDE.

LONDON, MONDAY, May 23.—During the past week the arrivals coastwise have been moderate, but owing to the sudden change to warm summer weather the consumption has fallen off more than one-half, and the prices of the former week were barely maintained. The following are this day's quotations:

Yorkshire Flukes	130s. to 150s.
Ditto Regents	110s. to 140s.
Lincolnshire Regents	100s. to 110s.
Dunbar and East Lothian do.	110s. to 140s.
Perth, Forfar, and Fife do.	95s. to 110s.
Do. do. do. Rocks	95s. to 105s.
Do. do. do. Reds	90s. to 100s.
French and Belgian whites	80s. to 100s.

BOROUGH AND SPITALFIELDS.

LONDON, MONDAY, May 23.—The supplies of Potatoes have been moderate. The trade has been slow at about late rates. The imports into London last week consisted of 7,358 bags from Antwerp, 534 boxes from Barcelona, 76 sacks 88 tons from Dunkirk, 2,335 barrels from Gibraltar, 154 baskets 1,036 boxes from Huelva, &c., 1,350 boxes from Lisbon, 3,536 boxes 211 cases from Genoa, and 2 boxes from Oporto.

English Shaws	120s. to 140s. per ton.
Regents	110s. to 130s. "
Scotch Regents	100s. to 130s. "
Rocks	90s. to 110s. "

COUNTRY POTATO MARKETS.—DONCASTER, (Saturday): Only a small supply of potatoes at to-day's market, and this led to rather better prices being made by holders. Regents 12s. 6d. to 14s., and rocks 10s. to 11s. 6d. per load.—MALTON, (Saturday last): There was no settled price for seed potatoes. Table sorts were firm, and not much offered, dealers buying at 12s. to 15s. per tub. Frame-grown new potatoes 1s. 6d.—MANCHESTER, (Saturday last): Lisbon (new) 2s. 9d. to 3s., Cornwall 10s. to 11s., Ormakirk 12s. to 14s. per 21 lbs., Yorkshire (old) 18s. to 20s., Scotch 12s. to 14s., Cheshire 10s. to 12s. per 252 lbs.—YORK, (Saturday last): There was a fair supply of potatoes for the season. Regents sold at 13s. per tub of 280 lb. wholesale, and 8d. to 9d. per st. retail; flukes, from 14s. to 15s. per tub, and 10d. per stone, and rocks 10s. to 10s. 6d. per tub. New potatoes 1s. 3d.

Irish, new	88 110

CORK BUTTER MARKET, (Monday last).—Ordinary: Firsts 109s., seconds 103s., thirds 93s., fourths 90s., fifths 70s. Mild-cured: Firsts 116s., seconds 116s., thirds 101s. In market, 1,300 firkins. (Tuesday).—Ordinary: Firsts 107s., seconds 101s., thirds 92s., fourths 90s., fifths 70s. Mild-cured: Firsts 114s., seconds 103s., thirds 101s. 1,430 firkins in the market. (Wednesday).—Ordinary: Firsts 103s., seconds 101s., thirds 92s., fourths 89s., fifths 70s. Mild-cured: Firsts 113s., seconds 108s., thirds 101s. In market, 1,380 firkins. (Thursday).—Ordinary: Firsts 103s., seconds 100s., thirds

91s., fourths 89s., fifths 70s. Mild-cured: Firsts 112s., seconds 109s., thirds 101s. Number of firkins at market, 1,700. (Friday).—Ordinary: Firsts 105s., seconds 102s., thirds 92s., fourths 86s., fifths 70s. Mild-cured: Firsts 108s., seconds 106s., thirds 99s. There were 1,450 firkins in the market. (Saturday).—Ordinary: Firsts 105s., seconds 103s., thirds 91s., fourths 85s., fifths 70s. Mild-cured: Firsts 109s., seconds 106s., thirds 99s. 1,600 firkins in the market.

GLASGOW, (Wednesday last).—A good supply of cheese in market, 1,478 being laid down. A fair demand for fine qualities at 1s. per cwt. advance. Cheddars (old) 62s. to 71s. per cwt.; do. (new) 50s. to 56s.; Dunlops (old) 61s. to 68s.; do. (new) 48s. to 52s.; Skim-milk 22s. to 25s.

SALISBURY CHEESE MARKET, (Wednesday last).—About 80 tons were pitched. The sale was very dull, especially for thick. Prices averaged 10s. to 12s. per cwt. less than May last year. Skims 18s. to 22s., half-skims 42s. to 54s., Somersets 65s. to 72s.

POULTRY, &c., MARKETS.—Turkeys, 8s. to 10s.; ditto, Irish, 6s. to 9s.; ditto, Irish hens, 4s. to 6s.; Goslings, 3s. to 10s.; Ducklings, 4s. to 5s. 6d.; Surrey Fowls, 4s. 6d. to 7s. 6d.; Sussex ditto, 4s. to 5s.; Boston and Essex, 4s. to 4s. 6d.; Irish, 2s. to 2s. 9d.; Rabbits, tame 1s. 6d. to 2s. 6d., ditto wild 1s.; Pigeons, 6d. to 10d.; Quails, 7s. per dozen. Eggs, best 7s. 6d., seconds 6s. 3d. per 120.

ENGLISH WOOL MARKETS.

CITY, MONDAY, May 23.—There has been a healthy demand, principally for the choicest descriptions, and values have been well maintained. Other qualities have been purchased to a fair extent.

CURRENT PRICES OF ENGLISH WOOL.	s. d.	s. d.
FLEECES.—Southdown hogs	per lb.	1 0½ to 1 1
Half-bred ditto		1 3 1 4
Kent fleeces		1 3 1 3½
Southdown ewes and wethers ...		1 0 1 1½
Leicester ditto		1 2½ 1 3½
Sorts.—Clothing, picklock		1 4 1 4½
Prime		1 2½ 1 3
Choice		1 1 1 2
Super		1 0 1 0½
Combing, wether mat		1 3 1 3½
Picklock		1 1 1 1½
Common		0 11 1 0
Hog matching		1 4 1 4½
Picklock matching		1 1½ 1 2½
Super ditto		0 11 1 0

BRADFORD WOOL MARKET, (Thursday last).—The tone of the wool market this morning is tolerably firm. The operations of consumers, although greatly lacking in spirit, are just sufficient to maintain prices at about the late range. Firmness is most marked in wethers', which are chiefly in favour. There is now a considerable scarcity of choice, bright wethers', and those that remain are eagerly sought after: prices slightly in favour of sellers. This is, of course, only a small portion of the trade. Most of the descriptions of wool are more neglected, and for some of the inferior sorts staples do not hold out rigidly for extreme rates. In skin wools, however, there is still a fair business doing, and we hear of some rather considerable transactions in the lowest class of Down wools. Speaking generally of the whole market, we should say that its tone, though pretty firm, is spiritless, and that the near approach of the clip deters buyers from operating at all in advance of their requirements.—Bradford Observer.

LEEDS (ENGLISH AND FOREIGN), WOOL MARKET, (Friday last).—The supply of new wool is yet small at the local markets, so that the prices likely to be given have not been tested. The quantity of old wool on hand, though sufficient to satisfy every one that there is no dearth, yet is not so abundant as to produce an impression that the wool market is greatly overstocked. Prices have undergone no alteration. The demand for colonial wool is not very brisk, but prices are well maintained, notwithstanding the large arrivals for the sales next month.

END OF VOLUME LVIII.

Curculio.

A copy of Henry's book is the property of Mr. Philip G. Brown, 25 Irving Place, New York City.

100

The Colonel.

winner of the Newport Stakes & Doncaster People's Chase in 1863 and 1870.

London, Published by Rogers and Telford, 205 Strand, 1870

PLATE III.

CAMELIA; A PRIZE JERSEY COW.

THE PROPERTY OF MR. P. GAUDIN, OF SPRING FARM, ST. MARTIN'S, JERSEY.

Camelia, bred by Mr. Gaudin, took the second prize in the heifer-in-milk or in-calf class of Channel Islands' cattle at the Leicester Meeting of the Royal Agricultural Society of England in 1868; and at the Manchester Meeting of the same Royal Society in 1869 she took the first prize for cows or heifers above three years old. In the year previous, at Leicester, Mr. Gaudin also took the first prize in the cow class with Lady Bird; while the two have won first prizes at the chief shows in the Island

of Jersey. Camelia and Lady Bird are both daughter of another famous cow—Maid of Plymouth.

"Beauty, quality, size, and colour" are the four cardinal points which Mr. Gaudin looks to, as he maintains that he unites these more successfully in the Maid of Plymouth tribe than in any other he has tried. He purposes crossing with this the Lady Greys, from Lady Best, the second prize cow at Leicester.

PLATE IV.

THE COLONEL.

WINNER OF THE LIVERPOOL NATIONAL STEEPLECHASE IN 1869 AND 1870.

The Colonel, bred by the late Mr. John Weyman in 1863, is by Knight of Kars, out of Boadicea by Faugh-a-Ballagh, her dam, Princess of Wales, by Bran—Modesty, by Pilgarlick.

Knight of Kars, bred by the late Lord Exeter in 1855, is by Nutwith, out of Pocohontas by Glencoe, her dam, Marpeasa, by Muley—Clare, by Marmion—Gohanna. Knight of Kars was a fair race-horse, but of nothing like the form of his famous half-brother, Stockwell, Ratanplan, and King Tom. His stock came out in 1863, and he is the sire of some fifty winners, although they are generally better over a country than a course. Mother o' Pearl, however, was a smart mare on the flat, while Albrighton, New Oswestry, Carlos, and Maesgwatha have, like The Colonel, told more in the Steeplechase Kalends. The Knight of Kars, now the property of Mr. Eyke, is located at Stanton, near Shifnal.

Boadicea, the dam of the Colonel, was bred by Mr. Davies on the hills at Monaughty, on the border land Shropshire and Radnor, in 1852, where her dam, The Princess of Wales, was also foaled; the half-bred stain resting with Modesty, foaled in 1827, a daughter on the best side of her head of the Yorkshire horse, Pilgarlick by Woful, out of Elizabeth, by Sancho. All the sort, with

the *A. S.* parenthesis attached to the nomination, could run a bit, and from old Modesty onwards have for the last thirty or forty years haunted the Welsh circuit—Cardiff, Knighton, Ludlow, Tenby, and so forth. Princess of Wales, however, a long way the best of the family in public, occasionally flew at higher game, and once ran well up for the Royal Hunt Cup at Ascot. Modesty herself was no great performer, even about home, but her produce included Mr. Jones' Gorse-bush, foaled in 1834; Mr. Gough's Greenfinch, by Tamworth, foaled in 1837; and Princess of Wales, by Bran, in 1839—all winners. The Princess of Wales was, in turn, the dam of Lily Dawson by Gladiateur, Butterfly by Orlando, and of the own sisters, Minerva and Boadicea, by Faugh-a-Ballagh. Boadicea's only living produce are Lady Port, by Knight of Kars, foaled in 1862, and The Colonel, and the mare herself died just previous to foaling at Little Brampton. Boadicea's career in public was not very remarkable, but her sister Minerva was a capital mare over a country, and in 1856 ran second for the Grand National at Liverpool.

The Colonel is a dark-brown, whole coloured horse, standing close upon fifteen hands three inches high. He has a good but not "pretty" head, long and well shaped,

with a particularly nice expression, auguring everything for his excellent temper. He has a well-inclined strong, but by no means coarse, neck, settling into beautifully laid shoulders. He does not look to be particularly deep in his girth, has a round rather roomy barrel, a rare back, and drooping somewhat short quarters, but jumping like. He is well let down to his hocks, has capital clean legs, with plenty of bone, and seems to be all over a remarkably sound horse. As we have already said of him elsewhere, The Colonel is one of the *neatest* nags ever seen—perhaps the term of all others that best fits his character. Nevertheless, he is not precisely the horse one might look for. He gives you more the idea of a very clever hunter over a trying country than racing away from a field of latter-day platers at Liverpool. Indeed, he has shown more speed than we should have quite given him credit for; as, however slight the stain in his pedigree may now be, The Colonel does not in his appearance convey the impression of being a thoroughbred horse. The Colonel was so called after Colonel, but now General, Percy Herbert, one of the members for South Shropshire.

As a race-horse, at light weights over short courses, The Colonel was a comparative failure; and in the autumn

of 1868 Mr. Richard Roberts, a neighbour and tenant of the late Mr. Weyman, at Richard's Castle, took the horse in hand with a view to more thoroughly complete his education for cross-country work. They chalked out a primitive but a very business-like line about home, and with George Stevens coming over occasionally to ride, and Mr. Mat. Evans, of "The Craven Arms," to set them going, The Colonel was prepared for his two Grand National races. Mr. John Weyman, his breeder and owner, was a tenant of Lord Powys at Little Brampton, where he always had a "likely" nag or two in his stable, on which he would occasionally himself show in public. He did not, however, live to witness the second victory of his horse, that has latterly been under the management of Mr. Evans. The stud came to the hammer at Knightsbridge on the first Monday in April, and The Colonel, at 2,600 guineas, was knocked down to M. André, the representative of the Continental Confederacy, which, as with Blue Gown, has no intention of throwing The Colonel out of work at once. There are some good cross-country races coming on abroad, which it is thought he cannot well lose, and where M. André proposes to act as his own jockey.

THE SALTS OF POTASH.

BY CUTHBERT W. JOHNSON, F.R.S.

The value of the salts of potash as fertilizers is still a moot question with the agriculturist. It is true that one of these, the nitrate of potash, has been long known as a valuable top dressing; but then its value as a manure has been always ascribed to the nitrogen, which is the base of its acid. The other salts of potash have been tried with results so discordant that little reliance has hitherto been placed upon them. The researches, therefore, which have within the last two or three years been instituted by Professor Voelcker, are of great importance. The reader will observe in the results of the most recent of these, to which I shall presently refer, that there is good reason to believe that the use of these salts, in conjunction, at least, with other fertilizers, will be productive of considerable advantage. This is the more important since, by the recent discovery in Germany of considerable deposits of impure salts of potash, their price has been very considerably reduced.

Reasoning by analogy, it would lead us to the conclusion that potash ought, in some form or other, to be a valuable dressing on many soils. There is, perhaps, no saline ingredient so universally present, as an essential constituent in plants, as potash. If, then, the soil becomes exhausted of this alkali by long continued cropping, its application to the land would naturally appear to be a fertilizing addition.

It is in this way and for such a reason, that chalk is added to those soils in which carbonate of lime is deficient in amount; phosphate of lime to such lands as are exhausted of that salt; and sulphate of lime to red clover, sainfoin, and lucern—these three crops containing this salt in sensible proportions.

Before, then, we proceed farther, we may usefully refresh our memories by referring to the results obtained by Professor Way, in his examination of the ashes or mineral substances obtained from various natural and artificial grasses.

The following table gives—I. the ash per cent. in the dried plant, II. the potash, III. the chloride of potassium in the ash of various grasses.

NATURAL GRASSES.

	I.	II.	III.
Meadow fox-tail grass	1.55	37.03	9.50
Sweet scented vernal grass	1.24	32.03	7.06
Downy oat grass	2.01	31.21	4.05
Soft brome	1.36	30.09	—
Crested dog's tail	2.38	24.99	11.60
Cock's foot	1.59	29.52	17.96
Hard fescue	1.66	31.84	8.17
Meadow soft	1.93	34.83	3.91
Perennial dandelion or rye-grass	2.16	24.67	13.56
Annual meadow59	41.86	.47
Smooth stalked meadow grass	1.65	31.17	11.25
Rough stalked meadow	2.20	29.40	6.60
Common cat's tail	2.26	24.25	.70
Annual rye-grass	1.99	28.99	—

ARTIFICIAL GRASSES.

Common red clover	1.85	36.45	2.39
Purple trefoil	1.68	29.13	—
Cow grass	1.77	34.72	.55
Common vetch	1.11	32.82	3.27
Alsike clover	2.12	29.72	6.29
Lucerne	3.04	9.99	1.54

But of course these ashes vary very materially in their composition. Some wood ashes, from Farnham, analysed by Mr. Nesbit (*Jour. Roy. Ag. Soc.*, vol. 7, p. 219), contained per cent.

Silica	4.25
Sand	10.00
Charcoal	0.35
Lime	29.50
Magnesia	6.65
Potash	7.55
Soda	4.89
Common Salt	0.80
Sulphuric Acid	3.25
Phosphoric Acid	4.70
Carbonic Acid	26.00
Phosphate of Iron	2.50
Phosphate of Alumina	0.50

Two or three other facts seem to lead us to the more

careful examination of potash as a fertilizer. It has been ascertained that when a soil is deprived of its potash, wheat or the grasses cease to produce on it remunerative returns. Liebig gives an instance of this in the case of a German cultivator who, in order to obtain potash, planted his land with wormwood, in which potash abounds (the old chemists who obtained an impure potash from this plant, called it "salts of wormwood"). The consequence was that he rendered his land quite incapable of bearing grain for many years afterwards, since he had entirely deprived the land of its potash (*Organic Chemistry*, p. 108). The ashes of wormwood were analyzed by Davy. He found in 10,000 parts of the ashes 780 of potash. In the same amount of the ashes of fumitory 790, and in those of beans only 200 parts. Other interesting researches seem to indicate the existence of a property possessed by soils to store up potash for the use of plants. That they have a very remarkable power of absorbing and retaining these salts was some time since shown by the experiments of Mr. Way (*Jour. Roy. Ag. Soc.*, vol. xi. p. 333). He passed solutions of caustic and carbonate of potash through different soils: in every case the potash was abstracted from the water, and retained by the soil. The same results were obtained when solutions of nitrate of potash, or muriate of potash, or sulphate of potash were employed: in every case the liquid, after passing through the soil, was found to be entirely free from potash. So that, as Way remarks, we thus meet with the unexpected fact that potash, and its carbonate, which forms very few insoluble compounds, are by a power inherent in soils made insoluble and separated from water. The English farmers towards the end of the last century were led to suspect the value of potash as a fertilizer, from noticing the good effects of an application of wood-ashes, since these ashes contain a considerable portion of potash. In Oxfordshire, according to the report of Mr. C. S. Read (*ibid.*, vol. xv., p. 245), wood-ashes are used chiefly in conjunction with other manures; but they are sown after, and sown on clover, sainfoin, and lucerne. It seems that although plentiful in the Chiltern district they are there sold at 16d. per bushel. It is the beech-wood which chiefly tenants the chalk districts of Oxfordshire, and, as we shall presently remark, this wood abounds both with potash and phosphate of lime. One very important fact must not, however, be overlooked—wood-ashes contain other salts of well-known value as manure. The ashes of some of our common weeds, for instance, abound with phosphate of lime. The ash of the couch-grass when analyzed by Mr. Kensington was found to contain in 100 parts (*ibid.*, vol. xviii., p. 352):

Carbonate of potash	14.10
Potash in the state of silicate	0.37
Soda in a state of silicate	5.69
Common salt	3.34
* Oxides of iron and alumina	13.40
Oxides united with phosphoric acid	9.38
Sulphate of lime	9.06
Carbonate of lime	3.80
Magnesia in a state of silicate	0.04
Soluble silica	24.93
Insoluble siliceous matter (sand)	17.50
	100.00
* Oxides equal to bone earth	20.32

In the ashes of several trees which abound in phosphate of lime Liebig found 20 per cent. of this salt. Now this fact is of considerable interest when we are considering the result of Professor Voelcker's trials, of a mixture of potash with other saline dressings. There is, be it remembered, no doubt of the usefulness of these wood-ashes on some lands. We learn from Liebig that so

great a value is attached to this material in the vicinity of Marburg, in Hesse Cassel, and in the Wetterau, in Hesse Darmstadt, that it is transported as a manure from the distance of eighteen to twenty-four miles. In these observations upon the application of wood-ashes as a manure, I have intended the ash as it is prepared by the combustion of the vegetable substance from whence it is procured. It then contains all the soluble salts as they existed in the plant. Another variety of wood-ashes, however, is sometimes found in commerce. I allude to the refuse wood-ash which remains after the common wood-ashes have been lixiviated with water. In those districts where considerable quantities of wood are burnt for the preparation of potash, this residual or insoluble portion of the ash accumulates in considerable quantities. This refuse matter consists, according to the examination of Professor Johnston (*El. Ag. Chem.*, p. 187), of silicate of potash, mixed with silicate, potash, and carbonate of lime, and when applied to the land is remarkably adapted for oats. It is best adapted for clay lands, and where laid on in considerable quantity (one or two tons to the acre), its effects have been observed to continue for fifteen or twenty years.

As the result of the present researches of Professor Voelcker lead him to incline to the conclusion that the use of the salts of potash is often advantageous to potatoes, clover, beets, and turnips, we will note the amount of potash found in the ashes of these important plants before we proceed to the results obtained by the able and cautious Professor.

The composition of these was ascertained by Professor Way (*Ibid.*, Vol. II., p. 530, Vol. IX., p. 189, Vol. VIII., p. 149-141). In 100 parts of these ashes he found the following proportions of potash:

Of the Potato	50.88 parts
" Red clover hay	14.85 "
" White clover hay	14.83 "
" Long red mangold root	21.63 "
" Skirving's swede bulb	36.16 "

The reader must not conclude that the crude salts of potash imported from the Continent are anything but very impure specimens. The composition of a variety of these native salts, imported from Germany, employed by Professor Voelcker in his experiments, were found by him to be composed in 100 parts of:

Moisture	11.63
Organic matter	.73
Oxide of iron	.34
Sulphate of potash	24.03
Sulphate of magnesia	1.14
Chloride of magnesium	12.01
Chloride of sodium (common salt)	47.85
Sulphate of lime	.78
Magnesia	.52
Sand	.97
	100.00

The conclusions to which the Professor arrives from the results of his experiments have very recently been reported to the Council of the Royal Agricultural Society of England, in language which I need not attempt to vary. He observed (*Ibid.*, Vol. VI., N.S., p. 146):

In reviewing the field experiments which, for a number of years, I have instituted with special reference to the conditions under which the land is benefited by the direct supply of potash in the shape of salts of potash, I have come to the conclusion, as far as my present experience goes, that these salts may often be applied with advantage to potatoes, clover, beets, and turnips.

In several experiments, tried on poor sandy soils during the past season, the addition of crude potash salts

to superphosphate of lime had a very marked and decidedly beneficial effect on the potato-crop, and also on swedes. Even when applied alone, crude potash salts benefit materially root crops growing on poor, sandy land. The same beneficial effect, I find by direct experiments, cannot be obtained by the application of common salt—showing that soda is a much less valuable fertilising constituent than potash, and incapable of replacing the functions of the latter in the vegetable economy.

Hitherto the price of potash has stood in the way of its being employed on an extended scale in agriculture. Even in its cheapest form—that of crude German potash salts—potash was too dear for practical application in agriculture. But as potash will, no doubt, be extensively used in agriculture if it can be had at a cheap rate, I have pleasure in directing attention to a mineral called Kainite, which is found in the neighbourhood of Staasfurth, in Saxony, and which, in round numbers, contains 24 per cent. of sulphate of potash, and 12 per cent. of sulphate of magnesia. This saline mineral can now be obtained in England, in a finely-ground condition, ready for mixing with other artificial manures, at about £3 3s. per ton, and probably less when considerable quantities are required. From 3 to 4 cwts. of ground kainite, mixed with an equal quantity of superphosphate of lime, per acre, has been found of great utility in the sugar-beet-growing districts of North Germany; and I have no doubt it will be found equally useful in England, where root crops are intended to be raised upon naturally poor or upon exhausted sandy soils. The crop, however, most likely to be greatly benefited by this potash manure is the potato.

On light soils, I would strongly recommend, as a manure for potatoes, the following mixture:—

- 4 to 5 cwts. of kainite (crude German potash),
- 4 cwts. of Peruvian guano, and
- 4 cwts. of superphosphate of lime.

In buying kainite as a source of potash, care should be taken to have a sample of the bulk tested for the amount of potash which it contains; for not only are some of the samples offered for sale very poor in potash, but some scarcely contain any potash at all.

Good kainite should contain about 13 per cent. of potash, and should dissolve in water without leaving any considerable residue.

The following analysis may be taken as fairly representing the

COMPOSITION OF A GOOD SAMPLE OF KAINITE.

Moisture (loss at 212° Fahr.).....	3.36
Water of combination.....	10.88
*Sulphate of potash.....	24.43
Sulphate of lime.....	9.72
Sulphate of magnesia.....	13.22
Chloride of magnesium.....	14.33
Chloride of sodium.....	30.35
Insoluble siliceous matter.....	71

100.00

*Containing potash..... 13.20

In another report (*ibid.*, p. 153) the Professor gives the results of some valuable experiments, instituted at his suggestion, in the season of 1869, at Eerick Park, near York, by Messrs. J. Coleman and J. Hall upon mangolds.

The mangolds were sown on May 11, 1869, on a barley stubble in 1868. The soil of the experimental field was of a light sandy character, and, though naturally poor, it was in a good agricultural condition, as the produce from the unmanured plot showed.

"The mangold crop was taken up, topped, tailed, and weighed, on the 11th November, 1869, when the following results were obtained:—

Plots of 1-20th of an acre.	Manure per Acre.	Produce per Acre.
		Tons, cwt. lb.
1 ...	No Manure.....	23 10 0
2 ...	Mineral Superphosphate 3 cwts.	23 10 0
3 ...	Mineral Superphosphate 3 cwts. and Potash salts..... 2 cwts.	29 5 0
4 ...	Mineral Superphosphate 3 cwts. and Peruvian Guano..... 1 cwt.	26 0 0
5 ...	Peruvian Guano..... 3 cwts.	24 15 0
6 ...	No Manure.....	21 0 0
7 ...	Mineral Superphosphate 3 cwts. and Potash salts..... 2 cwts.	30 5 0
8 ...	Sulphate of Ammonia... 1 cwt. Rotten Dung..... 20 tons	30 10 0
9 ...	Mineral Superphosphate 3 cwts. and Potash salts..... 2 cwts.	31 15 0
10 ...	Nitrate of Soda..... 1 cwt. Rotten Dung..... 10 tons	31 5 0
11 ...	Mineral Superphosphate 1½ cwt. Bone-dust..... 3 cwts.	27 15 0
	and Mineral Superphosphate 1½ cwts.	

The preceding tabulated results exhibit several points of interest, on which a few observations may be offered:

1. In the first place, it will be seen that the two unmanured portions of the experimental field yielded a fair crop of mangolds. One of these plots produced 23½ tons per acre, and the other 21 tons; or, on an average, the unmanured plots produced 21½ tons of mangolds per acre. The difference in the weights of the crops on Plot 1 and Plot 6 is not greater than can be expected in field experiments. The experimental field thus was tolerably uniform in character and well adapted for the trial.

2. Mineral superphosphate alone gave only an increase of 1½ tons, and thus appears not to be the kind of manure which ought to be employed for mangolds on light land.

3. The addition of 2 cwts. of salts of potash to 3 cwts. of mineral superphosphate proved very successful, inasmuch as it raised the produce to 29½ tons, and gave an increase of 7½ tons over the average yield of the unmanured portions of the field.

4. In these experiments, the addition of 2 cwts. of salts of potash had a better effect than the addition to superphosphate of 1 cwt. of Peruvian guano, or than 3 cwts. of Peruvian guano alone.

5. Peruvian guano alone answered better than mineral superphosphate applied by itself, but did not appear to be the best artificial manure that can be used on light land for mangolds.

We may learn from this that neither the exclusive use of a purely mineral phosphatic manure, nor a manure containing, like Peruvian Guano, an excess of nitrogenous compounds, produces the best crops of mangolds on light land.

6. A moderate amount of an ammoniacal salt, or of nitrate of soda, added to a manure composed of available phosphates and salts of potash, appeared to be very useful.

The mixture of 3 cwts. of superphosphate, 2 cwts. of salts of potash, and 1 cwt. of nitrate of soda, it will be seen, produced 31½ tons of mangolds, which, considering the natural poverty of the soil, must be considered a very good crop indeed.

The same mixture, it will also be observed, had a better effect than 20 tons of farmyard manure: for, while

Plot 9 gave an increase of 10 tons over the unmanured plots, 20 tons of rotten dung per acre produced only an increase of 8½ tons.

7. A heavy dressing of dung proved to be less beneficial than the addition of some superphosphate to a moderate dose of dung. The best crop, it will be noticed, was obtained by 10 tons of rotten dung and 1½ cwt. of superphosphate.

On the whole, the results obtained at Esrick agree well with those described in the series of experiments which were tried by Mr. Ellis at Iver Moor. Both sets plainly show that potash salts are very useful to mangolds, and that, in order to obtain the best economic results from their use for this crop, they should be mixed with superphosphate and a small quantity of either sulphate of ammonia or nitrate of soda.

I have repeatedly observed that a small quantity of nitrate of soda helps on the mangold plants in a striking manner, provided other fertilisers are used at the same time, or the land is in a high agricultural condition. The mixture of 3 cwts. of superphosphate, 2 cwts. of salts of potash, and 1 cwt. of nitrate of soda per acre, can be recommended, both as an economical and beneficial artificial mangold manure for light land."

The result of these researches will lead to other and more extended experiments with the salts of potash. They afford additional evidence of the importance of mixing together our artificial manures, and of avoiding the rapid conclusions at which we are too apt to arrive

from imperfect examinations. That we have during the present century made great advances in our knowledge of artificial fertilizers is an undoubted fact, but then we are well aware that many a vegetable mystery has to be unravelled, many a discovery yet made, before we can conclude that no farther advances are to be made in rendering our soils more productive. We are, in all probability, ever treading on the verge of some discovery relating to the food of plants, a knowledge which our former experience tells us we are often much nearer to, than we are always willing to believe. We have an instance of this in some of the laborious trials of the celebrated Arthur Young. It was in the year 1782 that amongst many experimental dressings he used various salts of ammonia and of potash; several acids, such as the nitric, the muriatic, and the sulphuric; and also impure varieties of phosphate of lime—as in the dung of poultry (*Annals of Agriculture*, vol. I. p. 150, vol. III. p. 122). Had he but mixed some of these together he would have formed that superphosphate of lime which, after the lapse of more than half a century, Liebig first advocated the use in 1840. The very numerous trials of Young were often made in large pots of earth, and extended over several seasons. His reports of them, always graphic, were ever and anon amusingly simple, thus he informs us on one occasion (*ibid*, vol. I. p. 162): "A carpenter letting a piece of timber fall on the pots while putting up a bench, broke some and tumbled the rest over. Here, therefore, ends this trial."

ON LAYING LAND DOWN TO GRASS.

BY THE NORTHERN FARMER.

In mixed husbandry the cultivated grasses occupy an exceedingly prominent and important position; so much so that much of the prosperity of the farmer who follows a fixed rotation depends on their successful cultivation. In the months of February, March, April, and sometimes even a portion of May, their absence, from whatever cause, is extremely noticeable and very much felt, the farm having a singularly bare and thriftless appearance, scarcely affording a bite for out-lying stock, such as sheep, and that at the very season when of all others it is most wanted.

No farmer holding light land can afford to neglect or attend but superficially to the proper seeding of those fields, which in the ordinary course require to be laid out to grass each season. The actual loss of cash in purchasing the seeds is not worth a moment's consideration when compared with the ruinous waste of land, rent and taxes being paid for that which gives no adequate return, and which will never give a return until again broken up, put through a course of restorative husbandry, and laid down in a proper manner. Notwithstanding the very marked improvement in the selection of grass seeds, and in preparing the land for their reception, which has been gradually effected, there is still much indifference displayed on the part of many farmers, and badly laid down fields are to be met with much more frequently than is consistent either with careful management or full profit.

With small farmers the field daisy (*Bellis perennis*) is the usual indication of thriftless pastures, this plant being sure to take possession of soils that have been long worked and laid down in poor manurial condition with bad seeds. Where it exists in abundance, the grass must of necessity be poor, as, notwithstanding the extreme prettiness of the daisy, its tendency seems to be to render those fields which it occupies absolutely sterile.

On large farms, where the manurial condition of the soil has been attended to, but the cleaning neglected, couch-grass is almost sure to have possession, to the almost total exclusion of the grasses which have been purchased and sown, involving considerable outlay of capital. Such fields afford no food for stock; and are easily recognised in spring by the white appearance of the vegetation, the brilliant and refreshing green of the cultivated grasses and clovers being altogether wanting. There can scarcely be a doubt but that the presence of couch in considerable quantity is the principal cause of the wretchedness of the hay crop in but too many instances, as it is quite impossible that the driest spring ever experienced could have the effect of seriously injuring a crop which is cut so early in the season, if the conditions for its successful growth were at all favourable. However rich in manurial constituents a field may be, it is impossible to have a successful hit of the seeds if cleanliness has not been rigidly enforced; and hence, whatever the expectations formed of the future capabilities of that particular field, either with regard to grazing or meadowing, they must inevitably result in disappointment when this has been neglected. Docks and thistles in first year's hay is simply disgraceful, and the man who permits these weeds to be present scarcely deserves the title of farmer, as a very little attention at the proper time is sufficient to prevent their appearance in this crop. Cleanliness and a high state of cultivation we thus find to be indispensable to secure a good hit and vigorous after-growth of the grasses and clovers; and, premising that the land has received all the attention that care and skill can devise, there is comparatively little danger of failure. This is more particularly the case when sown with spring-corn, and put in on the soft tilth a few days after the corn; every seed seeming to take, both clover and rye-grass growing with such vigour

as to threaten serious injury to the grain crop; and, in fact, on those lands which grow soft straw, a wet season does cause considerable loss, as when once beaten down amongst the luxuriant vegetation, the corn is never again able to recover itself. When the desire is to encourage the grasses as much as possible by sowing them simultaneously with the corn, barley on such land becomes a dangerous crop, escaping injury only in exceptionally dry seasons. Oats do well as a substitute, and so does April wheat, both crops standing much better than barley, and when the superiority of the straw is taken into consideration, will in general prove quite as valuable. On those soils on which barley is unusually productive, and being suited for malking purposes commands the highest price, the corn must be permitted to get a good start before the seeds are sown, so that all danger may be obviated. When the soil is rich the latter mode is absolutely imperative, and by adopting it success is nearly certain with both crops, the grasses and clovers not attaining full luxuriance until the severance and removal of the corn. The suitability of the seeds sown to the qualities and capabilities of the soil, both natural and artificial, requires to be carefully studied; as it is sheer folly to sow seeds that will not grow, or if through circumstances being peculiarly favourable they are enabled to make a start, the nature of the soil killing them out before they have been of any practical use. Thus it is useless to sow clovers on low-lying reclaimed soils; as even if when the corn is cleared off the clover appears moderately abundant, by the time spring comes round not a vestige of it will be seen. Alaike, which is supposed to do better on such land than any other, will scarcely be found to outlive the first winter. We speak from experience on this subject, no longer gained than the present season; as when recently looking over a twenty-acre field laid down last year, we found that on the lower half, which was drained some years ago, there was not a single plant of clover, while on the higher portion the surface was completely coated with a most luxuriant growth, the division being as distinctly marked as if drawn with a line. This we take to be a most conclusive test as to the uselessness of sowing clovers on land of a marshy or boggy nature, as the portion of this field from which the clovers have died out has been rendered as dry by artificial means as the upper is so naturally, although previous to its being drained it afforded the best snipe-shooting in the whole surrounding district of country. Some caution is necessary in laying down land to permanent grass, with regard to the introduction of short-lived plants, such as the Italian rye-grass; for, although affording a large amount of food for the first and second years, and having the very great advantage of coming in early, it is extremely apt to leave the sward of grass thin and patchy when it becomes exhausted, the very vigour of its growth preventing the other plants from diffusing them selves. Four pounds to the statute acre we consider quite enough on land in good condition; and that quantity will make a great appearance the following spring. On higher or poorer land, where the growth will not be so vigorous, the quantity may be increased to 6 lbs. When the conditions are favourable for success, the land clean and in good heart, and the seeds of prime quality, it is surprising what a small weight of seeds will prove sufficient for an acre. Although this fact ought to be pretty well known to farmers, it is certainly not acted on by all, as many of them give the preference to quantity rather than quality, covering their fields with the sweepings of some one's hay-loft, without having even once been put through a separator to try and get rid of at least a portion of the light seeds, and seeds of weeds, with which it is too frequently largely intermixed. Trashy as these seeds are they cost money to purchase,

besides the after loss which they involve by the poverty of the pastures. Were the same money per acre given to a respectable seedsman, say from 8s. to 14s., even although that amount would not purchase the full weight of seeds usually given to each acre, yet it would give a much better sward, besides escaping the wholesale introduction of the vilest weeds. It is scarcely safe to sow the grasses and clovers before the first week in April, sharp frosts and harsh winds being of frequent occurrence, both of which are highly prejudicial to the well-doing of such tender seeds. Unless as a mere matter of convenience it is not of the slightest advantage to sow early; those put in when heat and growth have fairly set in making such rapid progress as speedily to outstrip those sown earlier, and which have been checked when in the most critical stage. On lands difficult of access and which have been specially improved at considerable cost for the purpose of being laid down to permanent pasture, the seeds may with great propriety and much future profit be sown without a corn crop; the same course being followed on superior land, when it is desirable to provide a large supply of succulent food for autumn use. In general, however, the ordinary rent-paying farmer, following a fixed rotation, will be loath to sacrifice the corn, even although, from having abundant capital, it may be optional for him to do so if he thought fit. Young grass is in great danger of serious injury from being too closely eaten down in the spring, when there happens to be heavy stock of breeding ewes on the farm, particularly if the season is a backward one. To prevent the lambs from losing condition, the inducement is great to keep them on the seeds rather long, the injury committed by so doing being irreparable. The sheep eat out the heart of the clovers, and many of the plants perish; besides, when the surface is rendered completely bare immediately before the setting in of warm weather, the roots exposed to the scorching sun become so enfeebled as to render growth an impossibility. We consider it absolutely imperative when the young seeds are pastured with ewes and lambs, to remove the stock before they have had time to eat the young plants so close as to cause injury; and if removed in time to permit of hay being taken the same season so much the better, as the roots have then time to establish themselves, and excellent feeding is provided for autumn and winter. Cutting early is of great importance when good pasture is wasted, as the plants, not being exhausted by maturing the seed, make an immediate growth, actually providing more food, and of course keeping more stock after the hay had been removed than would have been afforded for the entire season had the sheep been kept on through the month of April. The after-grass is well adapted for young sheep, such as lambs newly weaned, the herbage being particularly sound and healthy.

THE HEREFORDSHIRE AGRICULTURAL SOCIETY.

—At the annual meeting, Mr. Jancey said he thought the item of payments to stewards might be reduced. He should propose "that the show be reduced to one day before the fair, and that a committee of some few be appointed to see in what way the other expenses could be reduced, and that the meeting be adjourned to receive the report of the committee." Mr. J. Walker seconded this. Mr. Pitt, whilst agreeing with Mr. Jancey, thought, at the same time, that the landed proprietors should make an effort to assist the Society to erect permanent shedding. After some little discussion, Mr. Jancey's resolution was ultimately shaped into the following: "That a committee be appointed to consider the following questions—First, the time of holding the show; secondly, the duration of the show; and, thirdly, the general subject of the finances of the Society."

THE BUDGET.

"The only phase of the argument to which the heads of the present Government have so far appeared willing to yield anything, has been in allowing the farmer more liberty in making use of his own produce. We see something of this in the offer of Mr. Gladstone's Mixture." It was thus that we wrote some six or seven weeks since, immediately after Colonel Barttelot had brought on his motion; while we said, further, that we were "inclined to think this offer of a substitute would only impede, if not the settlement, at any rate the direct discussion of the matter. It is taking us off the line of the hunted fox; while there is something in the very notion of people who brew their own beer having to provide themselves with licences that sounds obnoxious and inquisitorial. Moreover, we much question whether so clever a financier as Mr. Lowe would quite relish the idea of other people, more particularly of other people on the other side, adjusting the nation's burdens for him." And all this has precisely come to pass. With considerable ingenuity the Chancellor of the Exchequer contrived on Monday evening to run, as it were one into the other, the prayer to take the licence off public breweries and to put this on private establishments. He "dashed" one, as he had just previously "dashed" the other; and as for the pet substitute of the present school of Malt-tax repealers, Mr. Lowe "can make nothing of it—it would violate one of the first rules of taxation, namely, that taxation ought, as far as possible, to leave things as it finds them, and not give people inducements to alter their method of trade, and do things which do not tend to the improvement of the revenue." And so they lifted the right honorable gentleman off the line of the hunted fox; as he settled to the scent again just where we thought he would: "It has always been difficult to devise a means by which farmers might be allowed to use malt for their cattle without interfering with the revenue, and I believe all that ingenuity could do in regard to this subject was done when my right hon. friend the present Prime Minister suggested the mixing of the malt with linseed. I think, however, that the problem to be solved was not properly stated. It ought to have been put, not 'How can we allow the agriculturist to feed his cattle on malt?' but 'How can we allow him to feed his cattle on barley which has arrived at that stage which is best suited for the feeding of cattle?' One process which barley undergoes leads to the germination and generation of the saccharine matter, and the second is the kiln drying, which has no tendency whatever to improve the malt for the purpose of feeding cattle. On the contrary, it is prior to the kiln drying, when it is not parched up, that the barley is best suited to that purpose. What I propose, then, to the Committee is that we should permit farmers to steep their own barley and feed their cattle with it. The only precaution necessary to take, in addition to the ordinary Excise precaution of liberty to visit the premises, will be to provide that there shall be no kiln on the premises, or within a reasonable distance of them—say a quarter of a mile—so that we may have a reasonable assurance that the barley is really intended to be used for feeding cattle. I understand that when barley is in such a state that it is ready to be kiln dried, it is most suited to the feeding of cattle, and the Inland Revenue Department think we can make this concession to the farmer without putting the public to the great loss and injury which would result from transferring the incidence of the tax from malt to barley." And this, as we said before,

we say here again, is all farmers may expect to get in the way of relief from the present Government; as even this, according to Mr. Sewall Read, is not so much: "He dissented from the Chancellor of the Exchequer's statement that in allowing farmers to use sprouted barley for cattle food he gave them the very best produce capable of being made from barley for feeding stock. Malt was very much better, although it was not necessary to dry or roast the malt to the extent necessary for making beer." Noticeably enough, however, at the very last meeting of the Council of the Royal Agricultural Society, Mr. Thompson, as Chairman of the Journal Committee, recommended "that a series of experiments be set on foot during the next autumn and winter to test the comparative feeding-value of barley and malt, at a cost not exceeding £100." And this report was adopted. It would so seem that any such comparative value is not even now a settled question, although people were getting already weary of experiments, which may probably be made to cut either way.

There can be little doubt, moreover, but that many farmers are themselves getting weary of the manner in which the case of Repeal has of late been worked. The proposal of so inconvenient a substitute as that named was, as we maintained from the first, a mistake, and the sooner that it is dropped the better. Again, it is very evident, as we have continued to urge, that a Liberal Government does not intend to repeal the Malt-tax. We have said, "As a winning game, the battle has now for many years been fought in direct defiance of the first principles of political strategy. The chief 'opportunity' has generally been found when the Country Party is in opposition, or, in plain English, when a minority might be expected to rule a majority." To carry repeal, the agriculturists will have to *create* "a Party," the only question being, whether the county members are sufficiently in earnest to be put at the head of the movement? Plainly we doubt this, for so far they have pretty generally taken up the cry for election purposes, and for but little more. The true men in this way, in the House, might be counted off on one's finger ends. Our contemporary *The Economist*, whose opinions were so ludicrously adopted and hawked about elsewhere, thus coolly dismisses the subject on Saturday last: "It was only imagined that Mr. Lowe would reduce the malt-duty, because it was thought such a policy would be popular in counties. But this is quite a mistake. Not one county in ten cares the least about it or would benefit in the least by it." We will not go quite so far as this; but we are very sure that not one county member in ten cares the least about it. "Well, he did not exactly promise me anything, but he pressed my hand, as much as to say, 'Your business is done,'" reported the needy man to his family after his interview with the Minister; and very much in this way did the Central Chamber talk of its interview with Mr. Lowe. But then it is the inevitable fate of this same Chamber to muddle everything it touches, and the next step will be to try and forget as soon as possible the famous substitute "which would violate one of the first rules of taxation."

They tax the team horses, they tax the shepherd's dog, and now they are going to tax the bird-boy's gun. However popular the budget may be with other classes, it would certainly not threaten to find much favour with the farmer. But prettily as this notion of a gun-tax was

put, we fancy that we see in it something more than that which floats on the surface. There may be a growing inclination amongst Englishmen to carry arms, although saving in the way of the Volunteer movement this has not been so apparent. Still, there may be a budding tendency to expand such a habit. Let but the Game Laws be only partially repealed, let hares and rabbits come to rank no higher than rats and mice, and everybody will be ready to have a pop at them. In fact, but for this general gun charge every other man would then saunter along the roads and lanes with a gun in his hand instead of a stick or a spud. In any case the number of accredited Shots must considerably

increase. A professional man or a lad home for the holidays will, as it is, often take out a certificate for the sake of a week or so's sport; whereas, on the other hand, many are debarred from doing so by an expense which will no longer stand in the way. The outlying birds, as well as the mere vermin, like rabbits, will be more harassed than ever, and the change should so be fraught with some good, if it be not the prelude to something more. If, however, an exception is to be made in the case of the Volunteer, this should certainly be extended to the farm-servant whose business it is to scare away the crows or kill the vermin which injure his master's crops. —*Mark Lane Express.*

THE NEW FARM.

"Good news from home"—nay, rather sad news from farm. I say nothing of the murderous conduct of the frost towards the young ley planted wheats, nor of the cruel nip it has caught the clover stems just at the back of the neck, giving them a rheumatic twinge where the roller had managed to bruise it. I say nothing of that, for a good stirring with the horse-hoe, which is working capitally, will cause the one crop to tiller, besides, that under the surface, I find many weak seedlings just ready to start if more genial nights would encourage them. The wheat I don't think is after all as bad as it looks, although several of my neighbours are, I understand, breaking it up and replanting with barley. The clovers too were well dressed with a coating of long manure, so that I think they may come round, for there is nothing like long drawers and good keep for a cold. The intelligence is unhappily of a more vexatious description. A valuable young porcine matron, vexed I fear by the severity of her throes, has turned cannibal and devoured her offspring; while, on the other hand, master reynard has found our juicy stores out again and has appropriated several of our darling wild-ducks. This is the more annoying as we cannot leave them out at night now, and the usual region of their nests is unsafe. Unluckily they require to choose their own, and will not sit just where the fowl-wife wishes, so we have the carpenter building rafts to float on a pool enclosed within the fold-yard, hoping that the red robber will not venture there. He is, however, *sufficiently* bold, as Ciceronian authors write. In fact he waylaid his first victim quite close to the kennel of a terrier that, remembering former experience, I thought well to chain up in the orchard beside the faggot-heap, under which the ducks build. It was a curious upstanding, head-on-one-side, swaggering, tailor-like, comical, little mallard, white as snow too (being a cross with the call-duck) that he took first. The bailiff and I had been looking at the bird with some amusement during his afternoon meal, and observed that by some means he had lost an eye, a misfortune which possibly caused his quaint air. Perhaps, too, it was with a view to protection that he haunted the neighbourhood of the kennel, keeping his extinguished eye on that side, as the one-eyed hind of which there is record in *Æsop's* fable. Reynard is cute enough, and no doubt argued that where there is a kennel there is probably too a chain, and so he ventured up, choking our hero's throat by one snap of his lancet fangs, and completing his triumph by devouring the greater part of him on a neighbouring fallow. This was bad enough, and we were at once on the *qui vive*, but it happened that a few days later the children going to a low lying meadow, beside a brook, to gather violets, came across the carcase of a vixen fox with brush and foreleg gone, and a piece of lamb in immediate proximity.

An immense forest and a large tract of rocks, inaccessible to hounds, being situate not many miles hence, the foxes breed there in great numbers, although until lately they have not troubled our hen-house. I am afraid that under all circumstances there was about our homestead a feeling of something like exultation that the thief was caught, and the ducks got their freedom again. A fortnight from that date, however, only last Monday morning, as we arrived to look round, the hen-wife took a mallard's gorgeous head from a cleft in a twisted pear-tree, saying, "Master Fox has been here again." On the evening before I had been watching with so much delight the love-making rambles of the various pairs as they went working about in the old grass, and sucking ever and anon what seemed especially delicious, something I could fancy between a slug and a kiss, for their bills were working together in the same spot. So, too, the cunning plunderer must have found them, and, with a feeling of undoubted glee at the sport he was to spoil, came creeping from apple-tree to apple-tree until he got conveniently near to grab them, which he did most effectually, just cutting their necks through and leaving the bodies behind, having possibly been disturbed or struck with a feeling of due remorse. So the carpenter now is hard at work providing what I trust may prove a residence of safety. The cottagers under the hill tell me that they hear his lordship bark nightly. The plan they adopt to scare him from their tiny lambs is to rub them well with a ring of red ruddle around the necks. He will never touch a youngster so distinguished they tell me. There being plenty of rabbits about why cannot he be content therewith? From an apprehension possibly of taking tapeworm on board, a delectable form of parasite from which these pestilent ground game suffer considerably, as we were informed by medical authorities during the Trichina discussions, and which has made ourselves resolutely set face against what we were wont to consider, when boiled and smothered in onion-sauce, a delicate and delicious food.

Having all but overlooked "Observans's" letter, I am happy to give him the benefit of my experience in bull breeding if he will take it for just as much as it is worth. If he wishes to exhibit he must from the first do the calf well, keeping it in a box and letting it to its mother, or better to a deep-milking half-Alderney twice or three times a-day, and supplying it with meal, roots, cake, eggs, fine hay, &c. Feeding for exhibition is an art in which few thoroughly succeed, unless they have to help them a servant who has the inborn gift of knowing when and how. For it is no less. I will not bother him, however, but just answer his inquiries. The bull calf ought to have a light ring put into his nose as soon as he is

weaned, and as soon as the wound is healed the breaking should begin. Let one man lead him, or rather try to lead him out, for he is sure to pull back and resist. The smart application of a switch to the region whereby youngsters are best instructed will make him jump out and struggle. Pat and sooth him, the man in front holding him steadily meanwhile and walking on. Then if he again holds back, again the smart administration behind. One or two days of this tuition will ordinarily bring him to lead quietly. He should then be led and exercised daily, with many interludes of soothing and petting.

"Observans" will remember Lord Byron's recipe for dealing with a fractious flirt. "Pique her and soothe her: soon you'll have your way." So, too, he must conquer his Shorthorn princesses. He cannot break them in too soon. I had two gentle bulls last year, which, being kept for home use, were not fairly broken. The consequence was they could only be driven in company with a cow—and not led. This, in the end, became vastly inconvenient. A bull calf will do well on good pasture running by his mother. They should be driven under shelter during heat. I think, too, that there is something in what old breeders say, that the tail of a calf that runs with and sucks his mother on the open is apt to be high. "Observans" will notice that they generally suck swaying that appendage triumphantly in mid-air. On the field of course they suck oftener than they do when kept within doors. Hence, either the joint loosens out of symmetrical position, or at least from too frequent a repetition of the act they form a *habit* of carrying the tail high. (For further information on this head, see Aristotle's *Ethics*, Book II. cap. 1.) I have found no difference in disposition between bull calves reared two in a box or singly. Their boxes should be free from publicity. Being looked at, especially if there be a walk in front of them, irritates them terribly. I had one amiable fellow spoilt by the tricks of a lad tending a mason, whom I had occasion to employ near the box, and whom I wish the animal had pitched into primeval mortar.

I remember asking Culshaw about a bull which I bought at Towneley, and which became cantankerous. After an instant's thought he said, "oh, it's all owing to So-and-so" naming one of his ancestry. Temper is undoubtedly inherited. I had one youngster made so quick in his temper that he was called after a distinguished

auctioneer, all owing to a young lady with a white veil peeping hastily into his box through the open half-door. He started frightened to his feet, and from that hour continued fractious. I sold him, however, and the last time I saw him was with a rosette upon his brow in the show-yard, as gentle as need be. He had been put by his new owner into a secluded box, and treated by his attendant judiciously, with a mixture of severity and kindness.

Another amiable yearling having been turned into a yard for exercise, got his attention attracted by an old man who stupidly took that way to carry some straw for thatching. A few journeys passed off well. At last the animal took to follow and rub his front against the bundle. Finally, with a frik, he upturned the straw, and by consequence the old man too, who hobbled off in a fright, leaving the bundle to the bull's mercy. The animal reflecting on this issue became savagely addicted to butting from that day. It is with young bulls as with young boys; be firm, patient, and considerate. Promptly check any liberty taken; acknowledge and reward obedience. And now I think "Observans" will have had enough of me.

There have been several salmon taken by anglers in the pool under the house, but I find there is a gang of others bent on spoil. One of the professional fishermen informed me first. You may hear them "whistle in the stilly night," and the mud is covered with their cat-like tracks.

Being out early this morning, I found two of my men hotly tearing down a bank into which they had seen a weasel run. I disapproved and stopped them, for last week one of the stack-yard cats caught one and killed it, and on thrashing out a rick alongside we found no less than fifty rats, young and old, which this foreigner had doubtless come after. This vermin swarm had invaded us when our neighbour cleared his granaries, for we had been comparatively free before. The weasel I think does more good than harm. The stoat is of quite another sort. When we set about thrashing we had the gardener's fruit-tree nets stretched around the proceedings; the consequence was that not an individual rat escaped. The terriers caught every single one, no matter where they broke, being baffled by this fence, which they were not allowed time to gnaw through. But I have shot my allotted arrows. Once more adieu! VIGIL.

THE SCIENCE AND PRACTICE OF SEEDING.

Professor BUCKMAN has delivered a lecture before the Blandford Farmers' Club on this subject. He said he should only touch upon a branch of the subject, calling their attention to a few facts connected with agricultural seeds, and referring to certain experiments which he had made. With regard to our crop plants some people entertained the idea that when man was originally placed on the surface of the globe all plants necessary for his existence were put on the earth with him, just ready to his hand, ready to cultivate and work upon. But he entertained a perfectly different opinion. He believed that all our farm plants were derivatives, that by experimental processes they had been derived from wild ones. He inferred that all our garden esculents had been derived from cultivation, the forms and varieties gradually increasing and improving. They would observe the important fact that plants thus derived required cultivation in order to keep them in the position in which they were found. If you had a good plant it was important to pay a deal of attention to its development and growth in order to keep it in its position. With regard to seed it was important that they saved good sorts, that they did not allow it to grow wild and scattered about the

ground; they should adopt something like scientific processes in choosing that kind which they knew was the best for their purposes. Respecting the sowing of it, too, there were certain processes to be observed. They should take care to sow it sufficiently thin, so that one plant should not obtrude upon another; thus they would get those plants which would pay them for the different processes which they adopted. He had performed a few important experiments some time ago. He had always heard it asserted in some parts of the clay valleys that oats could not be successfully grown because they degenerated into wild oats. This might be a farmer's notion; but it was not a scientific notion. His notion was derived from experiment and practice; he believed that the wild oat was capable of producing the cultivated oat. The learned professor here entered at length into some experiments which he had made, illustrating his remarks on the black-board; he drew specimens of the wild oat, and some of its derivatives, showing the different auzes, also the long spikes, the silky hairs, and the berries characteristic of the plant. He had cultivated some of the wild oats, and next year he found that they contained seeds; by the process of cultivation he obtained in four

or five years oats of 38 lb. to 40 lb. per bushel. He was soon made aware of this fact when he examined some of the oats grown under wild circumstances, grown round the oat ricks—he found that they were not so good as the crop which he had sown. When he went into the market and found oats 86 lb. and 38 lb. per bush, he saw that some were thin in the berry, with some hairs at the base, showing that they were not the best kind, but oats that had degenerated into wild oats. There was every reason to believe that after all the wild oats about our farms had in a great degree degenerated from the cultivated oat. The inference was that, inasmuch as wild oats were capable of being by cultivation, getting the best examples, improved to a cultivated state, so cultivated oats would degenerate into wild ones. If they sowed oats of a poor quality on poor land they would find that they would have a poor crop. He deduced, as already stated, this fact; that inasmuch as wild oats were capable—by care and selection, by being put in prepared, cultivated ground—of advancing in the course of years to good cultivated oats, so good cultivated oats were capable of degenerating into wild oats. As the result of an experiment he had taken the seeds of a wild vetch and cultivated them, when he became aware of this important fact—that under cultivation half the seeds would be very small indeed, while the others would be double the size. Examine any vetch you liked, any sample produced that you liked, and you would find that the seeds varied considerably in size. He went to a farm, and he was shown some small vetches; the farmer admitted that they were small, adding “But then you see you get the measure.” Now experience showed him (the professor) that measure was not enough for him. Giving the result of experiments with the smaller and larger specimens, he showed the advantage of the latter. As a general rule they would find, he urged, that the best seeds would, under all circumstances, be the best for sowing. It was a folly to suppose that filling up the measure would answer the end in view; small specimens produced but small results. It was the same with plants as with animals; if you had not a good sire or dam you would be quite sure to have small results. He wished them to understand with regard to vetches that the matter of selection of the seed should be observed; that cultivated vetches were but derivatives from the wild vetch. Proceeding he entered into an account of experiments with the wild parsnip. He had some specimens of the wild parsnip, which he put in a new bed; he selected the seeds, planting them in prepared ground, and instead of having the forked roots (indicating the wild parsnip, as shown on the black board) he had the larger esculent (also drawn), which was at present in cultivation under the name of the student parsnip. Any of his friends present could try the experiment; they could take the wild parsnip seeds and put them in a drawer till next spring; then they could put them in a prepared bed. Some, they would find, would be covered with hairs, and wild, dark coloured; others would be light coloured. They must select their roots. Selected roots are of the utmost importance. From all the experiments to which he had referred he concluded that all our garden esculents, all our cultivated farm plants, were derivatives; that they had all been derived by cultivated processes familiar to every farmer, and which he constantly carried out. The farmer had his change of seed; he got his seed from different localities—these were cultivated processes. His (Professor Buckman's) object now was to point out the principles upon which those cultivated processes depended. In the first place the selection of seed was of the greatest possible importance. They knew very well that when they selected their seed they endeavoured to get seed of a good quality. They wanted occasionally to change the sort of seed. Why was this? Because if they did not change the sort, if they kept the same place for sowing, they would be neglecting some of the cultivated processes by which the sorts they aimed at had been derived. They wanted not only to change the description of seed but also to change the soil; they must go from one locality to another. Professor Buckman recommended that, when practicable, crops produced by the kind of seeds offered for sale should be examined. He observed that when a new sort was introduced into a district it became fashionable, for the reason that it had never been tried before. It took a new position. Your neighbour got an excellent crop from it, better than before; so you tried it yourself, and it became fashionable. But by and by another sort was introduced. Change was necessary on the principles which he had already

pointed out. From perpetual changes they obtained better crops. The greater the amount of changes the more they were likely to succeed. There was ample evidence afforded that the cultivated processes must be paid attention to. If this were not done no good results could be expected. Next he would call their attention to the quality of the seeds. They all knew that the seeds of all their crops varied very considerably, but they were perhaps not aware of the amount of variation. He had experimented largely with reference to this question, and he had come to the conclusion that a great number of seeds were sold in the market which ought not to be sold, for they did not germinate; they contained a great quantity of weeds. It was of the highest importance to get the seed free of weed. He had seen samples containing enough weed to stop all growth. Such samples every right-minded and judicious farmer would repudiate. With regard to wheat and barley he had tried some experiments. He had seen samples of seed of which 72 per cent. failed to germinate. He had seen barley of which 24 per cent. failed. Of some samples in his own neighbourhood the failure reached 30 per cent. Persons sowing seed at the present time sowed in some cases a sack per acre. Now before sowing they should try to do what he had always himself endeavoured to do—ascertain the germinating power of the seed. He never put into the ground a sample of wheat or barley until he had ascertained, if possible, what per-centage would come up, how much per cent. would germinate. It was easily done. The plan he adopted was to take a small flower pot and press the soil in it, leaving the seeds even; he put say a hundred seeds in. If placed in a hot-house the seeds would come up all the quicker. Thus they would see the amount of germinating power. He had done this frequently. He had made three or four experiments with barley. He had been much struck by some samples sent to him from the market. He remembered, for instance, receiving a sample of turnips. It was represented to consist of selected bulbs, and 96 per cent. would, it was said, come up. He tested the germinating power for himself, and found that 26 per cent. would not come up, notwithstanding it was represented that 96 per cent. would be the yield. Therefore it was important that farmers should be careful in these matters, that they understood the principles involved. They should ascertain for themselves as much as possible with regard to the quality and germinating power of the seeds. A respectable seedsman would ascertain this for them; still, they must look into the matter themselves—make it a matter of business, only trust worthy men. He should now like to point out to them some facts—which he hoped they would consider interesting—connected with the quantity of seed to be sown. This was a subject which would occupy them until midnight; however, he did not intend to keep them very long; he should merely point out some facts and experiments connected with thin seeding which, if they did not care about practising, they would at all events, he hoped, consider somewhat interesting. Regarding the quantity of seed to be sown, then, it must be regulated by various circumstances—not only by the quality of the seed itself, but by the climate, the soil, the kind of cultivation adopted, the forwardness of the work, and other circumstances which it would be quite idle for him to explain before such a society as that. He would point out to them some experiments which he had made in his own district. They might look upon him, he dare say, as a scientific man; but he only pretended to be a plain farmer, and if they came to his farm they would, perhaps, find many faults. They knew well enough that a person might have ideas and opinions, but could not get them carried out; he knew that for his own part he should find a difficulty in getting his men to do all the things he wanted. When he entered upon his farm his neighbours questioned the expediency of using superphosphates and artificial manures; they had not experimented with them, and they thought that it was no use for him to try them. He, however, adopted his own course, and the result was that persons were now using some of those appliances which before they would not use because, as they imagined, of their intility. He did not pretend to be a good farmer; he was not half so good a farmer as some of those present. He did not think he had farmed to much profit; he had, however, endeavoured to effect and carry on improvements, to make certain experiments connected with the science of agriculture, and that was as much as should be expected from a young fellow like himself.

He had determined to try experiments with regard to seeding. He had a capital man—a superior workman—he must not call him a bailiff because that was a swell name for a small farmer's man. He found, respecting barley, that his man was using for seed a sack of barley per acre. He said to him "That is too much. Suppose you take a tumbler and put three potatoes in it; you will find them too thick; or if you take a thimble and sow three or four barley corns in it you will find them too thick." He showed him that with regard to the sack of barley per acre he was doing pretty much the same thing. He, however, was at that time in a fresh district, and he had always respect for men acquainted with the district. He studied principles particularly because they could be applied universally. He was told that a sack per acre was not too much, and that his neighbour was sowing a sack and a-half, which really proved to be the case. It was remarked: "If you don't put it in, sir, you cannot expect to get it out." But after all that was not a scientific argument. If they came to analyse it they would see that there was a fallacy in it, which he should not now stop to point out. In 1864 he tried the experiment of four bushels of barley; in the following year he tried three, and he had a good crop—he thought quite as good as that produced by the four bushels; probably better. In 1866 he again tried three bushels with the same satisfactory result. In 1867 he tried two bushels, and in 1868 the same quantity, with favourable results. These experiments proved to him the advantages of thin sowing. He sowed in one part of the ground six pecks, and in another four pecks; they were in the same field, and the other circumstances were the same. As a result he had from the four pecks the most magnificent barley. The result of the whole experiments tended to show that the thinner the sowing the better were the samples produced; and an improvement in the quality of the produce, with a saving in the amount of seed, surely seemed desirable. He recommended them to make these observations for themselves—to put down to "log" every event. They should record the germinating power of their various seeds; the dates at which they were sown, the dates at which they came up. Putting all the circumstances together they would be able to say a good deal on the matter which they could not say unless they had some such evidence as that. What he said and wrote became scientific evidence; practical farming was the most scientific work in the world. Offering some remarks by way of conclusion the learned lecturer said he had endeavoured to point out certain principles from which certain facts might be deduced. He believed that the plants to which he had referred were derivatives. He had tried to show them the advantages of thin sowing where circumstances admitted it; if plants were sown thickly you never get anything like the crop you would otherwise have. A specimen of wheat was on one occasion submitted to him for examination, when he observed that it was "smothered out by weeds," or in other words that three or four times as much seed as was necessary had been sown, the greatest weed in a wheat field, as was once well observed, being the wheat itself. The gentleman who showed him this sample belonged to the county, and this conversation took place at a meeting of a board of guardians. They would see that sometimes a little business was done by boards of guardians. The gentleman knew it was a small kind of wheat, and denied at first that it was smothered out by weeds; it was, he said, "the cream of the flower garden." He, however, ultimately admitted that too much seed had been sown, that they had a little over, and they put it all in. The result was a poor crop. By the use of the black board the Professor illustrated the advantages of thin sowing with respect to oats. He found, he said, that he could grow oats on his light soil with a great deal of success, but in order to secure success he must sow half the quantity usually sown and the best seed he could procure. He did not look at seed that did not weigh 45lb. to the bushel; he had seen seed 48lb. to the bushel. If he sowed light samples he had a perfect failure. He had concluded from all the experiments he had performed that after all the best seed they could get was the cheaper to buy under any circumstances. No matter about the price; the best, the plumpest seed they could buy, was the best developed, the highest cultivated. They should aim to get as the parent of a crop, so to speak, a high kind of seed, just the same as they did with regard to stock. If they used degenerated sorts, why then, as with regard to their cattle, they were certain to meet with failure. He ad-

mitted that they could not do all this at once; they could not adopt the system of thin seeding at once. He congratulated them on burning their couch, which could not in that case hurt them. Some put it alyly up in a corner, fancying that it would rot. But he held that decidedly the best policy was to burn their enemies and to let their ashes become useful. He alluded to the large number of seeds from the common dock; he had counted, he said, as many as 80,000 seeds on one plant alone—at least he set a class of 20 students to do it, giving a branch to each student. To put weeds alyly in a corner did not, it must be confessed, look very well—that was not getting rid of the enemy. He fully recognised the advantage and importance of farmers' clubs discussing questions such as those which he had brought before them.

Mr. H. FOOKES (Whitchurch), thought they were much indebted to Professor Buckman for his capital lecture; he had given them a great deal of good and useful information in a plain, straightforward, and interesting manner. He had given the results of experiments which could be tried very easily by any farmer who had 50 acres of land. He (Mr. Fookes) did not exactly agree with the lecturer as to thin sowing; at the same time Professor Buckman had well observed that climate and other matters should be taken into consideration. He agreed with the Professor that the very best seed you buy was the cheapest in the end. Mr. Fookes referred to the success with which for a time he had grown Spalding wheat; he had sown it, he said, four or five years in succession; last year he sowed it on the race-course at Monckton. He liked, however, to change the sorts as often as he possibly could. He had found the Spalding wheat to degenerate. They had received some valuable information regarding oats and vetches, and he thought they would go home profited by what they had heard.

Mr. H. RICHARDS (Abbot's Court), inferred from what the Professor had stated, that in order to meet the question of thin sowing you required the land to be in a good state of cultivation. He could not believe that land in a low state required thick seeding. "Thin sowing" had been his motto for many years, and he believed he had never suffered from the practice; many had, however, he thought, suffered from too thick sowing. A good deal had been said about the members of farmers' clubs burning their couch. He had himself heard a good deal about it, but he did not attach much importance to censure passed upon them. He did not mean to say that members of farmers' clubs were better farmers than others, because he knew many non-members who were thoroughly good farmers. Great good, he thought, was derived from the plan of comparing notes together, stating their experience.

Mr. ROBERT FOWLER (Whitchurch) said in the professor that he did not only practice but also science. As far as his own (Mr. Fowler's) experience went the best thing they could do was to thoroughly cultivate, cleanse, and manure their soil. Next they must put in the best seed that could be bought for money at the best season of the year. They should keep the ground thoroughly clean and trust to Providence for the result. He had found from experience that the theory of thin or thick sowing should be guarded against by circumstances. When he began working on a little farm in Hampshire he almost insisted on it that the men should not use so much seed: He thought that twice as much seed was sown as ought to be. They then began thin sowing. But he had lived long enough to benefit by the experience of his neighbours, to know that they were not all fools; and he had gone back to their system, sowing as they did, as thick as ever they sowed, and perhaps thicker at times. If he had failed to do this it would have been much to his disadvantage. With regard to the quantity of seed sown farmers must be guided, he was satisfied, by climate, soil, and other circumstances. In some land a bushel would produce as thick plants as a sack would produce on other land. Regarding the wheat it had been thinned out this year by the frost; the frost had done it this time, and no mistake. He was only the previous day invited to ride over a friend's farm, his friend not knowing what to do with the wheat, it was so thinned by the frost. He had ploughed up a portion of it. His (Mr. Fowler's) advice was that if the land was thoroughly manured and in a proper state of cultivation the crop should be allowed to take its chance; but that if, on the contrary, the land had been worked out and was poor then there was no chance, and the

wheat might as well be ploughed out. He believed that a few years' practice taught them a vast deal. They did not find out things until they made certain experiments. He had learnt a little from what the professor had told them. Generally they coincided, he believed, with the views which he had advanced. Personally he had found by experience that it was essential to thoroughly cultivate and clean their land, using proper seeds at the proper seasons. He returned his personal thanks to the professor, whose pleasant countenance he hoped soon to see on his little farm at Whitechurch.

Mr. CHARLES FLOWER (France Farm) stated that some three years ago some white oats were bought at Bristol and sown in a good piece of land; the next year a capital crop of barley was reaped. This story had originated with Mr. Meikle, of Langton (Mr. Farquharson's bailiff) whose authority was undoubted.

Mr. FLOWER mentioned the case of a piece of wheat being spoiled by wild vetches. It had been pronounced to be a capital piece of wheat, and it was such, but under uncomfortable circumstances. Strange to say there had been no vetches there for 30 years, and the wheat crop this year was after two years' turnips. Now where the vetches came from he did not know.

Mr. FLOWER mentioned a report that couch properly cultivated turned into wheat at times.

Mr. G. GALPIN (Gamerton) joined issue with Mr. Richards on the question that it was unnecessary for the farmer to study chemistry. If you said that the farmer should not study it for himself, you might just as well, he thought, state that it was unnecessary to read a book yourself; somebody else could be paid for doing it for you. He wished the professor had spoken on grass seed; but time, he supposed, did not allow of his doing so. There were a few questions which he wished to put; one was whether it was not probable that in buying grass seeds you frequently bought couch. He would also ask the professor to enlighten them as to whether there was not two or three sorts of couch. He remembered buying what he took to be rye-grass; he called the attention of the seller to some small seeds, and the explanation was that it was grown on new land and had not come to maturity. He (Mr. Galpin) sowed it on clean land, but the result with regard to the quantity of couch was striking; he almost fancied that he was sowing couch grass. Now this was an important subject; he did not think they were able sufficiently to distinguish the different grasses. The whole subject of grasses was, he considered of the highest importance and demanded the utmost attention.

Mr. G. KEYNES (Spettisbury) thought with regard to thin sowing that they should study their land; he did not see that too thin sowing produced blight more than thick sowing did.

Mr. T. H. SCUTT, the Chairman, thought with a previous speaker that the subject of grass seeds was of great importance to agriculturists. He believed that they had a great many weeds in their grass, and recommended that the whole subject should be thoroughly considered. They could sow barley much thinner than wheat. He referred to the bad season with regard to the thinness of the crops. The lecturer, he said, had named 45lb. per bushel as the minimum weight for oats; he would have some difficulty in always selecting that; 40lb. was considered a pretty good weight. With a previous speaker, Mr. Cox, he did not think that the best samples of seed invariably produced crops of the best quality. Change of soil and other circumstances had to be taken into consideration. Regarding couch grass he did not think that they really had any business to burn any couch. He thought that if the land were properly managed, if they had any harvest, they could get rid of the couch by ploughing. On some farms not a bit was ever burnt; if it were allowed to rot it would be more beneficial to the land than if it were burnt.

Professor BUCKMAN, in the course of his reply, said that some questions of a scientific character had been put to him, to answer which would involve a longer lecture than he had already given them. In the first place he coincided with some remarks made on the Spalding wheat; he had seen wheat of a capital quality degenerated after three or four years, so much so that it might, in fact, be called by another name. Some wheats altered very much in colour. A great deal depended upon the soil and other circumstances connected with the cultivation. He had endeavoured to impress upon them the importance of paying attention to certain facts connected with science; they must have regard to them; they must look a

them fairly in order to get the best results; in order to get all the knowledge they could connect with the cultivation of plants. If they wanted good stock they looked carefully to the animals for breeding purposes; in like manner they made careful selections with regard to seeds for the propagation of plants. One of the speakers had stated with regard to oats, that he sowed some very thickly, and had all the better crop as a consequence. He (Professor Buckman) believed that this was sometimes the case. If they were late with sowing he was quite sure that it was necessary to put in all the more seed. It was important that all thin seeders should be up to the time; they must not be behindhand. Regarding the statement that white oats were sown, and that a crop of barley came up, all he could say was that he did not quite understand it (laughter). He had never yet succeeded in effecting such a change. He did not in the least dispute the evidence before him, it being given on the best authority; but he should certainly like to know something more about the matter. He did not think that white oats could under any circumstances change into barley: *non vice versa*. Again, it was stated that couch if cultivated at the proper time would grow into wheat. He did not think so. Science had done much; but there was always some source of error. Quoting from a pamphlet of his own containing some observations on seed, he stated that in a single sample of seeds he found 7,840 weeds; in a single pint he got 70,400. He calculated—taking this fact as the basis—that in a dozen pints of cloverseed required for an acre there would be 844,800 weeds. 17½ weed plants to the square yard were, he thought, enough to crop the ground. Weed seeds had such a faculty for growing, that they ever survived all the punishment given them. From experiments and calculations such as these he had pointed out they would see that they sowed most of their weeds; they would come to the same conclusions that he had done. He was on one occasion much struck by the wild camomile in a turnip-field; he could see nothing but camomile. The wild camomile was a pestiferous weed. Upon diligent inquiry, he found two or three camomiles had grown on the manure used for the ground. A single flower would produce 150 seeds. Two or three plants growing on a dung mizen would produce sufficient to crop a field with weeds. Here was indicated one of the ways of propagating weeds. Professor Buckman referred to the evils of dirty seed, expressing his opinion that it was now utterly impossible to get seed in the market as dirty as that sold say twenty-five years ago. Farmers, he said, who had looked into these matters, had become scientific men: they would not buy cheap and nasty seed. He recommended that they should burn rather than sell their noxious seeds. Regarding the subject of grasses, it was, he thought, a very wide one; and time had precluded his entering upon it. He did not, in fact, know a subject that was more interesting. He would advise the gentleman who had introduced it to go on with his studies: he evidently knew something about it. He (the lecturer) had made portraits of the various grasses; he had counted the number of seeds; he had a copy of every new grass; he had some hundred drawings. It was this faculty of observation, the constant determination to make observation, that after all made the true scientific man. What was science? Why, science was only this: they put this and that together, and then they came to accurate and sensible conclusions. He hoped that he should gain some knowledge of science from the remarks which they had made. The questions they had asked had set him thinking. They wanted to put all the facts together. They had very kindly expressed their satisfaction with his lecture. This was the first time he had come amongst them. He believed they were hearty and sincere in what they had said of him; and he hoped they would not make this the last time of his appearing before them. He hoped to come again, and that on that occasion he should not run away so soon.

Mr. W. FOOKES moved a vote of thanks to the Professor; and this was carried with acclamation.

The CHAIRMAN mentioned that it had been proposed to have an analysis of manures. The question had been fully discussed. But the Milborne St. Andrew Club were going to have an analysis also; and perhaps they would supply the Blandford Club with copies of the results, thereby saving expense. Probably the same manures would come under analysis at Blandford as at Milborne. He would suggest that a prize should be given for excellence in general root crops, and offered himself £5.

THE BREEDING OF DEVONS.

At a meeting of the Melplash Agricultural Society Mr. JOHN PITFIELD, of Symondsburry, read the following paper:— I will not pause to consider the locality from whence this beautiful and symmetrical breed was first derived, as I intend to confine my remarks to what comes under my own observation. It is probably true that at one time they were to be found only in one part of Devonshire, though now it would be absurd to imagine there are no good and pure animals out of the county whence they take their name. We have only to visit our agricultural shows to prove there are many choice herds of Devons not only in Dorsetshire but in several other distant counties. We must not, on the other hand, believe that everything that is called a Devon necessarily is one, for every little animal in a market or fair is often, if not generally, pointed out as one, because it is red and very small. That there are small Devons I do not attempt to deny, but that there are also fine weighty ones I think you will all allow. The size does not so much depend on the breed as the management, as I hope to prove to you by and by. I maintain that a good Devon can be, and must be, a fine "proofy" cow, which gives a good quantity of unusually rich milk; and I maintain that the oxen which earn money, and whilst at work grow into money more certainly than any others, are Devon oxen. I do not wish to make a bare assertion; we are practical men considering a practical subject, and I will endeavour to prove my statements. If there be no truth in what I say, let me ask why buyers come, not merely once, but again and again, to obtain steer calves in this very neighbourhood? They will soon be here again for another supply, for which they are glad to give a good price; so if any gentleman doubts my assertion I refer him to these annual purchasers. I know there are many—I dare say some now present—who will allow the hardy "proofy" quality to which I have alluded, but will add that the Devons are not the dairyman's cows, and therefore I repeat that a Devon need not be a little fat red cow which gives a very little milk, nor yet a great one which gives little or no milk. I believe the reason why Devons generally are supposed to be so small and such indifferent milchers, is that the principal breeders of the pure cattle have confined their attention too much to quality and symmetry, to the neglect often of those more important points, size and milk. They breed to sell or show, and therefore cultivate only those qualities that are pleasing to the eye. There are also some parts of Devonshire where, in consequence of climate or soil, we could only expect to meet with small animals of any breed; but that can be no reason why the owner of a herd, under different circumstances, should not succeed in obtaining a different class of animal. I do not intend to say anything about show stock, wishing to speak only of Devons as they are on the farm, paying as they do a very important portion of the rent. The pocket is the judge we have to encounter, and I hope to prove that this breed is well worthy the attention of any farmers' club. Therefore I will now proceed to say a few words about the Devon bull. Taking into consideration his important position, I think we must reverse the usual order of things, and give the gentleman the first place, for, with a choice cow, we can with the best of luck only get one good calf a-year, whereas with only one very good bull and 50 or 60 moderately good cows we may get 50 or 60 very good calves, which shows how particular we should be in the selection of a male animal; a few pounds extra being well expended in the endeavour to obtain a promising lot of young stock. My experience leads me to say, avoid a very fat bull, and especially an old one. If you trust to the former you will probably go short of calves; if to the latter you will find your stock smaller than you would wish. I would select, then, a bull not more than four years old; if a yearling he must not be worked too hard, lest his growth and natural good qualities should run the risk of being checked, or of never becoming fully developed. I am always very particular never to use a bull from a bad milcher, which I consider a most important matter; however good in other respects he would not be desirable for a dairy. Time will only allow me just to touch on the more important points. He

should be of a rich colour, with a good coat and skin, a clear white nose, a full bright eye, not too short a face, crowned by a pair of nice white horns, not too heavy or coarse, wide expanse of chest, great depth of girth, and a wide straight back; the tail well set on good hind quarters, no ugly hollows behind the shoulders or slack behind the ribs. I may mention that as with bipeds so with bulls, a bad temper seems hereditary; therefore it is highly requisite to use a good-tempered animal. His proper place, for various reasons, is a stall or loose box, as then many accidents may be avoided, and a great deal more be made of him than if he ran loose with the herd, which, considering the difficulty of finding and the price we have to pay for a really good animal, is of great consequence. Though a great believer in his wonderful "proofy" qualities and good constitution, I do not expect him to thrive without proper treatment. The food I recommend is hay, with the addition of a few beans. This I have found to answer well, whereas oilcake, I am inclined to believe, renders him to a great extent unsuitable for the purpose for which he is intended. Whilst on this part of my subject I may add that the services of a first-class bull are worth, in my opinion, at least £2 2s. The owner of such an animal honestly deserves that sum, and the money will bring good interest to the man who expends it. We are all aware that there are, or rather were, several good herds of Herefords in this county; but of late years the number is certainly decreasing, in some instances being replaced by Devons, which fact bears out my view that they are more suited to this locality; and I think I may safely venture to back my favourite breed, for dairy purposes, against the choicest herd of the other sort that you can mention. I will conclude this portion of my subject by repeating what a farmer in the neighbourhood told me only a short time since. He keeps a dairy of cross-breeds, and has tried both a Hereford and Devon bull; and he assures me the latter answers his purpose much the best in every respect. So, gentlemen, with this strong evidence I will leave well alone, and proceed to speak of the Devon cow; and as many of the remarks already made on the selection of the bull will apply to the cow, I will not repeat them, except to remind you she should possess size and quality. I insist on quality, as I find the better bred the cow the richer the milk. We all know that the quantity is no criterion of the quality, and, as the dairyman requires butter and not "sky-blue," it is evident that quality is of greater moment. As regards the colour of the cow, of course she must be red. I have no objection, however, to a little white before the udder. Some persons do not dislike a kind of yellow tinge with the red, but I am inclined to think that colour no indication of strength of constitution. I will not dwell on the points of the cow, but pass on to consider her general management. I believe about the greatest fault we commit is in the treatment of our in-calf cows and heifers. Devons will stand poor living as well and I think better than any other breed—indeed I have invariably found that the best bred animals keep in better condition on the same allowance than half-bred, but no in-calf beasts should be kept entirely on straw. I highly approve of good straw keep; it is healthy and necessary; but I am fully convinced that the outlay in the shape of a little cake is fully repaid to the farmer, both by the animals and the manure; and even if the dairyman himself paid half the cost he would not be the loser, as it necessarily follows that when beasts calve down poor it must take them some time to get up their own strength and condition before they can do justice to the dairyman. I like my cows to get an early bite of grass, and, therefore, though I am blessed with no water meadow, I always contrive to lay up as much pasture land as I can spare for their early use. With reference to barreners I arrange to take my own away from the dairy about the 11th October, and even then I find that they are very good beef. Quality tells again here. When offered for sale the superiority of good beasts is immediately shown, for we must all have remarked how quickly the best animals are disposed of for best prices at an auction. A great improvement is manifest in late years with regard to the

provision of shelter for cattle; but there is room for still more. Money expended in the erection of stalls is not lost. Warmth economises food, and we must all be aware how much hay is wasted by being thrown down before cattle in the fields. Time will not admit of my going into statistics; but when I say that no dairies in this neighbourhood are let at a higher rent than my own and other good Devon herds I hope I bring forward a strong argument to prove the statement that Devons can be, ought to be, and are suitable and good for dairy purposes. As regards heifers I would say that as a rule they ought not to calve under three years old. Though I adopt the common practice of selecting a few of the larger ones, and allowing them to calve at two years old, I often find that a heifer of two years gives more milk than when she is three years old; but at four years I frequently find that she will answer the expectation formed when she first calved. I need not say that in-calf heifers should be placed where they are well under the eye of master or man, and that they should be kept better than cows. My dairyman usually takes them as cows. Two-year-old barren Devon heifers of course will do well upon straw, and, if the straw be good, will require no artificial help. Yearlings I like to see in loose boxes, where they are to be had. I would give good hay, water, and a little corn. I find that a mixture of crushed beans, oats, and flaxseed answers well, and by using it I save my roots. Young calves of course require care and attention. I generally retain almost all my calves, binding the dairyman not to sell any without my sanction, and allowing him a quarter's rent of a cow for each calf, finding the corn myself, which is generally cracked beans, as I have discovered nothing better. When the calves are turned out I keep them well during the first year, and still continue the beans in the proportion of about one pint to each calf. Those dropped after March I do not turn out at all during their first year, and by this treatment I find that when spring comes round they have nearly overtaken those summered out of doors. These gentlemen, are about all the remarks I can offer this evening; and, in conclusion, if in 1808 it could be said that the Devons "are an important breed of animals, active at work, and their aptitude to fatten is unrivalled," I feel quite satisfied that the statement can be repeated in 1870; and, as a proof of the truth of a great deal that I have said, I shall be very happy to show any of you my own herd, and to allow you to form your own conclusions. In the meantime, if you will kindly pull my paper to pieces as much as you like, I shall be pleased, as I shall then have reason to think that some of my remarks are worthy of notice, and that the only object I had in view will be obtained, which was to create a discussion which may tend to help us to pass not merely a pleasing and convivial, but an improving evening.

Mr. JOHN POPE, the Chairman, said Mr. Pitfield had challenged them to prove that a mixed-bred animal would give as good butter and milk as a Devon. He (the chairman) considered there was no doubt Mr. Pitfield was wrong as regarded the quantity of milk; without question the cross-bred gave more milk than the pure Devon. They all knew they could not grow a crop of corn without straw, and he could not see why the cross-bred should not give as much and as good milk as the Devon. A person who owned an excellent herd of Herefords would no doubt give a direct contradiction to any assertion that Mr. Pitfield had a superior dairy to his. He (the chairman) believed there was no dairy in the neighbourhood to surpass that gentleman's—he alluded to Mr. Trask, of Mapperton Marsh. He differed from the lecturer as to the treatment of calves, and considered the harder they were bred the harder they would be in after life, and a better cow would be produced. The same rule applied to lambs. He did not mean to say they should stop them, but by too high treatment the cows were often deformed and weakly. The best and hardest cows were those bred in the open air, and which lived without much artificial food, such as cake, corn, and beans. He thought if they were kept upon hay and grass only the cows would be better and more useful than those which were kept in houses and fed with corn, cake, and other things. They might not reach that perfection of symmetry which some persons aimed to produce, but they would be more hardy. They all knew that a man might be acclimatised to almost anything, and so with calves. They must approach this question from a practical and not a theoretical point of view—as farmers keeping animals for profit, and not as gentlemen amateurs who kept a few "fancy" beasts in their parks. Where

they as agriculturists had to keep three or four cows the amateur might only run one; and it was a different thing to keep beasts for profit instead of pleasure.

Mr. TRASK was happy to have heard Mr. Pope's complimentary remarks respecting his dairy of Herefords. It had ever been a pleasure and his study to show good stock, and he had been moderately successful. With regard to the treatment of calves, he might say he had never been in the habit of giving them corn in houses until last year, when keep was short, and even then he had difficulty in getting them to eat from the troughs. Last year he gave the later calves a little corn, just as they were about to be turned out. He believed with the chairman that the hardier calves were kept in their younger days the stronger they would be when turned out. With respect to the age at which to breed from heifers, it had been his practice to commence at two years old; and he found as a rule the calves were larger than when the heifer did not begin till the third year. Every year told upon a cow; and he thought it advantageous to commence breeding as early as possible. He understood Mr. Pitfield to say, that after a person once bought Devon calves they would not care to have anything else; but he (Mr. Trask) had had people come to his farm and refuse to purchase any except they had a white mane (laughter). That he considered spoke well for his herd.

Mr. A. J. PITFIELD could not quite agree with Mr. Trask as to keeping calves too hard. He liked to keep them in growing condition and in good order; but he differed from the lecturer as to housing calves. It made them tender, and, although they looked well in the warm summer weather, they required to go into the box again directly the cold was felt, and oftentimes the result was that the farmer had a number of slipped calves. He advocated that they should have a shed into which they could go at will, and that they should be kept in growing condition. He considered that the great point in which farmers were at fault was the selection of the bull from which to breed. It was a singular fact, and no doubt Mr. Warren and other Devon and Hereford breeders would confirm the remark, that heifers would invariably take after the sire and the steers or bulls would take after the dam. The same remark applied to sheep—a good chivver always resulted from a good sire.

Mr. DAVY agreed with every remark that had fallen from Mr. Trask relative to the Hereford breed of cattle, and none of the arguments which Mr. Pitfield had brought forward would induce him to depart from his favourite breed. The Herefords would live in any locality; they were hardy and produced good milk and butter; and his dairyman would say none could surpass them. Their value, of course, depended very much upon the management of the owners. For his own part he generally reared a few more calves than he required for the dairy, and from these he selected the best milchers, so that if any heifer did not produce sufficient good milk he had her turned out. As regarded the sire they should be particular in the selection of a good animal from a well-known superior cow. He had lately taken a trip in Herefordshire and had selected a bull from an 80-cow dairy; this he intended to breed from for dairy purposes. He was of opinion that they could not, as a rule, obtain the greatest quantity of milk from the most fleshy beast. He had a half-sister to the steer which won first prize in the Hereford class at the Christmas show in London, and if any gentleman present was to see her he would say she was not worth £10, but she was a splendid animal and had reared two admirable calves. He had 31 cows in his dairy, and could safely say that not one of them had ever tasted corn, cake, or artificial food of any kind; they were fed entirely on hay and grass, and very often they could be grazed to over 50 score in weight. The Herefords could be grazed to great weight, at little expense, which was, of course, an advantage to the farmer. Mr. Pitfield had the advantage of him at the last Melplash show, but he did not think that gentleman could say his beasts were fed only on hay and grass.

Mr. J. PITFIELD: They had nothing more whatever.

Mr. DAVY: But what was their condition when heifers?

Mr. J. PITFIELD replied that his yearlings kept indoors thrived on half the amount of corn that others did.

Mr. DAVY said his heifers were fed on hay only, and he could raise them well and make a good price for them. But he repeated that Mr. Pitfield had the advantage of him at the Melplash show, and as he had heard that that gentleman is

tended to retire from competition this year he hoped he would reconsider his determination and allow him (Mr. Davy) to have yet another "chie" at him, at all events.

Mr. J. PITFIELD said what he had intended to do at the next Melplish show was to exhibit extra stock in all classes for which prizes were offered by the society. He was going to do this for the purpose of just "comparing notes." But as it was Mr. Davy's particular wish to compete with him, he would afford him the opportunity.

Mr. M. G. LEECH did not intend to take any part in the discussion of the evening, but one remark which fell from Mr.

Davy caused him rather to open his eyes. That gentleman remarked that he always bred a few more calves for the dairy than were required, and that he culled out the good ones, and those which were not up to the mark he turned out. Now he (the speaker) was partial to Herefords, and he was sorry to say he recently bought one from Mr. Davy. He supposed it was one that was turned out as unfit for that gentleman's dairy.

Mr. DAVY replied that Mr. Legge ought to have exercised better judgment; the heifer was not good enough for him to keep, so he sold it.

THE ROYAL DUBLIN SOCIETY.—THE SPRING CATTLE SHOW,

The opening show of the year was held as usual on the Society's premises in Kildare-street, to which additional space has been lately made by the purchase of some adjoining property, wherein the pigs were exhibited. This outlying accommodation afforded more room in Shilburn Hall for the implements and machinery, the breeding and fat cattle occupying the Agricultural Hall. This, the thirty-ninth show, was short of last year's entry by about eighteen; the numbers in 1869, being 206 of all ages and sexes, while this year 188 was the total. The quality of the stock, however, was fully equal, and probably the deficiency may be attributed to the absence of English exhibitors. But if the English Shorthorn breeders declined doing more, as in the case of Mr. Booth, than showing themselves, the implement makers mustered in great strength, thirty-five of whom from various districts crowded the halls with their several stands, so that it is presumed they still find it their interest and profit to visit the Island of Saints.

The yearling Shorthorn bulls numbered 122 highly bred animals, but though it must be confessed some of them were of no great merit, their general character was creditable. After a considerable time spent by the judges in weeding out and selecting their favourites, their awards settled down to placing Mr. Chaloner's Sir Leopold first. This young bull is by Sovereign (27588)—to be noticed with all his honours further on—out of Medora by Ravenspur (20628). Sir Leopold was bought in as a calf at the last sale of the Kingsfort herd for 12 guineas, and has paid well for his retention; he much resembles his sire, has a grand back and loin, crops well blended into the level back, is of fine proportions, and has a capital coat. His second is Mr. E. J. Smith's Heir of Lothian by Chief of Lothian (21417), out of Heroine, by Hero of Thorndale (18061); a fine red, with a commanding carriage, good crops, running into a straight level back, well sprung ribs, good fore and hind quarters. Lord Carrick's Knight of St. Patrick was put third; he is highly bred, being by Lord of the Empire (24442), out of Lupine the Twelfth, by Master Harbinger (18852); has a fine coat of hair, good crops, well backed, good ribs and ends. A fourth prize went to Mr. Bolton's Earl of Courtown by Duke of Marlborough, out of Doubtful, a grey Gauntlet cow. The high commendations were Mr. Bolton's Duke of Marlborough, and Mr. E. J. Smith's Cavendish; while the commended bulls were Mrs. Chaloner's Belmore by Sovereign; Mr. Drummond Dunlop's Harry; Rev. Mr. Mantray's Knight Grand Cross; Mr. James Moffat's Senator; and Mr. Shirley Montgomery's Royal Standard.

Many good animals stood in this section, some of these not in condition, but all well bred; as the most ragged amongst them may turn out serviceable to Irish farmers to improve their dairy and store stock.

The two years old section, numbering thirty, was, on the whole, the best class of that age hitherto shown. Mr.

Smith leads the way with the Earl, a scion from the Kingsport herd by Ravenspur (20628), out of Village Rose, and half brother by the dam's side to Mr. Chaloner's grand prize bull, Sovereign; a gay well-topped bull, with many good points, and likely to turn out a formidable competitor and serviceable stock bull. The Dey of Algiers by Knight of the Empire, out of Frank, a white Chieftain cow, stands next. His owner Mr. Moffet, of Ballyhiland, for many years has been devoted to Shorthorn breeding. The Dey of Algiers is of great substance, a little wanting in the crops, but he has a capital back, well-developed ribs, and good ends. Captain Cosby, Stradbally Hall, was put third for Colonel Frank, a Thornville bull by Agamemnon (23278), out of Fanny the Eighth, full of substance, symmetry, and quality. High commendations went to the Lord-Lieutenant, for a very substantial bull The Doge, and to Mr. Meadows, for Major Frank by Agamemnon, out of Fanny the Sixteenth, by Fugleman; the Major being a substantial serviceable bull, of fine symmetry and quality. Mr. A. Roll's Viceroy by Felix, and Mr. W. Humphrey's Bryan O' Lynn, were commended.

The three years old bulls and upwards contained sixteen entries, some of which have been distinguished before now; amongst them stood Mr. Chaloner's famous Sovereign, which now is first in the section, and the winner for good and all of the 150 Sovereign Railway Cup, and also the winner three times out of four of the Towneley Plate; he has never been beaten, being first as a yearling, and the winner of the Towneley Plate at this show, 1867, as the best breeding animal, male or female, in the yard. He was shown first in 1868 as a two-year old, and the winner of the Railway Cup, as the best bull over two and under five years old, but he lost the Towneley Plate in favour of Mr. Meadows' renowned Boliver. In 1869 he took the first prize in his class, the Railway Cup, for the second time in succession, and the Towneley Plate; in the same year, at the Tralee Royal, he took first place in his class, and the Purdon Challenge Cup, and is now the first bull in his class, the winner for the third and last time of the Railway Cup, and for the second time in succession of the Towneley Plate. The next in honour is Mr. Smith's fine bull Lictor, first in his class, and Railway Cup bull in 1867; in the same year first in the class at the Royal Society's show held in Dublin, and again at the Royal held in Londonderry in 1868, first in his class, and winner of the Purdon £50 Cup. Sir Robert Paul was put third for Knight of the Empire, from the Stack-house herd.

Eleven yearling heifers formed the next section, and never at any Irish show were there seen so many beautiful creatures, so level and good were they that the judges never had such a puzzle, particularly with the first and second. They weeded out the third and fourth, and then the contest lay between Mr. Meadows' Chaumontel by Agamemnon, out of Chaumontette by First Fiddle, and

Mr. Smith's Gertrude by his prize bull *Lictor*, out of *Gaiety* by *Jasper*, and this ended at length in *Chaumontel* being put first, and justly so. She is of great substance, level, strong, and beautifully backed, and nothing could surpass her coat. Gertrude of course came second, and unquestionably is a gem, but she was smaller and more delicate than *Chaumontel*. Mr. J. G. Grove, Castle-grove, whose herd is so famously and favourably known for many years, was put third for *Nepenthe*, who possesses grand substance and symmetry, but was tender on her feet. She is by *British Crown*, (21278), out of *Norman Lady* by *Sir Roger* (16991). The fourth went to Mr. Wm. Johnson, Prumplestown House, Carlow, for *May Rose* by *Prince of Rocklands*, out of *Amy* by *Khoinoor Diamond*. High commendations were given Mr. Meadows' *Polly Hopkins*, and Mr. Gumbleton's *Emma*, both exceedingly nice heifers.

Of two-year-old heifers in-calf or producing a live calf within twelve months, there were but three, Mr. Bolton taking the lead with *Ally Gwynne* by *Guy Gauntlet* out of *Moll Gwynne*, a sweet handler, with fine bosom, good back and loins, well ribbed, and a fine coat of hair. *Sir R. Paul's Olivia* by *Dr. Collins*, out of *Octavia* came next.

The three-year-old heifers also numbered but three, of which *Major Hamilton's Harmony* was pronounced to be the best. She is by *Duke of Montrose* (21599), out of *Mayflower* by *Duke of Oxford* the Fifth, and a fine showy cow, with indications of wealth about her. *Sir Robert Paul's Bonnie Lass* by *Patriarch*, out of *Beanty*, was put second.

The cows of any age numbered again but three, and there could be no mistake in putting *Major Hamilton's Merry Eyes* first; a full sister to his prize heifer in the previous section. Mr. Smith (*Little Moyle*) took the second degree with *Miss Matilda*, which occupied the same position last year as a three-year-old heifer, and is now a fine shapely cow.

Of *Herefords* there were but four yearling bulls; Mr. Pollock (*Mountainstown*) taking the prize and also a commendation; Mr. Kearney a high commendation, and Mr. Reynell a commendation.

Of aged *Hereford* bulls there were but three, Mr. Kearney taking the prize and Mr. Seally a commendation for another but bred by Mr. Kearney; and Mr. Kearney had it all his own way in yearling and two and three-year-old heifers and cows. This breed of cattle is not much encouraged by the Irish breeders or Societies.

Of *Polled Angus* cattle there were but two bulls and three females, Mr. Owen taking the only prize awarded; and of *Devons* there was but one bull.

Kerries mustered comparatively strong. There were five bulls of various ages in competition with each other, three two-year-old heifers, ten three-year-old heifers, and ten cows, but uneven in size and quality.

Of the west *Highlands* and *Alderneys* there were very few.

Of fat cattle, about seventy head of all breeds, sexes, and ages were exhibited, some of which were prime, but the greater number would take more time to ripen.

There are now no breeding sheep shown at this time of the year, in consequence of the endeavour to establish a good show in September, but there are entries of fat sheep, of which there were ten pens at this meeting all tolerably well finished.

The show of pigs, both black and white, was of such a superior character that there is nothing left to wish for, and it only remains to keep up their quality, and that is well done by introducing fresh blood from time to time; of *Berkshires* there were over 30 pens, and of the white breeds 16 pens.

The exhibition of poultry embraced all the most approved varieties, and was as fine and as good as it is pos-

sible they could be. The poultry occupied 218 pens. The pigeons were really beautiful and in splendid plumage, as shown in pairs in 61 very neatly got up cages. On the whole, the show was a decided success. All that is now wanted is sufficient space to exhibit the implements and machinery, and for which arrangements are in progress by the purchase of some adjoining premises.

The following were some of the principal implement firms which put in an appearance: *McKenzie and Sons*, of *Dublin*; *Messrs. Howard*, of *Bedford*; *Jack and Sons*, of *Maybole*, *Ayrshire*; *Ashby*, *Jeffery*, and *Lake*, of *Stamford*; *Jas. Eastwood*, of *Blackburn*, *Lanc.*; *Messrs. Ritchie*, of *Ardee*, *Louth*; *Le Butt*, of *Bury St. Edmunds*; *Morgan*, of *Dublin*; *Fawcett*, of *Kilcullin*; *Smith* and *Westwood*, of *Dublin*; *Rollins*, of *London*; *Richmond* and *Norton*, of *Liverpool*; *Bolton* and *Co.*, of *Norwich*; *Penny*, of *Lincoln*; *Mitchell*, of *Manchester*; *Kenan*, of *Dublin*; *Houghton* and *Thompson*, of *Carlisle*; *Thomas* and *Taylor*, of *Manchester*, &c.

On the evening of Thursday the members of the Society and their friends dined together in the Exhibition Palace. Lord Clancarty presided in the absence of the Lord-Lieutenant; and Mr. Clayden, for the judges, said that many of the animals exhibited at the show would do credit to any Royal show in England. He congratulated the Irish stock breeders on the improvement in the quality of the stock latterly sent to England from Ireland.

JUDGES.

SHORTHORNS.

J. Clayden, Littlebury, Saffron-Walden.
G. Drewry, Holker Hall, Newton-in-Cartmel.
J. Wood, Stanwick Park House, Darlington.

HEREFORDS AND DEVONS.

T. Radcliffe, Wilmount, Kells.
T. Rogers, Coxall, Brampton Bryan, Hereford.
W. Tudge, jun., Adforton, Leintwardine.

MISCELLANEOUS STOCK.

J. Borthwick, Prospect, Carrickfergus.
G. Hewson, Ennismore, Listowel.
G. N. Pardon, Lisnabin.

FAT STOCK.

N. Ennis, Claremont, Julianstown.
S. Garnett, Summerset, Clonect.
B. Hall, Freeson's-row, Liverpool.

SHEEP AND PIGS.

J. Borthwick, Carrickfergus.
J. Bruce, Milton Castle, Charleville.
Seymour Mowbray, Killeany, Mountrath.
J. Smith, Moyle, Carlow.

POULTRY.

E. Hewett, Eden Cottage, Spark-villa, Birmingham.
W. G. Mulligan, Springfield, Belfast.
C. H. Peacocke.

ROYAL AGRICULTURAL SOCIETY'S MEETING

IN 1871. — The Inspecting Committee of the Royal Agricultural Society, consisting of Lord Kenmore, Mr. Brandreth Gibbs, Mr. Davies, and Mr. William Torr, visited Wolverhampton, and were met by the Mayor. The party went over the race course, the proposed site of the exhibition, and from thence to the suggested trial grounds at Showell Farm. The Committee afterwards proceeded to Stafford, where they were received by the Mayor on Tuesday evening, and taken to the show-ground on the Common. On the following morning the deputation visited the land available for the trial of implements, on the Hopton-road, which consists of about 134 acres; and afterwards went on to Shrewsbury, where they viewed the ground at Old Heath. Deputations from these three towns will attend in Hanover-square on Wednesday week, May 4th.

ENGLISH TENANT-RIGHT.—This subject has been selected for consideration at the next meeting of the Farmers' Club, on Monday, May 2nd, when it will be introduced by Mr. Henry Corbet, the Secretary of the Club, and the author of the Prize Essay on Tenant Right.

SHEEP GRAZING FOR 1870.

BY A PRACTICAL FARMER.

Profitable grazing depends very much upon the satisfactory preparation, and due resting of the land to be grazed. The manuring, the soiling, the boning and chalking, the rolling, the chain-harrowing, or other means for improving the surface of the soil of all grazing lands, as well as the drainage beneath, ought all to be done before the approach of spring. The resting of the land, the freeing it from stock, and then "laying it in" for summer grazing, are all of great value in promoting the early and nutritive growth of the grasses in the pasturage. The absence of treading, the working of the worms, and the opening of drainage-pores by frosts and changeable weather is also highly conducive to an early and luxuriant growth of grass. This is all so well known by all good graziers, and is so generally practised, that we shall take the best grazing lands as being thus prepared for the summer grazing, and proceed to give our views as to the most profitable mode of grazing them. Sheep are, upon the whole, the most profitable animals to graze upon by far the majority of lands in this country. They yield two returns, mutton and wool. The great question, the desideratum to be arrived at, is the class or variety of sheep which will yield the greatest profit for grazing. This is a wide field for discussion, and there are many "pros and cons" to be reconciled. The immense importation of wool is dead against some of our most popular breeds. The importations of wool in 1866 amounted to 235,741,101 lbs.; in 1867, to 230,305,107 lbs.; in 1868, to 249,931,714 lbs.; and in the first eight months of 1869, to 189,864,384 lbs.; thus showing a large gradual increase, and that principally consisting of fine Australian and other like wools. This has brought down the price of our home-grown fine wools very considerably. The quotations, this day, March 15th, are as follows: Southdown hoggets 1s. to 1s. 1d. per lb., half-bred do. 1s. 3½d. to 1s. 4½d. per lb., Kent fleeces 1s. 8d. to 1s. 3½d. per lb., Southdown ewes and wethers 1s. to 1s. 1½d. per lb., Leicester do. 1s. 2½d. to 1s. 3½d. per lb., Leicester and Lincoln hoggets 1s. 4d. to 1s. 6d. per lb. These figures conclusively prove which is the most profitable wool to grow. The growth or production of mutton is quite another thing. My opinion is that on a great breadth of our pastures a large-framed sheep which only produces short wool is the best sheep for yielding the heaviest weight of mutton in proportion to his age and the food he consumes. This will be found amongst the various classes of "half-breds." We have only experience in three of these breeds, or at most four; if we take the Lincoln long-wools as separate from the Leicesters; from which, in fact, they owe their improved character. We have then grazed, to a considerable extent, the following "half-breds:" hoggets the produce of the Lincoln ram and Southdown ewe; the Leicester ram and Southdown ewe; the Cotswold ram and Southdown ewe, the Oxford down ram and the Lincoln ewe, and all from equally good sources. The Lincoln ram and Southdown ewes' produce we found too varied. Occasionally a heavy long-wooled hogget appears amongst the cross-breed, and *vice versa*, a Southdown hogget is seen, and others, with all the shades of fleeces and frames between the two breeds, denoting the cross to have been too extreme in affinity. The grazing of them, including the weight of wool produced, was tolerably satisfactory; but they were too long

in coming to maturity, "too long on the land." The produce of the Leicester-cross were smaller in frame, more compact, and they arrived at maturity much sooner, but their yield of wool and mutton did not equal the Lincoln-cross. The Oxford-down ram and Lincoln-ewe cross was from my own breeding ewes. They grew up very well and distinctive, and proved well in the quantity of wool. They were grazed last season along with several hundred other half-breds, principally from the Cotswold and Southdown cross; but not with equally profitable results, some of them being the last to arrive at like maturity, all however being fatted off within the year, as were also the Cotswold half-breds. As this cross meets our approval most, we will dwell shortly upon its value. The true Cotswold sheep is the largest and best formed sheep of the large breeds we possess, and has a great propensity to fatten at an early age. He grows rapidly, and produces a good fleece of wool, of rather fine character for a long-wooled breed. It is for the most part of a closer kind than other long-wools. This, with their other characteristics, their noble carriage, expansive chests, rotund frames, capital rumps, great height, and handsome looks admirably fits them to become the sires of this extraordinary class or stock of "half-breds." It is almost out of character to witness one of these gigantic rams performing his duties amongst a flock of beautiful Southdown ewes, but the produce is eminently satisfactory. They grow up quickly and healthily, and arrive at great weights in from twelve to fifteen months. Many thousands of these hoggets are annually fatted off in the eastern counties at twelve months. They are shorn prior to sale, and will leave fleeces of from five to seven pounds' weight; the quality of their mutton is not exceeded. The weight per sheep would probably average twenty-two pounds per quarter. Those commonly shown in the pens at market will vary from 18lbs. to 28lbs. per quarter so early as in the month of March. In the spring they are much sought after by the Lincolnshire and other graziers for their summer pastures, upon which they improve rapidly, and produce large returns of wool and mutton. They are quite docile animals, partly natural, partly acquired; for the winter graziers in the eastern counties are capital sheep managers, supplying them liberally with rations of cake or corn. This the summer graziers in most instances keep up, particularly if the sheep are forward in condition, and by such means they graze a greater number of sheep per acre, which yield a corresponding profit. This is one of the best breeds for summer grazing, but the supply is limited, and therefore not generally accessible. There are, however, many other breeds well worthy of the summer grazier's notice, which he will adopt in accordance with his locality, his pasturage, and climate. To this old rule of stocking his land he need not in these modern days strictly adhere, because the almost universal use of artificial foods has changed the character of summer as well as winter grazing. Inferior pasturage will by the judicious use of these aids profitably depasture a heavier and larger kind of sheep, or fatten a larger number of smaller ones. There is no rule for stocking grass lands now, as so much depends upon the spirit and enterprise of the grazier. The great thing now required, and indeed necessitated, is to cause the land to produce the very utmost of

wool and mutton. Well, the consideration with every grazier is, how to do it. All can't graze "half-breds." Let us take Southdowns: their mutton is superlative, they are speedy fatteners, and do well on inferior pasturage, they come to good weight at an early age, much heavier than their diminutive size denotes, but they yield fleeces of light weight, and now selling at a low price. This is dead against this breed, and all similar short-woolled breeds. Take pure Cotswolds or Lincoln long-wools. They are similar in size and proportions, and yield large heavy fleeces of valuable wool; but their large frames come to extraordinary weights upon being properly fattened, which cannot be done with all the aids man can bestow upon them, at the same early age of some of the lighter-framed and lighter-woolled sheep. If early maturity is immaterial they are capital sheep for the grazier. The wool pile tells much for them. Again, take Leicesters and Kents—improved Kents, for the improved Kents are becoming apt feeders. Both these breeds are exceedingly well adapted to graze sweet pasturage of medium quality, and are ready fatteners, leaving fair fleeces of excellent long wool. They are good, quiet grazers, and improve rapidly on fair pasturage, even without artificial aids. Their weight of mutton is good and quality excellent, possibly too great a

proportion of fat to lean meat. The Shropshires have become a valuable breed, and yield wool of like weight and quality with the half-breds named above. They are excellent fatteners, and well adapted for hilly pasturage or medium low-lands, and come to satisfactory weights. The mutton is very superior. The large Hampshire Downs are of similar size and quality, but yield less wool and greater weight of offal, not such quick feeders, but are better adapted for breezy downs. The Oxfordshire Downs have become popular owing to a combination of good quality. They possess large compact frames, are apt fatteners, yield large bundle fleeces of superior wool, come early to maturity at great weights. These various breeds are, I believe, the most prominent and best kinds for summer grazing, but I name them not in disparagement of any other kind which are more especially adapted to local districts; and in the general term Leicesters I include all shades of the breed from the large border Leicesters to the smallest of the class. Graziers have only to look closely into these matters to ascertain for themselves what is their best course. Meat appears to be the most profitable farm-produce at the present time, and no doubt will meet with ready and proper consideration by every intelligent grazier.

AVERAGE PRICE OF WHEAT PER QUARTER FOR TWO HUNDRED AND SEVENTY YEARS.

BATH AND WEST OF ENGLAND SOCIETY, AND SOUTHERN COUNTIES ASSOCIATION.

A meeting of the Council of this society was held on Tuesday, March 29th, at the White Lion Hotel, Bristol, R. G. Badcock, Esq., in the chair; there were also present, Messrs. J. D. Allen, H. G. Andrews, S. Best (Hon. and Rev.) J. T. Boscawen (Hon. and Rev.), R. Brent (Colonel), W. A. Bruce, Clement Bush, R. H. Bush, Thos. Danger, R. R. M. Daw, Fras. W. Dymond, Chas. Edwards, M. Farrant, John Gray, Jonathan Gray, J. D. Hancock, James Hole, J. E. Knollys, Jos. Lush, H. A. F. Luttrell (Colonel), H. St. John Maule, H. Middleton, E. F. Mills, H. G. Moysey, R. Neville-Grenville, M.P., R. H. Paget, M.P., T. Phillpotts (Rev.), W. B. Scott, Ph. D., R. J. Spiera, J. C. Moore Stevens, R. Trood (Major), H. Williams, and J. Goodwin (Secretary and Editor).

A communication was read from Sir Stafford H. Northcote, the president for the year, wherein, referring to his rumoured visit to Canada, he said, "I think it very doubtful whether I shall go at all; but, if I do, I hope in any case to be back in time for the meeting at Taunton."

The Council having at their last meeting granted a sum of £100 to the Arts Committee for the Taunton Meeting, in June next, now recommended the following appropriation of the grant. The £100 to be added to the sum received from the sale of the Art Union Tickets, thus forming one common fund to be drawn for by the subscribers to the Art Union and the annual members of the Society, and providing the following special prizes: Two of £20 each; two of £15 each; and three of £10 each. This recommendation was adopted.

The Railway Committee having entered into negotiation with the various companies for facilitating the traffic in connexion with the Society's approaching exhibition, satisfactory replies were produced by the Secretary from the managers of the Bristol and Exeter, the Midland, the Great Northern, the London and North Western, the London, Chatham, and Dover, the Somerset and Dorset, and other railways.

A clerical error having been committed by the judges in entering their award of prizes in Class XII. at Southampton, whereby Mr. W. B. Simonds, M.P., was represented as entitled to the prize of £20 for the best Hereford bull not exceeding two years old, and Mr. Nathaniel Benjafield, of Short's Green Farm, Motcombe, Shaftesbury, to the prize of £10 for the second best, the error was now rectified by the act of Mr. Simonds, who, having satisfied himself that a purely clerical error had been committed by the judges, waived his right to the prize money already paid to him, and this, with the sanction of the Council, was directed to be handed over to Mr. Benjafield as the actual owner of the first prize animal in his class; Mr. Simonds's animal taking the second prize.

Mr. J. H. Kennaway, of 19, Oxford-square, London, was elected to supply the vacancy in the Council occasioned by the death of Mr. John Woolcombe Sillifant, of Combe, Copplestone, Devon.

A communication from Mr. E. G. Carew Gibson, of Crofton Isle of Wight, offering a prize for pheasants at the Guildford meeting, was ordered to be referred to the Stewards of poultry.

NEW MEMBERS.

GOVERNOR.—Mr. R. Bright, M.P., Stocks, Tring, Herts.
MEMBERS.—Colonel Gustavus Basset, Telside Park, Cornwall; Messrs. Becket and Sons, Quiet-street, Bath; Mr. Edward Dymond, Sampford Arundel; Messrs. Follows and Bate, Manchester; Colonel W. R. Gilbert, The Priory, Bodmin; Mr. John George Johnson, Crosshouse, Torrington, Devon; Mr. William Lewis, Northgate-street, Bath; Mr. W. H. Richards, Stapleton House, Martock; Messrs. Southwell and Co., Albion Foundry, Rugeley.

THE LATE MR. H. HALL DIXON (THE DRUID).—A proposal has been made for raising a subscription for the widow and family of this gentleman. It would be wrong to infer that Mr. Dixon died in anything like indigent or needy circumstances, but there is a young family of eight children to bring up, and hence the origin of this movement. Mr. Jenkins, the Secretary of the Royal Agricultural Society, has consented to act as honorary Treasurer, and Mr. Thornton, the Shorthorn auctioneer, as honorary Secretary. The Duke of Devonshire has already headed the list with a donation of 25 guineas and other subscriptions have also been promised.

BOTLEY AND SOUTH HANTS FARMERS' CLUB.

THE WASTE LANDS OF ENGLAND.

At a meeting of this Club Captain MAXSE, R.N., gave a lecture upon Uncultivated Lands. Mr. W. Warner presided. A feature in the lecture was a map, with the proportion of waste land to cultivated land exhibited in blank parallelograms drawn to scale.

Captain MAXSE felt that there was a great deal of misapprehension and prejudice that required clearing away from our minds before we could examine the subject of our wasted land fairly and impartially. There are some people (he continued) who imagine that to call attention to the uncultivated land by which we are surrounded is to challenge the right of private property. They therefore petulantly refuse to consider the subject at all. There are others who belong to the Fatalist class, and, believing whatever is right, plead that whatever is out of cultivation ought to be out of cultivation in compliance with the design of Nature or (you are permitted to take your choice of these authorities) the canons of Political Economy. As to the first class of objections, this constant cry about the rights of property is a very dangerous one. Looking back in history we may observe that it is one which has been raised whenever an attempt has been made to redress an evil of any magnitude, and always by people who have had possession of some power injurious to the community at large, and of which they feared dispossession; whilst in reply to those who undertake to represent Nature and the *laissez faire* or "let alone" school, he ventured to say that both Nature and the Political Economists disown them. With this slight preface he proceeded to call attention to the extraordinary amount of uncultivated land in this country, illustrated by the map on the wall. Few people can look on that map without a feeling of astonishment at the amount of uncultivated land thus revealed at a glance, and in all probability this assertion will be heightened when they remember the common assertion that England is so densely populated, so exhausted in regard to space, that she must immediately commence to discharge her surplus population on other shores (Hear, hear). The idea of this map was acknowledged as due to Major-General Alexander, a gentleman residing at Southsea, who has made the subject of waste land his particular study, and who lent the speaker the original in a smaller form, as well as some valuable notes of a lecture he gave at Clapham last year. Captain Maxse proceeded to say that he particularly desired to distinguish between the amount of land that cannot be profitably cultivated by ordinary means, and the land that can be cultivated by ordinary means. In estimating the number of waste acres that should be in cultivation, he could only present approximate figures—in fact, estimates, and in order to confuse as little as possible, when referring to large areas, he gave only the gross figures, omitting the fractional figures. The total acreage of the United Kingdom amounts to 77 millions and a half, and of these we have, according to the Board of Trade returns, just issued, 46 millions under all kinds of crops, bare fallow, and grass, and out of this 46 millions there are 23 million acres of permanent pasture, meadow, or grass exclusive of heath or mountain land. This leaves 31½ million acres totally unaccounted for. The cultivated and uncultivated land is distributed in the following manner:

Taking England first, we find that out of an area of 32,590,397 acres, we have:

13,274,408 under all kinds of crops, bare fallow, and grass under rotation;
10,096,094 under permanent pasture, exclusive of heath and mountain land;
9,219,895 waste, or land unaccounted for.

In Wales, out of an area of 4,734,486, we have:

1,003,106 under all kinds of crops, bare fallow, and grass under rotation;
1,527,534 under permanent pasture, exclusive, &c.;
2,203,847 waste, or unaccounted for.

In Scotland, out of an area of 19,639,377, we have:
3,325,888 under all kinds of crops, &c.;
1,112,269 under permanent pasture;
15,201,240 (three quarters of whole) waste, or unaccounted for.

In Ireland, out of an area of 20,322,641, we have:
5,596,824 under all kinds of crops, &c.;
10,043,877 under permanent pasture;
4,678,940 waste, or unaccounted for.

In the Isle of Man, out of an area of 180,000, we have:
67,677 under all kinds of crops;
16,860 under permanent pasture;
95,463 (more than half) waste, or unaccounted for.

Two questions present themselves for consideration: 1. How much of this land should be in cultivation? and 2. What is the cause of fertile land lying waste?—and the first of these he regarded as their principal one. There was great difficulty in answering the first question with accuracy. There was no help to be got from official returns, those of the Board of Trade being confined entirely to the produce of land in cultivation. The figures as to cultivatable land out of cultivation were generally quoted from Porter's "Progress of the Nation," Spackman's "Analysis of the Occupation of the People," and McCulloch, and mainly founded upon a statement by Mr. William Couling, a civil engineer, who travelled all over England to gather statistics for a select committee of the House of Commons in 1837, and who said that there were, probably, but 15,871,463 acres of the United Kingdom irremediable, and upon his authority we were led to conclude that there remain, at the present moment, no less than 15,595,969 acres of cultivatable land still lying waste. Mr. Couling's figures were not unimpeachable; for, as an illustration, he estimated the cultivated land of Hampshire at 900,000 acres, whereas by the Board of Trade returns now we have but 685,540 acres cultivated, and he estimates the total amount of cultivated land in the United Kingdom in the year of his report at 46 millions, which is all that we have now after the enclosure of an additional million. If he does err, it is in the direction of under-estimating the amount of land that may be profitably cultivated, and, erroneous as his report may be, it is—shameful as the admission appears—the only report possessing official character which takes a comprehensive survey of our subject, and is that upon which all our usual information is based. The proper method of ascertaining the value of Mr. Couling's statement was to take different parts of the kingdom in detail, and this he proceeded to do, quoting Ireland and Scotland. Coming next to England and Wales, where we have 11,423,748 waste acres, he referred to several articles written by practical men from time to time in the Royal Agricultural Society's *Journal* upon the condition of various counties. Among them there is universal concurrence of opinion as to the extraordinary waste of our land wealth. Mr. Dyke Acland, whose authority will be regarded as unexceptionable, says that in Somersetshire alone "there are thousands of acres of moor and fen land capable of the highest order of arable cultivation." We have similar remarks on other counties. Mr. Bailey Denton stated before the Rivers Commissioners that whilst "only 2,000,000 acres of land in Great Britain have been drained, upwards of 20,000,000 remained undrained, and of this about 9,000,000 are clay soil." General Alexander, in a lecture, says—"Some few years since, when visiting Cornwall, I saw large tracts of waste land in all directions, and some of it covered with luxuriant growth of gorse and ferns. How is it, I used to ask in my ignorance, that land which can grow such magnificent weeds is not turned to better account?" "Impossible," was the answer I always received, "the land is not worth cultivating: it would not pay." Of course I had to be satisfied with this answer. Only last year on re-visiting Cornwall, I found that a large portion of the neglected land was in full cultivation and bearing rich crops.

'I see a great change,' I observed to a friend. 'Yes,' he said in reply, 'there is a great improvement: the farmers have taken in a great deal of the waste land, and some of it now forms the most productive portions of their farm.' General Alexander then refers to one of the causes that had tended to produce this result—"the landlords had granted their tenants very long leases of their land at exceedingly low rents." Evidence of this sort might be multiplied, and was doubtless within the memory of all present. Then we had general evidence from the Enclosure Commissioners, who have to report on the character of the waste land which is enclosed under authority, and of which he gave some specimens. Since 1827 (he continued) about one million acres have been enclosed, and a large portion of it brought into cultivation. This is not much, seeing that population has about doubled since that date, but it proves, in spite of the disadvantage under which agriculture labours in this country, that it has paid to cultivate a large amount of waste land. I have been careful to say that only a "large portion" of this has been brought under cultivation, because I believe that some of it, notwithstanding the plea upon which it was annexed to neighbouring estates, remains untitled, owing to the neglect and indifference of landowners. It may, however, be said that the land will not pay to cultivate, and that whatever has remained out of cultivation does so upon the sound commercial principle of its not paying. Now, when we say this, we must be very clear as to what we mean by "paying." If we mean that the land will not pay a high rate of interest upon a high nominal value which is purely an artificial one, there may be truth in the assertion, as far as the owner is concerned; but he should have considered this previous to undertaking responsibility of ownership. I contend that no one is justified in wasting (to a clearly appreciable extent) the productive power of land; and it must be remembered that although the land may not pay on the entire investment, including the purchase-money, it certainly will pay on the capital necessary to bring it into cultivation; there is, therefore, no ground for shirking the outlay—it is perfectly clear that the land pays no one while lying waste. Far more strongly does this argument tell in regard to common land that has been taken from the community, and allotted to proprietors with the express object of bringing it into cultivation for the general good. I cannot wish for a better illustration of the unjustifiable waste of good land, and of the contrast between the interest of large and small landowners in the cultivation of the soil, than is afforded by a common in my own neighbourhood called Titchfield Common. I shall content myself with a bare narrative of the facts of the case. This common was set out in allotments to large and small owners, in 1862, in the following proportion:—

Land set out to 32 owners in parcels exceeding 8 acres	900
Of this amount, up to Sept., 1869, eight owners had broken up and tilled.....	225
Leaving uncultivated	675
Land set out in 255 plots, in parcels under 3 acres	190
Of this, up to the same date, there has been broken up and tilled	182
Leaving uncultivated	8

These eight acres remaining, I believe, in the hands of speculators or lightholders. The capital necessary to bring this land into cultivation amounts to £10 or £12, and the average rent ranges from 30s. to £3, small tenants paying the highest rent, and I need hardly say purely for the sake of the produce of the soil. I now come to the consideration of royal forests and woodlands. These extend to about 100,000 acres. As nearly three-fourths of this is situated in our own county, the Woods and Forests question may be considered essentially a Hampshire one. We are thus brought, therefore, to our own province. According to the Board of Trade returns just published, Hampshire contains 1,070,316 acres. Out of this area we have—531,112 under all kinds of crops, bare, fallow, and grass under rotation; 154,428 under permanent pasture; 384,676 acres, or more than *one-fourth*, of it waste, or unaccounted for. Deducting 30,000 acres for water in rivers and estuaries, we are still left with 334,676 acres of woodland and common. I feel that you can all judge far better than myself of the amount of this which might be under profitable cultivation.

I have been fortunate enough to secure a very valuable opinion on this point. I imagine it would be difficult to obtain one more likely to secure universal respect than that of Mr. Blundell. He calculates that in Crown lands, heaths and commons, mudlands and estuaries, there are in this county at least 130,000 acres which might be profitably converted into use as arable or pasture. Now as, whenever a proposal for improvement or reform is made, the first opposition assumes the form of misrepresentation, I should like to say here that, although I complain of the amount of waste land there is on all sides, I do not ask that all woodlands should make way for the plough. There is some woodland which it would probably be advantageous to grub up and convert, but a large portion must always be desirable, not only for ornament but also for utility, and there is besides, soil solely adapted for timber cultivation. At present we have it in excess, and certainly what we have in excess in Hampshire is waste common land. If Mr. Blundell's 130,000 acres were absorbed into use, we should still have over 200,000 acres of wild land, which surely is as much as we can afford in a populous county. If, however, there is some misappropriation of woodland, how much more is there misappropriation of land in common and heath, and I should like to know where is the bit of common land that has once been got into cultivation that it does not pay to continue in cultivation. Our greatest waste of land is in the New Forest. We have lately had some characteristic correspondence on this subject. It is curious to note how on one side the experienced cultivator perceives fertility in the land, and how the landowner, to whom land bears but a residential value, can only perceive barrenness. Mr. Dickinson informs us that there is in the New Forest 60,000 acres of land capable of growing the finest grain and the finest roots in England, upon which Mr. Eddaille steps forward, demands his balance-sheet, declares cultivation won't pay, and insinuates against him the personal motive of desiring to manage the 60,000 acres himself; after which follows another residential point of view in Mr. Morant, who has read "with much pleasure and interest Mr. Eddaille's admirable exposure of Mr. Dickinson's fallacies"—the cultivator to him is the "ruthless agriculturist" who must hate the National Gallery because he wishes to grow more food. Well, I have been a lover of the picturesque all my life. We all know that

"There is a pleasure in the pathless wood,"

but this land question in the New Forest, as throughout England, is a question between sentiment and sport on one side and the lives and happiness of thousands of human beings on the other (Hear, hear). If the gentlemen of the New Forest could only realize this, I am sure they would not desire to preserve it as a "National Gallery" for the benefit of themselves at the expense of the nation. I have always understood myself (although Mr. Dickinson is probably as good an authority as anyone) that there are in the New Forest about 30,000 acres of corn-growing land. If this be so, why should not the successful precedent of Wickwood Forest (see an interesting account of this in volume 24 of the *Agricultural Society's Journal*) be followed with this amount, by reclaiming it, dividing into farms, and letting on leases of thirty-one years, reserving out of the rest complete common rights for the neighbourhood, and especially for the poor, who have suffered too much hitherto from enclosures? I would rather this were done than see it merely sold and absorbed into the unproductive "pleasure ground" of the rich (Hear, hear). I will not detain you further with the tiresome detail we have been compelled to enter on in reply to the first question. As regards opinion and information upon character and probable value of waste Hampshire lands I feel I shall be better as a listener than as a speaker. I hope I have succeeded in establishing in your minds that the figures with which we started are, as far as we have the means of ascertaining, by no means extravagant. That they are not is my own impression. Before concluding this part he inquired if it was desirable that all cultivatable land should be cultivated, and contended that a country could not be regarded as over-populated before all its resources were developed (Hear, hear). Those who talked of our population had their attention fixed upon the large towns, and it was true that more than half the population of England had collected in the large towns. But while these are densely crowded, the country had become depopulated (Hear). A constant emi-

gration has been going on for several years on the part of agricultural labourers into the towns, until, as Mr. Caird informs us in a paper read before the Statistical Society last year, "the proportion of the people of England employed in agriculture has diminished from a third to a tenth," and this within a single generation. Not only, however, is the number of agricultural labourers diminished, but the quality of the labour is affected, the proportion of boys and old men to able-bodied men having increased considerably. Hence he (Capt. Maxse) denied that we are over-populated. What we suffer from is the congestion in the towns and depletion in the provinces (Hear, hear). The method in which population is reckoned conveys a very fallacious idea. For instance, it is said that England and Wales have 347 persons to the square mile, but in some districts we have not more than one person to the square mile, and in the east end of London we have 130,000 persons to the square mile. The really important point in regard to population is its distribution. While we have eleven millions in the towns, there are but nine millions in the country; whilst Belgium, with a poor soil, is better off, although she has 430 persons to the square mile, for out of her population of five millions, one million and a half live in towns, and three millions and a half in rural parishes. In France, of the population of 38 millions, 23 millions are rural, and 15 millions non-rural. The most extraordinary and instructive statistics come, however, from the Channel Islands, which exist under a totally different land system to our own, and under which we find 1,900 persons existing happily, and in perfect comfort, to the mile, and land let (when let) at £5 to £6 the acre. Even the little island of Sark, with an area of only two and a half square miles, and no harbour, maintains 232 persons to the square mile, enjoying positive independence and happiness, and exporting more articles of consumption than they import. I take this information from a valuable pamphlet upon "The Land Question of the United Kingdom," by M. Tupper, of Guernsey, and I cannot resist calling your attention to the very instructive comparison he draws between the statistical position of the two classes of dependencies of England which are subject to different land systems. The first place he looks at is the Isle of Wight, which "with 86,801 acres of land has a population of 55,363, and scarcely any shipping or commerce." On the other hand, Jersey, with "under 28,000 acres has a population of 55,613, and 55,000 tons of local shipping, carrying on trade and commerce with the whole world." After further extracts the lecturer continued; Yet, it may be urged, the wealth of the country is enormous. So it is in one sense. So far as the measure of money goes, we—that is, some of us—are immensely rich. In the space of fourteen years our aggregate exports and imports have increased from £268,210,145 to £523,100,230. These big figures produce a very imposing effect—also, it is to be feared, a rather soporific one. People listen to them, say "All right," and go fast asleep over evils which in the mean time ripen, and ultimately reappear intensified. Notwithstanding the apparent wealth suggested by these figures, there would appear to be paralysis at the very source of the nation's life. While there is superfluous capital—capital in sufficient excess to compete in any wild scheme upon this or the other side of the globe—there is some cause that prevents capital turning itself upon English land and employing English labour. We want to grow more food. In order to do this, three ingredients are necessary—capital, labour, and soil. We have them all in superabundance. But the capital flies abroad, the labour goes to the workhouse and the gaol, and the soil lies waste, or at best grows Japanese pheasants for some idle gentleman to shoot at—who, may be, has so many other places to idle at that he can only afford one week to idle at the place where the Japanese pheasants have to be shot. Look at the amount of food we import from other countries. I believe myself we are too dependent upon other countries for food. Free-trade is right, but home waste is wrong. Even granting that we can obtain corn cheaper from other countries than we can grow it ourselves, it is quite certain that we already grow some at home, and if we can, we should grow more. But putting entirely on one side our importation of wheat, and there is this reason for putting it on one side, viz., that notwithstanding our population has increased 4,500,000 since 1841, the price of wheat is on an average lower than then; putting aside this as a matter of no moment (or assuming it to be an advantage) our annual importation of wheat, amounting to (in wheat and flour) 85,000,000—there yet remains an

expenditure of £42,000,000, in foreign agricultural produce and stock. Since 1854 our importations of food have almost doubled. Captain Maxse here enumerated the various items of food imported. Now, how much of this food might we not grow at home? (Hear). Look at the price of meat, a commodity which it is costly to import; compare the present price with its past. In the sixteenth century beef and pork were sold at a half-penny a pound, and veal at three-farthings; in the eighteenth century it rose to 8d. a lb.; and now in the nineteenth century it has risen to a prohibitory price as far as the poor are concerned. Again, what a volume of comest is afforded in that single item about eggs—£1,000,000 for foreign eggs! Our dairy produce, not less than our meat growth, is—it must be confessed—miserably deficient. The reason of this is that dairy produce is the result of small farms, and these we have very nearly abolished in England. The difficulty in treating this subject within the limit of a paper is to know where and when to cease drawing upon the accumulating argument and illustration that present themselves to demonstrate the error of our position. In saying this I beg you will understand clearly that I do not mean error in mode of cultivation; what I point out is error in the system of land tenure, upon which cultivation and agricultural enterprise largely depend. I believe that the system of agriculture in this country, when it can get fairly at work, surpasses that of other countries. We know at least that the yield per acre in bushels of wheat is much higher than anywhere else. Mr. Caird, after a consultation with M. de Lavergne upon the cause of this, attributes it to the larger proportion of our restorative (grass and roots) area to our corn or exhaustive crops compared with that of other countries, but whatever the cause, the fact of considerable excellence in cultivation is established, and it appears to me we should more largely avail ourselves of it. There is another point worth considering. Look at the cost of our pauperism and crime. We spend some £18,000,000 in the relief of distress and the repression of crime. Some people will say "Oh, you must always have pauperism and crime." To this I enter my most vehement protest. Misery is not God-ordained (however convenient it may be to declare it is), but man-ordained. Nature supplies everything in abundance. We cannot in the midst of our human hive, overflowing with energy and activity, seal up with impunity the primal source of all human industry and wealth. If we do, the energy and activity display themselves in very unpleasant forms. Puppen and rogues are manufactured as much as any other article. I think we should do well to remember the terrible disadvantage that poor people labour under born in a country where—being themselves destitute and without prospect—to use the words of Tennyson's "Northern Farmer"—

Property, property's ivry thing 'ere, an', Sammy, I'm blest if it isn't the saime oop yonder, fur them as 'as it, the best. 'Tis'n them as 'as munny, as breaks into 'ouses an' steals, Them as 'as oots to their backs an' takes their regular meal, Noa, but it's them as niver knows wheer a meal's to be 'ad, Take my word for it, Sammy, the poor in a loomp is bad.

—"Rights of property?" Yes, these—within reasonable limits—we respect; but the rights of property must not be pushed to the extent of involving the right to monopolise the means of existence. This brings me to our second question. What is the cause of fertile land lying waste? My paper has extended itself so far over the first question, that I shall have to shorten as much as possible my reply to the second. The cause is to be attributed to our land system, because it promotes the accumulation of land into few hands, artificially restricts its circulation in the market, and encourages an artificial value being placed upon land which is detrimental to its true agricultural value. The first proposition, that the land system promotes the accumulation of land in few hands, is proved by the fact that whereas in 1770 there were 350,000 rural landowners in England, we find ourselves at the last census (1861) with but 80,768, and is illustrated by the following passage from a very valuable work that has recently been published, entitled "Systems of land tenure in various countries." The article I quote from is by Mr. Cliffe Leslie, upon the land system in France. He says: "The contrast between the land systems of France and England, two neighbouring countries at the head of civilisation, may, without exaggeration, be called the most extraordinary spectacle which European society offers for study to political and social philo-

sophy. The English census of 1861 returned 30,766 landowners and 240,461 farmers," and he goes on to tell us that by the latest official statistics in France there are 5,000,000 rural proprietors, of whom nearly 4,000,000 are actually cultivators of the soil (the area of France being but one-third larger than Great Britain). He begged they would not think he advocated the French law of compulsory sub-division, which he proceeded to explain (although we may be quite sure that the effect of resisting moderate proposals will be that it will be ultimately demanded, and possibly conceded in a panic). The evil effect of our land system, he added, is that cultivation is not the primary object of ownership of land, and therefore that agricultural produce is not the measure of its value. There are two forms of value attached to land—the one is what may be called the residential value, and the other the agricultural value, and in this country the residential value (which of course is a legitimate one within reasonable limits) supercedes the agricultural value. Then, again, it is the object of so many good people to what is called found a family—that is to say, to get hold of some land and tie it up by means of the very mischievous power granted by the law, as long as possible within the noble family of Tomkins, away from every one else. The consequence is that when a natural cause arises (such, for instance, as the poverty of a Tomkins, and his inability to do justice to the land) to send the land into the market to a richer man, there is an artificial restriction in deference to the posthumous power of a departed Tomkins. The law, therefore, in the power it gives, stimulates a fictitious value to the land. It is to the interest of the community that land shall flow freely into the market whenever there is a natural cause impelling it there. But surely, it might be urged, in reply to all he had been saying, a man may do what he likes with his own, and it is his own property. This, however, called our attention to the fact that the right of property in land has a different foundation to the right of property in any other form of wealth. Mr. Mill says: "Whenever, in any country, the proprietor, generally speaking, ceases to be the improver, political economy has nothing to say in defence of landed property as then established. In no sound theory of private property was it ever contemplated that the proprietor of land should be merely a sinecurist quartered on it." I could cite passages innumerable from all the eminent authorities we are in the habit of deferring to—from Blackstone, Vattel, Adam Smith, Bentham, McCulloch, and J. S. Mill, in support of the views I have ventured to express. The attention of the community has, however, never been aroused to the importance of the subject, and it is to be feared never will be until the evil of the land system makes itself known in some disastrous manner. Crowds from all classes will flock to hear the disgusting revelations of a high-life divorce scandal, and the newspapers that report it fully treble their sale, but subjects of the deepest social and political importance, problems that depend entirely for their solution upon the amount of interest they are able to attract; questions affecting closely the lives and happiness of millions of fellow-creatures, and, possibly, the fate of a nation, are too often tossed with impatience aside; for

"Evil is wrought by want of thoughts
As well as by want of heart."

Mr. BLUNDELL, in opening the discussion, said he thought the lecture followed well upon the subject he had the privilege of reading a paper on in January, and that it entered most fully into a branch of it which he did not then introduce. The letter it had brought forward from Mr. Dickinson he considered too highly coloured, whilst Mr. Esdaile's was not coloured enough; and Mr. Morant seemed to have fallen into error in intimating that the balance-sheet of a notorious Essex farm had not been published. He presumed that this alluded to Mr. Mechi, who, it was well known, had published and circulated his balance-sheet. The subject seemed to divide itself into two heads—crown lands and private property. With respect to the former, that was a question for Government, and was not a party question, or at least ought not to be so, because of its importance to the country. It was a great disgrace that in these days of commerce and utilization such large tracts of land should remain uncultivated. Mr. Morant pleaded that the New Forest should be kept open for the sake of pleasure seekers, but they desired that in any enclosure recreation and pleasure grounds for the inhabitants should be

preserved, such as were to be seen in Southampton by the preservation of the common. He could not understand gentlemen going to Government and asking them to assist in sending labourers out of the country when there were so many thousands of acres lying unproductive which could be made to yield something yearly, if not of corn, of timber. It had been urged by some that the Forest was required for the navy, but we all knew the extent to which iron had superseded timber in ship-building, and if the money would realise 4 per cent., whilst the timber would not pay 2, and thus double the rent of the land, why, in the name of common sense, should the timber stand? The pauperism and the difficulty of maintaining people in this country demanded that every man should raise his voice against land lying waste, and force the subject upon the attention of the Legislature. As to the law of entail, there was no doubt that through this law and the shortsightedness of men who took advantage of it, many improvements were prevented, and the sooner Parliament looked into this the sooner it would show that it had really at heart the interests of the country which it governs.

Mr. JAMES WITHERS made some remarks showing the importance of agriculture in providing for the wants of the people, and urged that it was a disgrace to us as a nation to have so many able men occupying our unions and being fed, for the great part, on American and Russian produce, while so many thousands of acres of land were left in the country uncultivated. Having a plenty of capital and of spare labour and an increasing number of consumers, what good reason was there why they should not be applied to our waste lands? Some urged, he knew, that they would not pay for cultivation, but from 16 years' acquaintance with the New Forest he believed that it was not inferior in average quality to the commons in that immediate neighbourhood which had of late years been reclaimed and cultivated. Emigration had been talked of as a remedy for the present distress amongst the unemployed, but he urged that it would be far better and more to our credit to put them on our waste lands, and so to turn their able and willing bodies to good account amongst ourselves instead of sending them to other lands. Sport had been urged as a reason for retaining the Forest as now, but he believed that cultivation would increase the sport fourfold and that hares and partridges would be more plentiful under the altered state of things—a proof of which they had in that neighbourhood. He was opposed, however, to very small holdings, on the ground of their not being sufficient to keep three or four families respectably. The profits on farming had been so small that if the present average farms were split into four or five holdings there would be great poverty among the occupiers (Hear, hear). With respect to the letters of Mr. Dickinson and Mr. Esdaile, he agreed in the expression of opinion that one was coloured too much and the other not enough.

Mr. SPOONER would like to hear one or two points upon which they were specially called to fix their attention, whether as regarded the laws relating to the tenure of land, or the cultivation of the New Forest. He had read the letters which their last discussion upon waste land brought forward, and was struck by the extreme opinions of the two parties—the one who would preserve the Forest in all its native beauty and all its native ugliness, and the other who wished to grow eight or ten sacks of wheat on every acre of the Forest—and thought them both equally extreme, and equally astonishing to those who knew the Forest. With the letter of Mr. Morant he could not agree, as regarded the great injuries that would accrue to the present estates by more houses being built there. If the argument was good that the Forest was better, more productive, and more advantageous in every respect, if left to its native state, that argument would apply to the estates and mansions already existing. If they were good, a larger number would be good; but if bad, then they ought to be done away with. Referring to the barrenness of some parts of the Forest, as contrasted with more beautiful portions, he said that the improvements which had been effected in the plantations of late years must strike every one, and showed that there was no reason why every bog in the Forest should not be drained and cultivated with profit and advantage. The point he thought they should take up was, How could this land, as a whole, be turned to the best advantage? He never wished the Forest to be entirely done away with; but he thought that at least one-half of the present uncultivated land should be sold, the most attractive spots being selected, and

the rest improved, as far as may be, by planting or otherwise. He was sorry to see statements circulated that the whole of the Forest could be made productive, because that was notoriously not the case. Since long before the time of William the Conqueror, a very large portion of the soil had been taken away every third year. The custom was to pare one turf, and leave two. In three or four years the turf again grows, and in its turn is taken away. If this practice of cutting turf had never existed, no doubt there would be a soil through the greater part of the Forest, where there was absolutely no soil now, or not perhaps more than two inches to the dry gravel. If, then, this point of ability to cultivate all were pressed too far, he thought it probable that more harm than good would be done, because those statements would not bear the light of investigation. He should like to see at least one-third of the existing uncultivated land there brought into cultivation, the belts of estates sold, and the remainder improved as much as possible, but to remain intact as forest, or, at any rate, as public land. With respect to the population of the Channel Islands, he thought it more attributable to the climate, the great productiveness of the soil, and the large number of tourists that annually expended large sums there, than to the difference between their land-laws and ours; whilst, with regard to purchase of estates in this country, he had no doubt the rent-roll took a fair share in the calculations of an intending purchaser. As to the system of small holdings, although this district might be an exception to the rule, he had no doubt no farms were so badly managed as those in the hands of small holders, because their returns were so small as to hamper their enterprise.

Mr. GODERICH had no doubt that a considerable portion of our waste land was capable of some kind of production, but it would, probably, first require a great outlay. In many of the low lands of the New Forest only drainage and chalk were required to make them valuable as pasture; but with the higher lands it would be very different, and, therefore, he thought they should divide it into two districts—the upper and lower: and let the whole go into the market, either by the hammer or by private contract. It would take up a considerable deal of labour for a number of years, and be of benefit to the nation in more ways than one.

The CHAIRMAN thought the subject a very appropriate one at a time when in London and other places meetings were being held to promote emigration and to relieve distress. He was very pleased to hear the Government object to assist the views of those gentlemen who waited upon them the other day to send people out of this country. To have adopted their suggestion might relieve a present difficulty, but he believed in the end it would lead to a greater one. He thought that, speaking generally, the wealth of this country consisted quite as much in the people as in the land or the money, for the stronger a country was in people the better was it able to produce wealth, resist aggression, and consume its productions. The lecturer had shown them in a very lucid manner the quantity of land in this country remaining uncultivated, and he had no doubt that no small degree of the distress now prevailing was attributable to the large landowners for not employing labour in reclaiming and making productive these thousands of acres. It might be well to say that a man had a right to do what he liked with his own; but that clearly had a limit, and he thought that a man ought not to have the power of entail for more than one generation after him. With reference to the taunt to Mr. Dickinson, that he had not produced his balance-sheet, he had no doubt he could produce one quite as good as the occupiers of the farm before him, for he believed he was correct in stating that before, it never paid a shilling to the Crown, who now received some 80s. or 40s. an acre for it. Not only this, but the whole of the Forest never paid its expenses for many years. And when it was said it was absurd to talk about enclosing the New Forest, they had only to refer to what the late Lord Leicester did with so many thousands of acres in Norfolk, converting a blowing sand into a tract bearing turnips and corn in abundance; and he questioned whether any part of the Forest was so barren as these sands once were. They had plenty of clay there for bricks and tiles and to mix with the sand, and other opportunities of intermingling the soil; and, although it might be barren in some places, there was something in a soil brought to the air and exposed that would produce, if not corn, fir. It was clear that it now paid next to nothing, and as regarded the sentiment

that 60,000 acres should be preserved for the sake of a few picnic parties, he thought it time such sentiments should give way to the useful. He therefore thought they would have to ask the Forest proprietors to make up their minds to have the "ruthless agriculturist" there growing his turnips. There was no fear of a National Gallery being brought there, else he was not sure that some would be even found objecting to that.

Captain MAXSE, in reply, said that he purposely abstained from entering into the controversy of "Small versus Large Farms," though he knew that the principal modern writers and thinkers upon the subject agreed in the small-farm system—that he would like to see the laws of primogeniture, entail, and costly conveyance altered, and a tax laid upon cultivable land which remained uncultivated. They simply wanted that natural causes should operate in relation to the exchange of land, and he thought their opponents, by refusing to entertain moderate proposals, led to the advancement of the wildest agrarian theories. He then proposed a resolution to the effect that, whilst there are so many millions of acres lying waste, he was of opinion that attention should be directed to its cultivation as a means of employing our surplus population rather than to the question of emigration.

This was seconded by Mr. BLUNDELL and carried, and votes of thanks to Captain Maxse for his paper, and the chairman for presiding, terminated the meeting.

MEETING AT LYMINGTON.

A meeting was held in the Town Hall, Lympington, to consider the subject of enclosing the New Forest. The Mayor, Mr. Corbin, was in the chair. The meeting was very largely attended.

The Town Clerk having read the requisition calling the meeting,

The Rev. W. FIELD proposed the first resolution, stating that he should not make a speech, Mr. DICKINSON, of New Park, having agreed to second the resolution, which was as follows: "That, in the opinion of this meeting, the present condition of the New Forest is not satisfactory, from either an economical or social point of view, and that the time for effecting some beneficial change has now arrived."

Mr. DICKINSON said he felt very great pleasure in seconding the resolution. He had farmed for sixteen years on the New Forest land that had been once unproductive, but it was now very productive, and that not from any extraordinary means. He never knew anything got from spending nothing. Many farmers looked upon experimentalizing as unwise. He did not think so. If a new manure were brought to him, he tried it first on single plants, to see its effect. Thus he discovered that one manure would produce large crops of grass; another of corn; while another was simply poison; and so on. He had in his garden a range of pots that, in this manner, was telling him all manner of facts. He thought the New Forest was capable of keeping a much larger number of animals than he had formerly stated. He believed it was capable of keeping not less than 200,000 sheep, besides producing cereals over not less than 30,000 acres. The people in various parts of the Forest were half-starved, for want of employment. The New Forest—what does it now produce but fern and fir-trees? but if it were dug and cultivated it would produce gold and silver—oats, and wheat, and barley. It had been said of him he was not willing to show his balance-sheet. He thought very few farmers could produce a balance-sheet. He should want a couple of clerks to keep the accounts in such a case. But he knew he took care to look into his pocket at the year's end, and he could give them his word that the balance was always on the right side. He denied the statement that he had been losing money by his farming during the last sixteen years, and he would be happy to show a statement of these matters to any gentleman qualified to form a correct judgment thereon. The question with regard to the poor in the New Forest was this—Is a man to starve or puffer? In the New Forest children were sent out to pick up what they could, and every now and then they were prosecuted for damaging trees. As they grew up to be men they were often induced to take anything they could get when pressed with hunger and want. One night his hay had been taken from the field where it had been cut—with a horse and cart; his wheat at both ends of his farm had also been stolen. He

could tell of worse things than these if he chose. He was very happy to second the resolution.

The resolution was then put to the meeting and carried unanimously.

Mr. HELBY then rose to propose the next resolution:—That, in the interests of the general public, and particularly of the labouring classes, it is desirable that the New Forest should be enclosed and cultivated as speedily as possible, all vested interests being duly respected.

Mr. PETERSON, of Drumduan, seconded the resolution. He said he could not help feeling a lively interest in the welfare of the people among whom he had pitched his tent. He fully approved of the manner in which the resolution was worded. It was important that the vested interests it mentioned should be considered and respected. The resolution embraced the public welfare, and particularly the welfare of the labouring classes. Now, putting the New Forest, in round numbers, at a hundred thousand acres, he should call that very fair farming that did not expend more than £3 per acre per annum in labour. This, supposing the Forest to be cultivated, would bring to the labouring classes in it an income of £300,000 a-year—people who now were getting their living God only knows how. He wished to see those classes in the New Forest in a very different condition than at present. An idea was prevalent that England was overpopulated; this he denied. It was not that the country was overpopulated, but that a large portion of the land was badly cultivated, and some of it not cultivated at all. He did not see the necessity of emigration while such was the case. As a rule there was no person more helpless than the emigrant. He knew well that for one success there were three failures. We often heard about the lucky men, but not of those who did not succeed. The colonies wanted men of a very different material from those who so frequently went to them from this country. He denied *it* *toto* that this country was overpeopled. He knew Belgium, Lombardy, and China well, and was justified by his experience of those countries to deny it. We should rather inquire if the land in present cultivation was properly cultivated. Much ridicule had been thrown on the farming at Tiptree. He had been in the Tiptree country, and he would say that any one acre of the New Forest would be worth ten of that which had been taken in hand by razor-strop magic. But he had seen there a 14-acre field which had produced 20½ sacks of wheat—14 acres of which had formerly supported three geese and one donkey. About 20 years ago a geologist, Mr. Trimmer, published a pamphlet in the *Agricultural Journal*, showing the capabilities for cultivation possessed by the New Forest, with its calcareous marl, beds of coprolites, and so forth, of which it was full. As to the question whether it would pay or not, suppose the New Forest were sold to-morrow, it would yield to the Crown, and those who had rights therein an annuity equal to £10,000 a year at the least, to say nothing of the good that would arise from its cultivation. He looked upon Mr. Dickinson as a benefactor, who had shown them what could be done in the way of producing food from the land. He was not one who would sacrifice the welfare of the people to ideas of what was romantic and beautiful. He told them of a man who bought 100 acres of waste between Ringwood and Wimborne, at £6 10s. per acre, which he planted with quicks, where now 70 men were kept in constant employ, and in the summer months 150 men found remunerative employment. The New Forest land is now worth nothing except as giving some people an unbounded licence to ramble over the ground. He had been very much struck with a letter he had seen in the *Lymington paper*, signed "John Morant," which reminded him of an Ojibbeway Indian lamenting over the loss of his hunting-grounds in New York or Philadelphia. He was utterly at a loss to conceive how a gentleman of his position and education should have written such a letter, knowing it would keep away many worthy men from attending the meeting that day. It was evident he had not rubbed shoulders with the world, or such a letter would not have been written. Every man had a right to express his opinions, but no man had a right to use his influence to deter other men from expressing theirs. He did not agree with Mr. Morant's idea of the "ruthless agriculturist"—and "congeries of turnip fields." He did not exactly understand the term "congeries" as applied to turnip fields, which were difficult things to heap one upon another. He, the speaker, thought the welfare of the labouring classes ought never to be lost sight

of—that a happy peasantry was of far greater importance than a vast peasantry and howling wilderness. Mr. Dickinson had tried, and done well. A man had better even try and fail than not try at all. His desire was to see the most made of the land, and he was happy to second the resolution.

Mr. ESDAILE (Burley Manor), said he had attended the meeting, being desirous of hearing what would be said on the subject. It was a great question, and should be carefully studied. He desired to express no opinion. He was second to none of them in the interest he felt in the welfare of the poor in the New Forest. But he had heard with the greatest pain what had been stated by the gentleman who seconded the first resolution, that the New Forest children were sent out to pick and the men to steal. He must say, though among them there were some "black sheep," that the New Forest had an orderly, decent, and honest population. He could almost wish that this had been an evening meeting, so that these poor people might have been there to defend themselves. Speaking for them as a neighbour living among them, he denied the accusation. He was sure that Mr. Dickinson's kindness of heart would not permit him to state that these people were nothing but a population of thieves.

Mr. DICKINSON explained that he did not use the words as referred to by Mr. Esdaile. He said children were sent out to collect what they could in the Forest. This was an inducement to them when there to take other things. It was not the first time he had been misunderstood by Mr. Esdaile. He (Mr. Dickinson) held by his words, as he had himself suffered severely, and he could, if he liked, speak of worse things. He added that the New Forest contained all things necessary to cultivation. The marl found in it was the finest of all manures, and he had largely used it.

The resolution was then put, and carried unanimously.

Captain WILSON, R.N., then proposed the third resolution as follows: "That this meeting memorialise the Government to the effect that it is highly desirable to carry out the above resolutions by prompt and effectual legislation."

This was seconded by the Rev. J. B. BURT, of Beaulieu, who said that, as he had lived over forty years in the New Forest, had cultivated land there all the time, and had had intimate relations with its people, he thought he had some right to speak. Last year very many in his district were out of work, and came on the parish. He spoke to them of emigration. They said, "No; look at the land here lying waste; here's plenty of work, or ought to be." Before his window lay hundreds of acres of waste land that might be profitably cultivated, and would yield good crops. He had grown twelve sacks of barley and eight of wheat to an acre, besides heavy grass crops. It was possible some of the poor might think they would suffer in this proposed change, and that if a petition were got up many of them might be persuaded to sign it. He objected to the system of Crown enclosures for the growth of timber, which was now comparatively useless for navy purposes. He seconded the resolution, which was unanimously adopted.

The Rev. W. FIELD, seconded by Mr. DICKINSON, proposed "That a committee be appointed to embody the resolutions in a memorial to the House of Commons composed of the following gentlemen: Capt. Wilson, R.N., Mr. E. Dennett, Mr. Lewis, Mr. Purchase, Mr. Helby, Mr. W. Dickinson, and Mr. H. Doman."

The names of the Rev. W. Field and Mr. A. D. Peterson, were also added to the list.

Mr. R. SHARP, seconded by Mr. PETERSON, proposed a vote of thanks to the Mayor, and the meeting broke up.

THE PROVISION TRADE AT NEW YORK.—In 1869 the exports of pork from New York amounted to 72,019 barrels, as compared with 82,628 barrels in 1868; the exports of beef amounted to 32,299 barrels, as compared with 26,430 barrels in 1868; oatmeals were exported in 1869 to the amount of 47,941,458 lbs., as compared with 36,336,799 lbs. in 1868; butter to the amount of 1,168,447 lbs., as compared with 987,362 lbs. in 1868; cheese to the amount of 58,413,581 lbs., as compared with 41,233,806 lbs. in 1868; and lard to the amount of 30,383,538 lbs., as compared with 44,490,487 lbs. in 1868.

CAUSES DISCOURAGING THE APPLICATION OF CAPITAL TO AGRICULTURE

At a meeting of the Newbury Farmers' Club, Mr. J. J. MECHI read the following paper :

A nation superabounding in population and in wealth, which it loans to foreign nations in hundreds of millions, and yet, with its land half farmed and half capitalised, is dependent on foreign countries for nearly one half of its daily bread, must appear to every reasoning mind a pitiable, dangerous, and reproachful anomaly. There must be causes for this uncomfortable state of things, and into those causes we are about this evening to inquire. When this subject was proposed to me, I asked of myself the following questions :—

1. Are there practicable remedies ?
2. Will they benefit alike landowners, tenants, labourers, and the country at large ?
3. Can the necessary capital be found to carry them out ?

And I at once, guided by my own long practical experience as landowner and tenant, answered in the affirmative. As to capital, we are all, I believe, agreed, that almost any amount of money may be had on land security; and that is, I know, the experience of the several land drainage and land improvement companies that have been of late years established. I therefore anticipate that to give a security on the land for the cost of improvements effected by these companies will be hereafter looked upon as a commendable and desirable transaction. The time will come when purchasers of estates will naturally expect to find a considerable annual charge on them for liquidation of principal and interest of improvements effected through these companies. This system will (when legalised on entailed and embarrassed estates) bring into agricultural use and profit the surplus funds of those who, but for these companies, would never have thought of investing their money in agricultural improvements. It will divert millions from foreign loans that would go to strengthen foreign nations as our agricultural and manufacturing competitors, and would bring vast funds for agricultural use and profit. Before I continue my subject, let me say, truthfully and without flattery, that your county is one in the foremost rank of agricultural progress, thanks in great degree to that wise, good, and far-seeing man, the late much lamented Prince Consort, to the late Mr. Pusey, and to other spirited landowners and their tenants—some, alas! no more. I infer, from your invitation to me, and from the subject which you have chosen, that you are dissatisfied with the present condition of British agriculture, and desire to see it amended, so that we may be enabled, now that we have free trade in corn and meat, to compete successfully with foreign nations in the production of human food. I therefore ask myself, could we thus successfully compete? and I reply, with the confidence resulting from long practical experience, that we certainly could so compete, provided that all the conditions were favourable to the investment of more capital and intelligence in agricultural production. But how important and significant is this last sentence! It may be said to contain the whole future of British agricultural progression. In order to succeed fully, British agriculture should be, both as regards landowner and tenant, as free as air, and released from the numerous trammels which at present cramp its action and hinder its advance. I presume we are all agreed that so long as the average prices of meat and grain are remunerative, we, as farmers, shall not complain, although those prices may be subject to the ups and downs that have ever attended and ever must attend agricultural productions. But while the average prices since the introduction of free trade have been satisfactory to those whose farms are in a proper condition, favourable to capital, thousands of farmers who are deprived of those favourable conditions have had, and continue to have, especially just now, a painful struggle, and are totally unprepared to combat successfully with foreign competitors at the present low prices. Shut up in little ill-shaped fields, with broad hedgerows and timber trees, their land undrained, their roads wretched, their homestead ill-placed, their personal and animal accommodation insufficient and ill-arranged, their

leases restrictive and antiquated, and, in some cases, ground game in excess and a deficient capital, theirs, indeed, must be a sorrowful and unprofitable lot, still further aggravated by the uncertainty of annual tenure, and the absence of a valuation for unexhausted improvements. Not only have they to compete with foreigners, but also with those of their own countryman who, in every one of these respects, may be much more favourably situated than themselves. When I say that we could compete successfully with foreigners, it is because I know that we have an important natural advantage over them (from our greater proximity to a market) which, I think, may be taken as approaching 15s. per quarter on wheat. A considerable difference of opinion prevails as to the cost to foreigners of placing their grain in our market, and that is not to be wondered at, seeing not only how variable at times are the charges for conveyance by land or water, but also how different are our distances from the sources of supply. Estimates run from 8s. to 20s. per quarter; probably 15s. would not be far from the average truth. A friend, well versed in the foreign corn trade, writes to me thus: "As you put the question—Has the British farmer a protection to the extent of 15s. a quarter in wheat?"—coming from the Western States of America and the interior of the south of Russia, perhaps, you would be within the mark, but the great bulk of our supplies come not thence direct, although I have little doubt they do by displacement. A large portion of the wheat shipped at St. Petersburg ascends the Volga, nearly 2,000 miles, and is two years reaching the port of shipment! What are the charges, waste and interest of money? A Russian gentleman informed me that this tedious transit has been considerably hastened by the use of steam tugs on the Volga. The absence of local roads and bridges in Russia and other countries that supply us with grain, render its conveyance difficult and costly. They are, however, making railways with English money. We must not forget, in making our estimate, how numerous and repeated are the charges on transit, such as loading and unloading by land and water, cartage freight, insurance, commission, difference in weight, waste, damage by damp, heating, or salt water, the latter not recoverable by insurance unless from some accident to the ship. Now, as a good British farmer will average 5 quarters of wheat per acre (some years I have averaged 7 quarters per acre) he has thus an advantage, from natural causes, of 25 15s. per acre, to which must be added the difference in acreable produce which is certainly from 1 to 2 quarters per acre. The returns for the quantity of seed wheat sown are, in southern Russia, 5 for 1; in poor northern land in Russia, 4 for 1; in England, 14 for 1; with good farmers, 25 for 1; on my farm 40 for 1. In the United States of America it can be scarcely 6 for 1, because their average crops of wheat are, I have reason to believe, as low as 16 bushels per acre. Ours in England are 28 to 30. In Russia, America, and other foreign countries, the hand and horse-hoe are too generally neglected, and consequently they get a mixed crop of weeds, seeds, and grain. I am sorry to say that some farmers do this, even in England. Against our advantages, which I have described, must be set off cheap or nominally rented land, and the generally smaller cost of production. Take the extreme case in favour of the foreigner:

	£	s.	d.
Our rent, rates, tithes, and taxes	8	0	0
Cheaper labour in Russia	0	10	0
Other charges, manures, &c.	1	0	0
	8	10	0

—that would still leave a balance in favour of England. In America, whence we derive so much of our wheat, labour is double the price of ours, so that our advantage is increased to that extent. It may be useful to consider the present aspect of the foreign grain trade as it affects the foreign farmer, for he is by no means just now in a comfortable position, and, if I am not mistaken, those low prices will soon lessen foreign import, and gradually enhance prices here. Wheat has re-

usually been bought at Chicago (United States) at 90s. per qr., and in Russia at the same price. That wheat cannot be brought here and sold with any profit much under 40s. per qr., but how much does the farmer get for it who lives hundreds of miles away from any shipping port? for we must remember that most of the lands of the old settlements near sea-ports have been long since exhausted by constant croppings, and that it is only from the distant interior that supplies can be now obtained. Even with our good roads, which are wanting abroad, we cannot convey wheat to market under 2d. per qr. per mile, or 18s. 8d. per 100 miles. I know of oats contracted for, free on board at Montreal, in Canada, in May next, at 12s. 3d. per qr. How much will the poor farmer get, who is some hundreds of miles' distance from the shipping port? A Canadian gentleman assures me that after deducting from the present price paid in London, the charges in London, ocean freight, the transport from Chicago to New York (the port of shipment), and the charges at Chicago, with cost of land transport to Chicago, the grower realises only 13s. 6d. per qr. for wheat, or very little more than half the cost of production. He anticipates that supplies to us must greatly fall off. I am assured that exporters and importers of grain have during the last six months suffered a loss equal to £2,000,000 sterling, having ordered and bought too dear, expecting, as many of us did, that corn would realise a high price. The high price of labour in America is sufficiently proved by the fact that last year 120,000 mowing and reaping-machines were sold. Begging pardon for this digression, I now proceed to name the obstructions to agricultural progress:

1. Want of security of tenure by transferable leases.
2. Want of legalised sanction of valuation for tenants' unexhausted improvements.
3. Want of a more uniform practice in valuations, all other things being equal.
4. The law of entail.
5. The cost, delay, and difficulty of land transfer.
6. The want of drainage, local and arterial.
7. Small irregular fields, with too much hedgerow, timber, and ground game.
8. Unsuitable residential and animal accommodation, misplaced homesteads, and ill-shaped farms.
9. The retention of half the kingdom (£2,500,000 acres) in permanent pasture, much of it robbed, starved, poor, and unimproved.
10. The want of education.
11. A dislike to change, and a comfortable belief in antiquated customs.

SECURITY OF TENURE is one of the most important means for attracting capital. Human nature is alike in town and country. Who, in a town, would effect an improvement with merely annual tenure, or unsecured by a lease, with power to sell or transfer that lease? Without leases London and other great cities would have remained small and antiquated. The nineteen years' lease and the intelligent education of the Scotch farmer and his labourers, have, together, worked well, especially for the landowner; and only require the valuation of tenants' unexhausted improvements to make the system nearly perfect. Mr. Gladstone, in his able speech on the Irish Land Question, assumed that in England tenures were more certain than in Ireland. By courtesy they are, but not by law or contract. In order to satisfy my mind on this point I made inquiries of several of our most eminent landvaluers, whose replies, so kindly given, are as follows:

1. "I do not know how to answer your question, there being no data upon which to base an opinion. In the Home and Eastern Counties I should say leases were general; in the Midland and Northern Counties the exception. You may take this fact, however, as indisputable, that by far the larger majority of tenants would accept leases if they had the chance."
2. "I cannot give you from any data the extent of land under lease in England, but I do not think it can exceed one-tenth of the cultivated portion. I am very doubtful indeed whether the majority of farm tenants would have leases if they were offered, but this is owing to the present want of capital. Once got the capital that is wanted and leases would be a *sine qua non*."
3. "There are no means of arriving at any even approximate conclusion as to the proportion of leasehold to annual

tenure. The difficulty in England is to get the tenant to accept a lease."

4. "I consider that four-fifths of the land in England are held on annual tenure, and the remaining fifth held under all sorts of leases, some for the term of 7 years, and again for the term of 12, 14, and 21 years. I very recently gave the tenants of a large estate in Lancashire, for which I am agent, the option of holding on as yearly tenants or of accepting leases at 3s. per acre more rent than they were asked to pay as yearly tenants; all the tenants accepted the leases at the additional rent."

It is quite true that on certain noble estates, where it is made a point of honour never to change the tenantry against their will, there tenants do not wish for a lease and would decline taking one. The true reason is that they know that they hold at an unvarying or easy rent rate, with fixity of tenure, and they also know that under leases landowners obtain higher rents than without them; for while now all is quiet and undisturbed in the tenant's case, had they leases there might and probably would arise at the termination of those leases, revaluations or other reconsiderations. "But," said I to a tenant of 1,000 acres on such a well farmed noble estate, "supposing that an unjust or oppressive tenant for life should succeed to the estate?" "Oh," said he, "a few instances of wrong-doing would alarm the tenantry; they would change their high farming for a taking-out system, and the estate would soon become deteriorated in value." Again, he said, "The stewards of the estate are well aware of this; so we see no danger of such a kind." They justly observe that the Scotch nineteen years' lease (without valuation of tenants' unexhausted improvements) has enormously increased rents, to the landowners great advantage; and they thus appreciate their own more favourable position. Notwithstanding these facts, I am still decidedly of opinion that farming should be treated as a business, and not as a favour, and that leases, with a valuation of tenants' unexhausted improvements, would attract a greater investment of capital, and improve the class of tenants. I would strongly advise every one who feels an interest in these matters to peruse a work which is full of valuable evidence on most of the points of our discussion. The information it contains is far more copious than it is possible for me to lay before you this evening; and it becomes, just now, of great practical value, seeing that Government has recognised and is prepared to legalise tenant-right in Ireland. No one can for a moment suppose but that it must very soon become legalised also in England as well as in Ireland. In 1849 there occurred the late Mr. Philip Pusey's House of Commons' committee on Tenant-right. A digest of the evidence was prepared by Messrs. Shaw and Corbet, of the London Farmers' Club. A republication of that valuable document may now be had at Mr. Tuxford's, 285, Strand; or of Mr. Ridgway, 169, Piccadilly, price 8s. 6d. It contains the evidence of 60 eminent landowners, land valuers, and farmers, on the following subjects:

Tenant-right, customs of the different counties, pp. 1 to 55.

Cultivation of the different counties, pp. 56 to 124.

Tenure, pp. 125 to 139.

The necessity of legislative enactment to secure or create capital invested in the soil, pp. 134 to 163.

The laws of entail, and the policy of giving enlarged powers to holders of life estate, &c., pp. 164 to 173.

The general benefit that would follow from a recognised system of compensation for unexhausted improvements, pp. 173 to 186.

Farm buildings, pp. 187 to 199.

Permanent improvements, draining, chalking, marling, or claying, pp. 200 to 214.

Temporary improvements, pp. 215 to 221.

Dilapidations, and the justice of giving compensation to the landowner for injury, as well as to the tenant for improvement, pp. 222 to 234.

Advantage of breaking up inferior grass-lands, pp. 235 to 240. In 1849, when the foregoing evidence was taken, we had no land drainage and land improvement Companies. Now such Companies exist, and have at their command an almost unlimited amount of capital waiting for investment, when the laws of entail shall have been reformed, as suggested in the evidence at p. 164. These Companies will form the link that will connect the surplus funds of cities with agricultural improvement.

THE LAWS OF ENTAIL.—One-half of England is owned by 150 individuals, and one-half of Scotland by about twelve. In most of these cases the owners are merely tenants for life, fettered by very limited powers, quite inconsistent with agricultural improvement. Some relaxation has been granted by Parliament, but much more is required. I am glad to see that the succession question will be considered by the Government.

VALUATION OF TENANTS' UNEXHAUSTED IMPROVEMENTS.—No doubt we shall have for England a legalisation of tenants' unexhausted improvements, and a general but clear definition of them. We know that we have a body of able men as land valuers and land agents, forming a society called the Surveyors' Association. I hope that they will soon come to an agreement as to the most important questions, such as drainage of stiff clays, covered yards, fixed steam machinery, &c. We want uniformity of valuation, other things being equal. Now, I can find valuers and farmers in Essex who don't believe in the deep pipe drainage of stiff tile clays, although they would decline to stop the holes in their flower-pots. I look upon stiff soil deep pipe drainage as almost a permanent improvement, provided the outlets are kept free. Mine, done 25 years ago, are all perfect, and likely to remain so for another century. In light and springy soils the drains require more attention. Covered and enclosed yards with paved floors, I look upon as essential to the successful farming of stiff soils. It is a great mistake to suppose that such farms are not stock farms; they will produce stock food abundantly, and with proper management and suitable winter shelter, plenty of stock may be reared and fattened, as I know by experience. Modern agriculture, with its chemical and mechanical aids, and artificial foods and manures, has become quite a different affair from the primitive pastoral period of the past century, and requires in respect of tenure, concurrent and suitable conditions and valuations, giving confidence and support to the extra capital that must be now invested. The incongruous and inconsistent state of our valuations for tenants' improvements or investments is, as a system, or rather as a want of system, discreditable to us as men of business. In one county every improvement is by custom allowed for, in another not one is taken account of. A farmer in Essex may have expended £10 an acre in the draining and chalking of stiff clays, yet not one farthing would be received by his family should he die, and the farm be let the very next year after the execution of these costly investments.

THE WANT OF GOOD FARM ROADS.—In this age of locomotives steam-ploughing engines, weighing from 6 to 25 tons, a farm can hardly be said to be in a fit condition for capital until it has good internal roads. I know of more than one valuable engine stuck fast in the mud and waiting for a dry time.

AGRICULTURAL RESIDENCES.—Landowners often complain to me of the difficulty of finding tenants with capital to take their farms, forgetting that modern agriculture, with its greatly increased capital, is entitled to suitable conditions, very different from the antiquated arrangements of too many of our south country farmeries. Men of capital seeking for farms often say to me, "I would take that land, but the house and premises are wretched, the land undrained, and the whole affair unsuitable for the profitable investment of capital." If a tenant is to bring a capital of £15 to £25 per acre (which I recommend on arable land, and which is often the case in Norfolk and Lincolnshire), he must be treated as a gentleman, as I know to be the practice on some of our noble estates, where the tenants and their labourers rank high in comparison with neglected districts. That is the way to improve the landowner's rental and to feed the people. Modern farmers with education and capital do not wear smock frocks and dine in the kitchen with their labourers, as was once, and is now in some districts, the custom.

POOR OR NEGLECTED PERMANENT PASTURE opposes a great barrier to the investment of capital, the employment of labour, and the production of food for the people; 22,500,000 acres, being one half of our available land, are in permanent pasture, much of it poor, robbed, and unimproved, yielding a wretched produce of probably only 45s. per acre. Under cultivation, with modern improvements, an exactly opposite state of things would prevail. It is a mistake to suppose that arable lands cannot be made stock farms.

TREES AND HEDGEROWS must succumb to steam cultivation and modern improvement. I wish that our Board of

Trade would give us a return of the miles of hedgerows, their average length per acre, and the number of trees, and their numbers to each acre. The length of open ditches and water-courses would be also desirable.

GAME.—The exclusive privilege of sporting would, in many cases, attract tenants of capital. The detested gamekeeper, and too much ground game, often repel capital.

EDUCATION.—The want of it, either for our farmers or their labourers, must be a great impediment to successful agriculture. Scotch farmers and their labourers owe much to their long-established and general education, dating from the time of John Knox—300 years ago. In this respect they have stolen a long march upon us south countrymen, hence the general prevalence of Scotch valuers, stewards, gardeners, and bailiffs in England and Ireland. England is, however, at length awakening to the importance of education, and I rejoice to see that the matter is taken in hand by our Legislature. I have been told, more than once, by large practical farmers of the old school that not only was education not required, but that it would spoil their best labourers. Let us hope that this delusion is gradually passing away. What we require in our agricultural labourers and in ourselves is intelligence; and although it is only the Almighty who can give natural talents, man may cultivate and improve them. Certainly the ability to read, write, and cipher would afford to the labourer, desirous of information and improvement, the means of acquiring both, and thus of becoming a more useful member of society. Ignorance is not bliss even in agriculture, but knowledge is power. Not only will education render the labourer much more valuable to his employer, but it will also enable him, if he has talent and a desire for improvement, to emancipate himself from the mere drudgery of labour, and take a better position in society. Several of my best labourers, aged about 45, who have been with me more than 25 years, can neither read nor write, and they all regret it, especially the one who has managed my steam-engine and machinery for the last 20 years, and who could greatly improve his natural talent if able to read the current engineering literature. The superior intelligence and rapidly-increasing power of our American cousins arises from their passionate love of education, their Government and people having always made ample provision for national education by endowment with lands and by liberal taxation. It has been a paying investment, and, but for their vast area of cheap land, and the consequent high wages of labour, we should have lost ground in the competitive race of manufactures, and perhaps warfare. There are more than 120,000 public schools and colleges in the United States, most of them free. Education would also, no doubt, effect a religious and moral change in our labourers, and much diminish the difficulties of the beer-shop question. At present the uneducated labourer's mind is, comparatively, a blank, receiving no impressions from past or passing events, British or foreign; but educate him, and he, like ourselves, would take a lively interest in the world's affairs. The broadsheets of intelligence in newspapers and books would then give him wholesome excitement, and occupy pleasantly, innocently, and profitably, much of that portion of his time which is now injuriously wasted at the beer-shop. We have already a halfpenny newspaper in Essex, and I hope that the postal charges on them will be greatly diminished. Everybody in America reads a newspaper; there, newspapers were produced at a cheap rate long before we attempted it. We must, both landlords and tenants, expect and prepare for great changes in our agricultural practice. Local and arterial drainage, the utilisation of town sewage, the manufacture of beetroot-sugar or its distillation for spirits, the extensive use of steam for cultivation, and fixed steam-machinery, covered homesteads, &c., will necessitate a considerable relaxation in the stringency of leases, and require large additional investments of landowners' and tenants' capital. General and useful agricultural improvements, both by landowners and tenants, might gradually absorb much more than £500,000,000 of additional capital: it would be a safe and profitable investment. This is no exaggeration; I speak practically on the matter. We have nearly 50,000,000 of available acres, besides uncultivated wastes. The mere drainage of the portion requiring it would, according to our best authorities, absorb more than £100,000,000, to say nothing of many other costly landowners' improvements. The tenants' capital increased by 24 per acre would absorb an additional £200,000,000. On my farm and on many others the

incalculable sums expended by landowner and tenant are very much beyond the amounts I have specified. There need be no fear of our arriving too suddenly at the expenditure I have named: a host of prejudices by the way—let us try and remove them. The multiplication of our population, now numbering 33,000,000 (which 70 years ago were only 10,000,000), will outstrip, I fear, any attempts we may make to provide them with homegrown food. What a happy country this would be if, by the freedom of agricultural action and by the investment of ample additional capital and intelligence, we could produce our own food as we manufacture our own clothing and other necessities, and in the act of so doing employ more of the British people, thus diminishing suffering and pauperism, and increasing the wealth, strength, and content of our country. Experience has taught me that all this could be profitably done, and I pray that those who have the power may be moved to encourage, by suitable and improved legislation, and by every other means, so desirable a result. You will agree with me that the quantity of food we can produce must depend upon the quantity and quality of the manure which we deposit in the soil. Admitting this to be so, our country might be one of the most productive in the world, for not only do we consume all that we grow, but in addition some £70,000,000 worth (solid and liquid) of human food which we import from foreign nations, in addition to millions' worth of food for our live stock. The results of all this, which now pollute our streams, would, if applied to the soil, produce food enough without foreign imports, and spare our paying £3,000,000 annually for birds'-dung from Peru, and taxing the graveyards of the world for osseous remains. But if we have not yet made the land fat by sewage, we have evidently succeeded in fattening the bed of the Thames by pouring into it for many years the results of all the good things that we consume. There can be no mistake about this, for a French gentleman has succeeded in extracting it from Thames mud, and it is reported that he has established a factory at Battersea for that purpose. A series of chemical analyses have shown that there is an ample supply of it on all the mud banks, both on the north and south side of our once salmon stream. Can there be a more bitter satire than this on our national agricultural intelligence? Need we be surprised at this, seeing how many tons of fat pass daily into our river? In conclusion, this is an unfavourable time for arable land farmers, and many will suffer heavy losses. My balance-sheet for 1869 shows a considerable decline from those of former years, as you will see at foot. The difference would have been greater, but that I sold much of my corn before the heavy fall in price:

**BALANCE TO PAY RENT, ALSO INTEREST AND PROFIT ON
TENANT'S CAPITAL ON 170 ACRES.**

1869	£427	13	6
1868	572	13	6
*1867	773	5	10
1866	573	11	6
1865	543	7	4

Let us, then, resolve to amend our agricultural ways, for our own profit, and for the good of our country.

THE APPLICATION OF CAPITAL TO AGRICULTURE.

—At the meeting of the Warwickshire Chamber of Agriculture at Atherstone, Mr. T. Horley introduced his subject in an address, in which he said, it was Lincolnshire where agriculture was carried to the highest perfection, and he quite agreed with Mr. Chaplain that it was the best farmed county in England. He believed that great changes would take place in respect to agriculture in this and other counties, where they were universally behind the Lincolnshire farmers. Nothing, he considered, would have so great a tendency in causing capital to flow into the channels of agriculture as a certainty that the out-going tenant would be reimbursed for unexhausted improvements. There were, however, two sides to a question. The tenants should remember that if they did not do their duty they might be called upon to make good anything which had arisen from their mismanage-

ment or neglect. They should not consider one side of the question alone, and it was only fair that if the tenants asked for a guarantee that the landlords should have a guarantee also. He next referred to local taxation, and showed how unjustly it pressed on real property, and observed that it prevented in a great measure capital being employed in agriculture. They could not shut their eyes to the fact that if a gentleman having £10,000 put it into the funds he was entirely free from those taxes, but if, on the contrary, he laid it out in the improvement of the soil he was called upon to pay rates for that capital. That had a serious effect in preventing capital being employed in agriculture. This question had been debated for many years past, and evidence respecting it was taken before a Parliamentary Committee in 1848. It was the opinion of this Committee and the bulk of the witnesses examined before it, that it should be dealt with by a system of what was called tenant-right, and it was decidedly shown that this would be beneficial both to the farmers and landlords of this country. It was then universally admitted that it was very desirable that the question should be one of early legislation. He feared that many landlords did not understand this question. A rambling discussion followed that went but occasionally to the point, and the following resolutions were ultimately carried: "That the application of capital to agriculture is to a large extent discouraged by the absence of provisions which would secure to the tenant when leaving a farm the value of his capital invested, and the agreements which would ensure repayment to the tenant of money expended by which he has increased the value of the soil, would encourage the application of capital to agriculture by tenants, would add to the permanent producing powers of the land, and would thus materially benefit the landowner." And "That the existing law which places all local expenditure upon land and building, leaving other investments entirely free from such charges, is unjust, and is a great and serious discouragement to employing capital in agriculture."

PAYING THEIR WAY.—A short time since Mr. Mortimer, a gentleman down in the West, sharing in the very general dissatisfaction now abroad, spoke thus at a meeting of the Devon Chamber: "The Central Chamber was opened in 1865, and at present comprised some 180 members, of whom 26 were elected to the council. He was not aware of anything that constituted them the head of the chambers in the country, or that the country chambers should affiliate themselves to the Central Chamber. About fifty chambers had affiliated themselves to the Central Chamber, and sent a hundred delegated members to it, so that the council consisted of 126 members. The self-elected members of the Central Chamber had more weight than the chambers in the country. He did not consider they should place so much confidence in the Central Chamber; and he urged they should have a chamber where they could be properly represented. The chambers throughout the country had no common bond, and often were working in direct opposition to each other." Mr. Mortimer then moved a resolution, which we gave in our paper immediately on this being passed. In answer to Captain Davey, the secretary of the Central Chamber writes a letter, in which he says: "In order that there may be some certainty about attendance of a portion of the council, the twenty-six elected members of the Central Chamber are allowed second-class railway fares, and this takes up fully one-half of the money subscribed by the Central Chamber members." Only imagine, in order to secure "some certainty of attendance," the members of the council of the Royal Agricultural Society, of the council of the Smithfield Club, of the committees of the Farmers' Club, or of the council of the Royal Agricultural Benevolent Institution expending the funds of those Societies in sending each other up to London, carriage paid, second-class! Of course, the secretary then gets on to his favourite topic, and hints pretty broadly at sending round the hat again: "The active and liberal-minded chambers are from time to time increasing their contributions, while others are lukewarm or non-progressive;" while, as he plainly puts it, if the executive would only travel first-class, they would run pretty closely up to the income!

* In 1867 my wheat crop averaged 7 quarters per acre.

THE MANAGEMENT OF A DAIRY FARM.

[We have thought it useful to promote the subjoined correspondence.]

Dear Sir,—You might think me rather bold in intruding; but as I thought the writer of the articles "Northern Farmer" was some one with a sound knowledge of farming, some one that I durst safely follow, not one of Mr. Meehi's stamp, but one both safe and profitable, it encourages me to do so. Though I am a young man, I have been a subscriber to the *Mark Lane Express* twelve or thirteen years. I admired some articles written last winter, signed J. S., but I have a better liking for those signed "Northern Farmer," though both are very good.

I have about 125 acres of good second-rate land, all either naturally dry, or else well drained; also about 14 acres of land that is used to be a wood, but now only a little timber in; this is on a slope, but nearly all dry.

My stock consists of 24 cows at present; I generally have from 17 to 27, the greater number in winter, and the less in summer; also six calves of about five weeks old, from my own cows, though I have only one heifer out of the lot; these are the first I ever attempted to rear. I have three horses, and three carts of 11 cwt. each.

I have 136 Northumberland ewes, tupped with two Lincoln-Leicester tups, bred near Wetherby, due to lamb about the 8th of March. The milk is all sold at 3d. per quart, and fetched from the house; some of it is fetched a mile; it is all ready money, excepting about a dozen customers that pay monthly, in fact 80s. would cover all the bad debts I ever made with milk. I churn a little; being ready money, it varies at times; what we churn is whole milk, not cream; the buttermilk we sell at 1d. per quart, the butter averages here about 1s. 4d. per lb. (16 ounces.) Before tea and sugar became so cheap there used to be a great demand for buttermilk. Some time since I milked 35 cows; but churning a deal, my missus grumbled about it having so much butter making.

The last winter was my first beginning with sheep, partly through having so much grass left on the land at the back end of the year, and then when we came to mow the meadows, the hay was full of the old dead grass; and partly through the writer of the articles, signed J. S., in *M. L. E.*, I bought 60 Cheviot in-lamb ewes, 20 Penistone ewes, and a few what they call Derbyshire Limestones, bred near Buxton. We lost one ewe in lambing, one lamb through sucking in wool; but being rather short of land for them, we gave them a deal of cake and corn, and sold both ewes and lambs to the butcher. I went to the sale at Shrewsbury, in September last, the 3,000 sale, but I thought they sold very dear. I bid hard, but did not get a lot. I gave 48s. and 49s. for my north ewes at York, such would be bought at 40s. and 42s. the season before. What I should much like you to tell me is, for one thing, which way would you do with the ewes and lambs, first as to what, if anything, would you give them besides a good pasture? The ewes are all full mouthed. Would you sell off a part of the lambs, or all, or any of them?

I will tell how I keep my cows. I get from 12 to 15 loads of grains weekly, about two miles from here, at 2s. 6d. per load of 6 bushels; each cow also gets about 4lbs. daily of linseed cake and rape cake, together with 6lbs. of bean-meal, mixed up with the grains and mangolds, at present three times a day; once a day we fodder them with straw; what they leave we bed them with; we give them hay twice a day in summer; they get the same weight of cake and meal with the grains. We turn them out to grass* in April, but they don't

* We think that these fields should be examined well. If ryegrass is plenty, ergot of rye is a disease to which this grass is particularly liable. It consists of occasional black spurs, of variable length, growing in the position of the seeds, and is probably a diseased condition of the seed itself. This disease has nothing whatever to do with the seed, but where it occurs in any quantity it is usually an evidence of a damp condition of the atmosphere and want of drainage. If these spurs are to be found, we would recommend the writer to remove his stock, and especially in-calf cows, to another pasture, as cows eating the ergot will certainly slip their calves.—[Ed.]

go out in the night until the first of June; they were tied up early in October for the winter. I have tried letting them stop out in the day until near December; but they always had a deal of condition, and this is of some consequence, for I let them all go to the butcher. I have tried bulling a few, but they nearly always slipped their calves for several years; people here say it was through being too highly kept; but they never used to do it, and they have always had about 10lb. each cow of meal, or meal and cake per day. I did sell two that had been milked about 13 months for £66 at Christmas, these made about £10 more than they cost me; but they were very well bred, and made a good price, 8d. per lb.; but as a general rule of late they never make near the price they cost. At the present time they are very middling ones at £24 or £25 each; we need to get better at £18, besides the risks attending getting in fresh stock from fairs and markets. My cows used to carry their calves before I got some land that was very poor; it had not had a shilling spent on it for 50 years; it lies near the rock, but fair amount of soil on it; it used to burn in summer if there were 10 days without rain, but now a long drought scarcely injures it. I have limed it three times—with 6 tons per acre once, and 4 tons per acre twice; it has not missed having a dressing of either manure or lime these nine years; it is in pasture, it is full of benty grasses yet, and has a skin of about 2 inches thick of dead grass, something like that from a heath. We put the heavier sheep and lambs on this field last summer, but they did not grow a bit; then we let it get fresh, and put the Cheviots and their lambs on it, but they stopped growing also, yet they all did well on the other land. How do you think it would answer to break it up, and sow it with rape this season? This is a badly-farmed district; we live near what is called the back bone of England: they are almost all of them small farms, nothing but grass, milking six or eight cows, skim their night's milk, and mix it with their morning's fore milk, and retail out at 2½d. per quart. My land consists of four or five such places. The steward, for part of my land, does whatever draining I have wanted done; he has done it all, both carted 3 inch-pipes, and put them in free; they also keep all walls on the roadside. Of such I have 1½ miles in good repair, free also. The rent averages about 60s. the statute acre. I live on the outskirts of the town; it runs near 1½ mile from one end to the other; we are set on to two-thirds of the farm with 25 cwt. of manure with one horse, and for the remainder it takes two horses for that weight. There is horse and cow manure to be had at an average of 4s. 6d. per ton within 1½ mile of any of it, and they will put one-horse barrels of night soil on the land at 1s. 3d. per barrel; night soil and ashes mixed we can have free for fetching. We can get 35 cwt. or more hay to the acre. Swedes and mangolds are worth, on an average of years, 25s. per ton; they come some miles from here by rail, out of York.

All my land was in grass until 1868, when a gentleman came out of Nottinghamshire, and said to me, "Why don't you grow some cabbages and mangolds? This land will grow cabbages and mangolds with any land. Try an acre of cabbages, it will not be much loss if they fail." I did so, and put the manure on the flat surface, and only harrowed it, and got 5,000 plants; we had lots above 30lbs. each; and green crops being a failure, people were quite astonished. Succeeding with these, and the cows doing so well on them, I put in about 5 acres last year, also 3 acres of mangolds, an acre of kohl rabi, and a few swedes; my mangolds would weigh about 25 to 30 tons to the acre, kohl rabi 16 to 18 tons, but they were sown on some of the poorest land. People in this country said cabbages and roots could not be grown, neither could sheep be kept; they could not tell their reason for it, only some one tried a few sheep about 20 years since, and they could not manage them.

I only came into possession of one part of this land at Christmas, the owner having let his mansion; it is all in grass, but about 12 acres that has been part oats, part beans, potatoes, mangolds, and swedes; but it is turnip-sick, for it has had turnips on every other year, he being the only turnip grower for miles. I was thinking of sowing this with oats and seeds;

the fault with corn of any sort here is, being late to get ripe. I have a field of about 7 acres ploughed, and I think of sowing it with oats.

The field which I had the cabbages, &c., was four fields put in one. There was a deal of labour to get it into form so that it could be worked with horses. I have a midden in it of about 250 tons of horse and cow dung. I am thinking of planting cabbages, mangolds, &c. again.

The way we used the cabbages, part was cut with a large turnip cutter for the cows, and mixed with the grains, &c., the ewes got a good many carted on the grass fields; and a portion was given to some wethers feeding off 30 acres of good after-grass. I also sold a lot, about 10,000, to the hucksters about here. I can also get the winter eating of a lot of dry land near this very cheap.

The cows are milked winter and summer in a shippon, about 200 yards from the house. I should like to get a class of cows that would milk well at less cost. I have given since Christmas £127 10s. for four, they were so dear; they are York, and Skipton cows. I have bought five common ones, such as are bred about here, but they have not flesh about them; there is not a good bull kept in this district. I am rather fond of sheep, but know very little about them. I have given them a sack of bran (120 lbs.) every morning for some weeks, but since the storm, two sacks,—and hay as well; and shall have some mangolds to spare for them. I have about 25 acres of grass that nothing has been on since October.

I have written to you just as it came uppermost; it will need some trouble to sort it; it will need some patience; but I shall be heartily glad of any information from you; and if there is a time when you could come so far, I would most gladly pay you for your time. Yours truly,

A SMALL FARMER.

N.B. The sheep last summer we did not mix with the milking stock, I am puzzled what sort of stock to get to fully stock it, as for buildings to tie up in I have abundance.

Dear Sir,—I have received your letter per favour of the Editor of the *Mark-Lane Express*, and being unable at present to pay you a personal visit, shall endeavour to answer you by post as fully as possible.

I must thank you for the highly flattering terms in which you refer to recent articles which appeared in the columns of the *Mark-Lane Express*. You could not I assure you pay me a greater compliment than by looking upon these articles as practical, and capable of being carried out to the full in everyday practice by the ordinary rent-paying farmer, as that is the sole aim in publishing them, and to know that you, or any other reader, has been instructed or benefited, is both pleasing and satisfactory. I consider that if such exceedingly practical communications as that which I have just received from yourself appeared now and again in print, real bona fide descriptions of crops grown for particular purposes, and the amount of success attending their growth, as also the amount of concentrated food consumed by different classes of stock; a much better idea of farming, as it is actually carried out in different districts of the country would be arrived at.

I may say in passing, do not think too hardly of Mr. Mechi, as although he is admittedly too far ahead of his time for the bulk of agriculturists to follow; yet he has done a great deal in pointing the way, and in inducing monied men to give new systems at least a fair trial. Latterly he has refused to answer objections made by practical men to his published statements, a course I would say fatal to his popularity, and to his success as a practical teacher of his favourite pursuit, and one rather surprising in a gentleman whose countenance is the personification of geniality and good humour.

For the size of your occupation I would say you keep a large stock; your ability to do so being explained by the fact of your using so much purchased food in the shape of grains, cake, and bean-meal. But for your feeding liberally with concentrated food you could never have forced milking cattle to such a price as £33 a-head, even although 8d. a lb. was obtained for them. When a man has capital, and possesses sufficient spirit to invest it in these foods, your experience shows that it is a profitable investment, the produce of the animal being longer sustained, its amount largely increased, and the manure made both bulkier and richer in quality. By following the system which you have described, viz., selling to the butcher, when the diminished flow of milk renders it no longer profitable to keep her, it would be ruinous to feed only

with the food of the farm, as high-priced cows could not be disposed of at their original cost, several pounds less having to be accepted, the money which would in more favourable conditions form the owner's net profit being thus irretrievably lost.

The unavoidable deterioration in value that takes place in a herd of dairy cows kept on, and bred from for a succession of years, must always be allowed for in striking the year's balance, as if omitted the true result will not be obtained.

A number of old cows in a herd makes the dairy returns very deceptive, particularly in the case of butter-making, the milk being so much thinner from aged animals, and a second source of loss is thus introduced, the whole amounting to a very considerable sum on the year's receipts. To get rid of loss from this cause many intelligent men sell their cows on the third or fourth calf, replacing them by young animals of their own breeding, each animal on leaving the farm bringing all the money she could ever be worth, the extra price received proving amply sufficient to repay the trouble and expense inevitable in the production of good stock.

Your own experience in having to pay, say £25 for middling cows, is altogether in favour of this mode of management, as it clearly shows that careful breeding and liberality of feeding in conjunction with the ordinary business of the dairy is a great help in raising the annual return from that department of farm business and setting the man who follows it on the high road to success, if not competency.

I am sorry you did not state the exact amount in cash you made from each cow, as facts of that kind are invaluable if only for the sake of comparison, but as the price, 1s. per imperial gallon, is a high one for a country district, I will give you my own opinion as to what should be extracted from each animal.

You feed well, and, judging by the price you pay for them, have in your stall cattle of large frame capable of being forced to yield an abundant flow of milk. Taking the milk given by a well kept cow at 600 gallons, you have, at 1s. per gallon, the highly respectable sum of £30, but as you churn a little, and the price of butter only 1s. 4d. a lb., there must necessarily be some few deductions. That price for butter, even with the large price of 4d. per gallon for butter-milk, is not by any means equal to the price you get for the milk as it comes from the cow, therefore I deduct £3 from the cow's monetary return on that account, and taking £5 to cover the cost of concentrated food, you have still £23 left to pay for the home-grown, servants' wages, your own time and trouble, and interest of money.

I shall be exceedingly happy to know from you at any time whether this calculation is over or under your mark, and how much. Speaking experimentally, I believe it to be highly impolitic to turn out cows that are being milked and prepared for the butcher at the same time, more particularly of course in spring and autumn, the withering blast and drenching rains taking off condition faster than the best food can put it on. As a rule with dairy cows, whether they are kept as temporary or permanent stock, the later they are of being put out by night in spring, and the sooner they are housed in autumn the better it is for their own health and the interests of their owner, although very singular to say, the opposite appears to be carried out in practice.

The reason, however, is obvious, the supply of house food for winter being in too many cases inadequate, stern necessity compels people to resort to such unnatural treatment of the poor dumb creatures. Apart even from these considerations it is short-sighted policy, as the grass nipped in the commencement of its growth is never able to cover the ground and afford a full bite, and by-and-by, when the sun becomes strong, the roots from having no protection get scorched and the land becomes as incapable of affording sustenance to heavy stock as it is in mid-winter.

The remarkably high prices now and lately ruling for milking cattle of a good class is very encouraging to breeders, and every well-bred calf should be reared. It is of no use, however, rearing a badly bred one, as they are not worth the trouble; all such should be sent away the moment they are dropped, whether male or female. A heifer calf pure bred from the sire will, if healthy, even although extremely small when born expand rapidly if well fed, and will always be a decent thing to look at; whereas a miserable cross-bred article, however promising when dropped, will never maintain an equal

appearance on the same amount of food, and will fall very short in value when sold. It is very mortifying when a man has gone to a good deal of trouble and expense to procure a good bull to lose the reward of his trouble by having the calves slipped prematurely. For a year or two in a stock this will sometimes happen to a very distressing extent, and it may disappear for years without the arrangements for the care or comfort of the cattle being in the slightest degree altered. High feeding will not of itself cause abortion, the foods which constitute high feeding being small in bulk, and consequently having not the slightest tendency to overload the stomach, and thereby cause an undue strain on the vessels of the womb, or the embryo which it contains; neither has it the effect of suddenly lowering the temperature of the body, one of the most fruitful causes of untimely birth definitely known.

Although it is usually considered that when a large number of cows in a particular herd cast their calves, the cause is some subtle sympathetic influence unexplainable and undefinable; yet it has often occurred to me that farmers should not rest satisfied with such an obscure explanation of such a troublesome disease. It is but reasonable to suppose that a number of cows, the conditions of whose daily existence are exactly the same, and subject to the same atmospheric changes both in-doors and out, must be very similarly affected, and what will cause abortion in one animal must of necessity have the same influence on its neighbour, particularly if it resembles it in constitution. Careful driving, roomy doors and stalls, regularity in feeding, good ventilation, and a smooth floor to rest on are nearly all the precautions that can be taken in the way of prevention.

A comfortable milking-stall can be got up at very moderate expense, and for the sake of a little paltry economy the animals should not be hampered for room. Eight feet for every pair of cows should be allowed when of a large breed, and on no account should it ever be less than seven. Breadth of the house in the clear 13 feet, divided as follows: 3 feet for trough and fastening, 6 feet standing room, 1 foot for channel 4 inches deep, and 3 feet of path.

By this arrangement the cows must of course be fed from behind, the room given each pair as above stated being ample to permit the food to be taken to them without either annoyance or disturbance. In the case of a large stall with a double row of cows, I would decidedly then feed from the head as the convenience is obvious. The flooring should be of a substantial material, so as to ensure permanence, comfort and cleanliness. Fire-brick of the rougher and cheaper sort suits admirably, always looking neat, and there being no liability to injury from slipping.

The above is the description and dimensions of a stall in actual existence, and which I laid down my pen for a minute to go and measure, so as to give you it correct; it was built about 20 years ago of substantial materials, but without the slightest attempt at ornament, and a neater, more comfortable, or healthy cow-house could not be desired.

You have given immense sums for your cows, £32 each is something enormous; I would like to get two for that amount. Would you not try half-a-dozen or more Ayrshires and judge for yourself as to their capabilities as paying dairy stock? My own opinion is that they are the best breed going, and their progeny when crossed with a Shorthorn bull are handsome animals, of good stamina, and useful for any purpose. A few years ago useful animals of this breed could be purchased in the neighbourhood of Glasgow at from 10 to 12 guineas, at present the same class fetch from 15 to 18 guineas, but mind you an animal at the latter price is a decent one to look at, although smallish to those accustomed to Shorthorn crosses, a rare pair-filler, and keeps herself in good condition on a moderate supply of food. If you wanted to see this breed in her native purity the Glasgow or Hamilton shows would answer your purpose, although it is of no use purchasing prize cattle, they cost a great deal more than they are worth, and disappoint all but those who purchase for showing purposes.

In rearing calves success is easily attainable by liberal feeding, comfortable quarters, and separation while receiving milk. Attention to the latter point prevents sucking, and the absorption of hairs into the stomach thereby, and many lives can be thus saved by attention to a matter so simple. You do not grudge your cattle a little oilcake, therefore I think you will be disposed to give a little to the calves, than which nothing pays better. If supplied to them as soon as they will make

use of it, even in as small a quantity at first as half-a-pound a day, increasing it eventually to a whole pound; it preserves them in excellent health, and is actually a preventive of disease. For instance, it is well-known that the great scourge of young cattle, black-leg, or black-quarter, is scarcely ever experienced amongst those stocks where oilcake is regularly used, even although present and peculiarly fatal in the immediate neighbourhood. A good many years ago an old Aberdeenshire farmer told me that until he confined his calves in separate cribs and allowed them a small portion of cake his losses from black-quarter were most vexatiously heavy, but since he adopted both plans he had been perfectly free from it. His reason for confining them separately was not that which I have given above, but to prevent the strong knocking about and injuring the weak, their injured health and weakened constitutions from that cause making them more susceptible of disease.

You have been most successful in growing cabbage, although not conversant with them as a field crop. I would say the fresh land was the cause of their doing so extremely well; but the same land well prepared ought to grow a larger crop of mangolds than 25 tons, although for a beginning it was not bad. It would be cheaper to grow your own green crops than purchase at 25s. a ton, your land seeming to be easily worked and of easy access, and apparently very well suited to their growth. Green crops being such an excellent preparation for grass-seeds, and, in fact, the only way in which land can be got into proper order for their reception, as large a breadth should be grown each year as circumstances will permit. The very fact of your crop of hay being hard to cut, through the previous year's grasses being present in large tufts, would indicate that the land wants renewing by being put through a course of husbandry, couch and bent having to all appearance taken possession of the soil to the exclusion of the more valuable herbage.

It would be dangerous now to plough an old grass field and sow with rape, as if the sward were not well turned down the young plants could not root; and to have juicy plants, capable of affording a large amount of food, the freshly turned up soil would require to be very rich and full of organic matter, which is seldom the case on old and exhausted pastures. The better way would have been to plough and sow with oats this spring. Grab well and plough down on the removal of the crop in autumn. Grow mangolds or turnips with liberal treatment, and then lay down either with or without a crop. The enormous quantity of valuable herbage grown on a field so prepared when the latter arrangement is followed, being almost beyond belief until proved experimentally. The present season is the one to teach a man how to appreciate the value of laying a field down to grass without a crop, especially if he has a few scores of ewes lambing, as you have. The succulent grasses and rape leaves bring the ewe to her milk at once, and enable her to sustain it unchecked. This is a very important matter, as if the flow of milk is once checked from deficient food she never again recovers herself, and the lamb, instead of being fat, is merely fit for store—and not much good even for that. The lamb that gets a good start, and does not for a single day get an insufficient supply of food, may be almost seen growing, and before they are three months old the whole stock, if it is intended so to dispose of them, may be cleared off at a guinea-and-a-half a-head, and they need not be large lambs either at that price, as 8 lbs. a-quarter at 1s. a lb. is all that is assumed in the above calculation. To have the lambs fat should be the owner's whole care; and it is easily done, if the food has been prepared—the stock not over, but rather under the mark; and the lamb therefore pampered from the beginning. The moment the big price (1s. a-lb.) can be got for them let them go: it relieves the pastures, and gives the mother a chance of putting up condition early, and so being got rid of before the price of mutton falls, by the markets becoming glutted, which they invariably do in autumn. I give you the mixture of seeds which I sowed last April without a crop, although I am not aware that it possesses any unusual merit; but as it did noble service in September and October in finishing a lot of broken-mouthed ewes, and now is carrying the present season's lambs, it may be useful. I may remark, with regard to the proportion of rape, if the land is in high manurial condition, 3 lbs. to the statute acre is ample, as it branches wonderfully when well nourished, and that quantity will completely cover the

ground. If in only middling heart, 4lbs. will not be too much, as the difference in foliage and succulence is extraordinary: 1½ bushels perennial ryegrass, 1 bushel Italian, 2½lbs. cocksfoot, 2½lbs. timothy, 2½lbs. *Poa pratensis*, 1lb. *Poa trivialis*, 2½lbs. *Poa nemoralis*, 3½lbs. hard fescue, 2lbs. meadow ditto, 3lbs. white clover, 3lbs. cowgrass, 2lbs. red clover, 2lbs. alsike, 2lbs. trefoil, 1lb. rape; the whole costing for net cash 28s. the statute acre.

I may notice that a slight dressing of lime—even as little as 3 tons to the acre—on the removal of the green crop, slightly worked in so as to keep it near the surface, is highly beneficial to the grasses, imparting richness of colour and considerably-increased luxuriance, while at the same time, I believe, it sweetens the herbage.

With regard to the class of ewe most likely to be profitable, I decidedly say the Shropshire, if to be had for the value; but there is no use in buying anything that goes beyond the mark, either. For a permanent stock, that would be held over until they had given, say, at least four crops of lambs, one would give a little more for well-bred hoggets of well-proved excellence, so as to have a decent article to look at; but for a stock that is intended to be completely cleared out each year, a class of ewe that makes good nurses and costs little money must get the preference. To have a loss on each ewe when parted with, as should be the case when fancy prices are given (no butcher taking that point into consideration), would make the business all trouble and no profit. In this way the Cheviot sheep which you allude to come useful, as their cost is comparatively small. They stand high as nurses, and fatten readily when relieved of their lambs. From 28s. to 32s. is about as high a price as can be safely given for cast Cheviot ewes; and in general they can be purchased in the neighbourhood of the grounds where they are extensively bred for considerably less. The Falkirk Tryst, held in August, September, and October, is a very central district for procuring this breed; and thousands are annually trained at Larbert station, at the conclusion of each day's market, to be dispersed all over the kingdom.

For a nice stock, that one could be proud of, while at the same time making money by its produce, I think there is nothing to beat the Shropshire Down ewe, crossed by a Border Leicester ram. The lambs from this cross are exceedingly handsome, of fine size, remarkably well-woolled, and easily fattened; and the ewes are nearly as good nurses as if they were pure-bred. So good are they, that a few of those which most closely resemble the mothers may be held over each year, to keep up the stock; and you may be certain that they will not fail to give satisfaction.

In thinking so highly of the Border-Leicesters, I do not at the same time fail to recognize the merits of the Shropshire Down ram, if pure Down stock were preferred to crosses, or when used to cross white-faced ewes. As brought out to the perfection he is to be seen at the Shrewsbury sales; he is a magnificent animal, not easily equalled, far less surpassed. In purchasing rams solely for breeding, prize animals should be rigidly avoided, as the high condition to which the fashion of the day compels them to be forced injures them for reproductive purposes, besides incapacitating them from ever being able to gather their food in the open field, unless under unusually favourable circumstances. From 7 gs. to 12 gs. is enough for any farmer to give for a ram, and half the latter sum will often buy a first class animal. Soundness of constitution, hardness, and activity are more practically valuable than are many of the fancy points which enable a ram to carry off a prize.

Your 25 acres of clean grass will stand you in good stead now, as the lambs begin to come thick on you, and will pay well for the time it has lain idle.

Corn being now cheap, and linseed-cake (the only kind fit for sheep) also moderate in price, a more liberal allowance than is usually the case may be given, particularly while the weather continues severe and vegetation remains dormant. A morning and evening feed of 1 lb. to each animal of cake and corn mixed will not raise a large bill by this time two months; and if with this feed they have a few pounds of mangolds in the day as you propose, and fair pastures, your flock of ewes and lambs will be a credit to you by that time, and worth a large sum in hard coin.

Oats are the better for being crushed, and form a more substantial food than bran, and I think, at present prices, is better value.

Liberal treatment enables a man to clear out his stock early in the season at large and profitable rates. When badly fed they must be held over from necessity, and finished with turnips during the succeeding winter and spring. This mode draws a small farmer into too much trouble, and keeps too much money out; so that I come to the conclusion that the quicker the return in the case of sheep-breeding the larger are the profits. If you have a taste for it, a few of the handsomest ewe-lambs might be retained in "store condition as future breeders;" and then you have an opportunity of judging for yourself.

Wishing you the large amount of success which you certainly deserve for your spiritedness in feeding so highly and in purchasing such expensive stock, and again regretting my inability to visit you and make your acquaintance,

I remain, dear sir, yours truly,
THE NORTHERN FARMER.

THE PRINCIPLES INVOLVED IN THE BREEDING OF ANIMALS.

At the last meeting of the Dorchester Farmers' Club, Mr. W. C. SPOONER, V.S., of Eling, said: Although this was a topic which he had not for many years past brought before a Farmers' Club, yet he could but remember that it was an old hobby which he had occasion to ride at many former meetings. Nothing struck the student of natural history so much as that wonderful provision of Providence for the sustentation and reproduction of animal and vegetable life. There was no spot on earth so barren that there was not found on it either animal or vegetable life. The very sands of the desert were instinct with life. And wherever there was vegetable existence animal life was found—there were animals to feed upon the produce. It seemed a most wise institution of Providence that the power of reproduction should be given to ten, twenty, a hundred fold the extent to which food was raised; the limit was rather in the food supplied for vegetable and animal life than in the power of reproduction. Types were handed down from father to son, from ancestors to posterity, with wonderful exactitude. Nothing could be more wonderful in the human race than the peculiarity of countenance and the disposition to disease. The germ of a disease might have been invisible for a course of years, yet it must have existed in the parent form or it could not have been handed down. This was a subject for astonishment and reverence rather than for anything like ridicule or sarcasm.

The vitality and the types handed down from one family to another through a long course of years, through a long course of ancestry, were exceedingly astonishing. Although we were capable of studying and ascertaining certain facts, and ascertaining what those facts produced, yet the greater part was involved in mystery, and would probably ever remain mystery to us. We, however, could not do better than study those facts so far as was found useful, adopting those principles found to be correct. One of the first things which he proposed to speak to them about was the influence of the parent on the offspring. His object would be to present to them some of the leading principles involved in the breeding of domestic animals, and he should limit his examples to three classes of domestic animals—cattle, sheep, and horses. There were numberless examples in regard to other animals, but to deal with them properly he should have to give a course of lectures instead of a single one of half-an-hour's duration, such as the present. They had all heard of that celebrated work by Darwin on the origin of species, in which he came forward with a somewhat novel doctrine, differing very much from those opinions that had been formerly held. Mr. Darwin was disposed to think—and he brought forward many examples to prove it—that not only were there many groups of families handed down for many years, but that different species had descended from one common origin. He stated in that work

his intention to bring forward in an after-work a great number of facts to support his theory, and after a course of years he produced two volumes on "Animals and Plants under Domestication." If those volumes only proved that a vast amount of reading and research must have been involved in the inquiry into the subject, Mr. Darwin merited their warmest respect and their warmest admiration. Regarding the influence of parents on offspring he thought there was a sufficient number of facts to show that in the case of the three classes of animals he had mentioned the male had the preponderating influence as far as the external form was considered, and that the vital functions in the constitution more frequently followed the female than the male. Although the external form, the general appearance of the skin, and the colour more frequently followed the male than the female, it must be observed at the same time that if they considered this rule without an exception they would be exceedingly wrong. There were sufficient instances to prove that it was usually the fact. He enlarged on this part of his subject, giving many illustrations, amongst them that given by Mr. Darwin, of the Manx cat. This animal is tailless and has long hind legs. Dr. Wilson crossed a male Manx with common cats, and out of twenty-three kittens seventeen were destitute of tails; but when the female Manx was crossed by common male cats all the kittens had tails, though they were generally short and imperfect. Mr. Spooner then passed on to say that before the present day, before the existence of the Royal Society, which was now thirty years old, many experiments were tried in the breeding of domestic animals—sheep, cattle, and others—which experiments frequently ended in failure, so much so that the fashionable doctrine of purity of breed and nothing else held good at the time the Royal Society was established. He remembered the time when no other prizes were given for sheep than those for the Leicestershire class, which had struggled into importance although they were originally cross-bred animals. By and by innovations were introduced into the society, which was obliged to submit to public opinion by giving prizes for other breeds. Mr. Spooner enlarged on the principles of reversion and prepotency of transmission, on both of which Mr. Darwin treats at length in his work on "Animals and Plants under Domestication." He pointed out the effects of "in and in" breeding, furnishing his audience with many practical and telling illustrations as he proceeded. He thought the most perfect specimens of crossing were found to exist with regard to sheep. He ventured to think he was not too bold when he said more science and more practical knowledge had been used in the breeding of sheep than in any other class of domestic animals, if not all the other classes put together. A certain idea had taken possession of the mind with regard to breeding, and then practice and experiment had been adopted in order to produce the result which the mind at first conceived to be just proper, and right. This had been most successfully done. With regard to horses, he thought there had been less science, less practical knowledge, and less success than with regard to any other animals. It was well known with respect to cattle that the prizes at the shows had been confined to almost one purpose alone—that of producing the best animal for the butcher. Although it was exceedingly desirable and very important to afford food for the million and profit for the graziers, yet he thought the subject of milking qualities had been too much neglected—had not met with that encouragement in the fact of prizes being offered as had been the case with other animals. In Scotland the subject had received some attention. No doubt it had been neglected in this country because of the bother which it would occasion the leading societies. The consequence was that time after time the great object had been to produce the most perfect animal in its external appearance, one the most profitable, coming the earliest to maturity. The result of this had been advantages very good and desirable as far as they went. We had now three breeds, and it might be said we had none other of comparative importance—he referred to the Shorthorns, the Herefords, and the Devons. The old milking breeds had been done away with, there being scarcely left a herd of the old Longhorns, which were of great repute for the dairy. He thought it a matter rather for regret that we could not have the dairy breeds as well as the pure animals for the butcher. Dwelling on sheep, he must speak to the eminent services rendered by the late Mr. Ellman in

bringing out and improving the latent qualities of the South-down breeds. Great credit, he thought, was due to those who, whether profitably or not, had perpetuated this breed. The public were greatly indebted to the breeders of pure animals, because when the cross was wanted there was the source from whence to procure it; at the same time, a compliment was justly due to the successful breeders of the cross-bred sheep. Eight or ten years ago he was applied to by the editor of the *Journal of the Royal Agricultural Society* to prepare a paper on the subject of cross-breeding, particularly with regard to sheep. His compliance with this request brought him into contact with some eminent breeders, amongst others the late Mr. Humphrey. This well-known gentleman was a breeder of Hampshire sheep before the Oxford show of the Royal Society. He was struck with the inferiority and unsoundness of his own breed in comparison with the different other breeds exhibited there. He determined, if possible, to effect an improvement. "With this object," stated Mr. Humphrey in a letter, "I wrote to Mr. Jonas Webb to send me one of his best sheep, and he sent me a shearing by his favourite sheep Babraham, which made some good stock out of my large ewes. I went down the next two years, and selected for myself; but the stock did not suit my taste so well as the one he sent me, and I did not use them. I then commissioned him to send me his sheep which obtained the first prize at Liverpool; and from these two sheep, the first and the last, by marking the lambs of each tribe as they fall, then coupling them together at the third and fourth generation, my present flock was made. Not having used any other blood on the male side for more than twenty years, I found some difficulty at first, when putting the first-produce ram to the first-produce ewe, the lambs coming too small to suit my customers. To obviate this difficulty I drafted out the finest and smallest-bred ewes, replacing them with the largest Hampshire Down ewes I could meet with that suited my fancy; still continuing to use the most masculine and robust of my rams to keep up my size. Some of my friends advised me to use a large coarse sheep to these small ewes to remedy the defect; but the larger ewe seemed to me the better way, and that course I pursued. I got rid of my smallest ewes and replaced them with large ones, which gave me what I thought to be an advantage—the using no male animal but of my own blood, the pedigree of which I am now acquainted with for more than twenty years. It has succeeded hitherto beyond what I could have expected. My object has been to produce a Down sheep of large size with good quality of flesh, and possessing sufficient strength and hardiness to retain its condition while exposed in rough and bad weather to consume the root-crops on our cold dirty hills. Independently of the value of the Hampshire or West Country Down in an agricultural point of view for such localities as ours, they produce when slaughtered a valuable carcass of mutton, giving the consumer a good proportion of flesh to the fat, which is a point that may be too much lost sight of. I will, in proof of it, relate an instance which a gentleman told me the other day. When rearing in another county he sent to his butcher for 5 lbs. of mutton. The fat seemed so much out of proportion to the lean that he had the curiosity to weigh the lean. After carefully cutting it out he found it to weigh 4 lb., or only one-fourth of the whole. This anecdote indicates to those who are attempting by crosses to establish a new breed, or to improve an old one, the importance of producing an animal in which the flesh forms a due and sufficient proportion of the whole." Previous to Mr. Humphrey's time—60 or 70 years ago, the original sheep in Hampshire and Wiltshire was uncouth and bony, and had a large Roman nose, with a white face, although the descendants had black ones. It was the custom, in order to effect an improvement, for some of the best men in North Hants to go into Sussex and select the largest, coarsest, and blackest-faced rams they could get. The effect was greatly to improve the breed, but unfortunately for a very long time the North Hampshire men attached too much importance to large coarse heads, thinking that to that circumstance the early maturity of the lambs was due—which Mr. Humphrey afterwards so well corrected. There was a portrait of the old Wiltshire sheep in his essay on "Cross Breeding." The Hampshire sheep had been greatly improved by crossing the ewes with the Sussex rams—the class of sheep upon which Mr. Humphrey first operated. It was worth consideration to show how different breeders had operated in the improvement of the breeds. Crosses had taken

place in Wiltshire and Hampshire, and improvements effected by the famous breeders Mr. Rawlence and Mr. Humphrey, the former of whom acknowledged readily the vast improvement obtained from the sheep of the latter. Some breeders clung with superstitious tenacity to purity of blood, and you would suppose from their talk that their breeds came originally out of the Ark. The New Oxfordshire sheep was a very valuable breed, originating from a cross between the Improved Cotswold and the Hampshire or West Country Down. Passing on to speak of horses he had officiated as judge of horses on many occasions, particularly at the shows of the Royal Society. He had had good opportunities of witnessing what had been done and what had been lamented over and undone. If he were asked in what breed of horses the greatest improvement had been made with regard to the shows he should say unquestionably the heavy cart horse. In this class an amount of improvement had, he thought, unquestionably been established. The horses used for the cultivation of the soil and other purposes in this country were now superior to what they were 25 years ago. For the guidance of the judges had been set the excellent rule that they were not to pay too much attention to size and strength, but that they were to consider likewise activity and symmetry. This operated as a useful precaution. A great improvement had been effected, he said, with regard to the breed of horses. It was much to be regretted that the subject had been so generally neglected. He considered that the Royal Society—to which he himself belonged, and which he greatly respected, had greatly injured the breed of horses in this country, because they had encouraged a certain system of breeding, the inevitable tendency of which was obvious. You could not keep up a certain type without falling into a great error. After crossing and re-crossing, and after improving the animals, you got rid of those very improved animals, and got coarser and inferior ones altogether, in order to carry on the improvement. He mentioned that in the tenth generation there would remain in the offspring only the 1,024th part of one cross. Of late years it had been customary, he said, to give prizes for horses best calculated to produce hunters; one of the conditions laid down was that they must be thoroughbred. Now he thought there was a great mischief involved in that. The object of a Society should not be to produce a rare-show; utility ought to be the leading object. He was glad that this important subject of the breed of horses was receiving public attention in the country. It was fully recognised, he said, that when thoroughbred horses were introduced in the time of James I., they produced an immense improvement in the breed of animals. No one could deny the improvement that racing had established, and one of the strongest pleas in its favour was that it effected an improvement in horses generally. Queen's Plates were consequently offered for competition. Amongst other breeding establishments was one at Hampton. The prizes offered for competition at the Derby and other races were of sufficient importance to induce breeders to try to produce the best and fastest animals. He questioned himself that the slightest benefit arose from the Hampton Court establishment. He should like to see a system for providing useful mares, the rest of the animals being of sufficient weight and power for mounted cavalry and other purposes.

Mr. GEORGE would ask Mr. Spooner whether Mr. Darwin had decided the type of cats when they came out of the Ark—had they tails or not? This, however, would not, he must admit, affect them much as agriculturists. With respect to the type of animals, he thought that as a rule it was affected by the locality and climate in which they existed. The sheep in a warm climate, for instance, instead of being clothed with wool, had long hair like that of the goat. He reminded the Club that in the present day the consumption of animal food exceeds that of fifty years ago, and observed that farmers now go in for early maturity, for getting the greatest quantity of meat in the shortest possible time. Further, while the breeding of sheep and cattle had been found to pay, the breeding of horses had not always been attended with that success. He believed that Mr. Spooner had with justice complained that the breed of horses had not been improved to the extent desirable they should be, in which subject farmers were particularly interested.

Mr. T. CHICK called attention to an important point in the breeding of dairy cows. He admitted that the breeding of horses did not pay, but this was, he said, in his humble opinion

owing to the bad judgment of those who attempted to breed. When you got good mares and good horses—although he believed there was no such thing in this neighbourhood—nothing paid better than breeding cart horses.

Mr. CHAPMAN SAUNDERS did not think that the Oxford sheep were so pure a breed as the lecturer seemed to suppose.

Mr. WOOD HOMER did not think that the pastures of this county were sufficiently extensive for the breeding of horses. The mares would gallop about and disturb other stock. A district for breeding horses with any degree of satisfaction should have a large number of small enclosures. Regarding cattle he suggested the giving of prizes for the form of udder, good appearance, &c. What, he asked, was the object of keeping a cow? For the butcher? No; for the dairy. Experience at Dorchester and elsewhere showed, he said, that there was the greatest demand for cows for dairy purposes. This, he thought, was lost sight of by agricultural societies, and much harm was consequently done. Passing on to speak of the breeding of sheep the speaker expressed views similar to those advanced by the lecturer. The best way he thought was to take a certain type of sire and stick to it through the flock; then the animals would be matched well.

Mr. W. H. HAWKINS inquired of the lecturer whether if he saw a flock of sheep he could tell how they had descended. Regarding the breeding of horses he mentioned that at a certain competition a thorough-bred worth 300 guineas did not gain a prize, while one was awarded to an animal which fetched £15.

Mr. J. G. HOMER, the Chairman, said the lecturer had set forth that the form of the sheep ought to be studied. In his (Mr. Homer's) opinion quality was very much combined with form. The deep fore-quarters of a sheep, the depth of chest, the roundness of ribs, generally indicated a strong constitution in the animal; that was a point which breeders in sheep had adopted for many years. They must go back to Jonas Webb; his sheep were by some considered to be pure-bred animals. He (the speaker) used them for many years; but those sheep to his experience were not thorough-bred Southdowns. They, however, had a point about them which produced constitution; they had a good width of fore-quarters, which Mr. Ellman's sheep never had; this was a point in constitution which all ought to study. Judicious crosses had been the means of establishing thoroughly good flocks. Reference had been made to the Hampshire sheep. What was their origin? They had been shown a print of the Wiltshire sheep. He remembered the former coming by thousands into Fordington Field, and they were of such diminutive had breed that it was said a certain shearer of Martinstown could shear a hundred in a day. Half of them had no wool on their backs, and it was stated that one of them could be sheared while the town clock was striking twelve. It might be safely said that the breeds of Hampshire and Wiltshire had been wonderfully improved by crossing. The quality of the animal was a great study for the present generation. He agreed with the lecturer that the crossed animal was the best.

Mr. SPOONER, in reply, said: Mr. Genge had asked for Mr. Darwin's opinion as to the cat that came from Noah's ark. He declined to answer the question; the subject was too extensive, and, besides, he did not think that theology was one which should be taken up by Farmers' Clubs. Mr. Darwin had raised upon a vast number of facts a certain theory. He (Mr. Spooner) did not pretend to say whether that theory was right or wrong—the theory was that different species—the jackal, hyena, and dog—had descended from the same source; and he carried this still further—he had thrown out his ideas, thereby doing a vast deal of good in ventilating the subject. The original idea was that animals were descended from certain types which came out of the Ark—that was the opinion of a few; but could it be imagined that thousands, millions of animals of various bodies with various shapes could have proceeded from those few animals that came out of that small ark? But that subject was beyond their consideration at present. He agreed with Mr. Genge that climate and locality made a wonderful difference in animals. It had been remarked that this locality was not adapted for the breeding of horses; he (Mr. Spooner) simply recommended the breeding of cart horses, which really were profitable animals to breed. He would refer, in conclusion, to a proposed alteration in the judging at the Royal Agricultural Society's shows. It was proposed, he said that the

judges should be furnished with catalogues showing the pedigree of the animals and the names of the various owners. Now he thought nothing could be so detrimental as that; he should be very sorry to act under any such *régime*. He mentioned that at the Chelmsford meeting he overheard a conversation as to what a terrible thing the judges had done—they had absolutely

given the first prize to Prince Albert's horse; every one would say that they had awarded him the prize because he was the Prince. But the judges had not the slightest idea as to whether the animal belonged to a prince or a peasant.

A vote of thanks to Mr. Spooner was accorded, and the proceedings ended.

THE BLANDFORD FARMERS' CLUB. ROOT CROPS.

At the monthly meeting of this club there was a large attendance of members, to hear Mr. GALPIN read a paper on "The Cultivation of the Root Crop." He said: The preparation for the turnip crop begins immediately after harvest. It is needless now to insist on the importance of autumn cultivation. The time is gone by when the scanty pittance of food afforded by dirty stubbles can weigh for one moment against the advantages which are to be derived from taking time by the forelock, and eradicating the twitch before it has had time to make its second growth. To those gentlemen who have clean stubbles, all I can say is, they have the game in their own hands, and I envy them. Now which is the proper way to set about cleaning stubbles? Here, I think, a great difference of practice prevails. Some persons say, plough your stubbles clean as soon after harvest as you can. Others, don't plough but scarify them, as by this means you get over a greater breadth of work in a day, with the advantage of having all the weeds on the top. Others only half plough, so as to get over the whole of the stubbles as quickly as possible, and then come back and finish them if the weather permits. Of course the great object must be to do as much as we possibly can in a given time. We cannot safely reckon on more than three weeks or a month after harvest to do what is required to be done, as the weather does not generally admit of it. My own opinion is that when the stubbles are not too foul, or the ground is not too hard, the most expeditious way is to scarify with the Benthall or Coleman, as in this case you get the weeds on the top, without any admixtures of earth, but I have generally found that one scarifying is not sufficient. We must go first one way, and then cross it. At this rate very little more ground is gone over than if it were ploughed, except that if get the weeds on the top instead of under. But when the stubbles are very foul, then I believe the most expeditious plan is to plough clean at once, and what we do, to do thoroughly where it can be done rather than go over the whole, and only half do it. Now, in all farming operations time is money. The seasons go on whether the work is finished or not; and that which is not done in the proper time must be very often left undone altogether. If, then, the time for cleaning the stubbles is restricted, it is evident that the most economical plan, other things being equal, must be that which is most expeditious. Now many of you have steam-engines for the purpose of driving thrashing machines, which, unless let out to hire, must stand idle a great portion of the year; and it has often appeared to me worthy of consideration if it pays a man to buy a steam thrashing-machine, why it would not pay him to go to an extra expense in the engine, and add a steam cultivating apparatus to it. The difference between an eight-horse and a ten-horse steam engine would be about £40 or £50, and the cultivating apparatus £250 extra. I do not believe on our light soils steam cultivation in its present form to be more economical than horse-power; still, if we take into consideration the greater breadth of land got over in a day, and I may add the superior quality of the work done, I think it is worth consideration whether a steam cultivator, merely for the purpose of breaking up the stubbles in the autumn, and again in preparing for the barley crop and the turnip crop in the spring, using the engine at other times for the purpose of thrashing, &c., bearing in mind that a gain in time is a reduction of the estimated cost, would, on a farm of 400 acres of arable land, pay. The great objection to hiring seems to be that we cannot depend on getting it when we wish, and if wet weather sets in one is in a fix what to do, whether to send away the machine or go on and risk the state of the weather. At the same time, whilst advocating the use of the steam cultivator, I do not think it will pay unless we can, by its means, reduce the staff of horses kept on the farm

by three or four. Having, then, used our best endeavours to cleanse the land by autumn cultivation, it must be laid up in ordinary for the winter, which should be done by a good ploughing as deep as the land will bear it. If we have been fortunate enough to clean our land in the autumn, I believe on our light soils the less done to it the better, and, above all things, whether on light soils or heavy ones, we ought to be careful to do nothing unless it is in a fit state to work. Very often, in our anxiety to forward the work, we are apt to get on the land before it is sufficiently dry, and do more harm than good. Now there is one point on which I shall be obliged if gentlemen will give me their opinions. A certain portion of the land in course for the turnip crop will have been sown with vetches, or rye, or trifolium, or some other catch grass; which is the best way of treating such land after the crop is fed off? I mean with especial reference to our light dry soils. Ought we to plough it at once, and let it lay some time to gather moisture, or scarify, or raft it, previous to ploughing it? Of course I assume the land to be clean. Again, I am very much troubled with thistles, and without good ploughing I am afraid they are difficult to get rid of. If any gentleman will enlighten me on the subject I shall feel obliged. I believe the great object which we have to attain on our light dry soils is, whilst doing what is necessary for cleansing the land, to avoid as much as possible any unnecessary exposure to the drying winds, or in other words, to retain what moisture we can. I do not enter into the subject of manures for the reason stated above; at the same time I cannot help expressing the regret with which I see around us the great waste of animal manures in our bartons through neglect, and the absence of proper shedding, properly shuted, so as to carry away the rain water, instead of allowing it to soak out the most valuable constituents of the manures; and in our towns and cities, through the present system of drainage by means of sewers, where day by day hundreds and thousands of tons of valuable manure are discharged into the rivers, polluting them, or into the sea, never more to be reclaimed, if we except the infinitesimal portion which we get back again in the shape of guano, which supply seems to be failing us, or at least to be getting dearer and dearer year by year. I believe, with regard to the manures for the turnip crop on poor soils which have been badly farmed, we can hardly err in giving too much manure; but on good land, in a high state of cultivation, we ought to guard against applying too much stimulating manure, as we thereby get an extraordinary development of leaf, whilst the root, from its rapid growth, is more apt to suffer from the frosts of winter.

Mr. FORESTER quite agreed as to the desirability of commencing ploughing as soon after harvest as possible, and in some instances, when the crops could not be got off the ground in time, would plough between the stooks. There was no doubt that the fertility of the ground was derived in a great measure from the atmosphere, and, therefore, the sooner the ground was ploughed, especially where they had couch, the better, so that the sun, which at that time of the year had great power, might burn it up; but whether they had couch or not it was best to get to work as soon after harvest as possible, so as to get not only the benefit of atmospheric influence, but also that of frost, which was a great pulverizer of the soil.

Mr. JOHN KEYNES said that the plan which he adopted was to plough his ground as soon after harvest as possible, then dress it and let it lay for some time, and then plough the manure in. In the spring he ploughed his land for turnip, but not after green crop, for every time the land was ploughed the seed came to the top. He used Coleman's scarifier, which did not bring up the seeds. He thought that they were apt to get

the land too light for mangolds, and it was perhaps best not to plough so much but to get the land fine by scarifying. With regard to artificial manures he hardly knew what to say. He had but a very poor opinion of superphosphate, and thought they ought to use more bone than they did. He did not understand light manures but liked something he could depend upon. Last year he applied superphosphate and bone in equal quantities and had some excellent roots. With respect to steam cultivation, Mr. Keynes expressed himself in favour of it where practicable, and also of the use of the scarifier where the ground was foul.

Mr. H. FOOKES could remember the time when autumn cultivation was not thought of, and when it was considered that the ley would keep dry sheep for a month. He quite agreed with Mr. Galpin that the best way was to do the work effectually at once, rather than go over a large portion of ground and be obliged to do it twice. If they could get their land in good order by autumn cultivation he believed the less they did to it in spring the better for the turnip crop. Mr. Galpin had asked for information as to the best plan to be adopted where turnips followed a green crop. He (Mr. Fookes) did not like scarifying after a green crop, but was in favour of deep ploughing. With regard to artificial manures so much had been said and written about them, and each maker thought his own the best, that he would not say anything about them; but would mention a circumstance which occurred in his own experience. Last year he had as fine a crop of turnips as ever he had. An old mud wall fell down, and he used the material with his farm-yard manure, and the result was that he had the best crop of turnips he had ever had in his life, and not a single one club-rooted.

Mr. J. KEYNES explained that when he alluded to the use of the scarifier it was not after green crop, but for plain stubble.

Mr. BARTLETT said: With regard to the cultivation of turnip after a green crop, last year he had a clover ley, which, after ploughing up, he had double raked, and the turnips were very superior. He thought that if the land was properly cultivated in autumn the less there was done to it in spring the better. With regard to the waste of manure in the barton, the not having proper shoots to carry off the rain water, it had been a crying evil, but it was passing away. Yet there was room for a great deal of improvement in this respect. The most valuable properties of the manure were wasted, and by its loss they were obliged to have recourse to high priced artificial manures. All farm buildings ought to have shutes to carry off the rain water.

Mr. GROVES (Dorset) said, after green crop he prepared his ground with a skim coulter and then with a rim roller, and thoroughly ploughed it, and had a very good crop, for which he took first prize at the last Blandford show.

Mr. T. FRY did not think they could be too quick in preparing for the root crop. The last two or three years there had been great difficulty in getting a good crop on account of the dryness of the season. His plan had been to get as much land ready for the action of the atmosphere as soon after harvest as possible, and, unfortunately, as they were too well acquainted with the Dorsetshire clover as it had been called (and not like the American who said he did not know what couch was), he (Mr. Fry) considered that when the land was scarified it should be gone over with the chain harrow, so that all the couch might be collected, and exposed to the action of the sun, and if this plan was adopted he did not think they would have any trouble of burning it. He considered that if the land was properly prepared by autumn cultivation the less that was done to it in spring the better: for, by disturbing it, they lost moisture. With regard to artificial manures he considered they had been expending too much money in them. He had paid £200 last year, but he did not think he should expend so much this; at the same time he did not consider they could do without bones. The two first prizes awarded last year by the Shaftesbury Club for roots were given for turnips grown on land where no artificial manure had been used.

Mr. H. RICHARDS, in reply to Mr. Galpin's question as to the best mode for the cultivation of turnips after green crops, found it very important to solidify the soil, and therefore was in favour of disturbing it as little as possible in spring. He had seen plants come up and wither away in consequence of the land not being solid enough to retain the necessary moisture. There was an old implement, introduced he believed

into the county by Mr. Fookes' father thirty years ago (the only objection to which was that it required five or six horses to draw it), by which the land was best prepared for the turnip crop. That instrument he often saw lying in the ditch, but if farmers knew more of its value, it would be oftener used. From having a large crop of trifolium last year, not all fed off, he had a considerable proportion to plough in. He only turned it over once, but, by the aid of that instrument, he had as good a crop as he could wish for. The great secret being to solidify the soil, no instrument was more suitable. It was true it was hard to work, and it was a somewhat difficult thing to get men willing to use it, but what of that if it did the work well and thoroughly. He had seen ley lands where this instrument had been used bearing a good crop, whilst in those parts where it had not, scarcely a plant came up.

Mr. FOOKES explained that it was not his father but himself that introduced the Norwegian harrow, the instrument referred to, into the county.

Mr. C. FLOWER fully coincided with Mr. Richards as to the value of the Norwegian harrow. He knew of no instrument which assisted the farmer in getting a good crop of turnips as that. Respecting steam cultivation, he did not think it would be practical to have it in general use without they could have a steam traction-engine attached to the scarifier, and the machines very much simplified. It was a good thing, if possible, to have the land prepared in autumn, but when the wet weather set in it did not always answer. He hoped to see the day when a traction-engine, without chains and wires, would be available for agricultural purposes.

The CHAIRMAN (Mr. Scott) fully endorsed the opinion expressed that the sooner the land was prepared for the turnip crop after the harvest the better.

Mr. GEORGE KEYNES agreed with the lecturer as to the desirability of early autumn cultivation for the root crop, and with respect to the cultivation after the roots were taken up he commenced ploughing immediately. With respect to the Norwegian harrow, he had had one many years, and found it very useful when he broke up a portion of down land, but soon after that it was sent to Spettisbury, and thrown aside. He should, however, he thought, use it again, as so many present had spoken of its value in preparing land for turnips.

Mr. GALPIN, in reply, stated that when he lived at Kinson he never missed having a good root crop, but at his present farm he was not so successful. He thought probably it might be owing in some measure to a difference in the atmosphere. He went on the same principle at his present farm as before, but the remarks which had been made by Mr. Fookes and Mr. Richards threw new light upon the advice given him by their lamented friend Mr. Rawlings, which showed his kindness of heart and desire to assist any one he could. He was riding with that gentleman one day, and in course of conversation Mr. Rawlings asked what he was doing with a piece of down land he had broken up, and on his replying that he had set his men to plough it up again, told him it was the worst thing he could do; and, acting upon his advice, he (Mr. Galpin) stopped the work, the result being that he had a very fair crop. With respect to the observations made by Mr. Fookes as to the mud wall, he believed that the advantage derived from the application arose from the chemical action which took place. It was a well-established fact in chemistry, that by the exposure of any salts potash would be formed, and this by its exposure to the atmosphere, supposing no rain washed it away, would form nitric acid, a very powerful fertilizer. The mud wall had probably been standing for a number of years, and all that time the potash attracted the influence of the atmosphere, and he had no doubt that the extraordinary fertility Mr. Fookes had spoken of was caused by the presence of a quantity of nitrate in some form or other. Mr. Flower had spoken of the advantage which would be derived if a traction engine could be devised to use with a scarifier. In the *Times*, a short time ago, there was a long article giving a description of a newly-invented machine called a road steamer, and he thought by the explanation given that it would be applicable for agricultural purposes. It was formed with three wheels with india-rubber tires, and would go at the rate of eight or nine miles an hour.

On the proposition of Mr. Flower, seconded by Mr. H. Fookes, a vote of thanks was accorded to Mr. Galpin, who, in acknowledging it, proposed the same compliment to the Chairman.

FRAMLINGHAM FARMERS' CLUB.

THE MOST PROFITABLE MODE OF CULTIVATION.

At a meeting of the Framlingham Farmers' Club, Mr. Goodwyn, one of the vice-presidents of the club, in the chair, the subject for discussion was, "Cultivation, or how to draw the largest amount and value of produce from the soil at the least expense." This was introduced by Mr. D. SMITH, Parham, who said the history of a nation celebrated for wealth and power, is in every way intimately connected with cultivation. The soil may be said to be the true riches of a country, for in ancient, as in modern times, nations have increased in wealth, power, and importance, just in proportion as they have cultivated their soils. Commerce and manufactures are no doubt powerful resources for multiplying the wealth and greatness of a nation, but they never have nor never can flourish until the cultivation of its soil has reached a certain degree of perfection. After glancing briefly at the history of the cultivation of the soil from the earliest period, he continued: Our soils are composed of certain substances, having certain dormant capabilities, and there are few soils to which some improvements might not be made, whilst a vast tract of our land is capable of extensive improvement. The art of cultivation differs materially from any other art practised by man. Man can but prepare and sow, whilst the bringing to maturity remains in the hands of an ever wise and indulgent providence. But it is, nevertheless, incumbent upon us to discover the cheapest, simplest, and easiest methods of cultivation. That man who comes to his occupation free and disunited from old customs and prejudices and is willing to adopt sound methods of cultivation is mostly seen to be the leading man in the district; such a man it is true does not always thrive, but, from his being the introducer of new systems, is a benefactor to his country. That "knowledge is power" is strikingly applicable to the business of the farm. Knowledge is a capital of the greatest value in the absence of more available advantages. I have often heard, and from practical men too, that many farmers fail for want of sufficient capital, but more from want of sufficient knowledge. There is no class who rely more on their own skill than the farmers, yet we must admit a great number, perhaps the greater, have not acquired a thorough knowledge of their business. Nor can it be asserted that the cultivation of our soil has yet been brought to that degree of perfection which it is capable of reaching. In a business point of view the intention of cultivation is to obtain the greatest possible amount of produce from the soil, and the farmer's object is to raise it at the least cost—to afford him the greatest profit, and shall I be going too far in saying the more scientifically he farms the more effectually will his object be gained? The first step to this end will be, where practicable, the straightening the old crooked fences, doing away with all useless ones, and cutting down the pollard trees, and dividing the enclosures into sizes, according to the extent of the occupation, varying from 10 to 20 acres, with whitethorn fences neatly kept (but I do not think, however, that large enclosures of pasture would be so desirable). Thus a saving of land would be effected, as well as a saving in economy of management. To show how this applies, I may say a furrow nine inches wide and eleven miles long is equal to an acre; calculating that a plough travels at the rate of two miles an hour, and that it takes three-quarters of a minute for a plough to turn round, a distance of 44 yards is lost during the time of turning. In ploughing a field with furrows 500 yards long, this is a loss of $\frac{1}{4}$ of a mile per acre; with furrows 400 yards long, it is a loss of $\frac{2}{5}$ miles; with furrows 300 yards long, 5 miles per acre; with 100 yards' furrows, 9 miles; with a furrow 50 yards, 18 miles per acre. Our drainage might be equally efficient, and a vast amount of unprofitable labour would be dispensed with—I mean the labour of hedging and ditching—and applied to greater advantage on the land. I would also further recommend the better farming the banks and brews of the fences and ditches, they are but too frequently seen to be

nurseries for the most troublesome weeds. The next step in advance will be to provide a thorough and sufficient subsoil drainage; by this process we shall convert the water into us great a friend to us in enriching our soils as it is an enemy to us in undrained lands requiring draining. Even our forefathers discovered manure added to the soil of but little advantage, as is evident from their lazy, bad systems of husbandry practised to the present day in the remote and unimproved parts of the country. This brings me to the point at which food or nourishment is required. We are all doubtless aware that the ruins of one plant furnish life and sustenance to another, and that vegetation thrives on vegetable decay. Hence the necessity for a more strict observance for the procuring as much as possible, and for a stricter watch against the waste of any vegetable substance upon the farm either before it has passed through the animal or after, and whether in a liquid or solid state. I am sure by a strict observance against the waste of home-made manure—I mean manure made from animals kept upon rich diet, and not merely wetted straw—we should have less occasion for the use of artificial or concentrated foreign manures. I do not, however, mean to condemn their use; I think them valuable auxiliaries, and I am sorry to say I cannot discover how to get on without them; but what I want more strongly to impress upon you is the necessity of first making use of every available cartload of home-made manure before we purchase from abroad. The growing green crops and ploughing-in or, better, feeding off with animals eating a portion of some richer diet may be strongly recommended as an enricher at little expense. Having now divided my farm, drained it, and manured it, I come to the ploughing; and here I should recommend deepening the soil to as great a depth as is practicable according to the description of soil you are working upon, so as to allow and give the plants a more extended space in which to work their roots and to provide sustenance. By a deeper cultivation our crops will be better able to withstand the effects of a dry summer; and the looser your soil, the sooner will the superabundant water percolate through it, and turn that which has proved to you a bitter enemy into a good friend. In addition to the above, completely pulverising the land before seeding it will be found of the greatest advantage. Next I shall call your attention to eradicating as much as possible all vegetation save the one kind sought for. I need hardly remark to you how much easier and with how much less expense is the process of keeping land clean, when once cleaned, as compared with keeping the weeds in foul land sufficiently down to allow the crop a fair chance to grow at all; besides, the waste of nourishment to the crop must be considerable in foul land. As to the rotation of crops, a good cultivator needs no dictation on that head; for that which is prejudicial to the interest of his landlord would be equally so to that of himself. One who keeps and grazes a large quantity of cattle will be able to return to the soil a proportionate amount of manure for any fair cropping which he might adopt. I imagine a sufficient restriction to guard against excess would be a limit of three white-straw crops in five years. With agriculture in its present competitive position with the world, the agriculturist needs the greatest latitude; and, depend upon it, that landlord who acts the most liberally on that head will secure the best, most scientific, and most wealthy tenants. Now, I shall call your attention to the homestead, or the providing sufficient accommodation for cattle, in the shape of sheds and houses. I think I need fear no contradiction from practical men when I assert that the rent of a farm may be nearly, if not entirely, lost from this want of sufficient accommodation. Our forefathers' chief wealth consisted in cattle; and our chief dependence must be on cattle also. How can we enrich the soil without manure? and how can we make a good substantial manure without cattle? The manure-manufacturers may dispute with me; but sound practical farmers will not. Let me impress upon you—the more cattle you can keep, to keep

well, the better it will be for you; and the more rich, nutritious food you reasonably use in feeding, the more will be your profit, indirectly if not directly. I would under this head recommend a more extended system of house feeding in summer, believing it to be economical and advantageous. Now, gentlemen, I cannot recommend a small expenditure per acre to produce the largest amount of, and value of, produce from the soil at the least expense, more than I can tell you that the yard of cloth you can buy for the least money is the cheapest. Farming under the most economical principle possible is expensive, and in many instances, I fear, sufficiently so to be ruinous with the prices of the present time, whilst a more liberal system may provide a bare subsistence, leaving the chance of profit for the return of a fair and remunerative one. We had the advantage of a lecture here a few months since from Mr. Mechi. That gentleman (whom I always like to hear, although I seldom can agree with his ideas, for he mostly propounds some novel scheme which sets us thinking, and may in some instances fructify) advised us to expend more money on our cultivation. We have thought £10 per acre sufficient capital to carry on the business of a farm. But when we are told that it requires to be nearly, if not entirely, doubled to be remunerative, in comparison with other businesses, our thoughts are aroused; and a prudent man, and one who has the means to adopt such management, and who is desirous of seeing his business prosper without reference to the amount of outlay, provided there is a chance of reaping a remuneration for that which he sows, naturally seeks to solve this problem. Now, should it appear that this outlay will prove beneficial, the solution of it, in my opinion, amounts to the fact that we must have security in every sense for such an outlay. Let us look at it in plain business terms, and in doing so, I would ask you what man will buy or advance on mortgage on an estate a sum the interest of which will exceed the amount of the rent the property lets at after first paying therefrom all the fixed demands upon such estate, and is assured against all hidden claims? Then, gentlemen, and not till then, will the capitalist advance such capital; and then, and not till it is clear to the cultivators that such a heavy expenditure will produce such a result, will capital be brought to that amount and invested in the cultivation of the land. Perhaps I have deviated a little from my subject; and to return again to the query you ask me to answer, I must tell you in my humble opinion the largest amount and value of produce can only be grown by a judicious and liberal outlay of capital, and to insure such an outlay, the greatest amount of security is required, with liberal covenants; and these, with God's blessing, will no doubt produce harmony and the best feelings between landlord and tenant, with mutual benefits to each.

The CHAIRMAN expressed his pleasure at Mr. Smith's paper, but said he did not agree with that gentleman when he said that the great cause of failure in farming was not so much from the want of capital as of knowledge, for he should say the reverse was the cause. The main source of good farming must be keeping abundance of good stock and feeding that stock well. To put a sufficient amount of stock on the land required a considerable amount of capital, and then they must put their hands still further into their pockets to feed that stock and to obtain the best possible manure. Mr. Smith rather slandered the farmers when he said they had not knowledge enough for their business, but if he had said they had not capital enough he (the chairman) could have agreed with him. No doubt it gave a man a certain position and importance to be able to say that he farmed 250 acres, and there was a great temptation to a man to take that quantity of land instead of perhaps 140 or 150 acres when he really had only capital enough for the smaller quantity, but let them recollect that with every acre they took their expenses were increased whether their profit was or not. He did not want to go the length Mr. Mechi did, but he would say if the same money that was now made to do for 300 acres were laid out on 200 acres the return would be more satisfactory. The more the acreage was increased not only was there more to pay for rent and tithes, but more for taxes, labour, and the live and dead stock from which profit was not directly received, and in which money must be locked up, and it was only from the stock a man could put on his farm which would produce manure of a rich quality to grow more corn that additional profit could be obtained. He had seen many a man, who had been doing well on a small farm, tempted by circumstances of

one kind or another to take a larger, and borrow the capital and pay interest on it, find his money slipping away without his knowing how or where it went. He agreed with doing away with some of the old fences, and with the pollards (which were rapidly disappearing) but thought the fields might be made too large. In the large open plains there were, no doubt, some means of getting rid of the water which used to run into the old ditches, but he questioned whether the time would not come when there would be a difficulty in having the land lie as dry as it ought. Whether the water was to be permanently got away from large open plains of 60 or 70 acres of good heavy land without very heavy outlay was a great question. Every rational man would agree with Mr. Smith that the greater the care taken of the manure the better, and he knew a good farmer who employed a man whose sole duty was to gather up what would otherwise be wasted. After alluding to one or two other points in Mr. Smith's paper with which he agreed, the Chairman came to the question of giving liberal clauses as to cropping which were gaining ground fast. Mr. Smith spoke of the outlay depending on the security, and of money not being advanced unless the security was good, and he asked Mr. Smith what he meant by security—did he mean a sufficiently long term to take out of the land what he put in? Mr. SMITH said he meant security in every sense of the word.

The CHAIRMAN said a yearly tenant could not be expected to act as liberally to his land as one who had a lease for 8, 12, or 16 years to secure him. He thought that where ample capital was likely to be laid out on the farm, there would be no difficulty in obtaining a long term.

Mr. SMITH said there was other security besides security of tenure.

The CHAIRMAN granted that, but it was the first thing. With respect to other matters, no doubt Mr. Smith in his position felt as he (the Chairman) did some delicacy in alluding to the game question. Those who hired land where game was must hire either as a game farm or have security that they would be compensated for any damage. If they hired as a game farm they had no one to blame but themselves; but if they paid the full value of land under a guarantee that they should not be injured, they had a right to compensation if they suffered damage.

Mr. C. CAPON said it would be impossible to be free from all consequences if a man hired a game farm.

The CHAIRMAN said the game question was one which approached too near politics to be discussed at that Club. One other point Mr. Smith did not allude to, and that was the question of cottage accommodation in proportion to the size of the farm; for it was self-evident that if a man had to walk a mile and a-half to his work, his labour was not worth so much as if he lived on the spot. In that respect, though cottages did not pay a high rate of interest, matters were improving.

Mr. R. GARRARD said when landowners and agents saw that the land was well farmed greater liberty was given to the tenant than was the case at one time—not but that he thought they could not do much better than farm on the old four-course system. With respect to capital, he did not see if a man of energy had £3,000 why he should be cramped up to 200 acres if he thought he could work more. It should be the same in farming as in trade, for a man in trade with £2,000 would take a business requiring £6,000, borrowing the rest of the capital; and if a man could not make farming pay the interest as a tradesman could, it was not worth a man's while to farm.

Mr. W. CHAMBERS, jun.: I fear you can't make farming pay as trade does.

Mr. GARRARD: I think you ought to make it pay five per cent.

Mr. C. CAPON: If money is not worth five per cent. on a farm it ought to be.

Mr. PAUL READ said Mr. Smith had spoken of the necessity for good farm buildings, in order to carry on the business as profitably as it was possible, and it was very cruel that when new buildings were erected more rent was asked. With respect to leases, the Agricultural Relief Association, formed at Stowmarket more than 30 years ago, went on the principle that the tenant should be paid when he left the occupation for the improvements he had made, and should pay for damage he might have caused, and that he thought

would be better than long leases, for a long lease might tend to tie a man too long to the same occupation if he were a bad farmer, and if he were a good one he might wish for a change. As to the question of capital, he would not, with Mr. Garrard, advise a man with £2,000 capital to take a business requiring a capital of £8,000, for he believed he would make a mess of it. If they let a hardworking labouring man have ten acres of land at the rent and rates the farmers now paid, he would maintain himself, and to do so could not make less than £30. If the labouring man could make £30 a-year out of ten acres they ought to be able to make £600 a-year out of 200 acres; for though the £30 the labourer made included his own labour, they would not have so large a proportion of labour by half. He was not an advocate for cutting all the land into farms of ten acres, but he thought there ought to be more than there are. If they wanted to make a man an industrious, steady, good servant, and if they wanted to do away with pauperism let them set before the man the prospect of being able to take ten acres of land themselves one day or another. That would be a thorough reviver of the agricultural community; for let them remember that if there was only one ten-acre farm there would be a dozen competitors who would be saving up with the hope of being able to take it, and thus it would have a tendency to stop laziness and intemperance.

The CHAIRMAN asked if any gentleman had any answer to make to Mr. Read.

Mr. GARRARD would point to Ireland, where there were plenty of small farms. He would wish Mr. Read no worse fate than to be put into a ten-acre farm.

Mr. J. C. KENT: A ten-acre farmer is generally considered worse than a labourer.

Mr. READ said he could point to a man in Framlingham

who held ten or fourteen acres, and had not only paid double the rent most farmers paid, but after eight years was able to pay a still further increase.

Mr. PATTERSON contended that Mr. Read's comparison did not apply, for the £30 earned by the ten-acre farmer included all the labour; and if the amount paid in wages on farms of 200 acres were included he ventured to say many farmers made £600 a-year.

In the course of further conversation, Mr. WOLTON said he knew the generally-received notion was that a farmer ought to have £10 an acre capital, whilst Mr. Mechi had told them £20 would not be too much. He should like to know what was the amount of capital required to farm most profitably without going into fancy farming?

Mr. R. GARRARD said a man who took 200 acres of land ought to have £2,000; that was the amount it was generally considered he should have, but he did not say it was enough.

Mr. C. CAPON observed that it did not matter whether the man had the money of his own or borrowed it.

Mr. SMITH, in a brief reply, said he did not intend to disparage the amount of knowledge existing among the agriculturists of the county, but there were many who really began farming without having previously made it their business and soon lost money enough to induce them to withdraw from the occupation. He did not think they really knew the amount of capital they had in their farms, for when they spent money in draining a certain portion he was not prepared to say what was capital. In that way they were continually putting capital in, and he questioned whether they had so little as £15 an acre employed.

The CHAIRMAN conveyed the thanks of the club Mr. Smith, and the meeting ended.

ON VALUATIONS.

The letting of land grants an occupation of the ground for a specified time, at the end of which, removals and changes of occupancy very frequently happen from differences, failures, dislikes, and private wishes. No term of the year can be found at which a free and clear quitance can be made without the outgoing tenant leaving articles that are fixed and incorporated, and which cannot be removed or taken away. The value cannot be realized by any present method, but must wait the returns of crops and seasons. A loss would be sustained by the removal, and a gain would be acquired by the incoming tenant, who would derive a benefit without having expended a price for its value. The cultivation of the land must be performed and not neglected on pretence of removal, and that the profits would not be obtained; an intolerable damage would thence ensue, and not be borne. The due courses of husbandry must be maintained, as if no removal was intended, in order to secure, as far as possible, the much to be desired perpetuity of occupation. Justice and equity direct that an estimate be formed of unobtained values, and the payment made by the person who will reap the benefits to the person who has provided the sources of advantage. These reciprocities are now well defined and firmly established, and the mutual rights universally admitted. Improvements have been made and alterations are suggested, which will be admitted by the force of circumstances, and the conviction of benefit.

In the early records of the tenancy of land no notice is found of any compensation being made for alterations or improvements, or that any idea had been entertained on the subject of valuations. As the practice increased of temporary possession of land the views were enlarged, and as society multiplied new interests arose which claimed a just and primary consideration. The first notice is attached to the houses or buildings erected on lands for the residence of the occupiers, tenants and labourers, and for the animals and implements, and for the storing and manufacture of the grain crops. The houses were erected by the proprietors, and the tenants covenanted to uphold the proper condition by executing the necessary repairs, and when the tenant had done any improvement by erecting a wholly new building, at his own cost, or by making any beneficial alterations, in many cases the additions remained with the property wholly free and without compen-

sation, being considered as a fixture that was irremovable, and had become a part of the alienable ground. In other cases the improvements were valued by the award of "just men and true," who assigned a value for the benefits conferred on the property. The use crept in very slowly, and required much time, along with a concurrent force and pressure of circumstances, which is ever necessary to establish a permanent arrangement of any business or negotiation. The stipulation was early introduced, which gave the tenant from the landlord the raw materials of repairs, as rough timbers, stones and lime.

The land was used in the triennial cultivation of one-third in the process of following; one-third sown with autumn grains; and one-third in lent crops. All articles were transferred wholly free and without consideration at the end of any tenancy; the grain crops were reckoned equal in quantity to the giver and receiver, and the arable lands in the same condition of quantity and preparation. This simple condition of tenancy had lived with little or without any alteration till about the middle of last century, when the introduction of green and forage crops wholly revolutionized the entire system of agriculture, and fixed a new era in the practice of the art. The crops of different plants succeeding each other altogether varied the labours of cultivation, and very much intermingled the periods of return and the kinds of produce. The nature of the cultivation of land requires a time during which to derive the compensation of outlay of money. The cost of raising a green crop of roots cannot be repaid by the crop itself, as the benefit is extended over the succeeding crops of the rotation. No other business of life is so closely bound to this natural law as agriculture, and a greater risk is incurred during several seasons, which may be favourable or adverse, and the prices of produce are fluctuating and uncertain, demanding a wide consideration of the peculiar circumstances that surround the employment. The original mode of transfer did not provide for the increase of produce that arose from an improved system of cultivation, as it would leave the outgoer wholly deprived of the value of much labour and expense. The arrangement prevented all the confusion that arises from the mixture of new and old tenants being employed on the farm, and it has left its vestiges

is the yet remaining custom of farmyard dung passing free from the old tenant to the new. Even this arrangement is objectionable, as the improved management of one tenant may produce a greater quantity of dung at the end of the lease than was received at the entry. This increase will arise from a greater quantity of straw being produced, which is trifling in comparison with the quantity of grain that has been thrashed from it, neither of which was provided against by the primitive arrangement of a free transfer.

It was very early perceived that no period of the year could be found at which the tenure of land might be terminated without an expenditure of labour and money remaining unpaid to the tenant who left the occupation. The terms of the year were adopted from the Saints' days in the Romish calendar, which were fixed in the months as the times occurred. The mass, or feast-day, of a Saint became a period of time, and was used in the purposes of social life. The feast of St. Michael was fixed on 29th September, and very early became a term of much utility. Martinmas, or the feast of St. Martin, was fixed on 11th November. Candlemas was fixed on 2nd February, and so called from the number of candles used at the ceremony of Purification. Whitsuntide was fixed in May, as the early converts then appeared in white; Ladyday in March, so called from the annunciation of the Holy Virgin. The term of Martinmas is not very distant from Michaelmas, and is found in the same state of the farming produce. Candlemas and Ladyday are nearly placed, and are very similar in the above condition, the manufacture of the crops not being finished that was begun at Michaelmas and Martinmas. The two chief terms of comparison are the May and Michaelmas entry.

The Michaelmas term in September is the oldest period of time that was used in entering and quitting the temporary possession of land. It obtained the first preference with clerical bodies, who granted the first leases of land, and has continued in use over a large part of South Britain. The whole labours of the year come into view in the maturity of the crops of grain, the raising of root crops, the preparation of clay fallows for wheat, and other minor articles of value. The whole assemblage is due to the outgoing tenant to be valued to his credit, and paid to his behoof. The hay in ricks is valued at a fodder price, or the value reduced by the expense of carrying it to market: the straw is similarly valued, or given wholly free—the articles of hay and straw being evermost expressly reserved to be used on the farm. On this point so omission or relaxation has ever been made in all inland situations, where manures cannot be obtained in the full return. The barns are used during winter for the purpose of thrashing the grain crops by the out-going tenant, who gives the straw and chaff in some cases for the delivery of thrashed grains to a moderate distance. The fallow lands of bare clays and of root crops are valued in the rent and taxes of one year—the workings and manure, and in any seeds sown. Dung in heaps; grass leys of one or two years, in a half or a third of seeds and labour; copse woods, by the years of growth; hop gardens and poles, with minor articles of fruit trees and bushes, are all valued by well-known rules, that are much varied by local customs, which differ in the special articles that are subjected to valuation, and also in the rates allowed for compensation. These local usages have subsided into force, and are acted upon accordingly.

The payment of rent by the out-going tenant ceases on the 29th September, and at that period every connection must be severed and wholly discontinued, to prevent the unfriendly interferences and unpleasant collisions that happen during the winter's use of the barns by the out-going tenant, who may remove a distance of much inconvenience. The improvement in this term of quit and entry would be that the in-coming tenant purchase the grain crops just before maturity, when the reaping and storing may be very inconvenient from a distant abode. The grain crops may be reaped and ricked, as is the hay, by the out-going tenant, the contents computed by measurement, and the value fixed; the appearance of the stubble will guide an experienced judgment to reckoning of produce; and the two estimates being added and divided, the half of both amounts will constitute an equitable estimate of value. The amount of valuations may be somewhat lessened by the underwood being wholly managed by the landlord, when the farmer buys at the neighbouring sales of cut articles a quantity for his use, which will prevent the frequent misunderstandings

from the landlord preserving a number of standard trees for timber, which damage the under growths. Timber trees and copse growths are best produced in separation.

The Whitsuntide term, in May, presents a more clear separation between the outgoing and incoming tenant than the terms that have been mentioned, and has obtained a more extensive application in the leases and lettings of land. At that period the entire crops of grains and roots have been wholly expended in the application by the outgoing tenant, and no value remains unattached on these two very principal articles of produce. The grain crops sown in the spring of that year are the property of the outgoing tenant, and there remains for adjustment only the small account of the grass seeds and labour expended in the previous year, which will be grown into a crop of hay for the incoming tenant. The straw and dung remaining on the farm at the term, are conferred to the use of the farm, free from any charge of value from the old tenant to the new. This practice is a remnant of the old arrangement, which transferred the whole crops of all kinds to the new tenant without any value or discrimination, which chiefly prevailed in the southern counties of England, where the Michaelmas term was mostly adopted. In North Britain, the term of Whitsuntide had the largest application, and the practice was the most used of transferring the straw and dung free of any charge or value. Such goods were called "steel-bow," from the Teutonic, "stellen" to place, and "bovy" a field, as being goods placed on land, and attached to it, which were often delivered to the tenants by the landlord, and remained as his property, and to be redelivered at the expiry of the lease. The word being confined to Scotland may be of Scandinavian origin, and merely an inversion of the Swedish "bosteale," a residence or fixed abode. The practice has prevailed from time immemorial, and has acquired a very high reputation as a most beneficial arrangement, and prevents the accumulation of valuations to press upon the incoming tenant. In one sense the truth is undeniable, though a correct feeling of justice and a true sense of equity will reckon the dung and straws as a moveable article, and worth a value to the outgoing from the incoming tenant, as it has been produced by the previous crops, and from the excrements of animals, all which articles are exclusively the property of the outgoing tenant. The condition must be express that it be purchased by the incoming tenant, and a greater quantity may be produced at different terms to alter the equitable interchange of the commodity. But the custom has been long established, and the equity of it is not challenged.

The May term of entry to farms has long prevailed over the whole extent of Scotland and over the North of England. It has been most justly held to be the easiest and most accommodating to both the parties who quit and take possession of the farm. At no other period of the year is there found so complete a separation of the crops and labours of the farm, nor any time at which so fully the processes are ended and being commenced. A wholly entire separation never can be got—the labours of one year are extended into the next, crops sown in the end of one year are reaped in the next, lands are ploughed and fallowed in different seasons, and the grazings of one year are repaid from the following produce that is realised. The grain and root crops are the chief articles of produce, and demand the largest consideration, as from these sources all other productions have their origin. Hence, the foremost place that is ever enjoyed by these productions of the ground. All the straws and hays of the farm are manufactured and converted into dung lying in the yards, or carried to the fields into heaps, and the pasturage of the grass fields has not commenced by a mutual understanding and the general custom, or is expressly arranged by agreement in the lease or tenure of the lands. Grass seeds have been sown the previous spring on the barley and wheat lands after fallowing with manure, and come forward for a crop of hay in the first term of the new occupation. Hence the value of seeds and labour is due to the out-going tenant who has made the expenditure and has not reaped any benefit, to be paid by the in-coming tenant, who will derive advantage from the crop of hay.

The advantages are very great, and well understood, of winter ploughing the stubble lands intended to be fallowed for green crops or autumnal wheats during the next summer. No subsequent cultivation of the soil can ever compensate for the want of the exposure of earths to the vicissitudes of atmos-

pheric influence during the winter months. The old and yet prevailing custom gathers a number of ploughs from the neighbourhood to a "ploughing-day," gratis to the new tenant, when the work is very imperfectly done in a hurry and confusion, and very often at an improper season. The dung for the early green crops is beneficially placed in heaps during the late winter or early spring, and both performances of ploughing the stubble lands and of carting the dung is paid to the out-going tenant by the current rates of labour, along with any work done in preparing the lands for spring crops. These labours are of necessity to be done to prevent any damage to the farm from change of occupancy.

The value of auxiliary manures, as lime, bones, and guano, is awarded in a tenant-right of three years on the original cost and labour. The quantity of dung in the cattle-yards may be computed by allowing a certain quantity to the acre of straw of the previous grain crops. The valuation of grass leys of one year, and of the farm-yard dung that has been applied for one crop, has obtained only a bare mention, and has scarcely advanced into notice once. It may not be thought expedient to increase the transactions at the quit and entry farms, which should be free and easy, and exhibit the least possible appearance of change.

The Lent crops of grains grow into maturity as the property of the outgoing tenant, and are sold by auction in lots to the highest bidders, who carry the lots to different localities. Grains and straws are brought back to the farm in a similar way, which creates much labour and confusion, and an unnecessary loss of time. The purchase of the crop just before maturity will be a very considerable improvement on the old custom of a public sale, but it continues the connection after the term of quit, which should be wholly destroyed, and prevent the inconvenience of distant abodes of business.

The rent of the farm is paid half-yearly, with six months' grace, with the power of demanding the payment of the full

amount at the May term, if the farm be vacated at that time. This arrangement does not remove the anomaly of the incoming tenant paying the first half-year's rent for lands producing crops that are not his property—the purchase of the grain crops prevents the public sale, but continues the connection of the quit and entry.

It is now proposed to break this "steel-bow" arrangement, though the equity of it has not been challenged, and to sever the whole connection on the term day.

The following arrangement of valuations transfers the grain crops on the day of quit to the new tenant, who pays the rent half-yearly, and on the expiry of six months from the entry:

Clay Follows for Wheat.

1. One year's rent and taxes, full value of tillages, dung, seed, and sowing.

Green Crop Lands.

2. Full value of tillages and dung on the crop lands of the previous year, but no rent and taxes, as a crop has been got.

3. Full value of ploughing, seed, and sowing the grain crop of the present year.

4. Full value of the grass seeds, and sowing of the previous spring.

5. Full value of the winter ploughing of stubbles.

6. Full value of any cartage of dung.

7. Full value of the dung in the cattle yards.

8. Value of one year's grass leys in pasture.

The in-coming tenant now pays rent for lands producing crops that are his own, and all connection is wholly severed on the term day.

Objections may be raised against valuations in cases of none being used, as the general desire wishes the abolition where the custom is most prevalent. The May entry has attracted notice from these localities, and it is hoped the arrangements now suggested will appear to be just and equitable, and worthy of being adopted into practice.—J. D.

CHEESE AS AN ARTICLE OF FOOD.

[Prize Essay by Mr. L. B. ARNOLD, of Ithaca, read at the Utica Dairymen's Association.]

So extensively is cheese manufactured in the United States, and so commonly is it used in this community, that, at first thought, it seems almost a needless task to discuss its merits. But there are some objections urged against its use, as well as some considerations in its favour that it may be worth while to notice. A strong presumptive evidence in its favour is the fact of its being derived from milk. From the earliest records of our race the milk of animals has been extensively employed as an article of human food, and has been, by general consent, regarded as both wholesome and nutritious. Among all the multiplicity of foods used for the support of human life, milk is one of the most perfect. It is in fact almost the only food that will, when used alone, support life and maintain health and vigour for an indefinite length of time. The perfect proportions of its aliment are proven, if proof is necessary, by the fact that it is the only food of the young of all mammalia, and that they not only live upon it, but grow and thrive, and are perfectly developed in all their parts. Coming from such a source, it is very natural, and I may say fair, to presume that cheese should partake of the excellent qualities of the material from which it is derived. But there are objections sometimes urged even against milk. There are some people with strong vegetarian proclivities, so sensitive as to object to both milk and cheese, because of disease and a tendency to disease, in the cows from which it is produced. They say that domestic animals are reared under circumstances so artificial, and often so unnatural, as to produce a constant tendency to disease and often disease itself, and that in the case of cows, both may be conveyed to their milk. And hence they object not only to milk and all its products, but also to the flesh of such animals. That the treatment of cows is sometimes so improper as to produce disease that will influence their milk is doubtless true. The swill-milk of the New York city stables is notorious. Milk from cows fed upon the slops of breweries and distilleries, and other improper and unwholesome food, will doubtless par-

take of the food from which it has been derived. But cheese is not made from the milk of stalked cows. It comes from the milk of cows that live in the open country and inhale its purest breezes; that feed upon the fresh green grass as it grows upon the turf-clad hills and valleys, and that drink from the crystal fountains and sparkling rivulets, as meandering along the undulations of the fields, they first start on their journey oceanward. What better circumstances of health for cattle can be imagined than those which, as a rule, surround the herds of the dairy farmer in one of season lactation? Surely, the presumptions in favour of the healthful origin of milk for cheesemaking are strongly in its favour. Another objection sometimes made to the use of cheese, is that it does not fairly represent the good qualities of the milk out of which it was made; that it leaves out a part of the elements of milk, and those that it takes in are so altered in the process of manufacturing and curing, that they make the cheese a very different thing from the original milk. That cheese does not take in all the elements of milk is true, it leaves out nothing, however, that is worthy of notice but the milk sugar, and this is so easily and abundantly supplied by the saccharine matter and starch in the food with which cheese is eaten, that its loss can hardly be said to have any weight in disturbing the just proportions of its aliment. In respect to the idea that cheese, on account of changes made in manufacturing and curing does not represent the milk it was made from, let us look at the facts. They do not look alike to be sure, but appearances are sometimes deceitful and cannot always be relied on to determine important points. That milk must undergo many changes in appearance before it can be assimilated is evident. Milk in the cow's udder, and milk two hours in the stomach of a calf, differ as much in appearance as milk in the dairyman's pail, and milk in the form of a cheese; and yet, that the curd in the former case is uninjured and identical with the milk it was made from, will not be questioned. Nor will it be

questioned that the solid condition of the curd in the calf's stomach is necessary to prepare it for assimilation, for it is one of the steps in nature's own method of converting it into blood. I hold that the conversion of milk into cheese involves the same changes that occur in the stomach of the calf, and that it is only carrying out a part of the process of digestion. Let us compare what happens to the milk in the two cases and see. But first, let me remark, that the active agent in rennet is now known to reside in minute globular bodies called cells, which float in the gastric juice by myriads; that they are the cause of coagulation and digestion when applied to warm milk, whether in the stomach or out of it; and that they are like the globules of cream which they somewhat resemble, mechanically inclosed in the coagulum they have formed, and remain there to continue the process of digestion they have begun. Let us now suppose a gallon of milk to be taken into the stomach of a calf, and a quantity also placed in our cheese tub, gastric juice containing an abundance of digestive cells is applied to each, the one naturally, the other artificially; but with this difference; the quantity which the calf applies to one gallon of milk we apply to 300 or 400 gallons, and consequently one coagulates in ten minutes and the other in an hour. In one case the curd is broken up and kept stirred by the peristaltic motions of the stomach; in the other, with the curd knife and the hand of the dairymaid. The whey separates in each alike, but in one case it is absorbed away and carried into the circulation, and in the other it is carried away artificially. The curds in each case, at first soft, gradually harden till the whey is nearly all separated and they become firm and solid, one rapidly, the other slowly. We may now suppose that the curd in the stomach has assumed its most compact form, and the artificial curd a corresponding condition; that it has been through the press and now lies on the shelf in the curing room. The curd in the stomach full of digestive cells, with new ones in multiplied thousands poured out upon it with the increased supply of gastric juice, is kept at 98 deg. The curd in the curing room, containing only the cells employed to coagulate it, is kept at 70 deg. or below. In the former the digestive process is rapidly hurried on, and in a few hours the hard and tenuous structure of the curd begins to be broken down and appears soft and salvy, and to assume a cheesy texture, as well as a cheesy flavour and odour. In the latter, the process is slow. In a few weeks, instead of a few hours, its firm and tenuous structure begins to yield to the digestive agency, and also begins to soften and to assume the same salvy and disintegrated appearance and the same cheesy flavour and odour of the former, but unaccompanied with its strong animal odour. In the former, the process of disintegrating and softening goes on rapidly, till the whole becomes liquid and is carried away to serve the purposes of life. In the latter it is checked by drying and cooling, so that little change will be noticed for a long time. We now consider our cheese ready for use. It will be seen that all we have done is to carry the digestive process up to a certain point, and there to check it. We have digested the curd till it is just ready to dissolve, and there we hold it. We have the solid elements of the milk in our cheese tub in a good state for preservation, and yet so nearly digested as to require but little aid from the human stomach to dissolve it, and make it ready for the work of assimilation. Is it not plain, from the foregoing, that cheese is a fair representative of the milk from which it is made, and that it is entitled to the reputation we are in the habit of ascribing to it, that perfectly (and nutritious) wholesome luxury? The next objection I shall notice is the one most commonly raised, viz., that cheese is food in a state too concentrated for the human stomach. I shall not dispute this point; for I believe the human stomach was not made to hold food that contained nothing but pure nutriment like cheese and meat. It is too large for such a purpose. Our food must have bulk enough to distend the stomach and bowels, so as to afford a sufficient substance for them to act upon. Cheese will not do this when eaten alone, and hence some people would have us reject it together. But the same objection lies against beef, and pork, and mutton, and all similar food. Shall we reject them also? We do not, and should not, object to meat because of its being too concentrated to eat alone. We remedy its defective bulk by using with it some less nutritious food, as bread, potatoes, or roots; and the remedy is perfectly efficacious. We should do the same with cheese, and the objection would

lose all its force. And this we do instinctively. We never eat cheese with meat, or beans, or peas, or other strong food. We use it in connexion with farinaceous and fruit, with bread, pastry, and the like, and we do so with the happiest effects. The practice which prevails generally in selecting food to use with cheese is as much in accordance with reason as with taste. A little chemistry will illustrate this, and show us that we might, with profit, consume much more cheese than we now do. Chemistry divides our food into two classes; these which go to make up flesh and the framework of the body, and are called flesh-forming or albuminoids; and these which furnish the material for fat and animal heat, and are called fat-forming, or supporters of respiration. We do not use these two kinds of food in equal quantities: we take only one of the former to two and a fourth of the latter. They are found in just this proportion in milk. That it may be seen at a glance in what relative proportions the two classes of elements exist in some of the common articles of food, I have prepared a table, by selecting from some of the latest and best authors, to show what per cent. of albuminoids and fat-forming elements are contained on an average in the kinds of food named:

	Albuminoids.	Fat-forming.
	Per cent.	Per cent.
Milk	3.8	8.3
Butchers' meat.....	14.4	29.9
Cheese	24	31
Wheat flour.....	11.8	74.1
Wheat meal	13	67.6
Rye flour	10.5	72.5
Corn.....	10	68
Buckwheat	9	59.6
Peas	22.4	52.3
Beans	25.5	45.5
Rice	7.5	76.5
Fruits, all kinds	0.5	11.3
Potatoes	2	91

I have said that we consume on an average about $2\frac{1}{2}$ parts of fat-forming to 1 of flesh-forming material, and that is all we can consume. Whatever is in excess of these proportions is of no value. Wheat contains over 6 to 1, while cheese, it will be seen, contains an excess of albuminoids, that is, it has only $1\frac{1}{2}$ of the respiratory matter to one of flesh-forming, whereas it should have $2\frac{1}{2}$. This disproportion comes in consequence of its loss of milk sugar. If eaten alone it would not be consumed to the best advantage. Wheat-flour stands in the opposite relation. It has nearly three times as much starch, &c., as are necessary for, or that can be used with, its albuminoids; and hence, if consumed alone, is used at a great loss, besides the liability to disturb the healthful conditions of the body by its great excess of starch, &c. A moment's thought will enable any one to understand that to use cheese with any preparation of wheat-flour would tend to balance both their excesses, and make them both more valuable and nutritious than they could be alone. And the same is true with all the cereal grains, corn, buckwheat, rice and fruit. The use of cheese, therefore, with every variety of bread, pastry, fruit, &c. is not only proper, but earnestly to be recommended, as a positive aid in preserving a proper equilibrium in the elements of food. Cheese used in connexion with the bread grains, &c., as suggested above, has an economical value that it is well worth while for all purchasers of food to consider. Cheese is an animal food, and may, with advantage, be substituted for meat. At the current prices it is a cheaper food than butchers' meat. The average retail price of the latter for the past season at our markets, after divesting it of bone, has been 20 cents per pound, and cheese the same. But cheese contains more nutriment than meat when equal weights are taken. Meat, it is true, is perfect nutrition, and is all consumed. Assuming no waste, a pound of flesh may make a pound of flesh again. It cannot do more; while a pound of cheese, simply by absorbing water, will furnish the material for more than a pound of flesh. It is, therefore, the cheaper food of the two, and may be profitably substituted for it. But its highest economical value arises from its enhancing the value of other food with which it is consumed. By the figures in the table it may be seen that if a half pound of flour, that will cost only four or five cents, is converted into bread and consumed with a pound of cheese, the two together will furnish

a little more nutriment than two pounds of meat. The figures which represent their value stand thus:

	Flesh-forming.	Fat-forming.
One pound cheese.....	24.	31
One half pound.....	5.9	86
	29.9	67
Two pounds meat.....	28.8	59.8

Two pounds of cheese and the one half pound of flour will cost 25 cents, and the two pounds of meat 40 cents. Cheese sustains a similar relation to all the cereal grains, and in fact to almost all the food derived from the vegetable kingdom, and is therefore used with that class of foods with great advantage. Thus consumed it has an economical value that pertains to no other animal food. We cannot use butcher's meat, for instance, with wheat flour and produce any increased value over using them singly; for meat, as a rule, contains just the right proportions of flesh and fat (1 to 24). It has nothing therefore to offset with the excessive starch in the flour. Hence when meat is consumed with bread, potatoes, roots, &c., all the excess of starch or sugar they contain is wasted. The only valuable purpose they can serve is to supply the deficient bulk of the meat. It cannot possibly utilize them. This relation of cheese to food containing an excess of the supporters of respiration ought to be better appreciated by our people than it now appears to be. We live mostly upon food that contains an excess of fat, starch, or sugar, which we pay for at a heavy expense, without its contributing anything toward the support of life. By a better understanding of the relation that the use of cheese sustains to such food, so much of that excess might be utilized as to be sensibly felt in the cost of living. A large amount of food now consumed without any benefit, might be rendered available. There is another consideration connected with the use of cheese, as above suggested, that I would not have overlooked. I refer to its influence upon health. That a food in which the elements of nutrition are in the same proportions that they are used in sustaining life, is more healthful than a food in which they are in great disproportion, is a fact too evident to need argument or illustration. The nearer we approach to the perfect proportions in the elements of our food, the better must it be for our health. That cheese may be so used as to promote a better relation in the elements of food has been sufficiently shown, and hence the bearing which a more liberal consumption of it would have in promoting health may be inferred. There is still another peculiarity in the use of cheese that I may notice in this connection. It has been previously stated that the coagulation of milk was effected by the aid of minute globular bodies, called cells, that float in the rennet, and that they are enclosed in the coagulum they have formed, and remain there during the process of manufacturing and curing the cheese. All this is true, and more. Unless they are destroyed by some unusual treatment, they remain in the cheese until it is

consumed, and retain their power unimpaired. This may seem a strange assertion, but it is nevertheless true, and may be easily verified. If any one desires to do so, let him take a piece of rich old cheese and dissolve it in tepid water. When it is dissolved, or so softened as to mix readily with the water, apply it to a little sweet milk and keep it warm, and in due time it will coagulate in the same way as by the use of the rennet. If a microscope is at hand, he may see the cells floating about in the water in which the cheese was dissolved. When cheese is dissolved in the stomach the cells are set free, and resume their former efficiency, and become a positive aid in digesting other food. The opinion that cheese will digest other food, quite commonly prevails, and here we may see that it is founded in fact. This peculiarity which belongs to cheese may justly claim some weight while we are considering its merits. Enough has been said I think to show that there are good and substantial reasons for regarding cheese as a wholesome and valuable food; and that it is worthy of a more liberal consumption than it now receives. This opinion is not only verified by the argument offered, but is sustained by experience. As a community, the dairying people of the United States are very large consumers of cheese. They have at all times an abundance of good cheese of their own manufacture on their tables, and use it very freely, and they do so with the most favourable results. A more healthful and vigorous class of citizens cannot be found among us. As a nation, the English people probably consume more cheese than any other nation on the globe. Their annual consumption amounts to 300,000,000 of pounds for 30,000,000 of people, or ten pounds to each inhabitant. In the United States the annual consumption amounts to 180,000,000 for 40,000,000 inhabitants, or four and one-half pounds to each inhabitant. The statistics of mortality in the two nations show the conditions of health and longevity to be rather in favour of the English people. This difference may or may not result from the use of cheese, but in either case it shows that cheese does not hurt them, and that the people of the United States might annually consume more than double the quantity they do without doing them any injury. In conclusion, there are many reasons for commending cheese to a more general use. Besides being, when properly used, a wholesome and nutritious diet; besides being richer in nutritious value than butcher's meat or any other animal food; besides its peculiar ability to enhance the value and improve the healthfulness of other food with which it is consumed; besides the aid it renders in digestion, its readiness for use at all times without loss or trouble in cooking, its convenient form for handling and transporting, the ease and certainty with which it may be preserved for many months without loss or injury that occurs to other food from an excess of salt, all commend it to the favour of the public, and especially to the army and navy, where it could not fail to prove not only a luxury to our soldiers and sailors, but a cheap, healthful, and substantial substitute for the continued use of salt meat.

THE HERD OF MR. SHELDON, OF GENEVA, N.Y., UNITED STATES.

TO THE EDITOR.

SIR,—Thinking a description of Mr. James O. Sheldon's herd might be interesting to some of your readers, I will endeavour to give you some idea of it. His mansion, which is a splendid one, and in which much taste is displayed in the architecture, is situated on an eminence about the centre of his farm. This establishment is complete from the house to the pig-pen. Since the fire, when he lost all his fodder, he has built his cow-house of brick, and it is a very spacious one; the cows occupy one side, and the calves have each a pen to themselves on the opposite side. The cows are milked regularly, and are not allowed to suckle their calves, which are fed on new milk for a time, then mixed with skim, and afterwards raised on milk and linseed gruel. All seemed to be in a thriving condition, and I was glad to see that he did not force his calves. Taking Mr. Sheldon's herd in comparison to others, I have seen herds much fatter, and they varied much in this particular. Some of them were lower in flesh than I expected

them, while others carried much flesh, more especially at the ketch and round bone. These points seemed proverbial in the Oxforde. I was not prepared to meet with so many thick, mellow skins and long hair as I did in this tribe, as the originals at Oxford Royal Agricultural Show in 1839 were not of that character; most of them were thin skinned and fatty, peculiarly suited to the taste of the judges at that time. You may remember, Mr. Editor, that the judges judged the Short-horns at that day by raising the skin with the thumb and finger. Soft handling was *admired*, and by this admiration the Duchesses gained their reputation, which I cannot help thinking was a very great mistake, for from such constitutions sprang many diseases which was attributed to other causes. My experience tells me that a thin skinned animal is always tender: the lean meat is porous, and the fat is blabbery, the tripe and bowels are thin, all corresponding. They take cold easily, and it settles on their lungs, thereby breeding dis-

case, which becomes contagious. I have seen much of this in this country, more than I have in England. Many of the Duchesses inherited it, and breeders in this country patronized this kind of handling because it was fashionable, and many of them suffered much loss from this foible. They were led away from sense and reason by a clique of leaders who had selected this *soft touch*, and who were determined to drive it into the brains of rich men with their tongues and pens, and many a novice with more money than wit was taken in by them. The scene seems to be changed here now, and the thick, mellow skin and long thick hair of the Booth is taking the place of the thin skinned Duchesses. That firm touch, when ripe, is the Booth, is beginning to be appreciated, and the thin skinned ones are dying out or abandoned. You know, Mr. Editor, that the Bates sort was much admired for their *sweet heads*, and you also know that they took most of the prizes at Oxford because the judges were so much pleased with their *soft handling*. Two of these cows were much to my taste: they had thick, mellow skins, with plenty of long soft hair, but they received second prizes under the thin skinned ones. Now I will venture to suppose that this peculiar kind of the "Oxford Strain," or tribe, now owned by Mr. Sheldon were derived from these two cows, if it can be proved. I do not recollect the names, but the three heifers and the bull, coming three years old, distinguished favourites of Mr. Sheldon, are precisely the same quality—Booth-like. Mr. Sheldon called my attention more particularly to these four animals. They have been bred as closely as it is possible to breed them, and Mr. Sheldon is going to continue it still further, although the bull is half brother to the heifers, and other relation very close. He says he shall pursue this course of consanguinity. He believes that as long as they have constitution, which they certainly denote, and he can produce such animals by his course of breeding, he will continue to do so. I do affirm that these four animals are as near perfect as any animals can be: beautiful, thick, mellow skins as can be found anywhere, plenty of long, thick hair, and their quality of flesh cannot be excelled, according to my course of handling. I think they will die as well as Scots or Herefords whenever slaughtered. Still I cannot reconcile myself to this close breeding. It must fail, as it has with others, and I am very anxious to see the offspring from this experiment. This young bull has a very straight top and bottom, a little tucked up in his belly if anything, not at all characteristic of the Duchesses generally, for they are apt to be paunchy. He has no superfluous flesh on his neck, as most Shorthorns have; his shoulder blades are well covered (Booth-like), and his shoulder top as bare as it ought to be, but his shoulder point is not so full as it might be for the condition he is in. This, I think, is a very difficult point for Shorthorn breeders to contend with, more especially in the Duchess tribes. His crops are good, which is another evil in this tribe, and Shorthorns generally. His chine excellent, and his twist good. He has a fine round bone, and a beautiful ketch on the top of it, such that are very much wanted in what are sometimes called *pure bred* Shorthorns. Although his outward thigh was light, the inward part gave him a good twist, and I think this part of the round is considered by epicures to be the best quality when the animal cuts marbled. His tail was well set on and level with the chine, and he denotes as good a constitution as we find in an outward bred animal.

Now, I contend that the skins that cover these four animals protect the constitution, and that closer affinities can be bred in consequence of this protection. But breeders will overshoot the mark, and come to a dead lock, as the noted and veteran breeder the late Sir Charles Knightley did before them. It was precisely this skin and hair that his herd possessed when in their prime, as these four animals now under consideration belonging to Mr. Sheldon so plainly show. Sir Charles took a long course of very close breeding from his *own sort*, and this thick, mellow skin, with plenty of long, thick hair protected his strong constitutions; but as soon as the herd generally began to show signs of weakness in their calves, and they began to grow up with a sickly look, nothing seeming to make them thrive; the skin, however thick and mellow, and the hair, however thick and long, could not save them. This herd of Sir Charles Knightley's dwindled into nothing, entirely from in-and-in breeding. I hope these noted young heifers of Mr. Sheldon's, and the bull from which he intends to pursue the same course that Sir Charles did, will not fall by the experiment, but

I have strong fears that such breeding cannot last; when it once begins to fail, farewell to good breeding. Mr. Sheldon says he shall pursue this experiment; as long as he can breed such symmetry, quality, and constitutions, and, as his purse is ample, he can afford to indulge in a trial of this kind, however unnatural the course seems to be. I know I have lost much by this system of breeding, notwithstanding I have seen as fine animals bred amongst Herefords as the world produced. Old Sovereign was as closely bred as an animal could be. There never was a better bull of any breed in England, or a better stock getter. Probably he has got more prize animals than any bull in England of his day. It is these successful incidents that encourage men thus to breed, but that dead lock must come, and when it does, farewell to good breeding. I tried to persuade Mr. Sheldon to try one of Mr. Booth's bulls of the smaller families, or of Mr. Carr's; but he emphatically pronounced his judgment against this. As long as such animals will sell for 7,000 dollars to *fancy men* in England, with their risk in crossing the water, of course he will breed them; but I cannot help thinking such extravagance will die out. Now, I contend that these animals have bred back to the Alloy, as well as Habbuck, which I am satisfied from history is another Alloy, and from which the skin and hair of the Scot were derived, and that it is these two crosses that have kept up the constitution hitherto; but the test has yet to come, by the continuation of consanguinity. One good out-breeding will stand to build upon, and when there are two out in the Alloy and Habbuck the foundation is still better. How far these animals' pedigrees will apply to the two Alloys will be seen by applying to the English "Herdbook;" but the difficulty is to find out the distinction between the first Alloy and the second, as the produce of the first got so mixed up with the second that it was left *entirely* to the honesty of the breeder, to reveal or conceal as he thought proper, and it is generally supposed that the Alloy before Habbuck is mixed up with the best Shorthorns of the present day. This leads me to believe that these four animals of Mr. Sheldon's are strong productions from both Alloys, and gives them constitutions to produce their like again. May it be so, for I think Mr. Sheldon is trying earnestly to produce uniformly good stock, although his sales and purchases have given him a herd far from uniform in size and quality. I found some blubber in this herd, as well as in the other noted herds of the Duchess tribes, and some cows lacking in symmetry; but I did not find a thick, leathery hide amongst those I handled.

There was a yearling heifer in one of the calf-stalls (the name of which I have forgotten) that was equal to anything I ever put my eye or hand upon. Give me such animals as this, uniformly bred in a herd of Shorthorns, and I will praise that herd as highly as either Lewis F. Allen, author of the American Shorthorn "Herdbook;" or Luther Tucker (sen. or jun.), of *Country Gentleman*; or the late Mr. Tom Brown, editor of the *Ohio Farmer*, could have done it; but to praise a herd to the skies where there is disunion in size, quality, and symmetry is beyond my ability or desire. My attention was more particularly directed to a white cow in a stall, with a young calf by her side (I believe her name was Berlina). A more complete specimen of a Scotch cow I never saw. She had beautiful symmetry, very compact; as fine, thick, mellow skin, with long, thick, waving hair, as ever covered a Galloway; her legs were short, her fore and hind flank as full as a Scot's. Her full crops, meaty chine, straight top and bottom, her full eye and "very short horn" convinced me that she was thrown back to both Alloys, or some other Alloy had crept into the fold, to keep breeders from consanguinity, and that there might be other "closet men" (as Mr. Lewis F. Allen says Mr. Collings was) in England amongst Shorthorn breeders who were aware of the importance of this cross. If Berlina was mine, and I was a Shorthorn breeder, breeding bulls for the public, money could not purchase her.

The Hon. A. B. Conger, of Haverstraw, State of New York, has two cows precisely of the same character; but not, I think, with so *purely* the Scottish look as Berlina. Udora was the name of one of them; the other I have forgotten. These are the Shorthorns I like to write about, for I had rather praise than condemn, no matter to whom they belong.

Mr. Sheldon is breeding Alderneys as well as Shorthorns, and has some fine specimens of their kind; but I think this breed is only fit for fancy men, and are not a rent-paying sort. I am much indebted to Mr. Sheldon for the kindness shown

me, and I sincerely wish him success in his undertaking. I have no objection to his making 7,000 dollars of every animal he breeds; but he will have to come to England for this class of men, for such novices are become extinct in this country. I should say that Mr. Sheldon's farm was well adapted for breeding, worked under a good system, which it seemed to be, and is a very productive one. May he long live to enjoy his pleasant position, and call the attention of Englishmen with more money than brains to take his animals at all risks for 1,000 to 1,500 gs. each. Such men will "bear bleeding." He has everything around him that man can wish; and who can enjoy the comforts of home more than such a gentleman who has a mind capable of appreciating it?

Suppose Mr. Sheldon had chosen the thin-skinned, fatty animal to have tried the experiment he is now engaged in, this in-and-in breeding would have brought them to grief much sooner. There is another class of Duchesse tribe of this character, many of which have died of disease, which I attribute to their thin skins. How many of such animals have met with a premature death in this country as well as in England? These Duchesses of the opposite stock to Mr. Sheldon's were long in the leg, light in the crops, pannychy, and thin-skinned. In-and-in breeding told strongly upon them, and many of them died, even after being nursed with the most tender care; many died in this country before they added much to the stock.

W. H. SOTHAM.

"NO POLITICS" AT THE CHAMBERS OF AGRICULTURE.

At a special general meeting of the Warwickshire Chamber of Agriculture, held at Atherstone, Mr. J. H. Burbery presiding, the Secretary read the following letters, the one from Lord Aylesford, and the other from Lord Warwick:—

Packington Hall, Coventry, March 17th, 1870.

Sir,—I should be obliged by your taking my name from the list of subscribers to the Warwickshire Chamber of Agriculture, as I do not approve of it becoming a political association.

I have the honour to remain, yours,

AYLESFORD.

1, Stable Yard, St. James's, March 26th, 1870.

Sir,—I have received your circular inviting me to attend a meeting of the Warwickshire Chamber of Agriculture on Tuesday, the 29th of this month. Although unwilling to enter into discussion in writing, I feel it due to the Chamber, to my friends and tenants, and to my own character as a Warwickshire landlord, publicly to refer to the recent proceedings of the Chamber, and to explain the reason of my absence from their late debates.

When the Chamber of Agriculture was first established, landlords were specially invited to join, in order that all classes might unite in the discussion of subjects affecting the general good. It was, therefore, with sincere regret that I soon observed a bitter spirit arise, which has since culminated in a direct and most personal attack upon one class—the landlords.

This has prevented my attendance at the late meetings, and I confess that my first impulse, on reading the account of the proceedings at Coventry, was to withdraw my name from the Society, feeling that landlords could not remain silent under such unfair and sweeping imputations, and that unseemly re-remuneration could be the only result. I refrained, however, from this step on the consideration that none with whom I was personally associated had expressed these extreme views, and I should have been unwilling to class them with those whose opinions I felt sure they must disapprove of. That such was the case is proved by the bold and manly conduct of Mr. Ford, who well deserves, in my opinion, the hearty thanks of all who desire to see harmony between landlord and tenant, for firmly expressing his dissent from resolutions which asperse the character of the former, as a class who would knowingly, and for their own selfish gratification, injure men whom they in truth regard, and whose interest ought to be identical with their own. I do not go so far as to assert that the working of the Game Law is not a legitimate subject for discussion by a Chamber of Agriculture, but I will say that, considering how liable it must be to produce antagonism of classes, it should only be entered on in a moderate and kindly spirit.

The opposition to the present state of game-preserving assumes many forms. It comes 1st, from tenants who have seen, either in their own case or in that of their neighbours, injury done to crops by excessive preserving, and who, with every wish to be on friendly terms with their landlord, and without any desire to abrogate the present law, feel that they are entitled to more consideration in this respect.

2nd. From those who do not object to game, but on the contrary, in the words of one gentleman at the late meeting "hope that all tenant-farmers will become game-preservers,"

and whose only object, therefore, is that game should be transferred from the hands of the landlord to those of the tenant.

3rd. From those who wish all game to be utterly destroyed.

4th. From those who care little for game or injury to crops, and only use the cry as *capital* in their endeavour to unsettle and break down the position of landlord and tenant throughout the country.

The first class have my hearty sympathy, and I cannot conceive any reasonable landlord who, if the matter were represented to him in a really kind and friendly spirit, would not endeavour to meet his tenant half-way in this matter.

With the views of No. 2 I fear I do not altogether coincide; and although my friend Lord Leigh has, with his usual generosity, at once fallen in with them, I trust that one who cannot go quite so far will not be supposed altogether devoid of feeling on the subject.

Without going into the argument, however, I may, perhaps, be allowed to say that the circumstances of all estates are not similar, and that this may be shown to apply in the case of Lord Leigh. But further, I cannot agree that it is for the benefit of either party that game should be the property of the tenant. Perhaps, in the first instance, the tenant might be inclined to offer his landlord sport, yet I believe that this would soon die away, and that jealousies would be sure to arise. Even taking it in the most favourable point of view, it would not be a pleasant reflection for the landlord to feel that he was shooting on his *own ground*, on *suffrance*, game which was no longer his.

Then, again, if tenants are to be game-preservers, they must themselves employ keepers, not alone for the game, but as a protection to their houses and flocks (for the poacher will not spare them), and besides perpetrating the injury said to be done by game, they will find themselves saddled with expenses which must tell against their own pockets and their landlords' rents. With regard to No. 3, it will be sufficient to say that, as Mr. Phillips justly observes, it would have a strong tendency to drive landlords from their homes, and the foxhunter must remember that *faces* would be rather pressed for food.

The spirit which actuates No. 4 in their opposition to game is well explained by the remarks of Mr. Richards, who, when good landlords are spoken of exclaims, "Would to God we could find them!" and of Mr. Congreve, who describes contracts as "always broken by landlords." The justice of these sentiments I shall not debate, but there is something to me suspicious in the statement of Mr. McGeachy, in a letter last week, that we are to look to the "*great towns* of England and Scotland" to unite with Birmingham and Aberdeen in a demand for a repeal of the Game Laws.

I was not aware that hares and rabbits had gone so far as to take the streets of Birmingham by storm, and burglariously to enter the dwelling houses of its inhabitants in search of food. If not, to what are we to attribute this urbane indignation? Are we really to suppose that they are only actuated by affectation for the farmers, whose interests they have not always so scrupulously respected, or may they not fairly be suspected of some ulterior views.

Of one thing I am certain, that nothing is more foolish and wicked than antagonism of classes, and that they incur a heavy responsibility who are reckless enough to encourage it, and

hope to take advantage, for other purposes, of the evil spirit which it engenders. And now a few words on the subject of "the battue." I am one of those who would far prefer *moderate* shooting, with a friend or two, throughout the season, to the massacre of a large head of game once or twice in the year, with a dozen guns. Some years since the former custom prevailed; but it is only just to say that improved farming has been the chief cause of the change. Formerly numerous small plantations existed on a farm, and every hedgerow and stubble field was a cover for game; but the close cutting of these has forced high feeding, as game can only now be kept together in compact masses, and if disturbed more than once or twice in the year, is driven over a country where there is no cover, and lost. It therefore becomes necessary, when once disturbed, to kill it. The same thing applies to partridges. I infinitely prefer walking with a good dog, and seeing him work, but this for a similar cause is now impossible, and hence the necessity of *driving*. To conclude, for my own part I can see no good to be gained by legislation, nor can I willingly consent to dangerous interference with private contact between man and man; neither do I see that it is necessary for justice that I should resign my right of game upon my own land; but beyond this I am truly desirous that no tenant of mine should suffer from game in any way that can hurt him, though I will admit that it is difficult, as long as game at all exists, to avoid at times some slight inconvenience; but this, again, is usually allowed for in the original rent of the farm, and, if game is abolished or taken out of the landlord's power, you will find his farms put up to auction and the last penny of rent exacted.

I have no wish to see a *rabbit* on my lands, neither do I desire an overstock of hares, and if (as will sometimes happen) they inadvertently get a head, I will do my best to control them. Further than this, I should be willing in extreme cases, which I trust would not often arise, to have the damage valued by a friend on either side. I am far from saying that there are not instances of hardship, which I much regret, but I believe that, as a general rule, if tenants will not show distrust of their landlords, and the landlords on the other hand dismiss all selfish feeling, and sacrifice *excess* of game preserving to the benefit of their tenants, these unpleasant feelings (unless otherwise fostered) will soon subside, and a better understanding be come to without the aid of legislation.

I remain, sir, your very obedient servant,

WARWICK.

To the Secretary of the Warwickshire Chamber of Agriculture.

LOCAL TAXATION.—A special general meeting of the Lincolnshire Chamber of Agriculture was held at Lincoln, when Mr. Charles Bramley read a paper on the above question. The discussion was carried on by the Chairman, Mr. Ashlin, Mr. Trotter, and others, and the following resolutions adopted: "1. That in the opinion of this meeting the existing tax collected under the name of Poor Rate bears exclusively and unjustly on income arising from real property. 2. That the exemption from the Poor Rate assessment of income arising from personal property is not only unjust, but also impolitic, and prejudicial to the public interest. 3. That this tax indirectly increases pauperism by impeding industry and enterprise, and discourages the application of capital to the employment of labour and the production of food. 4. That the tax has an injurious bearing on house property, and presses especially on investments in improved dwellings for the working classes, and limits the demand for the labour of the skilled and unskilled artisans. 5. That the general tendency of recent legislation having placed the management of Poor and County Rates under boards and auditors, controlled by a central power, has to a great extent removed the objection that the maintenance of the poor, the highways, and the other purposes for which these rates are levied, are strictly local duties, and should therefore be defrayed by a local tax. 6. That the majority of county and borough voters are ratepayers, but not generally large money owners, and are therefore deeply interested in the removal of the present exemption from Poor Rate of income arising from money however invested or employed. 7. That this Chamber do therefore urge the Central Chamber to do all in its power to influence the Government to take up the early consideration of the incidence of Local Taxation with a view to the assessment of personal property to its fair proportion of the

burdens of the country, more especially as it is contemplated to further increase the pressure of Local Taxation by new rates for the maintenance of roads and education."

HOW TO GET UP AN AGRICULTURAL LEADER.—

We have seldom seen a more barefaced piece of literary "crib," and a more unblushing advertisement, than that of which the paper calling itself the "organ" of the Chambers of Agriculture was guilty last week. Its first leading article is taken almost bodily from the columns of our esteemed contemporary the *Economist*, and done so, sooth to say, in a patronising style! Surely, if it be the "organ" it represents itself, among all the "grinders" in the chambers, it might have found one to turn the handle of an original tune on the malt-tax. The advertisement, however—after the *Economist's* air—is its own, and played out with an effrontery that none but one of those foreign pests to Mr. Babbage could have displayed. Petitions in favour of repeal or reduction of the malt-tax ought, we are told, to be sent from every town and village; and forms of petition can be had (we give the advertisement gratis) from "the secretary of the Central Chamber of Agriculture. Address, the Salisbury Hotel, Fleet-street." Very ingenious certainly; but will the tub thus thrown out catch the whale? We fancy not.—*The Farmer*.—[The secretary of the Central Chamber may advertise himself at "the Salisbury," but, as we have said before, he has no office of any description at that hotel; and if his forms of petition be kept there, it is difficult to see where these can be stored, unless it be in the coal cellar.—Ed. M.L.E.]

THE GAME LAWS.—At a meeting of the West Kent Chamber of Agriculture held at Cranbrook, the Earl of Darnley in the chair, the following resolution was proposed by Mr. Chittenden,—"That this Chamber is opposed to legislation between landlord and tenant, but considers that progressive cultivation and successful farming require the ground game to be under the control of the tenant." Lord Holmesdale moved, as an amendment,—"That this Chamber, while entertaining the strongest opinion that an excess of game is prejudicial to agriculture, is also of opinion that the exaggerated statements made from time to time with regard to game are a serious hindrance to the settlement of the question." Mr. Hodson also moved, as an amendment,—"That, having regard to the interests of agriculture, this Chamber is of opinion that there should not be an over preservation of game, and that a right of action should lie for any damage sustained thereby unless the party preserving has, by means of walls or close fences, used his best endeavours to keep such game within his own domain; and that it shall be lawful for hares and rabbits to be destroyed by tenants and others on whose lands they may be found, at all times of the year, without any licence duty, notwithstanding any covenant to the contrary, the tenant first repaying his landlord any compensation he may have received from him in reserving the right of game." Both amendments were negatived, and the original resolution carried.

THE WORTH OF THE LABOURER.—He had a man, who he thought he did not exaggerate in saying was worth double to him of any man he had on his land; that man was a most intelligent man; if he put a perfectly new machine, which he had never seen before in his life, into his hands, he would not break it, but would learn how to work it in 24 hours—to conduct it and carry out all its operations with singular zeal and intelligence. If he wanted a piece of land sowing with seed—if he wanted this man to sow it with two bushels or with one bushel and a-half, he would see it regularly and uniformly done. Would anybody tell him that the man who could do those things was an uneducated man—a dangerous man—and likely to be one of the arabs of society? The man who could do that, and many more things he would not weary them with relating, could neither read nor write. An honest or a better fellow did not exist, or a man who did his duty better in the position of life in which it had pleased God to place him. Would they greatly improve their labourers by that rate-supported education? He was most anxious that every poor man's child should be able to read and write and cast accounts to a certain point, and above all that education should be formed upon religion and the bible. But when it was proposed to carry out a system of Government education, which was to be paid for out of their pockets, he was quite certain men would ask themselves, "Is it fair and just, and is it to our interest?"—*The Rev. H. Smythies at Leicester.*

LAVENHAM FARMERS' CLUB.

THE TENURE OF LAND.

At the March monthly meeting of the members of this club, Mr. MANFIELD read a paper on Land Tenure, in which he said: The land suffers not so much for want of capital as for want of security for that capital. My own opinion is that all land should either be let upon lease or upon a well devised system of tenant-right. I prefer leases because they give greater liberty to the tenant in the way of cropping than may be given under a system of tenant-right. I conceive that lease to be the best which will secure the best rent to the landlord and the greatest profit to the tenant. I have drawn up a lease and will bring before you the points in which it differs from many. From the list of reservations, pollard trees growing upon, or in fences adjoining arable land, are excepted; the exclusive right to game is reserved to the landlord with certain exceptions; if by fair and legitimate sport we can keep our landlords and country gentlemen living amongst us, it is desirable to do so; it contains a provision that it shall not be terminated without two years' previous notice in writing from either party. It is better for all parties to come to an arrangement as to the future some time before the end of the unexpired term. And I will go as far as to say that if a landlord refused to come to terms as to the future, two years before the expiration of a lease, I should take as much as possible out of the land, or put in as little as possible; if on the other hand a tenant would not come to reasonable terms, I should feel perfectly justified in giving the offer of the farm to another when the lease had nearly expired. I do not think a tenant can benefit himself by lowering the condition of his farm for a longer period than two years before the termination of his lease.

Clause 2 authorises the tenants' executors to assign to any responsible person, if the landlord shall decline to take the tenant's interest at a valuation, which is but fair.

Clause 3. The tenant to have a pecuniary interest in keeping up the repairs, he paying for half the labour in keeping up the buildings, &c., in repair, and all the labour in keeping gates, &c., in repair. All the fust to be put in repair by the landlord, and all materials to be found by the landlord.

Clause 8 allows the tenant to sell any article grown upon the farm, such as straw or roots, upon condition that he buys back an equivalent in oil-cake or feeding stuff. I think it most desirable that the tenant should be able to do this. I think this liberty should not be extended nearer than eighteen months to the termination of the lease, which would insure that all the produce grown upon the farm (except the corn, grass, or seeds), in the year next preceding the termination of the lease, should be consumed upon it.

Clause 9 gives the tenant liberty to farm and arable land in any place he pleases, except in the last two years, when it must be farmed on the 4-course system. It is here that the lease has the advantage over the tenant-right.

Clause 10 provides that if either landlord or tenant desire it, the landlord must provide tiles for draining, and can charge the tenant with the cost of an efficient man to see that they are properly put in.

Clause 16 provides that if any straw is destroyed by fire, the value of such, at foddering price, shall be laid out in the purchase of artificial food, to be consumed by stock, or in artificial manure to be used or left upon the land.

Clause 17 provides that the tenant may course hares during the coursing season; that he may kill the rabbits (except in April, May, June) at any time, or in any way that will not interfere with winged game. If this was generally adopted it would wonderfully lessen the estrangements and ill-feeling which subsist, and ought not, between landlord and tenant.

My experience of rabbits has been somewhat extensive; for several years the damage caused by them on a comparatively small farm exceeded £100 a-year, during which time the landlord persisted in saying there were none. I suffered so severely that had not an alteration been made I should have given the farm up, but after a bit I was allowed to kill the

vermin; the landlord expressed his surprise that there were so many. I afterwards had a lease of the same farm with a right to kill rabbits if they did me material damage. I was never troubled with them after. I cannot believe that a landlord would preserve such vermin if he really knew the damage they do; they are the greatest pests a farmer has to contend with.

Clause 19 provides that the straw and chaff and coider arising from the last year's crop of corn, thrashed before the expiration of the lease, is to be thatched, the thatching to be paid for by the in-coming tenant. Before the lease is forfeited for non-payment the rent must be demanded, and before the lease is forfeited for the breach of any stipulation it must be shown that the tenant will not submit to an award of arbitration.

Valuation Clause contains the usual conditions, except that it provides that the cost of draining is spread over a greater number of years than usual—

Of 30 inches deep 3 years,	
40 " " 5 "	
48 " " 7 "	

the greater the depth the greater the cost, and the greater the efficacy and durability. Therefore in future the time should be extended. I have inserted the usual conditions as to thrashing and carrying out the last year's corn, but I think they may be improved upon in this way: Let there be a fixed charge—say, of 1s. 6d. per comb for thrashing and carrying out last year's crop of corn, and 1s. 6d. per bushel for trefoil, and 2s. 6d. per bushel for clover-seeds. If the out-going tenant cannot come to terms with the in-coming tenant about the carriage, &c., he can get some one else to do it for him. I have heard valuers say that the thrashing is often more bother than all the rest of the valuation account.

The Mutual Clause contains a provision in case of a dispute arising as to the meaning of any part of the lease, and it provides that it shall be submitted to arbitrators who shall have power to settle it.

Mr. R. HAWKINS said they were not overstocked with game in that district, but when game was allowed to get ahead he did not know anything more injurious. He had no doubt many of them would agree that the Legislature ought to interfere, and not allow tenants to be over-run with game under any circumstances, whether the landlord interfered or not. As to rabbits he thought they should be considered as vermin, the same as rats, and destroyed.

Mr. T. P. HITCHCOCK said: Mr. Manfield had dealt gently with the question of game. Some people talked as if the Game Laws were peculiar to England, but they would find upon inquiry that they existed in other countries as well, and the law said everywhere that the game belonged to the owner of the soil. Indeed what other inducement would there be for a gentleman to remain in the country if he could not have his country sports. He thought, however, that the Game Laws ought to be restrained within proper bounds. It was a great hardship where a farmer hired land on the understanding that only a moderate quantity of game was to be preserved, and then the landlord afterwards let the shooting to someone else; perhaps it might be that the landlord died, and the next man, not caring about the shooting, let it to some one, a London stock-broker perhaps, who having no land, did not care a bit about the tenants, and the farmer had his crops destroyed by the abundance of game. Where a tenant-farmer had hired his land on certain conditions and his crops were injured, he thought the Legislature should step in, so that he was recompensed for all his losses.

Mr. W. RIDDELL said, as to game, it was quite right, what Mr. Hitchcock had said, that a man had a right to do what he liked with his own, but still he thought if a limited liability clause were introduced into their leases it might have a wholesome effect. If he was in the happy position of being a land-

lord, as he was only, he was sorry to say, to a very limited extent, he should not object to a limited liability clause, but still he would have game and he would have sport, and if the tenant thought he was not going to have either he would not suit him. But he should not object to a clause that if the damage by game exceeded a certain amount the value should be paid to the tenant, and in reference to this he was fully aware of the difficulty there was in valuing damage by game.

Mr. GAYFORD, for one, should be very sorry to see the game laws done away with. They wanted to get the country gentlemen among them, and they could not do that unless they had sport to give them. If they had not some of the right sort of the old aristocracy among them they would be in a pretty fix.

Mr. VINCE said they did not mind the landlords preserving a little if they would only come and live among them.

Mr. MANFIELD, replying upon the discussion, said he thought there must be legislative interference, for in some places game was not preserved as it should be; there was an excess of it, and it did damage. Of course there were parties—both landlord and tenant—who would take advantage where they had the opportunity, but he purposely omitted from his remarks all reference to them. After thanking the club for the kind way in which they had listened to him, Mr. Manfield said if by anything in his paper or in the discussion that had arisen from it a better feeling between landlord and tenant were brought about, or useless restrictions should be done away with, he should be very glad.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MONTHLY COUNCIL: *Wednesday, April 6.*—Present the Duke of Devonshire, K.G., President, in the chair; Viscount Bridport, Lord Berners, Lord Cheam, Lord Kesteven, Lord Tredagar, the Hon. H. G. Liddell, M.P.; Sir Watkin W. Wynn, Bart., M.P.; Mr. Acland, Mr. Amos, Mr. Baldwin, Mr. Barnett, Mr. Booth, Mr. Bowley, Mr. Cantrell, Colonel Challoner, Mr. Clayden, Mr. Clive, Mr. Davies, Mr. Dent, M.P.; Mr. Brandreth Gibbs, Mr. Hassall, Mr. Holland, Mr. Hornsby, Mr. Hoakyns, M.P.; Mr. Jonas, Colonel Kingscote, M.P.; Mr. Lawes, Mr. Leeds, Mr. Milward, Mr. Ransome, Mr. White Ridley, M.P.; Mr. Shuttleworth, Mr. Thompson, Mr. Torr, Mr. Turner, Mr. Webb, Mr. Wells, M.P.; Mr. Whitehead, Major Wilson, Mr. Jacob Wilson, and Dr. Voelcker.

The following were elected members:—

Althnatt, T. A., Watlington Farm, Tetworth.
Barclay, W. Leatham, Knotts Green, Leyton.
Blyth, James, Weasenham, All Saints, Brandon.
Brough, W. S., Fowchurch, Leek.
Byrd, Frederick, Dunston, Penkridge.
Callender, Peter, Devonshire House, Birkenhead.

Wright, Thomas, Seaton Barn House, Dudley.
Weatherhogg, George William, Newark.

FINANCES.—Major-General Viscount Bridport presented the report, from which it appeared that the secretary's receipts during the past month had been examined, and were found correct. The balance in the hands of the bankers on March 31 was £1,745 3s. 1d., £3,800 remaining on deposit at interest. The balance-sheet for the quarter ending March 31, 1870, and the statement of subscriptions and arrears were laid on the table, the amount of arrears due being £940. The committee had had under their consideration a number of cases of defaulting members, and they recommended that these cases be referred to the Society's solicitor, with instructions to take proceedings to recover the arrears of subscriptions due to the Society.—This report was adopted.

JOURNAL.—Mr. Thompson (chairman) reported that the committee recommended that a prize of £10 be offered for the best description of the most improved form of kiln for burning lime for agricultural purposes*. It was also recommended that the committee be empowered to spend £25 in obtaining an article for the *Journal* "On the Latest Improvements in the Management and Cultivation of Hops;" and that a series of experiments be set on foot during the next autumn and

* Essays competing for this prize must be forwarded to the secretary of the Society not later than June 15.

winter to test the comparative feeding value of Barley and Malt, at a cost not exceeding £100.—This report was adopted.

HOUSE.—Major-General Viscount Bridport (chairman) reported that the attention of the committee had been called to a recent assessment of the Society's house—the previous rating having been on a basis of £80, and the present demand being based on £280. The committee therefore recommended that the secretary be instructed to communicate with the Society's solicitor, with a view to an appeal.—This report was adopted.

LIBRARY.—Major-General Viscount Bridport reported that, with regard to the improvement and the gradual completion of the library, the committee recommended that a grant be made this year of £100 for the purchase of books, and that a future grant of £50 be annually applied for for the same purpose. The committee suggested that a list of books proposed to be purchased be made out by the Editor, and submitted to the Journal Committee for their approval. As to additional book-cases the committee recommended that the two spaces on each side of the fireplace in the council-room be successively appropriated when required, and that the House Committee be empowered to contract for the same.—This report was adopted.

GENERAL, OXFORD.—Lord Kesteven reported the following recommendation of the committee: That the secretary put himself in communication with other parties than those from whom refreshment tenders have been received, in order to negotiate with them.—This report was adopted.

On the motion of Lord Kesteven, it was resolved "That the secretary do put himself in communication with the Oxford local committee to secure the required lodgings for the officers of the Society at Oxford."

CHEMICAL.—Mr. Wells, M.P. (chairman), reported that the committee had had before them the correspondence between Messrs. Bradburn and Co., and Professor Voecker, and that they had nothing to add to their former report.—This report was adopted.

EDUCATION.—Mr. Holland (chairman) reported that only two candidates had entered to compete for the Society's certificates and prizes, and that neither of them desire to be examined either in geology or botany. The committee recommended the following gentlemen as examiners at the forthcoming examination, viz.: General and Agricultural Chemistry, Professor Living and Dr. Voelcker; Land Surveying and Mechanics, Professor Twissden; Book-keeping, Messrs. Quilter, Ball, and Co.; Anatomy and Animal Physiology, Professor Simonds.—This report was adopted.

SELECTION.—Mr. H. S. Thompson (chairman) reported that the committee, after full consideration of the question referred to them by the Council, relating to the power of adjournment possessed by the general meeting of the Society, fixed by the Charter to be held on a particular day in May, have to report their opinion that there is an inherent power in such meeting, when once duly constituted, to adjourn to another day for the more convenient transaction of the business of the meeting, within such limits as shall not admit of a departure from the evident intention of the Charter that a general meeting of the Society shall be held in London for the election of officers and other business at the particular time of year named.

JUDGES SELECTION.—Mr. Milward (chairman) presented a list of the names of gentlemen nominated by the committee as judges of stock and implements at Oxford; and he reported the recommendation of the committee that these gentlemen be invited to act in such capacities at the Oxford meeting. This report was adopted.

VETERINARY.—Mr. Wells, M.P., reported that in order to give effect to the resolution, arrived at by the

Council at their last meeting, the committee recommended that a sum of £25 be placed at the disposal of Professor Simonds for making experiments in pleuro-pneumonia, especially with regard to preventive measures. The committee had received the report of the Governors of the Royal Veterinary College, as well as a communication in reference to the resolution passed at the last meeting of the Council. This report having been adopted, the last-mentioned communication was read as follow:

"Royal Veterinary College, March 23, 1870.

"My Lords and Gentlemen,—The Governors of the Royal Veterinary College having considered the communication from the Council of the Royal Agricultural Society, dated March 3, 1870, beg to express their hope that the amount of the grant of £200 a-year from the Royal Agricultural Society will not be diminished.

"In proof of their earnest desire that the objects of the Royal Agricultural Society shall be attained, they beg to place the £50 a year, which they have for some years appropriated to the purchase of specimens of disease in cattle, sheep, and pigs, in the hands of the Council, and have made arrangements to the extent of their accommodation for the reception of any specimens the Council may forward to the College; and further,

"The Governors of the Royal Veterinary College request the Council of the Royal Agricultural Society to transmit to them such subjects for investigation to be undertaken in the College as they may decide upon, and the Governors will instruct Professor Simonds to conduct such investigation.

"The Governors have instructed Professor Simonds to report the circumstances connected with the diseases manifested in such specimens as may be provided by the Council, and the treatment thereof, to each meeting of their committee for general purposes," which meeting take place quarterly, and from which such reports will be immediately transmitted to the Council.

"The Principal is requested to transmit the communication now agreed upon to the Council of the Royal Agricultural Society.—I have the honour to be, my lords and gentlemen, your obedient servant, "C. N. NEWDEGATE, Chairman.

"To the Council of the Royal Agricultural Society."

It was then moved by Lord Bridport, and seconded by Colonel Challoner, "That the request contained in this communication be complied with." A discussion then ensued, in which Mr. Thompson supported the motion, and Mr. Jacob Wilson explained the views of the committee, and their reason for not acquiescing in the request of the Governors of the College. On the question being put to the vote, Lord Bridport's resolution was lost by 19 noes to 6 ayes.

The report of the governors of the Royal Veterinary College having been read,* it was moved by the Hon. H. G. Liddell, M.P., seconded by Mr. J. D. Dent, M.P., and carried unanimously, "That this Council call the attention of the Privy Council to so much of the report of the Governors of the Royal Veterinary College as relates to rinderpest, and urge the Privy Council to take this report into their immediate and careful consideration."

Memorials having been received from the authorities of Shrewsbury, Stafford, and Wolverhampton, inviting the Society to hold their country meeting for 1871 in those localities, on the motion of Mr. Jacob Wilson, the following were appointed as Inspection Committee to visit and report on the facilities offered by the competing towns: His Grace the Duke of Richmond, Sir Edward Kerriou, Mr. D. R. Davies, Mr. B. T. Brandreth Gibbs, and Mr. William Torr.

On the motion of Mr. Cantrell, the following list of competitors for the prizes offered by Mr. Mason and the Society for the two best-managed farms in the district round Oxford was ordered to be published:

* Extracts from this report are appended.

Cotter, William, Middle Aston, Deddington, Oxford.
 Craddock, Robert, Lynsham, Chipping Norton, Oxon.
 Daahwood, Frederick Loftus, Kirtlington, Oxford.
 Deane, Thomas, Huttons, Hambledon, Henley-on-Thames.
 Denehield, William, Easington Farm, Banbury, Oxon.
 Drace, Samuel, Eynsham, Oxford.
 Edmunds, William John, Southrop House, Lechlade, Gloucestershire.

Fowler, John Kersey, Prebendal Farms, Aylesbury, Bucks.
 Gibbons, George Thomas, White Hill Farm, Tackley, Oxford.
 Gillett, Charles, Cote House, Bampton, Oxon.
 Hall, William, Barford House, Deddington, Banbury, Oxon.
 Hatton, William, Kingston, Tetworth, Oxon.
 Latham, Thomas, Little Wittenham, Abingdon, Berks.
 Millington, Mary Elizabeth, Ash Grove Farm, Ardley, Bicester, Oxon.
 Penson, Robert, Foxcote, Chipping Norton, Oxon.
 Savidge, Matthew, Saraden Lodge Farm, Chipping Norton.
 Smith, Samuel, Somerton, Deddington, Oxon.
 Smith, Thomas, The Downs, Wootton, Woodstock, Oxon.
 Stilgoe, Nathaniel, Manor Farm, Adderbury, Banbury.
 Stilgoe, Zachariah W., Adderbury Grounds, Banbury.
 Treadwell, John, Upper Winchendon, Aylesbury, Bucks.

Mr. Torr then moved "That judges of live stock at the Society's country meetings be supplied with a list of the animals entered for the prizes which they have to award, omitting the names of the exhibitors, but giving the pedigrees of the entries," and he explained that his object was to ensure that the prizetakers should be good animals with good descent, stating his opinion that they ought to possess four or five crosses of pure blood.—Mr. Milward, in seconding the motion, expressed his regret that Mr. Torr had not adhered to his original intention, and proposed that the catalogues should be placed in the hands of the judges, and he quoted the case of a prize bull at the Society's Warwick meeting, which no breeder would have dared to use on account of his want of pedigree.—Mr. J. D. Dent, M.P., having stated that he would have voted for the motion of which Mr. Torr had originally given notice, but that he must oppose it in its present form,—Mr. Bowly expressed his dissent from Mr. Torr's views, mentioning particularly that in his opinion prizes given for animals at a sale rested on a different basis from that on which prizes were awarded at a show. He also remarked that the great success of the Society's shows was due to the certainty of the awards being made with impartiality. Mr. Jacob Wilson also opposed the motion, and expressed his opinion that if the object was to guarantee the possession of hereditary qualities Mr. Torr had placed the cart before the horse, for he should have moved that the possession of a certain pedigree be made a condition of entry.—Mr. Booth likewise opposed the motion, although personally he felt indifferent whether the judges, if they were honest and independent men, were supplied with catalogues or not; but he felt that many younger exhibitors would object to such information as was proposed being afforded to the judges. The resolution having been further opposed by Mr. Turner, Mr. Davies, Mr. Webb, and Mr. Jones, it was withdrawn by Mr. Torr, with the expression of his conviction that the discussion would have a beneficial effect, and that in future years it might be found possible to demand a certificate of pedigree as a condition of entry.

A letter from the president of the "Société des Agriculteurs de France," on the subject of an international agricultural congress was, on the motion of Mr. Brandreth Gibbs, referred to the Journal Committee.

The Secretary was authorised to affix the common seal of the Society to the diplomas of recently elected honorary members.

On the motion of Mr. Jacob Wilson, seconded by Mr. Brandreth Gibbs, Mr. Amos was empowered to commu-

nicate with intending exhibitors of steam-engines, with a view of ascertaining their respective "speeds" and other particulars, so as to facilitate the forthcoming trials of implements at Oxford.

Extracts from the report of the Governors of the Royal Veterinary College to the Council of the Royal Agricultural Society:

"During the past year (1869) events have occurred which tend to prove the increasing importance to the members of the profession of a complete and practical acquaintance with the diseases of farm stock, and especially with those which, normally existing in a mitigated form, are likely to assume an epizootic character, and occasion serious loss to the farmer, although they may not be essentially malignant in their nature. Such, for example, is the malady commonly known as 'mouth-and-foot disease.'

"Some interesting cases of disease of the skin of lambs were brought to the notice of the students. The disease possessed all the characteristics of the affection known as Crusta lactea in the human infant. The parts principally affected by the morbid action were the sides of the neck; and even the shoulders were ultimately attacked. Thick crusts of a dark colour covered the skin, which was also much inflamed and cracked. The young animals suffered much from local irritation and symptomatic fever, under which some sank. The cases, however, were not numerous in the several flocks in which the disease appeared—not more than six or eight among 150 to 200 animals. Application of the oxide-of-zinc ointment proved beneficial; but careful nursing and protection both from hot and wet weather were needed as adjuncts to the treatment.

"Some other novel cases occurred in lambs, in which death resulted from parasites existing on the skin. The parasites in question were those commonly known as ticks (*Ixodes Ricinus*). These parasites abound in most countries, and are met with both on wild and domesticated animals, firmly attached to the skin, from which they draw blood as their food. Until now they have not been found on animals in Great Britain to any extent injurious to health, much less as causing death. In hot countries, however, and particularly in many parts of South America, these parasites attack animals in such vast numbers, that even oxen succumb to the irritating and exhaustive effects of their attacks. Specimens of the skin of lambs, thickly covered with these epizoa, were sent from Kent by a veterinary surgeon consulted on the case. In his communication he writes that 'they had attacked the sheep and lambs, both on uplands and marshes, and that one farmer found a large quantity of them on some colts which were at pasture near to the sheep.' There are few parasites more tenacious of life than ticks, but experiments having shown that they can easily be destroyed by carbonic acid, was recommended that a trial should be given to dipping the sheep and lambs in a diluted mixture of the acid. This proved most effective in the destruction of the ticks, and thereby prevented a further loss of lambs.

"The chief event of the year in connection with cattle diseases has been the remarkable outbreak of the malady known as the mouth-and-foot disease. Few parts of Great Britain have escaped, and in one instance, at least, the disease was ascertained to have been introduced into Ireland by cattle exported from England. In Ireland, however, the malady has been kept far more in check than elsewhere by sanitary regulations, as the executive of the Government in that country was enabled to enforce the orders of Council through the medium of the constabulary.

"Another contagious disease of cattle has excited a good deal of attention—pleuro-pneumonia; and in addition to the legislative provisions for its suppression a revival of the system of inoculation by way of prevention has been resorted to. Experiments for this purpose have been begun in several parts of the country, but chiefly in Norfolk and Cheshire. Some of the results have been published, but in the present state of the inquiry no correct deductions can be arrived at from the data obtained. It may, however, reasonably be doubted whether the results will so far differ from those which were obtained in 1852-53 as to justify the adoption of the system.

"That no fresh introduction of the cattle plague has occurred within the year is a subject of sincere congratulation.

The disease, however, has been more than usually rife in many parts of Eastern Europe, and early in the year made its way from Hungary into Lower Austria, showing itself in several places, and among these in some villages near Vienna.

"The latest intelligence which has been received is far from reassuring.

"The plague had entered Silesia from the south-western districts of Poland, and although it was quickly stamped out, the state of things was so threatening that both the Prussian and Austrian frontiers had to be strictly guarded by the military. It may be thus hoped that Western Europe will be protected from further loss through this most malignant and infectious disease; but that Poland, Galicia, Hungary, Transylvania, and Buckovina will suffer severely from the outbreak cannot be questioned.

"With reference to another foreign disease (the smallpox of sheep) it may be mentioned that the Government measures,

which required that all foreign sheep should undergo a quarantine of fourteen days, or be slaughtered within four days at the port of landing, proved most effective in securing the country against the introduction of the malady.

"Passing from foreign to home diseases of a contagious nature, we find that scab in sheep has been exceedingly prevalent during the year. This disease is essentially parasitic in its nature—the analogue, in fact, of itch in the human subject. It is not difficult of cure, and many of the popular remedies are sufficient for the purpose. These, however, often fail in effecting a cure, as must the best chosen remedies, for want of sufficient care in its application. Each sheep in turn should be well examined, and the agent applied to every spot where the disease is found to exist. In all places where 'scab' are met with they must be well broken up with the fingers before the agent is used, otherwise neither the Acari nor their ova will be destroyed."

THE CENTRAL FARMERS' CLUB.

EXHAUSTION OF SOIL, AND THE VALUATION OF UNEXHAUSTED IMPROVEMENTS.

The usual monthly meeting of the Farmers' Club took place on Monday evening, April 4, in the Club Rooms, Salisbury Square, the chairman, Mr. James Howard, M.P., presiding. The subject fixed for consideration to be introduced by Mr. J. B. Lawes, of Rothamsted, St. Albans, was announced in the following terms: "Exhaustion of Soil in relation to Landlord Covenants, and the Valuation of Unexhausted Improvements."

The CHAIRMAN said: Gentlemen, the subject on the card for this evening's discussion is one of the utmost importance, and I think the Club may consider itself very fortunate in having induced so able a man and a gentleman of such high reputation in the scientific world as Mr. Lawes to introduce it (Hear, hear). Mr. Lawes has laid the farmers of England, and the farmers of the world, under a deep debt of obligation. His researches and experiments are such as have never been undertaken by any other private individual of the present generation; his contributions to agricultural literature will be read by many generations of farmers yet to come. We have heard, and most of us have read, a very great deal of late with regard to the two things mentioned in the card, namely, landlords' covenants and unexhausted improvements in relation to a sister-country. I believe we shall this evening have them lifted above their social and political aspects, and treated from a scientific point of view. Having made these few and brief observations, I will now call upon Mr. Lawes to address you.

Mr. J. B. LAWES then read the following paper:—A comparison of the conditions and practice of the agriculture of this country at the commencement of the present century with those which now prevail, brings to view many important changes. Among the more prominent of these is, not only the great improvement in those descriptions of machinery which were then in use, but the introduction and the very general employment of a large number of entirely new machines, adapted to almost every requirement of the farm. Not less characteristic elements of modern advancement and still continued progress are the improvement of our breeds of stock and the use of oilcakes and other purchased cattle-foods, contributing to early maturity and to a greatly increased production of both meat and animal manures; and lastly, the employment of large quantities of imported, and what are commonly called artificial manures, as distinguished from those which

are produced on the farm by the feeding of stock. Coincident with these changes has been a rise in the value and rent of land; much greater in the case of the light than in that of the heavier descriptions of soil. As a necessary consequence, too, much more capital has been expended in the cultivation of a given area of land. It is remarkable however that, with all these important changes of our own time, little or no alteration has taken place either in the actual course of cropping of any district, or in the views which prevail in regard to the necessity of adhering to a fixed rotation of crops. It would seem as if the systems of cropping established by our forefathers were proof against all alteration, in spite of the vastly improved means of mechanically working the soil, and the enormous increase in our resources of elements of fertility, in the form of cattle-food and manures imported from all quarters of the globe, and of artificial manures manufactured at home. Nor is it less surprising that, with the extensive and greatly increasing use of expensive purchased cattle-foods, the value of which can only be recovered in the meat and manure conjointly, there should be no recognised basis, or general system adopted, for the valuation of unexhausted manures, as between the outgoing tenant on the one hand, and the landlord or the incoming tenant on the other. As a contribution to the discussion of these important points, I propose to direct your attention this evening chiefly to the following questions: 1. Whether, in order to preserve the soil from exhaustion, it is necessary to enforce a fixed rotation of crops? 2. What are the best, or most generally applicable means at our disposal, for the estimation of the value of unexhausted manures? In considering the characters of soil with the view of arriving at some answer to these questions, it will suffice to confine attention mainly to the definition and illustration of those qualities which are commonly known under the term "*condition*," and to pointing out the distinction between these and those which are due to what may be called the *normal* or *natural fertility* of the soil. There are other points of great practical and scientific interest in connection with the state of fertility of our soils which must be left out of view on this occasion; as, for instance, the influence of the various crops we cultivate, the special effects of ordinary and of various artificial manures, the loss of fertilising

matters by drainage, and allied subjects. The word "condition" is in very common use amongst agriculturists. It is said that a farm is "in condition," or "out of condition," or in "high condition" or in "low condition." These terms are well understood to imply certain states of fertility which it is not easy to define more accurately in a few words. As I understand it, the word "condition" refers to those elements of fertility in a soil which, whether they have been accumulated by natural processes or by the art of the farmer, are capable of being turned to account in the growth of crops within a limited period of time, and which by such growth are soon exhausted. "Condition" is, therefore, something altogether distinct from the natural or standard fertility of the soil. A soil may be naturally very fertile, but at the same time very much out of condition; or it may be naturally very poor, but in very high condition. As an illustration of a soil brought into a state of high condition by natural causes, I will quote a few sentences from that great writer on the science and practice of agriculture, M. Boussingault. In his *Rural Economy*, p. 231, he says: "By far the finest crops of Indian corn in America are obtained upon breaks of virgin soil. I do not hesitate to say that the husbandman gains from six hundred to seven hundred times his seed under such circumstances. The mode of proceeding upon these breaks, which I have frequently witnessed, deserves to fix attention for a moment. The planter chooses the end of the rainy season for cutting down the trees and the brushwood; everything remains where it falls until it is sufficiently dry; fire is then set to the heap, and the burning extends and lasts even for weeks; all the smaller branches are completely consumed, nothing but the charred trunks of the larger trees remain. As the rainy season is about to return, a man, with a pointed stick in his hand, goes over the burnt surface, making a hole of no great depth at intervals, into which he throws two or three particles of Indian corn, over which he draws a little earth, or rather ashes, by a slight motion of his foot. This primitive mode of sowing terminated, the planter takes no further heed of the crop; his habitation is often so remote, that he never visits it until harvest time: the rain and the climate do all the work: it is unnecessary to hoe, the burning having destroyed all the plants that were indigenous to the soil, nothing rises but the grain which has been sown. In such fields, stems of Indian corn are frequently seen of the height of from twelve to fourteen feet. It rarely happens that more than three consecutive crops are taken from the burnt soil; and the last, though still very superior to anything which we can obtain by our regular husbandry, is not to compare with the first. As there is no want of forest, it is held preferable to make a fresh break." Here, then, we have an instance of a soil in which the elements of productiveness, having been gradually accumulating for ages, are so far exhausted by three successive crops of Indian corn, as to render it more profitable to abandon the land, and clear a fresh portion of the forest, than to cultivate the same area over again. As a more familiar instance of land brought into "condition" by somewhat similar causes, may be mentioned old pasture, when broken up and converted into arable land. The cases of land brought into "condition," which it is much more to our present purpose to consider are, however, those in which the immediate productiveness is due directly to the outlay of capital by the tenant, by the use of purchased foods and manures, by means of which the land is brought for a longer or shorter, but still only for a limited period, into an increased state of productiveness. By way of special illustration of such "condition" I will direct attention to some results selected from among those of the numerous field experiments made on my farm at Rothamsted. Table 1 shows the produce of dressed corn per acre, on certain plots of a field which has now grown wheat year after year for more than a quarter of a century. Up to the autumn of 1843 it was under the ordinary system of cultivation of the farm. In 1839 it was dunged, and grew turnips; in the next four years it was unmanured; growing barley in 1840, peas in 1841, wheat in 1842, and oats in 1843. In the autumn of 1843 the first experimental wheat crop was sown, and the twenty-seventh is now growing. Portions of the field have received no manure whatever during the whole period of the experiments; one portion has been manured with 14 tons of farm-yard dung every year; and the remainder, divided into numerous plots, has been manured with different descriptions of artificial manure, the same description having, as a rule, been applied to the same plot year after year for the last eighteen years, and in

some cases for longer still. Table 2 shows the results of experiments in which barley has been grown year after year in an adjoining field for many years in succession, the nineteenth crop being now in the ground. The plan of manuring has been very similar to that in the wheat field, portions being always unmanured, part being annually manured with farm-yard dung, and the remainder divided into plots, which have been manured, respectively, with different descriptions of artificial manure. Table 3 relates to experiments on the four-course rotation of turnips, barley, clover or beans, and wheat; and therefore illustrates "condition" of soil under circumstances much more nearly representing the ordinary practices of agriculture than when corn crops are grown year after year on the same land. The twenty-third crop—that is to say, the third crop of the sixth-course—is now growing. The root-crop, commencing each course, has been liberally manured with

* Mineral manure.

† Ammonia-salts.

‡ Mineral manure and ammonia-salts.

mineral manure, ammonia-salts, and rape-sake; both roots and tops have been carted off the land, and the three following crops of each course grown without any further manuring. Clover was the third crop in the first course; but as it will not grow once in four years, beans have been substituted for it in the succeeding courses. The Table gives the average produce, respectively, of turnips (roots and tops), barley, beans, and wheat, over the second, third, fourth, and fifth courses—that is to say, over the four complete rotations in which beans were grown. Table 4 gives the results of experiments conducted for fourteen years in succession on permanent meadow land, the plan of manuring having been much the same as in the case of the experiments on wheat and barley.

I will first call attention generally to the fact that, throughout the long periods over which these various experiments have extended, "condition" has been equally kept up whether farm-yard dung, or certain chemical mixtures, were employed. In the wheat experiments, the average of 26 successive crops grown by farm-yard dung was 33½ bushels; the average on plot 16, of 21 crops grown by artificial manure was 36½ bushels, and the average on the same plot, over 13 years when the artificial manures were increased in quantity, was 39½ bushels. In the case of the barley, the average over 18 years of farm-yard dung was 43 bushels, and over 18 years of artificial manure 47½ bushels. In the rotation experiment, after the removal, on the average of the four courses, of about 13½ tons of turnips, which had been manured with artificial manure, the average of the four crops of barley was 48½ bushels, and that of the four crops of wheat 36½ bushels. Lastly, in the 14 years experiments on permanent meadow land, the average produce of hay where farm-yard manure was employed, was 43 cwts., and where artificial manures were used 54 cwts. It is obvious, therefore, as I have already said, that land can be kept in "condition," whether continually under grain crops, under rotation, or growing natural grasses, equally by farm-yard dung or artificial manures. I will now endeavour to illustrate the extent, or limit, of duration of "condition" of soil, under different circumstances of manuring. I will refer first to the experiments on wheat, the results of which are given in Table 1. During the first eight years, from 1844 to 1851 inclusive, plot 16 was variously manured with mineral manure and ammonia-salts, and gave an average annual produce of 30½ bushels. During the next 13 years, from 1852 to 1864 inclusive, it received every year a mineral manure, composed of salts of potash, soda, and magnesia, and superphosphate of lime, and also a largely increased amount of ammonia-salts, namely 800lbs. per acre per annum, and the average produce over the 13 years was 39½ bushels. The manuring was then stopped, so that the crops of 1865 and since, have been entirely unmanured. The crop of 1865, the first after the cessation of the manuring, was 39½ bushels, the second 17½, the third 14½, the fourth 22½, and the fifth 16½ bushels. It is obvious, therefore, that the "condition" of the land, due to the unexhausted residue of the manures applied during the 21 previous years, was sufficient to yield a fair crop in the first year after the manuring was stopped, but that the produce then rapidly declined. It should be stated, however, that the quantity of ammonia applied in this experiment was very excessive, amounting, in the 21 years, to as much as would be supplied in 10 tons of Peruvian guano. Deducting the amount of nitrogen in the increase of

crop in the 31 years, from the amount supplied in the manure during the same period, it appeared that nitrogen equal to more than a ton of ammonia, and to more than would be supplied in 6½ tons of Peruvian guano remained unrecovered in the increase of crop. An analysis of the soil to the depth of 27 inches from the surface showed that about one-third of this excess still remained in the soil within that depth, at that period; leaving, however, the remaining two-thirds still unaccounted for. Even the one-third retained within a depth of 27 inches from the surface would appear, from the small produce yielded by it to be so diffused, and locked up in such states of combination in the soil, as to be available in very small quantities annually. Of the remaining two-thirds, doubtless a part is still retained in the soil below a depth of 27 inches; but probably the largest proportion of it has passed off, in the form of nitric acid, in the drainage-water. In the other experiments on wheat, the results of which are given in the Table, the amounts of ammonia applied were by no means so excessive, only half as much being annually applied where they were used at all, as during the 13 years of excessive application on plot 16. During the first eight years of the 36, that is from 1844 to 1851 inclusive, plots 5, 17, and 18, were manured with various but, upon the whole, somewhat similar mixtures of mineral manure, ammonia-salts, and sometimes rapecake, and gave nearly equal average amounts of produce over the eight years, namely—29½, 30½, and 28½ bushels, respectively. From that date, 1853, to the present time, a period of 18 years, plot 5 has been manured with a mixed mineral manure containing salts of potash, soda, magnesia, and superphosphate of lime; and every year during the same period plots 17 and 18 have been manured with the same mineral manure, or ammonia-salts, alternately. For example, in 1853 plot 17 received ammonia-salts, and plot 18 the mineral manure. In 1853 plot 17 received the mineral manure, and plot 18 the ammonia-salts, and so on, alternately for the 18 years; thus, plots 17 and 18 have each been manured nine times with ammonia-salts and nine times with the mineral manure during the 18 years, the difference being that when one received ammonia-salts the other received mineral manure, and *vice versa*; and, accordingly, we have had each year one plot manured with mineral manure following a residue of ammonia-salts, and one plot manured with ammonia-salts following a residue of mineral manure. Over the 18 years the average produce of plots 17 and 18 was exactly the same, namely—34½ bushels in each case; but if we take the average of the 18 crops grown by mineral manure alone, whether upon plot 17 or 18, we find it to be only 17½ bushels, whilst the average of the 18 crops grown on either plot by ammonia-salts is 31½ bushels, or nearly 14 bushels per acre per annum more. At the time of the commencement of this set of experiments the utility of supplying ammonia as manure for grain crops was vehemently disputed, it being asserted that if only a sufficiency of available mineral constituents were provided within the soil, the plant would obtain all the necessary ammonia from the atmosphere. It would hardly be possible to select, or arrange, a set of experiments more entirely conclusive against such a view. The mineral manures, though always succeeding upon a residue of ammonia-salts, gave only a small crop, whilst the ammonia-salts, succeeding upon a residue of mineral manure which had been useless without them, gave a large crop. My present object is not, however, to show the effects of one manure compared with another, but to ascertain how far the unexhausted residue from previous manuring affects the produce of succeeding crops. Plot 5, manured every year with the mineral manure alone, gave an average over the 18 years of 17½ bushels, whilst the same mineral manures applied on either plot 17 or 18, and always after a residue of ammonia-salts, gave only 17½ bushels, or less than ½ bushel per acre per annum of increase due to the unexhausted residue of the previously applied ammonia-salts, these being employed in comparatively moderate quantity. From these results it is clear, that the soil may be kept in "condition" to yield a fair crop of wheat every year, by the application of ammonia-salts and certain mineral manures; but, that, if the ammonia-salts be only applied in moderate quantity, the unexhausted residue will very little affect the produce of succeeding crops. I will now refer to Table 2, which gives some results of experiments on the growth of barley for eighteen years in suc-

cession on the same land. Plot 2A has been manured every year with superphosphate of lime and ammonia-salts; and plot 2AA has received the same amount of superphosphate every year, and twice as much ammonia during the first six years, but only the same amount as plot 2A each year since. Taking the six years of the double application of ammonia on plot 2AA the result is an average of 49½ bushels, against only 45½ on plot 2A, with the smaller amount of ammonia-salts, thus showing an average increase of four bushels per acre per annum due to the extra amount of ammonia-salts applied. In 1853, the first year in which the amount of ammonia applied on plot 2AA was reduced to the same as that on plot 2A, it still gave five bushels more than the latter; in the next year it gave only 1½ bushel more; and in the third year the produce was practically equal on the two plots. Here, again, then, the unexhausted residue from the ammonia-salts previously applied has appreciably increased the succeeding crop; but it should be stated that the amount of ammonia-salts—400lbs. per acre per annum—applied during the previous six years was, for barley, very large, indeed excessive. Table 3 gives the average produce over four consecutive four-course rotations, in which the turnips were liberally manured with mineral manure, ammonia-salts, and rapecake, and the whole crop (roots and tops) carted from the land. On the average, about 13½ tons of turnips were removed; yet it will be seen that the unexhausted residue from the manures applied for the turnip crop was such that an average produce over the four courses of 49½ bushels of barley, 21½ bushels of beans, and 36½ bushels of wheat, was obtained. In the experiments on permanent meadow land, the results of which are given in Table 4, plot 2, was manured with 14 tons of farmyard dung per acre per annum for the first eight years, and has since, that is for six years, been left entirely unmanured. It will be seen that during the eight years of the application of dung the average annual produce of hay was a little under 43 cwt., and that during the six following years it amounted, without any further application of manure, to a little over 43 cwt. of hay, thus showing a very marked effect from the unexhausted residue of the previous heavy dressings of farmyard dung. From the above results, relating to wheat, barley, rotation, and permanent meadow, the following conclusions may be drawn: 1. That condition of land may be maintained, either by farmyard manure or by artificial manures. 2. That when active nitrogenous manures, such as Peruvian guano, ammonia-salts, or nitrate of soda, are applied in only the moderate quantities usually employed in practical agriculture, the unexhausted residue left in the soil after the removal of a corn crop has but little effect on succeeding crops. 3. That when rapecake, bones, and other purchased organic manures, which yield up their fertilizing elements comparatively slowly, are employed, the unexhausted residue left after the removal of the first crop may yield an appreciable amount of increase throughout a rotation. 4. That when farmyard dung is employed the effects may be apparent for a still longer period. 5. That when mineral manures, such as phosphates, salts of potash, &c., are used, the effects of any unexhausted residue are too slow and gradual to admit of any determination of their value. So far I have endeavoured by means of some actual experimental results to illustrate "condition" of soil, and it is obvious that when it results from the expenditure of capital in the purchase of cattle food or direct manures it should be reckoned as the property of the tenant. I now propose to consider those other characters of a soil which are not included under the term "condition." When a tenant takes a farm, what is it he agrees to pay rent for? Partly for the use of a residence and farm buildings; but the greater portion of the rent is paid for permission to grow crops on the land. The course of cropping is either expressly stipulated in the lease or agreement, or the tenant is bound by the "custom of the country." As he is subject to penalties if he deviate from the course so prescribed, it must be assumed either that that course is the very best he could follow for his own interest and profit, or that by following any other, with a view to increased profit to himself, the interest of the owner would be sacrificed by a reduction of the natural or standard fertility or rent-value of the land. Admitting that the recognized rotation of any district may be, upon the whole, the most suitable to follow in it, it nevertheless will not be denied that the farmer of intelligence and capital would, if he were permitted to do so, occasionally deviate from it with profit to himself at any rate.

It will be well, therefore, to direct attention to some results illustrative of the extent and limit of the productive capability of a soil of a certain class or character, with a view of forming some judgment of the probability of injury to the land by a deviation from the ordinary course of cropping. I have, in the course of my various experiments, sought to gauge the capability of my soil to yield crops for many years in succession without manure, and even under more exhausting conditions still, and some of the results obtained are recorded in Table 5. It should be stated, however, that in no case has any attempt been made to increase the productiveness by either subsoiling or deeper ploughing than usual; though great care has been taken to keep the land as free from weeds as possible without injury to the crop by treading.

The first column of the table shows the produce of wheat obtained for 26 years in succession, from 1844 to 1869 inclusive, on a portion of the experimental wheat-field which has received no manure whatever since 1839. The average produce, per acre per annum, over the 26 years, has been rather over 15½ bushels of dressed corn, about 14 cwt. of straw, and 22½ cwt. of total produce (corn and straw together). The average over the second half of the period is 1½ bushel of corn and 2½ cwt. of straw—less than over the first half; showing perhaps a slight, but at any rate no very marked, tendency to decline in annual yield. I hold in my hand a specimen of this unmanured produce grown in 1863, the 25th crop of wheat in succession, and the 29th crop since the application of any manure to the land. Here also is a section of the soil, taken to the depth of 30 inches; and, so far as can be judged from appearance, certainly no one of experience in such matters would take it to be naturally more fertile than the majority of moderately heavy soils in this country.

Nor does the rent of similar land in the neighbourhood (25s. to 30s. per acre tithe-free), or the condition of the farmers of the district as to wealth, indicate any great fertility of the soil. On plot 10A the productive capabilities of this same soil have been still further put to the test; and the results enable us not only to gauge the past, but to form some idea of its prospective productiveness. For the crop of 1844, the first of the experimental series, this plot received a dressing of super-phosphate of lime and silicate of potash; but not any, either potash, soda, lime, magnesia, phosphoric acid, or silica, has been applied since that date. For the crop of 1845, and for each crop since, that is for 25 years in succession, it has been manured with ammonia-salts alone. During that period it has given an average annual produce of 24½ bushels of dressed corn, and 24 cwt. of straw per acre, per annum, being an average annual increase over the unmanured produce of 8½ bushels of corn, and 9½ cwt. of straw, and a total increase over the 25 years of nearly 220 bushels of corn, and 239½ cwt. (nearly 12 tons) of straw. It is obvious from these results that the soil of this plot 10A has yielded up annually, for this long period, considerably more mineral matter from its own resources than the unmanured plot. There is, however, an average annual produce of 1½ bushel of corn, and 3½ cwt. of straw less over the last 13 than over the previous 12 years of the period. Assuming this to be due to exhaustion, and not to difference of seasons only—and there is the evidence of analysis that it is at least in a great measure due to exhaustion—it is still obvious that it would take many more years yet to bring down the annual yield of this plot to that of the unmanured one. The next column in the Table shows the amounts of produce of barley obtained for 18 years in succession on the same land, without any manure, in an immediately adjoining field. The average produce over the whole period is 20½ bushels of corn, and 12½ cwt. of straw, per acre, per annum. There is, however, a considerable reduction of produce in the later years; the average of the first 9 years being 23 bushels of corn and 13½ cwt. of straw, and of the second 9 years only 17½ bushels of corn and 10½ cwt. of straw, or a reduction of 5½ bushels of corn and 3 cwt. of straw, per acre per annum, over the second half of the period as compared with the first. This more rapid reduction in the case of barley than of wheat is doubtless due to the much more limited range of the roots of barley, so that in its case an actually less bulk of soil has contributed to the crop, and the exhaustion, though telling more upon the crop, is, therefore, more superficial than in the case of wheat. The permanent meadow-land gave, over 14 years, an average of 23½ cwt. of hay per acre per annum without manure, and, as the figures show, an average of only ½ cwt. less over the second than over the first half of the period.

ILLUSTRATIONS OF NATURAL FERTILITY.—TABLE 6.

Unmanured Four-Course Rotation, conducted through 5½ courses (22 years), 1848-1869.

Average of 2nd, 3rd, 4th, and 5th courses (16 years), 1852-1867.

Years.	Description of Crop.	Unmanured, every year; sixteen years, 1852-1867. Turnips carted off.
1852, 1856, 1860, 1864	Swedish turnips*	18½ cwt.
1853, 1857, 1861, 1865	Barley	40½ bushels.
1854, 1858, 1862, 1866	Beans	12½ "
1855, 1859, 1863, 1867	Wheat.....	34½ "

* Roots and tops.

Lastly, as Table 6 shows, the 2nd, 3rd, 4th, and 5th courses of 5 consecutive entirely unmanured 4-course rotations gave scarcely any turnips at all; but the average of the 4 crops of barley was 40½ bushels, of the 4 crops of beans 12½ bushels, and of the 4 crops of wheat 34½ bushels. To sum up the chief points of these illustrations of the extent or limit of the fertility of a somewhat heavy loam, of by no means extraordinary quality, it has yielded an average annual produce, without any manure at all, of 15½ bushels of wheat for 26 years, of 20½ bushels of barley for 18 years, of 23½ cwt. of hay for 14 years, and, under rotation for 20 years, an average

over the last 4 courses, or 16 years, of 40½ bushels of barley, 12½ bushels of beans, and 3½ bushels of wheat. I confess that my view of the productive capability of heavy, or even moderately heavy soils, has undergone considerable change since I commenced the various experiments to which I have referred. Formerly I supposed that a very few years of consecutive corn-growing would suffice to reduce the corn-growing capabilities of any ordinary soil to practically nothing. Such, however, is not the case; and a very little reflection will show how essential it is for the well being, if not, indeed, for the existence of man, that the elements of fertility should be so locked up and distributed throughout the soil, as to be capable of being taken up by crops extremely gradually, and so to last for an immense period of time. If needy landlords, or indigent tenants, could have drawn upon the locked up elements upon which the maintenance of the natural or standard fertility of the soil depends, how little fertile soil would still remain in England? It has sometimes been argued that the soil is to be looked upon as little else than a support for plants, to which the cultivator must add all the constituents necessary for the growth of the crops he removes; just as the manufacturer who hires a mill has to supply the cotton or other material for the manufacture. I think, however, it would be difficult to account for the difference of rent paid for land, except on the assumption that it yields, from its own resources, a greater or less surplus, in the forms of corn and meat, beyond the amounts required to pay the cost of cultivation, to return interest on capital employed, and to afford a profit to the tenant. I think, further, observation will show that, excepting in the case of the lighter soils under modern management, the rent-value of different descriptions of land has generally borne a closer proportion to their relative natural fertility than to any other circumstance. Let us suppose, for example, three descriptions of soil; one that would yield 5, another 15, and another 25 bushels of wheat per acre, from their own unaided resources; that is, without the use of any purchased cattle-food, or manure. A soil which would yield only 5 bushels of wheat would probably bear no rent at all, the whole value of the produce being required to meet the costs of cultivation. The soil yielding 15 bushels would doubtless pay a rent, and the one yielding 25 bushels a considerably higher rent. But now let us assume that all three cultivators were able to go into the market and purchase cattle-food and manure; the three soils would be very differently affected by this importation of elements of fertility from without. An amount of money expended in food and manure that would raise the produce on the poorest soil from 5 bushels to 25, would not raise that on the medium soil from 15 to 35 bushels, and still less would it increase the yield on the best soil from 25 to 45 bushels of wheat. It is obvious, therefore, that the surplus available for rent, dependent on such an use of elements of fertility from without, would be proportionally the greatest on the poorest soil, and the least upon the naturally most productive soil. It is chiefly in the fact here illustrated, that is to be found an explanation of the rapid rise in the rent of light soils of late years; compared with heavy land, they are cultivated at a less cost, they are much better adapted to carry stock, and with the aid of purchased food and manures they can now rival in productiveness the natural fertility of clays and loams. So long as the farmer depended almost exclusively upon the natural fertility of the soil, the surplus to pay rent was much less on those light soils which could supply from their own resources but little of the constituents required for the growth of crops; but since he has been able to go into the market and purchase, in the form of cattle-food and direct manures, those elements of which his soil was deficient, the increase of productiveness which followed has, as a matter of fact, been found to be proportionally much the greater in the case of the lighter and naturally less fertile, than in that of the heavier and more fertile soils. Thus, the productiveness of light soils is in a greater degree dependent on the amount of capital expended on food and manure than is that of the heavier soils. Moreover, the increased fertility, and the increased rent of the lighter soils of late years, are partly due to the accumulations from the past expenditure of the tenant. This increased productiveness is, however, of the character of improved "condition"; and hence it is that the productiveness of such soils may be comparatively easily and rapidly reduced. That, excepting in the case of light soils under the conditions above referred to, the amount

of rent paid is, in practice, chiefly dependent on the natural fertility of the soil, and not on the amount of capital employed by the tenant, is evident from the fact that there are, on many estates, highly cultivated farms with abundance of capital invested, adjoining others in a very opposite condition; the poor farmer being able to set apart from the produce of the land as large a surplus in the form of rent as his higher farming neighbour; whilst any demand for an increase of rent on account of increased capital employed, would be met with the remonstrance that the benefits arising from the increased expenditure of capital by the tenant should justly accrue to himself. From the facts and arguments which have been adduced in regard to the natural fertility of the heavier soils, and to the essential conditions of productiveness of the lighter soils, the question naturally suggests itself—whether, or under what circumstances, the more frequent growth of corn than accords with the recognised rotation of a district might be permitted without risk of deteriorating the property of the landlord? Although any such repetition of corn-crops is strongly objected to, as tending to exhaust the soil, it is remarkable that many operations which affect the soil in an exactly similar way are are not only allowed, but approved. A fallow, for example, is an economical means of obtaining the produce of two seasons in one year; certain costs of cultivation, seed, and harvesting, are saved; but so far as the removal of constituents from the soil is concerned, it is immaterial whether two crops of wheat of 16 bushels, or one of 32 bushels, be taken from the land. By liming, again, certain constituents which are locked up in the soil are set free and rendered available much more rapidly, and so are removed in larger quantity within a limited period of time than they otherwise would be. The same result, namely, the export from the farm of larger crops within a limited period of time, follows in like manner from the use of the subsoil plough, the steam smasher, and a great variety of implements of modern application. In fact, all these processes, which are regarded with favour rather than otherwise, have the one object and result of causing the soil to yield up its elements of fertility more rapidly. I believe that whilst a greater freedom from the adoption of a fixed rotation would often be beneficial to the tenant, it would not, if accompanied with proper conditions, result in any injury to the landlord. In saying this I trust it will not for a moment be supposed that I would recommend the abandonment of a rotation of crops, and the continuous growth of corn. To be more specific, what I do think is, that where fallow, or liming, or subsoiling, or steam smashing, and allied processes, are admissible and advantageous, or where root crops cannot be consumed on the land during wet weather without injury to the succeeding crops—that is to say on the heavier and deeper soils—barley may often be grown both in larger quantity and better in quality after wheat than after a root crop. Again, where mangolds are manured, as they often are, with 20 or even 30 tons of dung per acre, I see no objection, either from a scientific or practical point of view, in taking out of the land the large quantity of mineral constituents still remaining available after the removal of the mangolds, by growing two or even three corn crops in succession, with the application of artificial manure for each extra crop. Very generally, indeed, two corn crops might be taken in succession from medium and heavy land, provided it be kept free from weeds, and artificial manures be applied for the second crop. Nor do I think that real injury would be done by the occasional growth of peas, or even an extra corn crop, on light soils, when the seeds have failed, as occurred after the dry summer of 1868; indeed, as much of some fertilising matters might be washed out of the soil by drainage as would be exported from the land in the extra crop. So far I have endeavoured to illustrate what is "*condition*," and to point out the distinction between it and what may be called the *natural fertility* of a soil. I have maintained that "*condition*" is a quality dependent on the expenditure of the tenant, and that it should be considered as a part of his capital. I have also shown that "*condition*" may be withdrawn, or reduced, by cropping, within a very limited period of time. "*Natural fertility*," on the other hand, is the property of the landlord; and although it is not absolutely inexhaustible, it is very little liable to injury from any system of agriculture which, so far as present appearances enable us to judge, has any prospect of prevailing in this country. It remains to offer some suggestions of a practical kind, with a view to the pro-

tection of the landlord, or succeeding tenant, from injury, in case of any considerable modification, or the entire removal, of the usual restrictions in regard to cropping; and also as to the best, or simplest, method of estimating the value of the unexhausted capital of the outgoing tenant, with a view to compensation from the landlord or the incoming tenant. It will be admitted on all hands, that if the tenant were unconditionally free as to his course of cropping, and he were to leave his farm wholly under corn, the landlord would not so readily obtain a tenant for the farm. I would propose, therefore: 1. That all land should be given up with a fixed proportion under fallow, root-crops, seeds, and corn-crops; the proportions to be settled according to the custom of the locality; and that the outgoing tenant should pay a compensation to be assessed by competent valuers, for any excess of land under corn over the so fixed amount. 2. That, excepting under special arrangement, and with the purchase of stable-dung, or similar town manures, no straw or root crops shall be sold off the farm. 3. That the tenant should be required to keep the land free from weeds; and, in default, to pay compensation to the landlord or incoming tenant for the cost of cleaning; such cost to be assessed by competent persons. The cost of cleaning foul land which is in high condition is much greater than that of putting land which is poor in condition, but free from weeds, into good condition. Moreover, the state of the land as to weeds should be one important element in deciding whether an extra corn crop should or should not be taken. If, therefore, the tenant be allowed greater latitude in regard to cropping, more stringent clauses should be inserted in agreements against foul land. However highly a tenant may farm during the early or middle years of his occupation, he, as a rule, endeavours as far as possible to withdraw his capital out of the land, by reducing its condition towards the end of his term, lest neither the landlord nor the in-coming tenant should adequately compensate him for his unexhausted manures. It must be admitted that there is great difficulty in laying down any rules which shall be generally applicable for the estimation of the productive, and consequently the money, value of the residue of manures which have previously been applied to the soil, and have already yielded a crop. It has been shown by reference to direct results, that some important constituents of manure either leave little or no unexhausted residue in the land, or leave it so combined within the soil, or so distributed throughout it, that it produces little or no appreciable effect on succeeding crops. Some manures, on the other hand, have been shown to produce marked effects for several years after their application. It is obvious, therefore, that it would require a very complicated sliding-scale to enable us to estimate the value of unexhausted manures under the many varying conditions that would arise—as to the description and amount employed, the soil, the season, and the crop grown, were it attempted to take as a basis the valuation of constituents already underground. In Lincolnshire and adjoining counties half-inch bones are valued to the in-coming tenant the second year after application, and in some instances guano is valued after it has grown a crop. It would, I think, be much more satisfactory that all valuation should, if possible, relate only to what is above ground. Nor do I see any difficulty in doing full justice to the out-going tenant without taking into account the value of the unexhausted residue of manures which have already yielded a crop. The three items upon which I would rely as the basis of a valuation in favour of the out-going tenant are—the farm-yard manure made during the last year of the occupancy; the manure from purchased food which has not grown a crop; and the straw of the corn crops of the last harvest. The quantity of straw grown is a pretty sure indication of the condition of the land in regard to recent manuring. To take an extreme case by way of illustration, the continuously unmanured wheat plot which has been already referred to, gave an average of only about 14 cwt. of straw per acre, whilst plot 18 gave, over the 15 years of heavy manuring, 46½ cwt. or 3 1-3rd times as much. Now, if I had entered upon a farm with the straw of the corn crops given over to me not exceeding 14 cwt. per acre, and left it with straw averaging 3 1-3rd times as much, I might surely in justice claim, of the landlord or my successor, compensation for such an increase in the quantity of straw; indicating as it would the increased condition of the land. In reference to this point, it may further be remarked, in passing, that not

more than about 5 per cent. of the weight of the straw is derived from the constituents of the soil itself; by far the greater part being derived from the atmosphere, through the agency of the manures applied, and directly due therefore to the expenditure of the tenant's capital. I propose then, as a part of the compensation to the improving out-going tenant, that he shall be paid the consuming value of the straw which he leaves in excess of that which he entered upon. The next point to consider is, the valuation of the manure which has been obtained by the consumption of purchased cattle-food within 12 months from the termination of the occupation, and which has not yet yielded a crop. Some years ago I published a Table showing the calculated value of the manure resulting from the consumption of 1 ton of each of the chief standard articles of cattle-food. Those estimates were, at the time, considered by some to be somewhat too high. They have lately been carefully reconsidered; and, taking into account the higher money value of some of the chief constituents at the present time, it has been decided to make but little further alteration than to add a few articles to the list that were not previously included in it. The results are given in Table 7.

TABLE 7.

Estimated value of the Manure obtained by the Consumption of different Articles of Food, each supposed to be of good quality of its kind.

Description of Food.	Money value of the Manure from one ton of each Food.
1. Cotton-seed Cake, decorticated	£ s. d. 6 10 0
2. Rape Cake	4 18 6
3. Linseed Cake	4 12 6
4. Cotton-seed Cake, not decorticated	3 18 6
5. Lentils	3 17 0
6. Beans	3 14 0
7. Tares	3 13 6
8. Linseed	3 13 0
9. Peas	3 2 6
10. Indian Meal	1 11 0
11. Locust Beans	1 2 6
12. Malt-dust	4 5 6
13. Bran	2 18 0
14. Coarse Pollard	2 18 0
15. Fine Pollard	2 17 0
16. Oats	1 15 0
17. Wheat	1 13 0
18. Malt	1 11 6
19. Barley	1 10 0
20. Clover Hay	2 5 6
21. Meadow Hay	1 10 6
22. Bean Straw	1 0 6
23. Pea Straw	0 18 6
24. Oat Straw	0 13 6
25. Wheat Straw	0 18 6
26. Barley Straw	0 10 9
27. Potatoes	0 7 0
28. Turnips	0 5 6
29. Mangold-wurtzel	0 5 3
30. Swedish Turnips	0 4 3
31. Common Turnips	0 4 0
32. Carrots	0 4 0

It will be observed how very widely different is the estimated money value of the manure obtained by the consumption of one ton of different articles of cattle-food in common use. It is obvious, therefore, that, in settling the amount of compensation to be paid to the outgoing tenant for the value of the manure produced by the consumption of purchased food, it would not suffice to take a fixed proportion of the purchased-food bill, but the value of the manure-constituents of the particular description of food actually employed must be estimated. It would no more be fair to make the valuation irrespective of the value of the constituents obtained from the different descriptions of food, than it would be to charge the same price for the inferior descriptions of guano as for the best Peruvian. As the value of the constituents obtained as

manure from one ton of the various foods has been estimated at their market price, if sold in a concentrated, dry, and easily-portable state, some reduction from the amounts given in the Table should be made in the valuation supposed, on account of the risk of loss by decomposition and drainage, and for the extra cost of carriage and application to the field, all of which will be greater in the case of the cattle manure than in that of the dry purchased manure. For these reasons I would propose that one-third, or one-fourth, less than the amounts shown in the Table should be allowed for all purchased cattle-food used within twelve months of the termination of the occupation, provided the manure obtained from it has not yet grown a crop. It is, I believe, the custom in Norfolk, and in some other counties, for the tenant going out at Michaelmas to apply the dung made during the previous winter to the root crop, the incoming tenant taking the crop at a valuation. The objections to this plan are, that the root crop is a very uncertain one, and may, in a bad season, be very much less than the amount of manure should produce, and that if the outgoing tenant has fed his stock upon purchased food, the value of the manure cannot be recovered in the root-crop alone, even if the season be favourable. For example, in one of the courses of experimental rotation to which I have referred, after a liberal manuring of rape-cake, salts of ammonia, and mineral manure, less than $\frac{1}{4}$ tons of roots were removed; and the result was, that the succeeding crops amounted, without any further manure, to 60 $\frac{1}{2}$ bushels of barley, 43 $\frac{1}{2}$ bushels of beans, and 46 bushels of wheat. It is obvious that, under the system referred to, these heavy crops of barley, beans, and wheat, would become the property of the incoming tenant, whilst he would only have to pay for the manure which had largely contributed to produce them, the small value of $\frac{1}{4}$ tons of roots. I would submit that it would be a much finer arrangement to value the manure made during the winter by the load, or ton, and that the incoming tenant should also pay two-thirds, or three-fourths, the estimated money value of the manure from the purchased food consumed in its production. If, in addition to this, the outgoing tenant were paid the consuming value of the straw of the corn crops of the last harvest, he would receive fair compensation for the capital which he had invested in "condition," whilst the incoming tenant would only have to pay for that which possessed an actual money value. The conclusions arrived at in the course of the foregoing discussion may be briefly summarised as follows:

1. "Condition" is a quality quite distinct from *natural fertility of soil*: it is mainly dependent on the amount of capital expended by the tenant in the purchase of cattle-food or manures, and is, therefore, his property; it may be easily and rapidly reduced.

2. The *natural fertility* of a soil, whether high or low in degree, is, comparatively speaking, a permanent quality; it can only be injuriously affected by the continuance of an exhaustive system of cropping for a long period of time; it is the property of the landlord; and, excepting in the case of very light soils, it is the chief element in determining the rest-value of the land.

3. In the case at any rate of the heavier soils, it would generally be beneficial to the tenant of capital and intelligence, if he were allowed much more freedom as to cropping than present customs permit.

4. No injury is likely to result to the landlord from granting the tenant permission to crop as he pleases, provided he be bound to keep the land free from weeds, and to leave a fixed proportion under fallow and green crops, at the termination of his occupation.

5. No simple rules, applicable to various descriptions of soil, crop, and manure, can be laid down for the valuation of the unexhausted residue of previously applied manures which have already yielded a crop.

6. By the valuation of so much of the farm-yard manure, and of so much of the manure constituents derived from purchased cattle food, as have not yet yielded a crop, and also of the straw of the last harvest, fair compensation may be made to the out-going tenant, whilst the in-coming tenant will only be required to pay for that which has a fixed and easily-ascertainable money-value.

In 1845 the late Mr. F. Pusey made the following remarks in an article in the *Journal of the Royal Agricultural Society of England* (Vol. V.): "The subject of unexhausted im-

provements seems to me the most important of all agricultural subjects for landlords at present, and the improvement of our agreements in this respect to be a condition *sine qua non* of any steady and general improvement of the soil or its cultivation." If this were true then, how much more is it so now? During the quarter of a century which has elapsed since these lines were written very great advances have been made in British agriculture, and every step in the progress has been accompanied with an increased outlay of money. If abundant capital is to be attracted to the soil, it is essential that liberal covenants in regard to cropping should be adopted, and fair compensation for unexhausted improvements made. If I have this evening in any degree contributed to that advancement of knowledge which is necessary before we can hope to attain marked improvement in these respects, I shall feel that I have not occupied your time in vain.

Mr. J. J. MOCHT said he had listened to Mr. Lawes's remarks with much interest and satisfaction. There were two points to which he wished to allude. First, he would observe that Mr. Lawes's deductions were drawn from a certain quality of land, and that whether it would be safe to rely upon such results in the case of other kinds of land—for example, light sandy soils—was open to question. Again, his own experience differed rather from that of Mr. Lawes as regarded the improvements resulting from an improved application of manures to heavy soils. He had often found that the application of an abundance of manure to the best quality of heavy soils produced quite as great an effect in increasing the crop as was produced on lighter soils, and he might even say that the effect was greater. Without at all desiring to boast, he might declare that on his farm, which, when he went to it five-and-twenty years ago, produced at the utmost in damp seasons from 2 or 2 $\frac{1}{2}$ quarters per acre, had through the application of good manure yielded 8 quarters of white wheat, followed by 7 $\frac{1}{2}$ of rye. In 1867 60 or 70 acres of land under tillage produced on the average 7 quarters per acre. It was clear, therefore, that heavy land was, after being well drained, very grateful for an improved system of cultivation with the aid of rape and corn-fed animals. He quite agreed with Mr. Lawes as to the advantage of keeping land clean, even in reference to adjacent farms. Indeed, he believed that the law would enable a man who sustained injury in consequence of a large quantity of thistle-seed being continually blown from neighbouring land to recover damage, and he thought he remembered cases in which that had been done after an ineffectual complaint. As respected drainage, it was most important that the ditches and outlets should be kept constantly open, and the drains should not be allowed to get stopped up. He attached special value to what Mr. Lawes said about root crops, which his experience showed to be far more difficult to grow than corn crops.

Dr. VOELCKER said he hoped he might be permitted to compliment Mr. Lawes on the very valuable paper which he had just read (Hear, hear). In his opinion that was one of the most valuable papers ever heard in that room, and he was sure that in saying that he would be supported by the opinion of the practical farmers assembled (Cheers). Perhaps he (Dr. Voelcker) looked a little too much at theory, but certainly, so far as the science of Mr. Lawes's paper was concerned, he must say it seemed to him perfectly sound, and quite consistent with all that was known about the application of manuring elements to the soil. He believed that the great majority of those present would endorse, with very few exceptions, the practical deductions with which Mr. Lawes's concluded. These deductions seemed to him extremely valuable; and he regarded them as a most useful attempt to settle the vexed question of the compensation to be paid to the outgoing tenant. That question was a very difficult one, and if he had to settle it he would cut the Gordian knot by giving the tenant a long lease, tying him down to farm during the last rotation of cropping according to a prescribed mode, and leaving him to do almost what he liked in the interval. He had remarked in that room that it was an extremely fortunate circumstance that a tenant could neither impoverish the land permanently nor permanently increase its fertility; and Mr. Lawes had expressed the same—just the same—thought before them that evening in a very practical and telling manner in speaking as he did about the permanent fertility of land. He (Dr. Voelcker) went the whole length with Mr. Lawes in thinking that farmers could not materially alter the permanent

fertility of the soil, and hence the practical advice which he had given for years on that subject was that, as a rule, tenants should be allowed to get whatever they could out of the soil, knowing, as he did, that if they took too much from it they would soon come to a stand-still (Hear, hear). While, on the one hand, he would recommend a landlord not to take a bad tenant, he would also advise him to let a good tenant do with his land as he pleased. Neither light nor heavy land could be profitably farmed except a good deal of money were spent upon it, and after all it came to this: in which way should the tenant spend his capital? Of course the spending of capital was like everything else that practical men had to do with—a matter of discretion. There were cases in which a large outlay must prove unprofitable. No man would send a son who was a confirmed idiot to Oxford or Cambridge University; and, in like manner, if you had a thin soil of three or four inches resting on chalk or marl, as was the case, for example, in some parts of Cambridgeshire, it would be useless to turn up that soil or spend much money upon it. The question was then, how much money could be spent profitably? As a rule, however, it would be found that the amount of produce depended very much upon the amount of capital which was laid out. In the case of light land they had not only to keep the land in condition but they had to supply all the elements of fertility—all the raw materials of growing crops; while in many heavy soils valuable mineral fertilizing matters were naturally present in an almost unlimited extent, speaking practically, and it required only certain constituents, like guano or sulphate of ammonia, to put the land in proper condition. Deep draining, steam cultivation, the thorough breaking up of the land, the ploughing up of stubble, autumn cultivation—these expensive operations generally improved heavy land, and made the clay farmer less dependent upon manures; while on light lands they must spend a large amount on manures if they wanted to grow paying crops. He fully concurred with Mr. Lawes, that a good tenant-farmer ought to be left in a very large measure independent of a rotation of crops (Hear, hear). A rotation would, indeed, naturally follow. A good farmer would find out what rotation suited him best, but he should not be tied down (Hear, hear). Nothing was more injurious to the progress of farming than the being tied down to a certain course of cropping (Hear, hear). He firmly believed, in the long run, the rotation profitable for the tenant would also be most profitable for the landlord. The interest of the two would always go together. He could not quite agree with Mr. Lawes that in compensating for unexhausted improvements no allowance should be made for the effect of artificial manures on succeeding crops (Hear, hear). There were certain artificial manures which told very materially upon the crop following that for which they were applied. For instance, if a turnip crop were well manured with superphosphate of lime, even mineral superphosphate, the result would be seen in the succeeding crop. Some years ago he made some experiments upon turnips with superphosphate of lime, and the result was that he could trace in the succeeding barley crop, as it were by a line, the part of the field where it had been applied. He thought, therefore, they should not go so far as to say that in no case should an allowance be made for the effects of artificial manures on the succeeding crops. That remark was still more applicable to the use of bones. Bone-dust had a more lasting effect upon vegetation than almost any other artificial manure, and he thought, therefore, that where there was no lease the landlord ought to pay a portion of the outlay for boning pasture land. In the case of poor grass lands the result of applying bones might be visible for at least five or six years; and hence the compensation for bone-dust should exceed that for guano.

MR. MECHT: On heavy soils bones never show any result.

DR. VOELCKER: Then you should not use them (laughter).

MR. R. LEEDS (Castle Acre, Brandon) said there was one expression in Mr. Lawes's paper which rather puzzled him when he heard it. From what that gentleman said about the land being "tortured" he inferred that he was not in favour of deep cultivation.

MR. LAWES: O yes, I am indeed.

MR. LEEDS said Mr. Lawes also remarked, he thought, that barley being a shallow-growing crop fell off sooner in the amount of produce than wheat. He could not reconcile those two things.

MR. LAWES observed that barley was a shallow-rooted crop, and exhausted the soil quicker on that account.

MR. LEEDS remarked that that was rather in favour of deep cultivation.

MR. LAWES: No doubt.

MR. LEEDS said he could not agree with Mr. Lawes that straw was a good criterion for a valuation at the end of a tenancy. For many years he cultivated a light land farm. He farmed it highly, and used a great deal of artificial manure and feeding-cake. His thatching bill varied nearly half. One year it was £28 and another only £16, and the same quantity of feeding-stuff was used in both cases. It would not do, therefore, in his opinion, to take straw as a criterion for compensation.

MR. JOHN THOMAS (Bletsoe, Beds) wished to make one or two remarks with reference to cropping. He believed that all tenant-farmers were too much restricted in that respect. The first thing that a landlord, or his agent, should do was to look to the man, and if he had got the right man in the right place—a man of capital and skill—he should not restrict him; for if such a man took too much out of the soil he would soon find out his mistake, and resort to a better system (Hear, hear). The landlord had of course as much right to take care of himself as the tenant; but if the tenant were compensated for unexhausted improvements, instead of being induced to take all he could out of the soil towards the close of his occupation, that would be better at once for the landlord, for the in-coming tenant, and for the community at large (Hear, hear). One great evil connected with the question was that many land-agents knew nothing at all about farming (Hear, hear). They had plenty of theory but no practice (Hear, hear). A man who assumed the character of a land-agent should have previously undergone a certain examination (laughter) as members of the medical profession did; otherwise, they might be dictating to men how to crop their land or manage their farms without knowing anything whatever about the matter (Hear, hear). Professor Voelcker seemed to think that heavy land was much more profitable than light land farming. In his (Mr. Thomas's) experience it had been quite the reverse ("No, no"). Heavy lands, no doubt, often yielded large crops under good management; but there were seasons when they would produce scarcely any crop at all. On light lands they could almost always produce beef and mutton, and adapt themselves to circumstances, so as to meet the peculiarities of seasons and so on; while on heavy lands they might only be able to obtain wheat at 40s. a quarter, and that was an operation which he, for one, was sick of (laughter).

MR. H. TRETHEWY (Silsoe, Amphil) said he cordially united with those who had spoken in such complimentary terms of Mr. Lawes's introduction. He agreed with that gentleman in a great deal of what he said, but there were a few points on which he differed from him. In the first place he did not concur in the opinion that straw would be a good criterion of value, with respect to unexhausted improvements. They had only to go back two or three seasons, when owing to a large amount of wet, the amount of straw was exceedingly small; while in dry seasons the straw crop was generally very good. The same remark applied to hay. Compare the crop of hay last year with that of the year before. In his own case the crop had doubled under the same treatment. Therefore, he thought, such a mode of valuation as that suggested by Mr. Lawes could scarcely be adopted. Another thing in the paper which he could not understand was, the extraordinarily small quantity of 18½ cwt. of Swedish turnips per acre. Supposing there had been some other crop, khol rabi or mangold, the result would, he thought, have been much greater. As regarded the question of leases, he had expressed his views in that room before, as to the comparative advantages of leases and yearly tenancies. He had stated that, so far as his experience went, it tended to show that on estates where leases were not the rule, but, on the contrary, yearly tenancies, the tenancies remained much longer than where an opposite system prevailed, and he could give abundant proof that such was the case. Another result of leases was very high and increasing rents (Hear, hear). Leases had prevailed in Scotland for many years, and it was a notorious fact that rents were higher there than in any part of England. Even in England, where leases prevailed, the expiration of the lease was generally followed by an increased rent. Yearly tenancies went on generation after generation. He did not mean to say that it was prudent to take a farm under a yearly tenancy without some kind of agreement for compensation; but he held, that under

a good landlord, or a good family—[A voice "Or a good agent?"] Well, they must take agents as they found them (laughter)—under a good family, he said, a man was safer as a yearly tenant with a compensation clause in his agreement than he would be under a lease [A voice "How long notice would you have?"] The usual notice was only six months; but he did not know that that much signified, because if there were a two years' notice, there would, of course, be a much more stringent clause as respected the system of cropping. With regard to the question of compensation, he thought that might be settled very easily without any valuation at all. As he in effect said before, an estimate founded on the straw or the hay crop would, in his opinion, be very fallacious. The proper mode of proceeding was, he thought, to have an agreement in the first place as to a scale of compensation, and in his judgment that scale might be easily adjusted. Mr. Lawes said that he would have two-thirds or three-fourths of the value of the manure.

Mr. LAWES observed that by that he meant manure made from any artificial food.

Mr. TRETHEWY said of course something would be allowed for the root crop, which would be obtained through the manure made by the artificial food consumed the year before.

Mr. LAWES: I don't know that.

Mr. TRETHEWY thought there should be. Supposing there were a crop of roots, would not Mr. Lawes allow something for the manure that produced it?

Mr. LAWES replied that he wanted to avoid all underground valuation.

Mr. TRETHEWY said he did not concur in that view. He would go a little further, and allow something for the dung in growing roots. There were two ways of assessing that. In one case the crop was taken at a valuation, in the other the value of the artificial manure which produced the crop. He should go for the value of the manure to be certified or proved by bills showing that such artificial manure had been consumed. He should take half for the manure in the yard, and a quarter for the crop. That was the rule he generally adopted. One little difficulty that had to be dealt with in that case was, that a certain quantity of manure must be applied to all lands in common husbandry. They could not farm without a certain proportion of manure being used on the farm; and the question was how much of that manure, if produced by artificial food, was fairly chargeable to common farming, and how much the tenant was entitled to be paid for when he was leaving. Supposing on a heavy land farm a man grew beans, oats, and other cereal crops, and purchased no cake. That he should be paid for all the manure which he brought to the land in order to produce those crops could hardly have been intended, if such manure was produced on the farm. There must be some kind of line drawn between the natural condition of the land and the natural cultivation required to keep it up to that condition. He thought all that was required might be comprised in an agreement to the effect that should a tenant apply more manure than was necessary to keep the land up to that state of fertility, he should be paid accordingly. Supposing there were a farm including 100 acres of arable land, a certain quantity of manure would be required for its general cultivation, and anything beyond that should be allowed for on quitting. As regarded the comparative merits of light and heavy land, Mr. Thomas, in his preference for the former, seemed to forget that unfortunately seasons affect light as well as heavy land.

Mr. THOMAS said he referred to medium light land, not to land which was extremely light.

Mr. TRETHEWY said as regarded artificial manures, as they all knew bones were more lasting in their effects than guano, the one remaining for five or six years, and the other only for one or two; but he thought a scale might easily be adopted under which such differences might be adjusted.

Mr. NEILD (Worsley, Lancashire) thought that what they had to consider that evening was not so much the different tenures of land as the proper compensation for unexhausted improvements when a tenant was quitting a farm. No agreement would apply under all circumstances and in all cases (Hear, hear). He could not agree with Mr. Lawes in reference to the compensation for what might be called tillages or light manures. In 1868 the farmers in his district used manures on a large scale in the cultivation of turnips. In that year they got little or no crop; but in the following year,

1869, he grew the best crops of wheat, and of clover under that wheat, that it had ever been his lot to obtain on the farm which he occupied. Had he therefore left the farm last year, the tillage of 1868, being underground, would have remained for his successor, and he himself would have derived no benefit from it (Hear, hear). They were now entering upon a new phase of farming; and he believed the sewage of towns would have a great effect upon production. In the neighbourhood of Liverpool and Manchester, an immense quantity of sewage would be brought upon the land, and great results might be expected. As regarded the course of cropping, he agreed with a preceding speaker that the grand thing for a landlord to aim at was to get the right man in the right place, and that would afford much better security for good farming than any parchment enactments (Hear, hear.)

Mr. G. SMYTHIES (Marlow Lodge, Leintwardine) said he was much struck with two features in Mr. Lawes's paper. One was the extreme fairness of that gentleman in recommending the use of ammonical manures in preference to mineral manures, though it was well known that he was a large manufacturer of the latter; and the other was the statement that 40 bushels of barley per acre and 34 of wheat were grown without any manuring on land which was let tithe-free at 27s. per acre. He was sorry to say that he paid 30s. per acre and paid the tithe, and with what appeared to him good manuring he could not produce such an amount of produce. The gist of the paper seemed to be the best way of compensating tenants for their outlay. Mr. Trethewy, while opposing leases, seemed to him to speak indirectly in favour of them. He said that wherever leases were the rule rents increased very much; and every one would agree with him (Mr. Smythies), that where rents increased very much there must be a corresponding increase in the produce of the soil, and that that was an extremely good thing for the community. That was a question which must be viewed in reference to the community at large as well as in reference to individual landlords and tenants; and if, as he believed could be proved, land under leases produced the greatest amount of produce, leases were things to go in for. He knew very well that English tenants generally did not like leases; and the reason for that was, perhaps, that the greater portion of the aristocracy were very kind and favourable to their tenants, and did not wish to turn them out, so that the tenants felt on the one hand that they had sufficient security for their occupation, if they choose to stay, and on the other that they were at liberty to leave. He thought that feeling was at the bottom of the indifference about leases. Still that did not tend to produce the best kind of cultivation, for they might rely upon it, that farmers would not pay a higher rent than in the long run was justified by the return. There was a stimulus in the case of a man who had a lease which led him to get more out of the land than was obtained under any other kind of holding. The question what should be allowed for in the land at the end of a tenancy did not seem to have been much elucidated by that discussion. Mr. Lawes thought the matter should be decided by the straw, but every subsequent speaker appeared to think that that would make compensation depend too much on the seasons. That brought them back to the cost of manure. Now, in his part of the country there was nothing like lime as manure; but in some cases lime was exhausted in two or three years, and in others the effects were seen for five or six years, and how, then, could a fair valuation be arrived at on that basis? He recollected that when he first began to use guano, that is in 1843 or 1844, the results were seen for seven years. As regarded bones applied to land in Cheshire the effect was, he believed, in some cases almost as good now as it was at first (laughter); while on the other hand Mr. Meech assured them that in his neighbourhood bones did no good at all. This matter was an extremely complicated one. He believed, however, that the tenant would be perfectly safe if the landlord would undertake to pay him for the use of a certain amount of oilcake. Still there was nothing like a lease to induce a tenant to farm well.

Mr. TRETHEWY observed in explanation, that Mr. Smythies must have misunderstood him if he supposed that he implied that under yearly tenancies land was not farmed as well as it was under leases. He wished now most distinctly to say that he believed that with proper agreements land was farmed quite as well under a yearly tenancy as under a lease.

Mr. J. BRADSHAW (Knole, Guildford) observed that Mr. Lawes had read a most valuable paper—a paper which fur-

nished a basis for making calculations as to unexhausted improvements. The fact that the experiments had been carried on for 18 or 20 years made them very reliable. It had been well pointed out by several speakers that the duration of the effects of bones and other manures differed according to the nature of the soil, and that variation of course bore closely on the question how much should be received in the way of compensation by an outgoing tenant.

Mr. J. TRASK (Highleaze, Yeovil) thought that Mr. Lawes's conclusions were on the whole very just. As regarded what had been said about straw not being a good criterion of fertility, he would remark that although not a perfect criterion it affords a material element in the calculation. He had known very bulky straw crops grown on soils in good condition, but he had seldom known a poor, or comparatively exhausted, soil to produce a considerable amount of straw, either in a wet or dry season. In such matters the whole aim should be to give such inducements to the outgoing tenant to farm in the last year of his tenancy as well as he had in previous years. If that were done the requirements of what was called tenant-right would be satisfied, while if they went beyond this they might do as much harm as by falling short of it.

Mr. CLEMENT CADLE (Gloucester) wished to add his humble testimony to the value of Mr. Lawes's paper, but there was one point that had escaped notice in the discussion. Mr. Lawes said he was not in favour of any restriction in cropping, except in the last year or two of a tenancy. Now the majority of tenancies in this country being yearly ones, with a six months' notice to quit, under such circumstances there would be great difficulty in restricting a tenant in the last year of his occupation, all the land would be under some crop or other when the notice is served.

Mr. R. J. NEWTON (Cambridge, Woodstock), having succeeded Mr. Howard in the chair, in consequence of that gentleman being compelled to leave, then summed up the discussion. After remarking that he felt himself rather out of place in that position, he said that so far as he could gather from the remarks of Mr. Lawes in his excellent paper, and from the observations of succeeding speakers, it was the general feeling that much greater freedom should be allowed to tenants in manuring and cropping their farms of course without prejudicing the interests of the landlords; and that compensation should always be given to tenants for unexhausted improvements; and he felt sure that if those objects were secured, the effect would be that a great impetus would be given to the improvement of agriculture (cheers).

Mr. LAWES then replied: he observed that Mr. Meehi thought that he had laid too much stress on the experiments which were made in his particular soil. Being fully aware of the difficulty of drawing conclusions from results obtained in any one quality of soil, he had tried to get similar experiments to his own carried out on different kinds of soil—for example,

at Woburn, at Holkham, and in Kent; but he was sorry to say that the matter was attended with great difficulty, and, in fact, owing to weeds or game, or both, the experiments were not altogether satisfactory, and were consequently given up. He did all he could to secure similar experiments to his own elsewhere, but in vain. Another point raised in the discussion, was the valuation of unexhausted manures which had grown a crop. Professor Voelcker had justly observed that bones were an admirable manure, and that the effects were permanent. On some soils the effects of bones were so permanent that they never seemed to do any good at all (laughter). Mr. Meehi thought they were of no use to himself. The truth was a manure might have a special action on a particular crop, on particular soils, and in particular seasons, and no general rule, therefore, could be laid down for the valuation of the unexhausted residue of manures which have yielded a crop. He wanted to have the valuation transferred to what was above ground. The greatest exception taken to his paper had reference to straw. It was naturally remarked that in some years the straw crop was good, and in others bad; but on the other hand, it should be remarked that, whether the crop were good or bad the higher men farmed the more straw they obtained (Hear, hear). The tendency of all high farming was to produce a large quantity of straw. If valuations were transferred in the manner he proposed, a tenant going out at Michaelmas would have two straw crops valued. There would be the straw in the dung, which, he (Mr. Lawes) said, should be valued instead of the turnips, the straw of the last corn crop, and, besides, the value of the manure from the purchased food consumed during the winter. If there were a bad crop of straw one year, there would probably be a good one the next, and with the two there would be a fair basis of valuation. As to the valuation of artificial manures, there was no rule universally applicable. If a man asked him the value of an artificial manure in a particular case he might tell him something near it, but he could not lay down a general principle which would apply to all cases. For example, in one of the experiments he had referred to there was a residue of 600 lbs. of ammonia per acre within 27 inches from the surface, and that did not produce as much effect as 20 lbs. applied afresh on the top of the soil. There was 600 lbs. of ammonia worth 9d. or 10d. per lb., and perhaps it would not produce more than a bushel of corn a year for the next half century. If the valuation were transferred to things that had a tangible money value, that would, in his opinion, secure justice to both parties (cheers).

On the motion of Mr. MEECHI, seconded by Mr. J. THOMAS, a vote of thanks was given to Mr. Lawes for his paper.

On the motion of Mr. H. TRETHEWY, seconded by Mr. LITTLE, thanks were also accorded to the Chairman, and this terminated the proceedings.

WHAT THE CENTRAL CHAMBER OF AGRICULTURE HAS DONE

"They were increasing constantly in numbers, and yet practically they had done nothing. They were endeavouring to perform three most important and difficult tasks—to obtain agricultural Freedom of Trade, to obtain Equal Rating, and to obtain Representation in reference to taxation in the shape of County Financial Boards. Those were the three things which they were established to secure, and they had not advanced one step." So said Mr. Tomline, M.P., when opening the April business in his office of chairman of the Central Chamber of Agriculture. The scope of this Society would here seem to be somewhat arbitrarily limited by its President, and, indeed, the agenda paper went at once to a correction of the honorable gentleman's impression. The first discussion of the day did not turn upon Free Trade, the Equalization of Rates, or the establishment of County Boards; nor, for that matter, did the second. Whatever was said, however, on this or that question, it must

be sufficiently clear that the Central Chamber has "practically done nothing," as that its deliberations are attended with little or no effect. Of this the first topic taken afforded some remarkable illustration. At the meeting in March the Council passed a resolution declaring that "adequate opportunities for instruction may be secured by regular attendance at school up to the age of ten years, supplemented by partial attendance after that age, and that compulsory attendance of children up to the age of twelve years would prove a great hardship to the labouring classes." In accordance with the trimming timidity usually evinced by the Central Council this resolution is as roundabout as it well can be, but if it mean anything it comes to this—that no labourer's child should be compelled to attend any school after he is ten years of age. And, no doubt, a very proper and sensible amendment to the Government Bill would this be. But what has happened in the

interim? At meetings of local Chambers and Farmers' Clubs there has been an almost unanimous expression of feeling, very plainly put, in favour of the ten instead of the twelve years' clause. In Northamptonshire, Lincolnshire, Berkshire, Oxfordshire, Warwickshire, Nottinghamshire, Worcestershire, Hertfordshire, Cornwall, Norfolk and Suffolk resolutions have been carried substituting ten for twelve; while Leicestershire and Staffordshire would appear to have gone altogether against compulsion. The course of the Council on the force of such a manifesto would look to be obvious enough. So far as we can pretend to understand the action of that mysterious carriage-paid body, there is a long sitting on the evening previous to the meeting, when with much care and deliberation "appropriate" resolutions are drawn out for presentation on the next morning. The Education Bill was announced to come again under consideration, and, with the evidence of the agriculturists of the country taken as it were in the mean while, nothing would promise to be better warranted than strengthening or more emphatically pronouncing for the ten years' term, as embodied in the resolution of the March meeting. But the Council in its collective wisdom thought otherwise, and, instead of supporting the original resolution, did everything to weaken its effect, for the first motion submitted on Tuesday ran thus: "That this Council considers that the partial attendance of children between the ages of ten and twelve, as approved by the resolution passed at the last meeting, would be best attained by requiring a certificate of proficiency for every child employed in labour." In the face of all that has since happened throughout the country it is here attempted to fuse or confuse the compulsory attendance from ten to twelve years; although of course as a member, whose name our reporter did not succeed in catching, very properly remarked, "at the last meeting the Council passed a resolution declaring that ten years should be the limit of compulsion, and if a resolution was now adopted to the effect that a child was not to be allowed to go to work after ten unless it obtained a certificate of proficiency, that would be a retrograde movement; it would, in fact, be reversing what was done before." Precisely so; as this brings us back to the chairman's first charge. If the Council will only reverse at the next meeting all they have done at the previous one, "practically, they will do nothing." This marching backwards may be perhaps safe enough in its way; but still it was not altogether countenanced on Tuesday, when an amendment, proposed, as we believe, by one outside member, and seconded by another of the "unpaid," was carried by a majority of more than two to one—the point of this being that "no compulsory attendance should be required after ten years of age."

And here a very pertinent question arises. Is the Council of the Central Chamber—the carriage-paid company which assembles on Monday evening—supposed to represent the sense of the country or the sense of itself? If this be really a central body, of course the first duty should be to collect the opinions of the corresponding societies throughout the country, and frame resolutions in accordance with the majority, as so expressed. Of all the local Chambers which have taken the Education Bill into consideration it would be interesting to hear how many have gone for ten instead of twelve years as the limit for compulsory attendance. And if, as we shall assume, there were a majority in this direction, why was not a clear decisive resolution to that effect put before the meeting on Tuesday? Mr. Mortimer said the other day, down in Devonshire, that "the self-elected members of the Central Chamber had more weight than the Chambers in the country. He did not consider they should place so much

confidence in the Central Chamber, but that they should have a Chamber where they could be properly represented." Every word of this would certainly seem to be warranted by the proceedings over the Education Bill on Tuesday. These "self-elected Members," if Captain Craigie's motion were put with their cognizance, did not properly represent the local Chambers. Their duty would have been to put the ten years' limit as a substantive motion, and to have left Captain Craigie to have done what he could with his proposition as an amendment. Instead of that, they put the cart before the horse, by giving as it were their countenance to this retrograde movement, although ultimately in a meeting of some thirty people the sense of the country prevailed over the sense of the Council.

The Central Chamber of Agriculture was started, not, if we remember aright, precisely to carry out the three objects enumerated by the present chairman, but to look to matters coming before Parliament, and there are now two or three Game Bills launched. Whereupon Lord Aylesford withdraws from his Chamber as he does not approve of this becoming a political association, and Lord Warwick admits that he is very much inclined to do so from exactly the same reason. At the meeting, however, in London on Tuesday it was deliberately declared, "That in the opinion of this Council the application of capital to agriculture is discouraged by—amongst other causes—the over-preservation of ground game." This evil, however, was significantly enough passed without any discussion, possibly from the fact of the over-preservation of ground game having already come under the consideration of the Council. And what has been done by the Central Chamber to remove this discouragement to the application of capital? As Mr. Tomline would say, "practically nothing." In fact, if there had been, it is likely enough that the chairman of the Central Chamber might have followed the example of the noble lord in Warwickshire, and have withdrawn, as not approving of this becoming a political association, that is as regards the over-preservation of game.

Looking at the ludicrous want of administrative ability as displayed by the direction of the Central Chamber of Agriculture, we have not hesitated to express our opinion as to its little use or worth. Or, in the more concise condemnation of its own chairman, "practically they have done nothing, and not advanced one step." A good strong resolution, issued under the authority of a central society, and embodying as it should have done the opinions of agriculturists, might have had its effect on the Government Education Bill. But, should Mr. Foster care to look in this direction, what will he find? A pitiful division of 18 to 8, and the sense of the country frittered away by captains and clergymen. Surely the world is getting very sick of this sort of thing!

PRIZES FOR GARDEN ESSAYS.—Mr. W. Egerton Hubbard's prizes, offered through the medium of the Royal Horticultural Society, have been awarded as follows: For an Essay on Cottage Gardening, the prize of £5, to Mr. E. W. Badger, *Midland Counties Herald*, Birmingham; for an Essay on Window Gardening, the prize of £3, to Mr. H. Buttery, Clapham. For the former prize, thirty-four essays were sent in, of which number those from Mr. W. P. Ayres, Nottingham, and Mr. E. Luckhurst, Egerton House Gardens, Kent, were highly commended; and those from Mr. D. T. Fish, Hardwicke House, Bury St. Edmunds; Mr. A. Meikle, Read Hall, Whalley; Mr. P. Grieve, Calford; and Mr. W. Earley, Digswell, were severally commended. For the Window Gardening Prize, eighteen essays were contributed, that from Mr. D. T. Fish being highly commended, and those from Mr. E. Luckhurst, Egerton House Gardens; Mr. A. Meikle, Read Hall; and Mr. W. Moss, Shelfield, Wickham, Hants, were commended.—*Gardener's Chronicle*.

THE CENTRAL CHAMBER OF AGRICULTURE.

A Council Meeting of this Chamber was held on Tuesday, April 5, at the Salisbury Hotel, Mr. Tomline, M.P., presiding. There were about 30 members present.

The CHAIRMAN, in opening the proceedings, said that they were increasing constantly in numbers, and yet practically they had done nothing. They were endeavouring to perform three most important and difficult tasks—to obtain agricultural freedom of trade, to obtain equal rating, and to obtain representation in reference to taxation in the shape of county financial boards. Those were the three things which they were established to secure, and they had not advanced one step. A short time ago our Minister in China entered, with the consent of the Government, into a treaty, and brought it home with the idea that it could not possibly be opposed. It took away all the transit duties in China, but added 2½ per cent. to the import duties in that country. Lord Clarendon wrote a favourable paper about it, but one or two Chambers of Commerce disliked it, and acted with energy. They went to the Minister, and, in spite of the assent of the Government, and the long and able paper of Lord Clarendon, they gained their point. Such was the result of the efforts of one or two Chambers of Commerce, and that was what he (the Chairman) called decisive action (Hear, hear). Was it not a contrast to what they had done that such rapid success should have followed the action of one or two Chambers of Commerce? He thought they ought to see why it was that similar success had not followed their own efforts (Hear, hear).

Mr. A. PELL, M.P., brought up the following Report of the Local Taxation Committee:—

"The Local Taxation Committee, in presenting their Report, have much pleasure in stating that their executive committee have met regularly twice a week since the last general meeting of the committee on the 7th of March. These meetings have been attended by Sir Massey Lopes, Bart., M.P., chairman, Mr. A. Pell, M.P., Captain Craigie, and Mr. C. F. Gardner, secretary. The circular letters addressed to secretaries of provincial Chambers, requesting further contributions, and asking for lists of magistrates, landowners, and others, have been written and sent out by the secretary, as ordered at the last general meeting. Letters will be sent to the magistrates, landowners, and others, as authorised by the committee, as these lists arrive from the provincial Chambers. Replies have been received from many of the secretaries, and some donations. The committee also beg to report that nearly twelve thousand copies of the 'Prize Essay' have been distributed. The committee cannot close their report without expressing their deep sympathy with their chairman, Sir Massey Lopes, in the severe domestic calamity which he has sustained, and which has caused his unavoidable absence."

In accordance with a recommendation of the Business Committee for co-operation with the International Decimal Association on the question of "Uniformity of Weights and Measures," it was resolved, on the motion of Mr. NEILD, "That a petition to the House of Commons for a Select Committee of Inquiry into the subject be signed by the chairman on behalf of the Council."

On the motion of Mr. C. S. READ, M.P., seconded by Mr. GEORGE ANDREWS, it was further resolved, "That the thanks of the Council be voted to the several Chambers of Agriculture which have increased their subscriptions or forwarded donations to the funds of the Council."

The discussion on the provisions of the Elementary Education Bill, adjourned from the previous meeting, was then resumed.

Captain CRAIGIE said that as he made the motion for adjournment it was his duty to reopen the question. In doing so, he would allude to three distinct points. The first was that the bill was not now in the same position as when they last met. It had been read a second time, and therefore its principles had been approved by the House of Commons. The second point was that there had been promises of important amendments on the part of the Government, and various suggestions had been thrown out as to what should be done in

committee; while the third was that what might be termed the congested state of public business in the Lower House rendered it extremely doubtful whether the bill could pass into law during the present session (Hear, hear). These things should make them very careful as to what they said on the subject, and in his opinion it was desirable that it should be treated by them strictly as an agricultural question, and not as an imperial one (Hear, hear). The vexed question of religion seemed to him inadmissible in that Council, and he hoped that every speaker who followed him would, like himself, abstain from alluding to it. Two exhaustive resolutions were passed at the last meeting, and before proceeding to move an amendment he would reiterate the protest made on that occasion against any contributions being made for elementary education out of local rates until the incidence of those burdens had been altered (cheers). Even that rating question stood in a different position from what it did when the question was adjourned, the likelihood of even the small measure which was then referred to being passed in the present session being very small indeed, and that fact strengthened the protest to which he had just alluded (Hear, hear). There were four points to which he thought the Council might usefully address itself on that occasion—first, what was meant by the "partial attendance" after ten years of age? mentioned in one of the resolutions passed at the last meeting; secondly, the distance to be fixed upon as a limit for attendance at schools; thirdly, the alleged pauperising tendency of free education; and, lastly, the absence of any provision in the bill for technical education, which if judiciously given would, he thought, produce a very good effect in rural parishes. He would move the following resolution: "That this Council considers that the partial attendance of children between the ages of ten and twelve, as approved by the resolution passed at the last meeting, would be best attained by requiring a certificate of proficiency for every child employed in labour." They all knew the difficulty which existed with regard to ages. He did not think it mattered how a child acquired additional education after the age of ten, whether in a night school or in any other way. It would be quite enough if the inspector were satisfied that he had attained the fourth standard, that being made the test of proficiency (Hear, hear).

The Rev. Mr. BOTTFIELD (Shropshire) did not think the Council need trouble itself very much with regard to the period between ten and twelve, as very few boys were then employed in agriculture ("Oh, oh"). He spoke from his own experience in the matter. He had a school of one hundred and twenty boys, and he found that the average age was eleven years and three months. He quite agreed, however, that there were many boys of ten, eleven, or twelve—big lusty lads—who might be usefully employed in agriculture (Hear, hear); and he thought that parliament should be contented if such boys attained as much education as would fit them to perform their duty in after-life (Hear, hear). If a boy had thoroughly mastered reading, he would never forget it. Having once learnt to read a column of a newspaper, he could afterwards study for himself. He thought that amid the attention bestowed on the children of labouring men, the children of a large class of farmers has been too much overlooked. While the labourer might obtain for his children a good education, perhaps for nothing, men immediately above him must either send their children to a pauper-school or not have them educated at all. There were no schools provided for the intermediate class. A school which he originated in his district to meet that difficulty—it was a school for all classes, the children of labourers as well as of farmers and others—had been in existence for 17 years, and complete success had attended it. There were now 130 boys, including the sons of labourers, the sons of farmers, the sons of tradesmen, and even the sons of gentlemen, some of whom he hoped one day to see in the house where their chairman sat. He sent his own sons there, and though he afterwards paid two or three hundred a year for their education, he had not the slightest hesitation in saying that the education which they received in that school was

better than that which they received subsequently. [A voice—What is the highest sum charged?] Fifteen shillings a quarter. As regarded the question of distance, mentioned by Captain CRAIGIE, he found that one boy came six miles to his own school and several farmers' sons came three miles. Payment was not compulsory, but for 11 years there had not been a single instance in which a parent had not wished to pay.

Mr. WILES (Cambridgeshire) observed that most persons seemed now to have entirely lost sight of the importance of industrial education, which in his opinion should begin at ten years of age at the latest. He was not at all inimical to education; but it struck him that the country was running wild about it ("No, no"). If the compulsory principle was to be carried out, it must be applied to the children of peers as well as to those of peasants (Hear, hear). Noblemen must in that case have their children educated as well as vaccinated (laughter). Some rich parents spoiled their children; and he supposed they would be called to account (laughter).

Mr. SMITH (Essex) asked the Chairman whether the religious question was to be admitted into the discussion?

The CHAIRMAN replied that it was to be excluded, and the meeting was to confine itself as much as possible to the point before it.

Mr. GARFIT (Lincolnshire) observed that the great problem was, how the children of agricultural labourers were to be compelled to attend school, as the Government proposed, and yet the family be fed and clothed? He believed that many persons went with the stream in advocating compulsory education, without individually approving of it (Hear, hear); and, in his opinion, it could not be enforced without interfering injuriously with the right of parents to secure a maintenance for their children. Many children could not be fed and clothed properly even now; and what would be the use of driving a half-fed and half-clothed child to school? (Hear, hear.) If there must be compulsion, let it, at all events, not extend beyond the age of ten, when boys became very useful to their parents or their employers. He concluded by moving as an amendment, "That this Council considers that no compulsory attendance should be required after ten years of age, and that, after a certificate of proficiency in reading and elementary writing at any age, no compulsory attendance should be required."

The Rev. E. H. WILLES (Leicestershire), in seconding Capt. Craigie's resolution, said he believed there would be no necessity for compulsory education in rural districts where good schools were provided. Nor did he think that rating would be required under a good system of school management. In his own parish—a parish comprising a population of 300 souls—the children's pence and the Government grant together paid all expenses, and left a surplus.

Mr. WEBB (Worcestershire) advocated exemption from compulsory attendance, in the hop districts, during the picking season, when the mothers were in the field and the home shut up.

Mr. VARDEN (Worcestershire) concurred in this view.

Mr. WHITWELL (Peterborough) supported Capt. Craigie's resolution, on the ground that, after ten years of age, a certificate of proficiency ought to satisfy everybody. He deprecated any attempts to stop the progress of education. At the present moment many agricultural labourers could not read the names on carts. ("Oh, oh!") A week ago he asked a labourer to read a name, and he could not do so (A Voice: "That is the exception"). He believed that it was not the exception. In such remote districts as the Government Bill was especially intended for, there would in many cases be no schooling without compulsory education and local boards. In a school of 300 children with which he was connected the master told him that the greatest difficulty he had to contend against was the voluntary principle, adding that, if attendance were made compulsory, the table would be better filled up, and the children all the better for it. The man he mentioned was only 40, and a very good labourer too (Hear, hear).

Mr. LEMAN said that in his county great attention was paid to the education of the labouring classes.

Mr. HERMAN BIDDILL seconded Mr. Garfit's amendment, which seemed to him much more to the point than Captain Craigie's motion. He wished that gentlemen who advocated compulsory education up to 12 years of age would consider what it would lead to. How was a child to be forced to attend school? What did compulsion mean? It meant fine

in case of non-compliance, and where there was no money fine meant the gaol (Hear, hear). He admitted, however, that Mr. Forster's bill only required a little alteration to make it suitable to the wants of the country. As a large employer of juvenile labour in agriculture he would warn farmers against waiting until the bill was passed before seeking to get its provisions altered; whatever was to be suggested in the way of alteration must be urged now. His idea was that there were many parents who could not spare a child for school beyond ten years of age, and he was for limiting the restriction to that age. He had six boys in his employment under 13, and some of them had been at work for four or five years, and he felt certain that some of the parents could not have spared their child's labour even in the first year that he (Mr. Biddell) employed him.

A member observed that at the last meeting the council passed a resolution declaring that ten years should be the limit of compulsion, and if a resolution was now adopted to the effect that a child was not to be allowed to go to work after ten unless it obtained a certificate of proficiency, that would be a retrograde movement; it would, in fact, be reversing what was done before (No, no). At the preceding meeting it was declared that no attendance at school should be required after ten.

Captain CRAIGIE explained that the resolution on the subject passed at the last meeting was, in effect, that regular attendance should be required up to the age of ten, and partial attendance afterwards.

Mr. GENGÉ ANDREWS said he concurred neither in the original motion nor in the amendment. He believed that the longer they discussed the question in the way they were discussing it, the farther they would be from any conclusion. The longer he listened, the more he felt that they were in a mist (Hear, hear). The main point on which the Council were agreed was decided opposition to the rating principle, and he believed there was a general feeling against labourers being compelled by law to send their children to school (Hear, hear). One fact of general application was more expressive than a long string of arguments. Some time ago he met with a case in which a labourer's daughter, who was one of a large family, earned 2s. a-week by making gloves, thus supplementing, to that extent, the father's wages of 10s. a-week. The Government Bill as it stood would prevent that.

Mr. SMITH (Essex) felt, that to compel children to attend school after they became ten years of age would be to lay a very heavy burden on many parents. A great number of children could, at that age, earn 2s. or 2s. 6d. a week, which materially helped the parents in providing for the wants of the family. The proposal to authorise the levying of a 3d. rate for education greatly strengthened the arguments of the Local Taxation Committee.

Mr. CURZON was sorry to be obliged to endorse the opinion expressed that day that many labourers could not read the letters on carts. A short time ago he met with a case in which a girl who was a witness at a Coroner's inquest, and who had left school only two years before, was obliged to put a cross against her name (Hear, hear, and a Voice: "That shows that the schooling was not very good"). There must, he thought, be partial compulsion or attendance at night schools after the child became ten years of age.

Mr. NEILD (Cheshire) hoped the meeting would confine itself strictly to the agricultural aspect of the question (Hear, hear). The Council had been censured for what it did at the last meeting, and he believed many who took part in the proceedings would not now vote for any compulsion at all (Hear, hear). He had in his employment children under 13 years of age who were earning as much as 4s. 6d. a week, and he felt certain that unless lads were initiated in agricultural work early, they would never learn in after life. By providing a little for industrial education, and not forgetting the primary point of feeding and clothing, parliament would do a great deal more good than by sticking altogether to scholastic education (Hear, hear). Many persons in his parish said that people were now riding the education horse to death (Hear, hear). Notwithstanding all that had been said about the ignorance of agricultural labourers, he believed that the school attendance in most of the rural parishes would shame the towns in a comparison (Hear, hear).

Mr. GARFIT, as the mover of the amendment, then replied. He said that if he had been previously aware of the feeling

of the meeting as manifested in the discussion his amendment would have gone a little further in the direction of opposition to compulsory attendance at school (Hear, hear). He was in favour of compulsion in so far as it would oblige parishes to provide adequate school accommodation, but opposed to it in so far as it would compel children to go to school (cheers). If they provided pure water for cattle the cattle would drink it, and the same principle applied, he believed, to the case of schools. Compulsion would, when carried out, produce a revulsion against itself. Even Mr. Forster seemed hardly to have made up his mind on the point, but the Birmingham party was urging him on in that direction, and hence it was important that agriculturists should urge him in the contrary one.

The Rev. E. H. WILLES reminded the meeting that compulsion was already carried out in towns under the Factory Act.

Captain CRAIGIE appealed to the meeting whether it would be wise to revoke, as he thought it would do by adopting Mr. Garfit's amendment, the decision which it came to at the last meeting, after long and grave deliberation. The resolution passed on that occasion was so worded as to avoid declaring that there should be no compulsion, but it distinctly affirmed that there should be none after ten years of age. He thought it would be wise for the Council to leave the question there, and not pass an amendment by which, in his opinion, they would stultify themselves in the eyes of the country. He was perfectly prepared, if the seconder would assent to it, to insert in his resolution the qualifying words, "in country districts."

Mr. MUNTZ expressed his approval of the limitation of compulsion to the age of ten.

The amendment was then submitted to a show of hands, and carried, the numbers being eighteen for and eight against it; majority, ten.

The CHAIRMAN said that the next question for consideration was the causes now in operation which discourage the application of capital to agriculture; and a discussion followed as to the propriety of postponing the matter until the next meeting in May, a course which was strongly advocated by Mr. Jasper More, and opposed by Mr. Genge Andrews, Capt. Craigie, and Mr. H. Nield. The last mentioned expressed his surprise that such a proposal should have been made after the long preliminary discussion which took place in the Executive Committee the previous night in settling the resolution to be submitted to the Council. The Committee were engaged until past eleven o'clock, and had considered the resolution clause by clause, to the best of their ability; and if the council were to waive the present opportunity of pronouncing its opinion on such an important subject, all he could say was that the Central Chamber of Agriculture was not likely to pass muster with the practical farmers of England. It was then agreed, on a show of hands, that the discussion be at once proceeded with, and

The CHAIRMAN read the resolution prepared by the Business Committee as follows: "That in the opinion of this Council the application of capital to agriculture is discouraged by the following causes—1. The undue amount of local taxation upon capital invested in land and its improvement. 2. Uncertainty of tenure. 3. Absence of compensation for unexhausted improvements. 4. Unnecessary restrictions upon courses of cropping. 5. The over-preservation of ground game."

It was then arranged that the several "causes" indicated should be taken and considered separately; and

Mr. WHITAKER thereupon moved, "That the application of capital to agriculture is discouraged—first, by the undue amount of local taxation upon capital invested in land and its improvement." He observed that matters of such magnitude as were embraced in the resolution which had come down from the committee required the careful attention of all the local chambers, and that the sooner the subject was gone into with spirit and determination the more likely would they be to arrive at a just conclusion, and to meet the wishes of both the landlords and the tenantry of the country. The resolution involved some very vexed questions, but they must not recoil from their consideration simply because of a diversity of opinion. Especially when they saw the progress that was being made—he might say in a revolutionary direction—with the land question (Hear, hear), it was the duty alike of landlord and of tenant, and the possessors of real property generally, to stand forward and avow their opinions with equal

moderation and firmness. There were portions of the resolution to which he was not favourable; but the first clause of it set forth a truth which no reasonable man would attempt to deny (Hear, hear). The purchaser of an estate worth £1 an acre, invested in it say capital to the amount of £5,000, and increased its value from £1 an acre to £2 or even 50s., by drainage, new buildings, and other improvements, when in would step the rating committee, and tax the capital so invested to the amount of 12 per cent.; whilst, if the money had been invested in the funds, it would be charged only with the income-tax of 4d. or 5d. in the £1. In these circumstances, he asked, whether it was likely that either landlords or tenants would invest their capital largely in the improvement of the land so long as such an iniquitous system of local taxation continued. Upon this first clause of the resolution, then, he trusted that every chamber of agriculture and farmers club in the kingdom would be unanimous, and that the Local Taxation Committee would have their hands strengthened by the resolutions which those several associations might arrive at on the subject. Having made this reference to the Local Taxation Committee, he would take the opportunity of remarking that that committee ought to receive a much larger support than they had yet done from the chambers of agriculture, and that unless funds were supplied to them to work the Central Chamber more efficiently, this grand movement in the interest of the farmer would fail (Hear, hear). He said this because he found that the subscriptions on the part alike of societies and of individuals were of such a meagre character that they would not enable the Chamber to carry out the important objects that it had in view. If they turned for a moment to the operations of the manufacturing community, they would see the large manufacturers coming forward and giving their personal exertions and money subscriptions to promote their common interest; and that the agricultural community should remain quiet and utterly apathetic when this important question of local taxation was being agitated, was to him a source of great amazement (Hear, hear).

Mr. GENGÉ ANDREWS seconded the motion, because it was almost the only question upon which this Council and the local Chambers might be said to agree. It was a question, indeed, as to which there was scarcely a discordant opinion entertained (expressions of dissent). He did not mean to say that that was absolutely and positively the case, but that there was such a great majority of the members of this and the local Chambers in favour of it that they might safely assert it to be the leading question which the vast preponderance of opinion was ready to support. That, he thought, would be generally admitted. What was the question in itself? It was not that of creating a new tax; but they were attacking the system of exemption from a tax. They contended that capital invested in land and in the cultivation of land was more heavily burdened by taxation than capital invested in any other property or pursuit. It was not wise or politic to lay an extensive tax on the production of food, so far as agriculture was concerned, for the tax had to be paid before any profit could arise to either the owner or the occupier of the land. More particularly was it an injustice to the owner. For if he were the possessor of land which scarcely afforded any rent, there was a tax of 12 per cent. upon the net annual income of that land, and that must operate as a bar to its cultivation on the slightest depreciation in its value. The land must therefore go out of cultivation if it did not pay rent. On the other hand, it was quite clear that if these local taxes were distributed over the income arising from the whole of the capital of the country, however invested, the land instead of 12 per cent., would probably have to pay little more than 4 per cent., in other words, the burden it bears would be reduced by two-thirds if it were fairly distributed over all the capital returning a profit in the country. The result would be a large extension of the area which could be brought into cultivation; and therefore an increase of employment for capital and consequently of labour. Even upon economic considerations then, he held that they had fair ground for saying that these local taxes were imposts levied upon the raw material of food, were unjust and impolitic, and injurious to the common weal, leaving out of the question the interest of the landlord and farmer. As to the farmer, he was not directly interested in this taxation, which really fell upon the owner; but collaterally another element came in which brought the occupier very strongly into the field. They all knew that the farmer could not

change his stock with the same facility that a trader could change his. Once that the farmer had invested his capital, it was in itself a serious tax upon him to have to remove it (Hear, hear). Consequently occupations did not frequently change hands, nor were rents often adjusted. It was not natural indeed that they should; because, in the first place, the profits of farming were exceedingly precarious. There might sometimes be a run of two or three years with scarcely any; and, again, for two or three years there might be a profit; so that if changes were frequent they would be fatal to good cultivation in every respect (Hear, hear). Take the case of a man who has been an occupier of land since the year 1832, in a district where rents were not doubtful from day to day. He found by the returns of the Poor-law Board that six or seven millions sterling had been expended in that period upon the purchase of sites, legal expenses consequent thereon, and the erection of union houses alone. There had also been a greatly-increased expenditure on the building of gaols, lunatic asylums, militia stores, and county courts. In his county (Somerset), for example, the outlay on an assize hall amounted to £100,000. Now he should like to know upon whom all that expenditure had fallen (Hear, hear). The man who had been an occupier since 1832 had not only had to pay for these buildings, but the interest upon the money they cost, which in 25 years had been as much as the capital itself. Besides that he had had to bear large additional charges which had been placed upon the poor-rate. If at any time he wanted redress on account of these things, all he could do was to go to his landlord and ask for it; but the fact was that these increased burdens had come upon him gradually, and in practice it was very rare indeed that the man was able to get an abatement of rent on the ground of those additional charges on the poor-rate which he had not contemplated when he entered upon his occupation (Hear, hear). Collaterally and indirectly, then, the occupier was deeply interested in the present system, though it was true that, in the abstract, the taxation fell solely upon the owner (Hear, hear). At the present moment a Committee of the House of Commons was engaged in inquiring into the advisability of dividing the burden between the owner and the occupier; than which he believed a more insidious proposal was never made (Hear, hear). One of the principal promoters of the Committee, not the Chairman himself, but a gentleman who sat on the right hand of the Chairman, told him a year ago that he was quite ready to relieve the tenant from some of his future responsibility; and when he (Mr. Andrews) was examined before the Committee, a few days since, he stated that the proposal was ridiculous; for he contended that if they did anything in that direction the whole charge should be borne by the owner. Had it been laid upon the owner from the year 1832, was it likely that the additional charges would have been imposed on the poor-rate as had since been the case? He thought not; and if they were placed on the owners now, he believed the eyes of those gentlemen would sooner or later be so opened that the chambers of agriculture would have that interest with them much more heartily than at present. What he said, however, was that the system of exemption ought to be abolished. There was some difference of opinion in many minds as to the mode in which that should be done; but if the exemptions ceased, and the charge were placed on the basis of the income-tax the trading, manufacturing, commercial and farming interests would still have to pay the income-tax as they now did upon their profits. One thing quite clear to him was that if a man had £10,000 invested in mortgage it was as much realized property as if it were invested in land or houses, so that the argument that profits ought not to be assessed would not exclude the doctrine that capital ought to be assessed. Take a large brewer or manufacturer who had a considerable capital invested in his business, was that capital to escape altogether? was it not as good as if it were embarked in land? It was even admitted by a great many persons who did not support the farmers or their associations that the exemption of realised capital, however invested or employed, was an injustice; and he agreed with the late Sir G. Cornwall Lewis, that the profits of capital when realised, were as assessable to the relief of the poor and the twenty-five other objects to which poor-rate was applied as any other capital. For the information of his brother agriculturists, he would enumerate the various heads under which the money levied as poor-rate was expended. They were these: For the

relief of the poor, £6,959,000; payments towards county, borough, and police rate, £2,511,000. Then came constables' expenses and costs of proceedings before justices; registration fees on account of the Registration Act; vaccination fees; parliamentary and municipal registration; highway board expenditure; proceedings at law and equity; surveys and valuations; other expenses not discriminated. Next, there were the heads of county rate expenditure; rural police and superintending constables; conveyance of prisoners; gaols; prosecution of prisoners; shire halls; lunatic asylums; maintenance of pauper lunatics; county bridges; clerks of the peace; coroners; inspectors of weights and measures; interest on principal of debts; repayment of debt; militia storehouses, and miscellaneous. Nobody could say that these various heads were for strictly local purposes, and the fact was that local and general purposes were mixed up together (Hear, hear).

Professor BURN moved to amend the clause by striking out the words "capital invested in land and its improvement," and substituting for them the words "capital invested in the improvement of land." What they wanted to show was the reasons that people would not come forward and invest their money in the land. These were two: first, that they were taxed on their improvements, to which they naturally objected; and next, there was the uncertainty as to what the amount of taxation would be. When a man took the lease of a farm, he calculated that his rent would be so much, his tithes so much, and his taxes so much, and thus he arrived at his probable profit. But these local taxes were continually increasing, and never taken off; consequently he could not fairly calculate what would be the amount, though he might be aware that he would have to pay far more at the end of ten years than he would at present. And this uncertainty about knowing what his outgoings and incomings were likely to be, acted as a great discouragement in the application of capital to the improvement of the land.

The CHAIRMAN: Your point is that year by year the rates become larger without the tenant knowing what they would be. The amendment seems to be a logical one; and although the Business Committee have placed on the agenda paper the resolution as it stands here, I will take the sense of the Council upon it.

Mr. NEILD thought there could be no objection to the amendment, which after all appeared to be simply a verbal alteration.

Mr. VARDEN, in seconding the amendment, observed that what was termed "rent" consisted of two parts: payment for the use of the natural powers of the soil, and payment for the use of the capital invested in the soil. For the purposes of the present discussion, they had nothing to do with the first. The simple question they had to consider was, What prevented capital from being attached to the land in the form of improvements? It was not the question, What taxation fell upon the land? but What fell upon the improvement of the land? If they followed out the view of the late Sir Robert Peel, they would at once perceive the cogency of this. That view was that everything which bore upon the means of production should be swept away, and a substitute placed by taxation upon profits; because a tax upon the means of production was a bar to improvement. In the light of that principle, therefore, the Chamber was asking for relief; for a tax upon the improvement of the land acted just as much upon agriculture as a tax upon the raw material formerly did on the imported article. What they wanted, then, was that the capital attached to the land should be in precisely the same position as capital employed in any other manner (Hear, hear).

After some remarks from Mr. WILES, and Mr. BRAMLEY, the amendment was put and negatived, and the original motion agreed to.

Mr. RUSSELL next moved that the application of capital to agriculture was discouraged by uncertainty of tenure, and the absence of compensation for unexhausted improvement. These questions he regarded as essentially interesting to the tenant farmer. As to uncertainty of tenure, it was well known that thousands of landowners objected to grant leases; and he for his part readily admitted that there would be no necessity for leases if a fair system of compensation for unexhausted improvements were established. Those who contended, however, for leases for the protection of the tenant were perfectly right in doing so under present circumstances; but it was

not necessary that the existing system should be always in operation; and as there was now a land bill before the House of Commons for the protection of the occupier in Ireland, he saw no reason why the English tenant also should not be equally protected (cheers). Of course the relations between landlord and tenant were different in the two countries; but in a modified degree, and so far as improvements were concerned, some legislation in the same direction was as much required in England as in Ireland. What advantage was there in a lease beyond the security it gave a man that he would not be disturbed in his holding for a certain length of time? True he would put his capital into the soil during the earlier portion of the term, but he would make a point of taking it out again before the lease had expired (Hear, hear). Now if he were entitled to compensation for unexhausted improvements, there would be no necessity for his doing anything of that kind; and he might continue to farm just as well at the close as at the commencement of his tenancy (Hear, hear). In his opinion, then, it would be for the mutual interest of landlords and tenants that compensation should be given for unexhausted improvements, and that that compensation should be secured by Act of Parliament (cheers).

The motion having been duly seconded,

Capt. CRAIGIE thought it desirable that the wording of a resolution of such grave import should be carefully weighed, and he felt that the could not endorse the first three words of the combined clauses, viz. "Uncertainty of tenure," because their meaning had not been satisfactorily explained. There were few parts of the country better off in respect of compensation for unexhausted improvements than Lincolnshire, where a perfect system prevailed. He held in his hand an agreement between a landlord and tenant in that county, and under its provisions a number of things were specified with regard to which the tenant could recover all the capital he had invested at the end of his occupancy, though he might quit upon a six months' notice only. What was really required was compensation for such things as draining, manures, and especially feeding stuffs. He begged to move, as an amendment, therefore, that "Uncertainty of tenure" be omitted, and for the words "absence of compensation for unexhausted improvements," that "absence of leases or a well-regulated system of compensation for unexhausted improvements" be substituted. These amendments would, he thought, meet the case, as respected sufficient security of tenure, without the use of words which, in their present connection, were to many persons decidedly objectionable, and he hoped that by voting for them the Chamber would pronounce an emphatic condemnation of the doctrine which found some favour in these days that there was such a thing as an acquired property termed "occupation" beyond what a man had expended in improvements.

Mr. GENCE ANDREWS, in seconding the amendment, said that, in practice, compensation for unexhausted improvements was a question between the outgoing and the incoming tenant, and was not a question in which the landlord was particularly concerned (dissent). That, he considered, was a point which all should understand; and if any system of compensation for unexhausted improvements could be agreed upon by tenants, landlords would be only too happy to sanction it.

Mr. WHITAKER, alluding to uncertainty of tenure, contended that in the case of a tenant-at-will the obligation to quit at the expiration of a six-months' notice was most objectionable. He believed, however, that landlords as a rule would be satisfied if their tenants had a longer time afforded them for making their arrangements to leave. The question of compensation for unexhausted improvements required grave consideration; and he, as a poor landlord, would not like unconditionally to consent to it himself, for the tenant might be a wealthy man, who chose to drain, use artificial manures, and erect costly buildings and sheds, all of which might improve the value of the property for the particular description of farming he pursued, such as, for example, the feeding of stock, when the farm itself might not be suitable to the purpose. He was of opinion, therefore, that all improvements by the tenant should receive the previous assent of the landlord; otherwise, in the case of a rich tenant and a poor landlord, the improvements might be carried to such an extent as, if not to ruin the latter, to compel him to mortgage his land.

Mr. WEBB supported the resolution as it came from the Business Committee, with regard to uncertainty of tenure. As

the law stood he might be in possession of a farm on the 1st of September; but the tenant-for-life having died the next tenant-for-life might come in and turn him out of possession on the 29th of the same month. In fact, a case of this sort had lately occurred in his county (Worcestershire). As to unexhausted improvements, it was the interest of every man, both the lessee and the tenant at will, that he should farm as well and invest as much money in the land in the last year when he went out as in the first year when he came in; it was equally the interest of the incoming tenant to have the land in the best possible condition. In the vale of Evesham, a few of the largest tenant farmers, holding among them about 8,000 acres, had met and laid down a short code of tenant-right, which was neither more nor less than that the incoming tenant or the landlord should pay the outgoing tenant for his unexhausted improvements; and that the outgoing tenant should be liable to a penalty for neglect, so that his successor should receive the farm in a state of perfection.

Mr. G. SMYTHIES, as a tenant farmer, objected to any compulsory interference by the Legislature between owner and occupier. He concurred with Mr. Whitaker in protesting against the landlord being compelled to make allowances to his tenants for improvements, whether he liked them or not. All he would ask the Legislature to do was to permit tenants for life to make these agreements, which they could not do at present. As to making it compulsory, he did not believe that farmers generally wished anything of the kind. They only wanted to enable those to do it who had not the power of doing it now.

Mr. NEILD pronounced the amendment of Capt. Craigie mere hair-splitting. For his part, he desired to approach the landlords' question with as much honesty and fairness as the tenants' question. If a just system of compensation for unexhausted improvements could be established, they might almost do without any leases at all. It was a delicate thing to go to a landlord and tell him that he must give a lease. If he (Mr. Neild) were the owner of an estate, he should like to do what he pleased with it. The landlord should, therefore, be left perfectly free and unfettered in that respect; and if any good was to be done, an endeavour should be made to bring about a union of feeling between him and the tenant. The necessity for compensation for unexhausted improvements, Mr. Neild illustrated by the case of a widow lady who, on the decease of her husband, was left with a large farm upon her hands. An enormous outlay had been made upon it; but she had no one to look to for compensation, and no resource but to trust to the kindness of the landlord (Hear, hear). There was a good deal of commotion in Parliament just now with regard to the Irish land question; but he was really beginning to think that we wanted some legislation of the sort in England also (Hear, hear). Upon the whole, he was of opinion that the uncertainty of tenure and the absence of compensation for unexhausted improvements did militate against the advance of agriculture, and that if a well-digested system of compensation could be arranged this country would very soon double the produce of her soil.

The amendment on being put was negatived by an overwhelming majority.

Mr. WHITAKER then moved to amend the original motion by making compensation conditional on the previous consent of the landlord to the improvements effected by the tenant; but no seconder appearing it fell to the ground, and the original motion was carried unanimously.

The other clauses in the resolution of the Business Committee, ascribing discouragement in the application of capital to agriculture to "unnecessary restrictions upon courses of cropping" and the "over-preservation of ground game," were also agreed to; and a vote of thanks to the chairman terminated the proceedings.

THE LATE MR. W. FISHER HOBBS.—The portrait of this distinguished agriculturist has, in accordance with the resolution passed at the last Meeting of the Committee, just been hung in the dining-room at The Farmers' Club, where it comes as a companion picture to that of the late Mr. Robert Baker, also painted by subscription. The likeness, however, is not equally good, although it is only fair to say that the artist, Mr. Knight, B.A., had but one sitting or so, when Mr. Hobbs was in very ill-health.

THE SOCIETY OF AGRICULTURISTS IN FRANCE—MEETING IN 1871.

At the Manchester meeting of the Royal Agricultural Society, a deputation from the French Society of Agriculture had, as we specially reported at the time, an interview with the Prince of Wales. This embassy came with the object of inviting his Royal Highness, as President of the National Agricultural Society of England, to become an honorary member of the French Agricultural Society, a request which was at once acceded to, and the union of the two bodies thus auspiciously inaugurated. But what is the French Society of Agriculture—or, more properly, The Society of Agriculturists of France? For some years past Englishmen have been tolerably familiar with French exhibitions, whether of stock or implements, and it would so seem rather late in the day to cement such a sympathy as is here implied. The agriculturists of France and the agriculturists of England should have been old friends, and, like the lodgers in Dickens's sketch, have interchanged mutual civilities and weekly papers long since. When we call to mind all the stories of what Brandreth Gibbs and Hall Maxwell did in Paris, and of the impression which the Babraham Downs and the Tillyfour Polls created, we might only interpret this visit as paid in particular compliment to the high position which our past President occupied otherwise than in his mere relations to agriculture. But it is not quite so. The Society of Agriculturists is the embodiment, or perhaps more precisely the effect, of the previous agricultural celebrations in France. These, as is well known, were too often far better conceived than carried out. Nothing could be more beautiful than the design, nothing more awkward than the execution; and matters came to a climax at Billancourt in 1867. As our own report then ran—"this incongruous scheme has been a most lamentable failure. Every expectation has been doomed to disappointment." And from the ashes of this failure arose the Society of French Agriculturists. To afford some really becoming illustration of steam ploughing M. Lecouteux, a landed proprietor and editor of the *Journal d'Agriculture Pratique*, collected subscriptions through the agency of his paper not merely sufficient to induce Messrs. Fowler and Messrs. Howard to work their several systems at Corbeil, near Paris, in the August of the same year, but with a very satisfactory balance still remaining. This surplus it was eventually determined to devote to the establishment of an agricultural society altogether independent of Government support or interference, and with our English national society as the model. M. Drouyn de Lhuys, the diplomatist, and one of the eight members of the Privy Council of the Empire was elected President, and M. Lecouteux Secretary, so that the venture was well launched, while it already numbers more than five thousand members, with a handsome fund wherewith to develop its intentions. On the Ollivier Ministry coming into office, the Society, after a hard fight, received its Charter from the Government, and is now accordingly one of the recognized institutions of France. There was a long sitting, extending indeed to many days, of the administration in February, to determine as to its foundation principles and course of action, and now the good ship may be said to be fairly afloat. Under the auspices of the Society of French Agriculturists a great Congress will be held in Paris during the month of May, 1871. There will be companion exhibitions of cattle and implements; "a combination" of all the rural Societies of Europe; investigations on the present knowledge of the art of agriculture, practical and scientific, and every possible stimulus offered for further advancement in the same direction. Nothing could look to be more whole-

some than this movement, as it is one which even a few years back it might have been altogether impossible to have originated in France; while in its infancy it does the English farmer the honour above all others to come over here again and again for advice and example. It had representatives both at Leicester and Manchester, who, we may be sure, were doing something more than paying empty compliments, but the rather profiting themselves by our experience of the last thirty years or so.

THE CENTRAL AND THE LOCAL CHAMBERS OF AGRICULTURE.

At a meeting of the Council of the North of England Chamber of Agriculture, the President, Mr. W. H. Charlton, Hesleyside, in the chair,

The SECRETARY reported that he had received the following resolution from the Devonshire Chamber: "That this Chamber, convinced of the necessity of more united action amongst the chambers of agriculture throughout the country, desires respectfully to submit that subject for their careful consideration, and to invite their cordial co-operation in suggesting and adopting such measures as may be deemed best calculated to promote among the various chambers a more united and harmonious course of action."

Mr. LAWSON cordially concurred in the object of the Devonshire Chamber, but it was not desirable to enter upon the subject without having given it that mature consideration which it deserved. He therefore moved that it be taken into consideration at the next meeting. He quite concurred that the Central Chamber did not at present correctly represent the local chambers—(Hear, hear from the President)—and he thought the Central Committee committed a great and fundamental error when they requested local chambers to send up deputies to consider and decide upon the question of agricultural statistics, and came to no decision upon the subject, clearly showing that the Central Chamber either chose an inopportune time for bringing the question forward or did not carry it to a solution which they ought to have been prepared to do.

The CHAIRMAN said he might add that, after the discussion upon turnpike roads at the meeting of the Central Chamber, which he attended, about one-fourth of the members left, and the question of agricultural statistics was discussed by the remainder.

Mr. LAWSON: I think I understood you that they displayed nothing in considering the turnpike roads to alter the conviction of what I said; and that they did not proceed to a decision upon it.

The CHAIRMAN: No. Mr. Hugessen said the Government were going to bring forward a bill to alter the incidence of local taxation in some way; but that there was no chance of anything being done about turnpike roads themselves this Session. It gave him a very bad opinion of the business habits of the Chamber.

Mr. C. D. BALLELY had great pleasure in seconding the motion. He quite concurred that the Central Chamber should be an associated chamber, and that time should be given to the local chambers to thoroughly discuss each question before it came before the Central Chamber, and arrived at a conclusion upon it.

The CHAIRMAN thought it would be difficult to get union among the chambers.

Mr. LAWSON thought it might be done; chambers of commerce did it.

Mr. DAND, Hauxley, thought they diffused their energies too much; they should grapple with some subject, local taxation, for instance, and devote all their energies to it. The incidence of taxation affected them more than anything else.

The CHAIRMAN: I think it does.

Mr. LAWSON: It is a national subject, but particularly affects the landed interest, because they have been left on what we may call a lee-shore, to take care of themselves.

Mr. DAND: And there seems to be an inclination to pay for every fresh scheme out of the local rates.

The resolution was then carried.

STALLIONS FOR THE SEASON, 1870.

[NONE BUT THOROUGH-BRED HORSES ARE GIVEN IN THIS LIST].

The Groom's Fee, if not included, varies from a Guinea to Half-a-Crown.

SALE OF MR. HODGKINSON'S SHORTHORNS AT MORTON, RETFORD.

BY MR. JOHN THORNTON.

This herd has been selected and bred during the last ten years from stock bred by the late Mr. John Hall, Kiveton Park; Mr. John Armstrong, Palterton; Mr. George Bland, Coleby, and other breeders. Among them were some animals in direct descent from Lord Spencer's noted herd at Wiseton, including two specimens of the No. 54 of Lady Sarah family. The bulls that have been in use at Morton Grange have been bred chiefly from the Wiseton herd, combined with the blood of Messrs. Bates and Booth, viz.: Majestic (24510), by Mr. Booth's Lord of the Hills, from a daughter of Zeal, bred at Wiseton; and Duke of Nottingham (25992), by Mr. Bolden's Grand Duke 6th, from a descendant of Dimity by Zenith.

Thirty-eight cows realized an average of £25 15s., and a total of £977 11s., and nine bulls an average of £24 12s. 4d., making £221 11s. The total proceeds were £1,199 2s. for 47 animals.

LONG-WOOLLED SHEEP—30 ram hogs were then sold, bred for many years from the flocks of Messrs. Burgess, Stone, and Sanday, and lately from Messrs. C. Clarke, Marshall, and Johnson.

CAPTAIN OLIVER'S SHORTHORN SALE AT SHOLEBROKE, NORTHAMPTON.

By MR. J. THORNTON, ON APRIL 13TH.

The farm attached to Sholebroke Lodge until recently formed part of the ancient forest of Whittlebury, some portion of the premises having been the offices of the forester. Nature has done but little for it; and a more barren or uninviting pasture we have seldom seen. If Shorthorns can flourish here, no part of England need be without them. A goodly array of breeders mustered at Sholebroke on Wednesday last to witness the dispersion of the well-known herd, all being offered with the exception of the Grand and Cherry Dukes and Duchesses, Lady of the Lake of Foggathorpe descent, and four heifer calves, which are retained as the foundation of another herd. The animals were in nice trim, not in any way pampered—a state of things alike satisfactory to buyer and seller. The greatest competition was excited for Lalage 4th, of Bates' Olive Leaf tribe—a very handsome cow, of good colour, but short in her quarters—when Mr. S. E. Bolden, of Grand Duchess fame, once more appeared on the Shorthorn scene, and claimed her at 450 guineas. This event caused great excitement among the "locals," who, no doubt, thought she might reach 40 or 50 guineas; their hearty cheers, however, testified the delight they felt, that their popular neighbour had secured so great a price for one of his stock. Mr. Bolden also purchased Bracelet the 8th, 9th, and 10th at 130, 100, and 190 guineas. It was rumoured around the ring that Mr. Bolden was the adviser of one of our large railway contractors, into whose hands these animals would eventually go. Lords Fitzhardinge and Skelmersdale were also present, the former, after spirited biddings, securing two of the famous Wild Eyes tribe at 170 and 140 guineas; while Lord Skelmersdale confined his attention to The Charnier tribe, of Milcote renova. Earl Fitzwilliam, Sir Tatton Sykes, and Sir Curtis Lampson, with the Hon. C. W. Fitzwilliam were also among the foremost purchasers.

A luncheon was served to about 350 in a tent near to the ring and presided over by Colonel Kingscote, who in a few well-timed sentences gave the usual toasts. The company then adjourned to the ring over which Mr. Thornton presided, and it is only right to add, conducted the business in a very efficient and becoming manner. We subjoin the "official" history of the herd: The foundation was first established at Stockwood Park and Milcote sales in 1860; the Orange tribe came from the former, and the Sweethearts, Frills, and Queens, from the latter; the Adelina tribe following them from Panton. The next year Cowslip 5th and Lalage were bought at Mr. Jonathan Peel's sale; both these animals are full of Kirklevington blood, the latter being in direct descent from the Olive Leaves or Barringtons, formerly in Mr. Bates' possession. Romulus Butterfly (18741) was then purchased privately from Col. Towneley; and in 1862 the Mason or V tribe came from Mr. Surtees, who obtained it from Mr. S. Wiley, and he purchased No. 51 at the great Chilton sale. The same year Cherry Duchess 9th and Grand Duke 7th (18977) were added to the herd. This bull was bred by Mr. Bolden, by Grand Duke 3rd from Grand Duchess 4th, and is own brother to the dam of Duke of Devonshire's 600-guinea Grand Duke 10th (21848). At the close of 1862 Wiley Witch was bought at Mr. Marjoribanks' sale at Bushey Grove. The Bracelets, with two crosses, Grand Duke and Seventh Duke of York, were originally at Castle Howard and Holker Hall, but came from Mr. Graham of Yardley, in company with Lady Wild Eyes 2nd, granddaughter of Wild Eyes 27th, bred by Mr. Bates. The most important additions to the herd were made in 1867, when Grand Duchesses the 17th and 18th were bought at Preston Hall for 1,560 guineas.

COWS AND HEIFERS.

Viscountess, red, calved January 23, 1859, by Duke of Argyll (11375), out of Baroness by Master Goldsmidt (13315).—Earl Fitzwilliam, 43 gs.
Darlington 9th, roan, calved July 7, 1859, by Marmaduke (14897), out of Darlington 8th by Fourth Duke of Oxford (11387).—Mr. A. J. Robarts, 46 gs.
Bracelet 2nd, white, calved March 20, 1862, by Seventh Duke of York (17754), out of Bracelet by Second Duke of Bolton (12739).—Mr. J. Cole, 50 gs.

THE COOLLATTIN SHORTHORN SALE.

The annual sale of Earl Fitzwilliam's yearling bulls took place at Coollattin, co. Wicklow; Messrs. Ganly, auctioneers. The following is a list of the animals, purchasers, and prices:

Prince Consort (27135), calved Nov. 22, 1868.—Mr. Leslie, Saddle, Ross-shire, £35 14s.

Royal Oak (27371), calved Dec. 5, 1868.—Mr. Magenis, Roscommon, £48 6s.

Jolly Tar (26475), calved Dec. 8, 1868.—Mr. Ellis, co. Wicklow, £39 7s. 6d.

Lord of the Isles (26706), calved Dec. 14, 1868.—Mr. Glancy, Roscommon, £42.

Prince Oscar (27191), calved Dec. 27, 1868.—Mr. Hornidge, co. Wicklow, £32 11s.

Pleisades, calved Feb. 2, 1869.—I. T. Hamilton, M.P., £29 8s.

Vulcan, calved Feb. 4, 1869.—Mr. Glancy, £43 1s.

Julian, calved Feb. 25, 1869.—Mr. Keogh, £22 1s.

Ploughboy, calved Feb. 25, 1869.—Mr. Brown, co. Carlow, £18 7s. 6d.

Islander, calved March 5, 1869.—Mr. Trotter, Garguslon, Ross-shire, £33 1s. 6d.

Ich Dien, calved March 5, 1869.—Hon. Mr. Proby, £23 17s. 6d.

John O'Gaunt, calved March 7, 1869.—Mr. Hanlon, co. Carlow, £26 5s.

Peveril of the Peak, calved March 12, 1869.—Mr. Courtney, co. Wicklow, £22 11s. 6d.

Safeguard, calved May 10, 1869.—Mr. Montfort, co. Wicklow, £15 15s.

They were all by Lord Stanley (24466).
Average, £31 4s. 9d.

NORTHAMPTONSHIRE AGRICULTURAL SOCIETY.—The show of entire cart horses in connection with the above society took place at Northampton, with the following result: Best stallion for agricultural purposes, the property of or hired by the exhibitor, first prize £10, Mr. John Manning, Orlingbury—chestnut colt, bred by Mr. Stokes, sire Old Champion, 8 years old; second of £5, Mr. John Roach, Gretton—England's Glory, bred by Mr. B. Shaw, Swineshead, sire Mr. Taylor's England's Glory, sire of dam Old Lincoln, 7 years old. The judges were Mr. Thomas Woods, Wychley Warren; Mr. William Treasler, Moulton; and Mr. F. J. Berry Stanion.

THE SECOND-BEST CHRISTMAS COW.—At the last Birmingham Show we spoke to Messrs. Mitchell's Blue Belle as "a very sweet, almost dainty creature," and as one, "what with her pretty lady-like head, her nice long low frame and light bone, that would seem yet more an ornament for the herd than a victim to the shambles;" and Blue Belle has just dropped a very pretty heifer-calf.

SALE OF MR. W. HEWER'S CATTLE AND SHEEP.

This sale took place at Northleach, on which occasion, as might be expected from his reputation as a breeder of cattle and Cotswolds sheep, there was a very large attendance of farmers and dealers from the adjoining district, as well as others from more distant counties. Mr. Hewer spared no expense in obtaining the best blood, and he had succeeded in collecting a herd which, in point of form and quality, contained perhaps a greater number of really good animals than could be found in this part of the country. The oxen and steers were very fresh having had neither cake nor corn; amongst the three-year-old steers were some extremely choice beasts well calculated to make prize animals.

The sale commenced shortly after one o'clock, Mr. Villar, of Cheltenham, officiating as auctioneer. The sheep were first brought to the hammer. The ewe tegs, which were sold in lots of five each, were speedily knocked down at prices varying from 38s. to 168s. per head, the principal buyers being Mr. Swanwick, of the Royal Agricultural College, Cirencester; Mr. Canning, whose purchases are intended for New Zealand; Mr. Easton, from Scotland; Mr. Phillips, of Dorn; Mr. Tucker, of Poundborough; Mr. Hodges, of Milcote, Stratford-on-Avon; Mr. Smith, of Bibury; Mr. Fletcher, of Shipton; Mr. W. Harding, of Northleach; Mr. Matthews, of Thenford Farm, Newton; Mr. Deacon, of Dix; Mr. Rayer, of Withington; Mr. Lord, of Brize Norton; Mr. Wheeler, of Elkstone; Mr. Porter, of Cola St. Aldwyns; Mr. Humphries, of Sevenhampton; and Mr. Clare, of Bampton.

The ram tegs, of which there were 30 lots, realised prices varying from 5s. each the lowest to 9½s. the highest, several other lots fetching 7½s., 8s., and 8½s. each. Amongst the buyers were Mr. Easton, from Scotland, and Mr. Little, of Norecutt, purchasers of the highest-priced animals; Mr. Godfrey, Rissington; Mr. Pedley, Kilkeny Farm; Mr. James Taylor, Long Compton; Mr. Swanswick, of the Royal Agricultural College, Cirencester; Mr. Hiatt, Snowhill; Mr. Frampton, Uffington; Mr. C. Newman, Long Furlong Farm; Mr. Frampton, Fernham, Beds; Mr. Rivette, Rendcombe Park; Mr. Stevens, Farmington; and Messrs. Hands, Harwood, and Taylor.

A well-bred Hereford cow, Bloomer, fetched £25 10s., the buyer being Mr. Ailday, of Chipping-Norton; and her calf £10 10s., the purchaser being Mr. George Hewer, who is taking to the farm. A Hereford cow, Young Bloomer, was bought by Mr. Stilgoe, of Adderbury, for £27 10s.; Pretty Maid, and Cherry, fetched £29 each; Blossom, £22 10s.; and Snowdrop, £38. The working oxen realised high prices, several of them ranging up to £37 a-piece, the lowest being £28. Amongst the buyers, besides those already mentioned, were Mr. Barton, Cola St. Dennis; Mr. Peachey, Coverley; Mr. Hulbert, North Cerney; Mr. Austin, Wroughton, near Swindon; Mr. H. Cuss, Cricklade; Mr. Stranks; Mr. Harding, Northleach; Mr. T. Palmer, Nailsworth, &c.

The steers and heifers fetched good prices, the highest being £42, bought by Mr. Harding, of Northleach, and others were purchased by Mr. Leonard, Dursley (£37); Mr. A. Pike, Tewkesbury; Mr. Waller, Farmington; Mr. Tanner, Welford, Berks; Mr. T. Porter, Baunton; Mr. Slatter, Stratton; and Mr. Hulbert, Cerney.

EXPORTATION OF BREEDING STOCK TO AMERICA.—A shipment of two-year-old and yearling Shorthorn heifers left Liverpool by the "Denmark" for Mr. James O. Sheldon, Geneva, New York. These animals were purchased in this country and shipped by Mr. John Thornton, as breeding stock for the celebrated Dutchess bulls in Mr. Sheldon's herd. Mr. Cheney's herd at Gaddesby supplied two heifers—Bouquet 3rd, a roan of the Foggathorpe tribe, and of the same family as Col. Towneley's prize heifer Baron Oxford's Beauty, and May Lass 2nd, roan, descended from Mr. Fawkes' Millicent tribe; both these heifers were by General Napier a bull of Bates Princess blood. Lady Worcester 4th, roan, a Bates' Wild Eyes heifer, was selected from Mr. John Harvard's herd at Winterfold, and Sidonia 2nd, a red of Mr. Bowly's Gazelle family, from Mr.

Isaac Downing. Two heifers were bought of Mr. Hugh Aylmer—Guava 4th, with some Booth blood, and Britannia 18th, red, descended from Mason's No. 6 Chilton sale. A Booth heifer, Rosary Charm, was purchased from Mr. Torr at Aylesby, and Rosemary, descended from Mr. Cowling's Kitt stock, came from Teesdale. These animals had a very good voyage, and were landed safely at Mr. Sheldon's farm at Geneva, New York State, on the 10th of March. As the United States Government restrict the importation of live stock, they were accompanied with certificates of health from the breeders and magistrates of the district. Messrs. Walcott and Campbell, who recently purchased Mr. Booth's cow, Bride of the Vale, for 1,000 guineas, are in treaty for another shipment of Shorthorns, including Colonel Towneley's heifer, Baron Oxford's Beauty, and other well-known animals, and a small lot of heifers and bulls will shortly be sent to Colorado.

THE CONTAGIOUS DISEASES (ANIMALS) ACT TO MARCH 5, 1870.

Mr. Sewell Read has asked for a return of stock diseases, which is not yet printed. He desired to have a return of the number of cases reported to the Veterinary Department of the Privy Council, but was informed he could only have the number of infected farms or places, and in the case of *pleuro-pneumonia* that some local authorities did not get into order till the Michaelmas quarter sessions were over (for there was no power, in fact, to put the local authority in motion till the sessions met), but after they were made to keep a register of all cases of disease for each inspector to weekly report to the Privy Council. It seems so very odd that no record of the number of cases thus reported is kept by the Veterinary Department. Possibly they consider none but pleuro are of sufficient importance to render a record necessary; but then why trouble the local authorities and inspectors to make these weekly returns?

A return of the number of farms and other places in Great Britain infected with foot-and-mouth, pleuro-pneumonia, sheep scab, and glanders reported to the Privy Council:

Foot-and-mouth...	16,140	Scab	1,69637
Pleuro-pneumonia	911	Glanders	

There are in the 911 outbreaks of pleuro 2,763 cases reported—no record seems to be kept of the number of cases of foot-and-mouth, sheep scab, and glanders. Foot-and-mouth has prevailed in all counties, but there are only five infected places reported for Cornwall: the West Riding of Yorkshire seems to have suffered most, and then comes Suffolk. There is no case of pleuro in Cornwall, Dorset, Gloucester, Hereford, Monmouth, Westmoreland, or the East Riding of Yorkshire; and the Welsh counties are free from this deadly disease, save Denbigh and Flint. Cornwall furnishes 261 farms on which scab prevails, Devon 166, Monmouth 124, Somerset 103, Cumberland 89, Leicester 87, and Northampton 78. Northumberland, Westmoreland, East Riding, Cambridge, and Berks are clear.

PLOUGHING AGAINST TIME: A CHALLENGE.—A ploughing-match of a novel kind has recently taken place at Bainingale, Shropshire, and it was certainly an extraordinary performance. Mr. Southall, a farmer, undertook, on the impulse of a bet, to plough one acre of land, in a workmanlike manner, within three hours, using a single plough, to which four horses were attached, working two abreast and driven by a boy. The field selected was a wheat-stubble, and the crop had been cut with a reaping-machine. The plough has been many years in Mr. Southall's possession. It was made by his own blacksmith, according to his own plan, and under his instructions. The work was completed in the short space of two hours and sixteen minutes, to the entire satisfaction of the judges, and amidst the applause of a large concourse of agriculturists who had assembled to witness it. Mr. Southall is open to challenge any plough, whatever its construction may be for accuracy of work and ease of draught; and, according to our correspondent, Messrs. Howard, Messrs. Ransome and Sims, and other celebrated implement-makers must look to their laurels.

THE GAME-LAWS BILL.

Draft of the bill to amend and to assimilate in certain respects the laws of England and Scotland relating to game, as introduced by the Lord Advocate:—

Whereas by the law of England the tenant in the possession of land for the time has the sole right of killing and taking the game thereon, unless right be expressly reserved by, or granted to, the landlord or any other person; and it is expedient to assimilate in this respect the law of Scotland to England, and also to amend and assimilate in certain other respects the laws of England and Scotland relative to game, and to make certain provisions for the protection of tenant-farmers against injury arising to them in consequence of any undue increase of hares and rabbits, when they are prohibited by the landlords from killing and taking these animals: Be it therefore enacted by the Queen's Most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same as follows:—

1. This Act may be cited for all purposes as, "The Game-Laws Amendment Act, 1870."

2. For the purposes of this Act, the words and terms hereinafter mentioned shall have and include the meanings hereinafter assigned to them, that is to say:—

The term "lessor" shall mean the grantor of any lease of land for a year or a longer term, and also the person for the time in the right and subject to the obligations of the grantor with respect to such lease.

The term "lessee" shall mean the grantee of any lease of land for a year or longer term, and also the person for the time in the right and subject to the obligations of the grantee with respect to such lease.

The term "game" shall be deemed to include hares, pheasants, partridges, grouse, heath or moor game, black game, and bustards.

The term "Martinmas" shall mean the eleventh of November.

The singular shall include the plural, and *vice-versa*.

3. The Act of the Scottish Parliament, 1621, chap. 31, "anent hunting and hawking," is hereby repealed.

4. In all cases where any person shall occupy any land in Scotland as tenant, under any lease or agreement made subsequently to the passing of this Act, such person shall have the sole right of killing and taking the game and rabbits upon such land, unless such right shall have been expressly reserved by the landlord, or granted to him by the tenant, or except in so far as such rights shall have been so reserved or granted.

5. No lessee in the occupation of any land in England shall be liable to prosecution, or to any penalty or punishment under the Act 1st and 2nd William IV., chap. 32, intituled "An Act to amend the laws in England relating to Game," or under any other Act or Acts of Parliament, for pursuing, killing, or taking hares or rabbits on such land, or for giving permission to any other person so to do; but the permission of a lessee without right shall not avail any person to whom it may be given: provided always that nothing herein contained shall protect a lessee against an action for breach of any contract whereby he is restrained from pursuing, killing, or taking hares or rabbits on the land of which he is lessee.

6. No lessee in the occupation of any land in Scotland shall be liable to prosecution, or to any penalty or punishment under any Act or Acts of Parliament, for pursuing, killing, or taking hares or rabbits on such land: provided always that nothing herein contained shall protect a lessee against an action for breach of any contract whereby he is restrained from pursuing, killing, or taking hares or rabbits on the land of which he is lessee.

7. No injunction shall be granted in England, and no interdiction shall be granted in Scotland, upon, or in order to pro-

test or enforce any contract whereby a lessee is restrained from pursuing, killing, or taking hares or rabbits on the land of which he is lessee; but the lessor shall be left to his ordinary legal remedies other than injunction or interdiction upon such contract.

8. When the exclusive right of killing hares or rabbits has been reserved by, or granted to, the lessor, and he shall fail or omit to keep down the stock of these animals to such an extent as shall be fair and reasonable in justice to the lessee, who is prohibited from killing them, such lessor shall be liable in damages to the lessee for the loss, injury, and damage caused to him by such failure or omission: provided always that in judging of the extent to which it is fair and reasonable that such stock should be kept down, and also in assessing damages, regard shall be had to the character and cultivation of the land, the amount of the rent as compared with the real value, and the terms and conditions of the lease.

9. Any lessee who, by himself or others for whom he is responsible, hunts, kills, or takes game or rabbits contrary to the terms of his lease, or of his bargain with the lessor, shall be liable in damages for breach of contract, and the same may be recovered in the form and manner hereinafter provided.

10. Any lessor who, to the injury and damage of the lessee, fails to fulfil the obligation incumbent on him under clause 3 of this Act, shall be liable in damages as for breach of contract, and the same may be recovered in the form and manner hereinafter provided.

11. In England, damages to any amount not exceeding £50, for which liability is incurred under the provisions of this Act, may be sued for in the county court within the district of which the lands upon which the claim of damages has arisen, or any part thereof are situated, and the judge of such county court may remit to a man or men of skill to inspect the premises and report, and shall try and decide the case without a jury.

12. In England, when the damages claimed exceed £50, any action therefor shall be brought in one of the supreme courts of common law at Westminster.

13. In Scotland, damages to any amount not exceeding £50, for which liability is incurred under the provisions of this Act, may be recovered by action before the sheriff of the county in which the lands or any part thereof are situated; and such action may be raised and proceeded with in the form and according to the procedure observed in the Sheriff Small Debt Court, subject to the following provisions in cases where the amount sued for exceeds £3 6s. 8d., viz.:—

First, That counsel, agents, and procurators shall be entitled to appear for the parties in such actions.

Second, That the sheriff shall take and preserve a note of the pleas of parties, and any evidence that may be adduced.

Third, That the sheriff may remit to a man or men of skill to inspect the premises and report; and,

Fourth, That when the sum sued for exceeds £25, the sheriff's judgment shall be subject to appeal to the Court of Session.

14. In Scotland, when the damages claimed exceed £50, any action therefor shall be brought in the Court of Session.

15. Any action by a lessor against a lessee for damages of the nature hereinbefore provided for, shall be brought within three months of the date of the act or acts on account of which damages are claimed, and shall not hereafter be competent.

16. Any action by a lessee against a lessor for damages of the nature hereinbefore provided for, shall be brought not later than Martinmas of the year in which the injury was done, in respect of which the damages are claimed, and shall not thereafter be competent; and the year shall, for the purposes of this Act, be taken to run from Martinmas to Martinmas, and only one such action shall be competent in the same year to the lessee against the lessor of any farm.

17. Any written agreement between a lessor and lessee to refer to arbitration claims of damages which have arisen, or may thereafter arise between them, of the nature hereinbefore provided for, shall be valid and binding, although the arbiter

or arbiters may not be named; and if either party shall refuse or fail for ten days after written notice to name an arbiter or arbiters in pursuance of such agreement, the arbiter or arbiters named by the other shall be at liberty to proceed and to act as if he or they had been duly appointed by both parties.

18. A written decision by an arbiter or arbiters named by the parties, or by one of them, after the refusal or failure of the other as aforesaid, or by an arbiter or arbiters duly appointed under any such agreement as is contemplated in the preceding section, or by an oversman duly appointed under any such agreement, shall be valid and effectual in act of law, according to the true intent and meaning thereof, although it shall not be in the form of a formal award or decree arbitral, and it shall be no objection to the agreement to refer to the nomination of an arbiter or arbiters, that the same is not contained in a formal deed, provided it be in writing, admitted or proved to be genuine.

19. A lessee who is by contract or agreement with the lessor prohibited from killing hares or rabbits on the land let to him shall be at liberty before the term of Martinmas in any year to render to the lessor, his known factor or agent, an account of the damage caused to him in the year by the failure or omission of the lessor to keep down the stock of these animals, and to name an arbiter to whom he is willing to refer his claim against the lessor for such damage; and provided the amount claimed does not exceed £25, the lessor shall be bound within fourteen days of the receipt of such account and nomination to name an arbiter to act for him in regard thereto, and the arbiters named by the parties respectively shall be entitled to decide finally upon the lessee's claim, or if they cannot agree, to name an oversman or umpire, who shall be entitled finally to decide upon the same; and should the lessee fail to name an arbiter within the time hereby limited, the arbiter named by the lessee shall be entitled to decide upon the claim.

20. No proceedings under the preceding clause shall be void for want of form, and the arbiter or arbiters, umpire or oversman, having jurisdiction by virtue thereof, shall be at liberty to determine the course of procedure and the nature and extent of the inquiry which it is proper to make, and their decision or decisions shall be final, and although informal, may be enforced by action in act of law.

21. It shall not be competent to any lessee to have in respect of the same farm more than one such arbitration as aforesaid in any one year, and such arbitration shall preclude an action by him in the same year for damage caused by hares or rabbits upon such farm.

22. This Act shall come into operation from and after the first day of February, 1871.

ABERDEENSHIRE TENANT FARMERS AND THE GAME LAWS.

A largely attended meeting of tenant farmers and others in the Alford district of Aberdeenshire was held at Bridge of Alford to consider the Game-law Bills before Parliament.

Mr. WALKER (Bithnie) presided, and said he could not introduce the subject better than by reading a letter from their representative, Mr. M'Combie, M.P., who took great interest in the question, and unflinchingly represented the wishes of his brother farmers in this important matter. The letter stated that the member for West Aberdeenshire was very glad that the farmers of Alford were meeting in the matter, and would have been delighted to have been present but for important engagements in other parts of the country. He could have wished very much that Mr. Loch and Mr. M'Lagan had agreed to amalgamate their Game-law Bills, and not have divided public opinion about their merits. He was very glad that the Lord Advocate had promised to lay upon the table of the House of Commons a Government bill, and in consequence of this, Mr. Loch's bill had been postponed. A bill brought in by any private member would (Mr. M'Combie thought) have very little chance of being carried in opposition to a Government measure, which he hoped would deal in a satisfactory manner with this vexed question. If it were not a measure that they could accept, it would only increase agitation on the subject. A strong feeling was now arising in this country that the time for a compromise has passed, and that nothing short of entire abolition will be

accepted. His sympathies, he said, entirely went with this feeling, and he was glad many Scotch members were of a similar opinion. Nothing but bad health would prevent him from being in his place in the House of Commons when Mr. Taylor's bill or the others on this subject came up for discussion. Mr. Walker, after reading the letter, referred to the change which has recently come over the minds of farmers in respect to the public discussion of this question. What he proposed ten years ago—the public discussion of game-laws by agriculturists—was now extensively adopted. No one had made a greater change than their respected member, who, in 1860, was a zealous game protector, and in 1870 was prepared to abolish the law. His opinion was that, in order to have successful legislation, the old laws would require to be entirely repealed. Mr. M'Lagan's Bill—an honest measure—would have been satisfactory in 1860, but not now. Mr. Loch's bill would evidently perpetuate the laws. Many difficulties interfered to prevent the farmer benefiting by the proffered boon of conceding hares and rabbits. He was afraid the landlords' consent would be necessary to the killing of hares and rabbits as much after the passing of Mr. Loch's Bill as it was now. Mr. Loch's bill certainly promised compensation for ravages by game, but how could these damages be correctly ascertained? He condemned the clause in Mr. Loch's bill enabling the tenants to break contracts with proprietors. They had themselves to blame so long as they had a voice in making the laws of their country if they allowed their crops to be destroyed by game any longer. They should go in for entire abolition, and they would be supported by their brother farmers in Scotland as well as England, and also by inhabitants of towns.

Mr. BENTON (Crookmore) moved the following resolution: "That the Game-laws are injurious to the interests of agriculture, inasmuch as they give one class power to preserve and multiply to excess wild animals which feed upon and destroy the tenants' crops designed for the food of the people." He supported the resolution briefly. He said it was more a national question than one affecting merely proprietors and tenants. It would be generally admitted that Game-laws favoured one class at the expense of another.

Mr. FORBES (Newbrace) seconded the resolution, which was carried unanimously.

Mr. MITCHELL (Auchnagathel, Keig) moved: "That the present Game-laws are a national evil, inasmuch as they encourage poaching, are a fruitful source of lawlessness and crime, and greatly diminish the progress of agriculture." When one-third or one-half of their crops, he said, as the case might be, were destroyed by game, there was very little use of what remained, in consequence of frost. The damages, especially on grass fields, were incalculable. The Game-laws fostered poaching and crime, as well as much ill-feeling between landlord and tenant.

Mr. LAWMOND (Mosshead) seconded the resolution, which was carried with acclamation.

Mr. ANDERSON (Wellhouse) said it was very unpleasant for them to take up a position against their landlords. Aberdeenshire farmers had taken the lead in this matter, as shown by the result of the last two Parliamentary elections. Other Scotch counties had since followed their example, as had also several English constituencies. The preservation of farmers' crops was indirectly as much the landlords' interest as the tenants'. Aberdeenshire proprietors did themselves great credit by not only joining but leading the farmers in stamping out the rinderpest, and the farmers now regretted that the landlords did not join with them in stamping out the game pest. Farmers were not guilty of complaining, and were too keenly alive to their own interests to open their mouths against their landlords, and to come thus forward without a grievance. Let the rights of property be regarded as sacred upon the one side as the other. Were not their crops as much their property as the landlords' purses were theirs? Did they not waste their labour and capital in cultivating crops which were sacredly their own? Mr. Loch's bill was, he would say, calculated to be favourable to the Lowland and unfavourable to the Highland tenant; while it would be unfair to Lowland landlords, and beneficial to Highland landowners. If the Lowland landlord did not get hares and rabbits, he would be left with only a few partridges; while the Highland landlord would have his deer and grouse preserved. The result of this Bill would be free-trade in game in one part of the country,

and Protection in another. Nothing short of entire abolition would do. The rabbit warren was probably not so destructive as the deer forest. The rabbit in its mischievous powers was half-brother of the rat, and though the red-deer was the most noble of four-footed game, he was not destined to take the place of man. Deer forests had been created at the expense of evicting thousands of families from Highland glens, and he regarded the deer forest as the greatest blot on the Game-laws. Game watchers could no more prevent professional poachers from killing game than they could prevent notorious thieves from stealing. It had been said that the letting shootings and preserving game encouraged noblemen and gentlemen to live for some time in the north and spend money. It was only a few hotelkeepers and gamekeepers that benefited by this arrangement, and during the eight or nine months of the year during which the game was not shot, the farmers' crops suffered greatly. He maintained there was more need for the repeal of the Game-laws than of the Corn-laws. They had Liberal as well as Conservative proprietors in Parliament opposed to abolishing these laws. He was afraid the most dangerous opponent to abolition was the Liberal landlord, who gave the measure a sort of half-warm-hearted support to enable him to face his constituents. He feared there were lions thus in sheep-skins. Before they obtained their wishes in this matter, he thought it would be necessary for town and country inhabitants to form themselves into an Anti-Game-law League, which they should do. He concluded by moving the following resolution: "It is the opinion of this meeting that of the several Game-law Bills which may be introduced into Parliament, the only one which will remedy the evils complained of is that which proposes their entire abolition."

Mr. WALKER (Mill of Fawlis) seconded the resolution, which was carried unanimously.

Mr. REID (Upper Balfour) moved: "That a petition embodying the above resolutions should be sent to Parliament, through our representative, Mr. McCombie, with an urgent request that he use his influence in getting the prayer of the petition granted." He regarded Mr. Loch's bill as a mockery to the tenantry of Scotland.

Mr. ROSS (Corbanchory) seconded the motion, which was declared carried amid great cheering.

A vote of confidence was then passed unanimously in Mr. McCombie, M.P.; and a vote of thanks to the Chairman closed the meeting.

A petition in terms of the last resolution was numerously signed after the meeting terminated, which was, without exception, the most unanimous for total abolition that has yet been held among northern tenant-farmers.

THE GAME LAWS.

At a meeting of the East Suffolk Chamber of Agriculture at Ipswich, Mr. NEWSON GARRETT read a long paper on this subject, and concluded by moving the following resolutions, which were seconded by Colonel Sir R. A. S. ADAIR:

1. "That the present game laws are injurious to the best interests of landlords, tenant-farmers, and the country at large; and that their influence is demoralising to all classes."

2. "That they add greatly to the heavy rates, the payment of which is yearly becoming more irksome and distasteful to the whole community, and to the judicious reduction of which each Government in its turn professes to accord its most hearty approbation."

3. "That hares and rabbits ought to be excluded from the operations of the game laws; that their preservation, being incompatible with good farming, is contrary to the public good, and that therefore all contracts, having for their object the preservation of hares and rabbits, ought to be declared illegal."

4. "That the expenses of all prosecutions under game Acts ought to be defrayed by the persons concerned in the actions, and not by the county."

5. "That this Chamber of Agriculture is unanimous in hoping that the hon. Members for East Suffolk will use their influence both in the House of Commons and out of it, for the thorough investigation, and for the reform of these laws."

The meeting appeared by no means inclined to go altogether with Mr. Garrett, and Mr. E. DECK moved as an amendment,

"That the over preservation of ground game is injurious to the best interests of landlords, tenant farmers, and the country at large." Mr. GARROULD seconded Mr. DECK's resolution.

Mr. R. L. EVERETT proposed the adjournment of the debate, and deprecated taking any resolution upon a part of the question, which should be debated as a whole. Mr. W. KERSEY seconded the motion.

Mr. NEWSON GARRETT objected strongly to the amendment, and pressed for a division on the first resolution.

Mr. M. BIDDLE, who had succeeded Mr. Henniker-Major, M.P., as chairman, ruled that he must first put the amendment for the adjournment of the discussion which had been last moved, and said he should like to have more said about the remedy for the present state of things. He was sure Mr. Garrett's position would be no less strong for an adjournment.

Mr. GARRETT: I come here not to maintain Mr. Garrett's position, but I come here on the part of the farmers, and I protest against the adjournment of the discussion. I press for a decision now. (Cries of "Chair, chair," and "Order.")

The CHAIRMAN then put the amendment moved by Mr. Everett, which was carried by a large majority, and the meeting was declared adjourned for a fortnight.

Several members essayed to continue to address the meeting, but votes of thanks were passed to Mr. Garrett and the Chairman, and the hall was soon cleared.

THE GOVERNMENT GAME BILL.—The Bill is very different from any which has hitherto passed into law upon the subject of game. The clauses are few and very simple. But they indicate perhaps more clearly than any other measure which has been introduced by Government since the commencement of the Reformed Parliament in what direction public opinion is drifting. Not that the measure can be characterized as democratic. On the contrary, it is eminently moderate. But when compared with any previous Acts which have been passed on the subject of game there is a marked difference. And it is this—that, whereas in all former Acts almost without exception, the interest of the landlord has been paramount, in this Bill it is the interest of the tenant which is paramount. The object of the Bill is to assimilate the laws of England and Scotland relating to game. In Scotland it appears that game is not the property of the tenant. When he enters on a lease he has no more right to the game upon his farm than he has to the landlord's residence. In England it is otherwise. But, on the other hand, it appears that in England the farmer who has resigned his rights to the game may be treated as a poacher if he should take a head of game off his own farm. In Scotland he cannot be so treated. In these two particulars the Lord Advocate proposes to assimilate the laws of the two countries. Henceforth, if this Bill passes, game in Scotland is to be the property of the tenant. Henceforth the tenant in England may take what game he likes off his own farm, and he can be dealt with by a civil action only. It is obvious that both these alterations in the law will tend greatly to better the condition of the tenant. But these are the first steps only in this direction. No injunction or interdict is to be granted whereby the tenant can be restrained from killing all the hares and all the rabbits on his land if he be so minded. The landlord's only redress in such a case is a civil action for damages against the tenant. The latter may kill every four-footed animal on his land, and then leave the assessment for damages to a jury of his peers. This is an important weapon in the farmer's hands, and one which is well calculated to bring even the most exacting of game-preservers to reason. But the Lord Advocate proposes to go beyond this. In cases where the landlord reserves the right of killing hares and rabbits he is bound to keep down the stock of these animals within reasonable limits, under penalty of liability in damages to the tenant. And the reasonableness of the limits and the amount of the damages are to be judged of after due regard is paid to the character and cultivation of the land, the amount of the rent, and the conditions of the lease.—*The Saturday Review.*

THE GAME LAWS IN SCOTLAND.—The Haddington Farmers' Club has just held a special meeting to consider the Game Laws and the Game Bills before Parliament. The

chairman, Mr. Scot-Skirving, moved that the Club petition Parliament against the Lord-Advocate's Game Bill *in toto*. Mr. Durie, Barney Mains, moved that the Club think the Lord-Advocate's Bill an improvement on the present law, but the motion was not seconded, and the chairman's was declared carried. Mr. Hope, Fentonbarns, then moved that the club should express an opinion in favour of Mr. M'Lagan's bill, which excludes hares and rabbits from the game laws. The chairman moved the previous question, stating that by a former deliberation the club was in favour of Mr. Loch's bill. The motion of the chairman was carried by 10 votes to 9. The Aberdeenshire Branch of the Scottish Chamber of Agriculture had also a meeting, and passed resolutions adverse to the Lord Advocate's Bill.

THE HARES AND RABBITS.—The tenants on the estate of Lord Leigh, Stoneleigh, Warwickshire, have just had prepared an address expressing their appreciation of his lordship's liberality in granting them permission to kill the rabbits and hares upon their respective farms. They express a hope that his example will be extensively followed by other landowners, and that thus a frequent source of discontent will be removed. The address, which is richly illuminated, with a Gothic border, is signed by 27 tenant-farmers, each holding from 300 to 400 acres.

THE HARES AND RABBITS.—ANOTHER SAD STORY.—At the inquest on the body of Mr. John Hewitt, who held a farm under Sir Charles Anderson, Bart., at Lea, and whose untimely end we chronicled last week, it was elicited that deceased just before succumbing to the effects of the poison said, "I cannot bear it any longer: these rabbits have killed me." Frequently of late he would look out of his window and say, "I have sown my corn, but they'll eat it again." We have been informed that last year deceased had to sow some of his fields twice over, and, notwithstanding, one field of 16 acres yielded only 6 quarters.—*Stamford Mercury*.

THE CENTRAL AND LOCAL CHAMBERS.—Chambers of Agriculture are happily beginning to realise the fact that, in regard to the agricultural interest, they are of no use whatever. We have endeavoured, by means of arguments which at the time were unpalatably strong, to convince them of this palpable truth. The force of facts, data, and reasoning had not, however, its desired effect at the outset. For the provincial Chambers could not readily believe that the way they were being misrepresented and misled by a few men in London, who affected to be, "We, the Farmers of England," was really as bad as we described. This is often the result when a case happens to be put in a necessarily strong form, and the conclusions come to run counter to the hope—it may be of the "hope against hope"—of the personages interested. Men are thus staggered, but for the time being they are not convinced. Now, however, that the Chancellor of the Exchequer's financial statement for 1870 is before the farmers of the country, it will surely not need much more discussion for the agricultural interest generally, and provincial Chambers of Agriculture in particular, to fully estimate the depths of social, commercial, and political humiliation into which they have been led by the Council and officials of the Central Chamber, and their "Accredited Organ" Company (Limited). But our anticipations and predictions had happily begun before the Budget of Mr. Lowe was published. Therefore, now that the right honourable gentleman has, on the part of the Government, not only not conceded one single request made by the agricultural interest, but has increased the burdens of farmers, while he has brought them more and more into competition with foreign soils and climates, that indignation which we said was gathering will, in all probability, very soon explode with suitable force and effect. But of this we shall have more to say in another column. The really important data, however, to which we have here to draw attention is the way in which provincial Chambers begin to express their dissatisfaction at the manner in which their views have been perverted, and their publicly expressed displeasure has been turned to private account by a coterie of political adventurers and their co-partners—the Company (Limited) of newspaper speculators and puffers. The Devonshire Chamber was the first to move in the form of passing a resolution of dissatisfaction; and, to our surprise and great pleasure, the North of England Chamber endorsed the resolution subsequently.—*The North of England Farmer*.

HIGHLAND AND AGRICULTURAL SOCIETY.—The April monthly meeting of the directors was held in Edinburgh, Mr. Graham Binny in the chair. Specimen horse shoes, made after the Charlier and Goodenough systems, forwarded by M. Charlier, were laid upon the table, with an illustrated pamphlet by M. Charlier. Copies of the premium list and regulations for the general show which is to be held at Dumfries, from the 26th to the 29th of July, were submitted. The draft of a letter to the conveners of the counties connected with the show to be held at Perth in 1871, viz., Perth, Forfar, Fife, and Kinross, as to the auxiliary subscription, was read and approved. Forms of first and second class certificates in forestry, to be signed by the president of the Society, the board of examiners, and the secretary, were approved of; and it was resolved that the next examinations in forestry should be held about the beginning of November. The examination of the students at the Edinburgh Veterinary College, for the society's veterinary diploma, was fixed to take place in the College Hall, Clyde Street, on the 18th, 19th, and 20th April, commencing each day at ten o'clock, and it was resolved to grant the usual medals to the students who pass the best examination in the various departments. The secretary read a letter from the agent for Professor Dick's trustees, sending one from Professor Williams suggesting that there should be two examinations for the Society's veterinary diploma every year, instead of one, namely, the usual examinations in April, and an additional one about Christmas, as two examinations in the year are of great advantage to any student who may be rejected. The proposal was agreed to by the board. Drawings of first and second class cattle waggons, as patented by Mr. Reid, Granton, Edinburgh, were submitted to the meeting.

THE EDINBURGH VETERINARY COLLEGE.—There have been no lectures on anatomy in the College for a fortnight, owing, as it is alleged, on one side, to the inability of the lecturer, Professor Brandford, to manage his class; while on his part it is understood that there is a feeling against him, amounting to something like a conspiracy, on the part of the students and others in connexion with the College. Certain it is that he has been grossly insulted in various ways, pelted in the face, and burned in effigy; and, as showing their spite towards him, the pupils have also broken several of the college windows. One of the students had been brought before the magistrates and fined for riotous conduct, and as he afterwards refused to apologise to Professor Brandford, that gentleman deprived the whole of his class of whatever advantage was to be derived from his prelections. Deputations of collegians waited upon the Lord Provost and magistrates, who are trustees of the College, and represented Professor Brandford as being unfit to teach them. The trustees offered their services to effect a reconciliation, but this was declined by the Professor, on the ground that he was well enough able to manage the class himself. Things have now come to this pass, that the trustees, at their meeting at the end of last week, came to the resolution "to make investigation into the state of matters in the Veterinary College, and take such evidence as may be judged necessary, with full powers to appoint a substitute for teaching the class of anatomy during the investigation, or for the remainder of the session, and make such other arrangements for the College as they may think necessary." It is to be regretted very much when such an *emoult* occurs in an educational institution of such importance.—*The Farmer*.

LOCAL TAXATION.—At a meeting of the Cambridgeshire and Isle of Ely Chamber of Agriculture, the question of "Local Taxation" was introduced by Mr. Hicks, J.F., Chairman, who proposed: "That a petition be presented to Parliament praying that the injustice under which the landed interests in this country labour, in being taxed for imperial as well as local purposes, in exoneration of other property, may be remedied." Mr. Oliver Claude Pell, J.F., Wiburton, seconded the motion. Mr. W. Marshall, of Ely, made a powerful speech in opposition; but the motion was carried by 22 to one, several not voting.

BEDFORDSHIRE AGRICULTURAL SOCIETY.—**SHOW OF STALLIONS.**—The first prize, £10, dark brown, Mr. J. Roach, Gulton, Uppingham (England's Glory); second, £5, Mr. F. Carpenter, North Marston, Bucks (Active),

WHARFEDALE AGRICULTURAL SHOW.

The Wharfedale Agricultural Society, established in 1798, has a history that extends far beyond the memory, if not the existence of its oldest supporters, but age sits lightly upon it. With all the vigour of a new undertaking, it anticipates nearly every other exhibition of the kind in its annual shows, and in its ripe experience it knows well the channels through which to aim at success. The seventy-second show of the society was held at Otley, when there was no falling-off in the display in the strictly agricultural sense.

The judges were: Cattle and Horses, J. Knowles, Wetherby; R. Bramley, Morton Grange, Northallerton; and W. Lancaster, Roker, Sunderland. Sheep and Pigs: C. Carr, Rowley Grange, Scarcroft; and J. Lynn, Stroxton, Grantham, Lincolnshire. They made the following awards:

SHORTHORNS.

BULLS.—One-year-old, Lieut.-Col. Markham, Aberford. Two-year-old or upwards, W. Fison and Co., Burley-in-Wharfedale. Bull calf, Major Stapylton.

Cows.—One-year-old, E. H. Marshall, Wootwood Hall. Two-year-old, W. M. Spence, Otley. Three-year-old or aged, Major Stapylton.

BULLS.—One-year-old, Wm. Linton, Sheriff Hutton (cup); 2, Thos. Wall, Addingham. Two-year-old or upwards, C. Wright, Tadcaster; 2, M. Lamb, Caley Farm, near Otley. Bull calf under 12 months, J. Renton, Otley; 2, J. T. Robinson, Thirsk.

Cows.—One-year-old, J. T. Robinson (cup); 2, T. H. Hutchinson, Catterick. Two-year-old, J. T. Robinson; 2, H. H. Fawcett, Old Bramhope. Three-year-old or aged, J. Renton; 2, J. W. Botcherby, Darlington. Heifer calf under 12 months, W. Linton; 2, J. T. Robinson. Cow, any age, for dairy purposes, J. T. Robinson; 2, W. M. Spence, Deanfield House, near Otley.

STALLIONS.—Blood stallion, J. H. Wright, Ripton. Roadsters, H. R. W. Hart, Dunnington Lodge. For draught or agricultural purposes, J. Forshaw, Burley-in-Wharfedale.

GELDINGS, COLTS, and FILLIES.—Hæck under 15 hands, any age, H. Crossley, Halifax (cup); 2, Thos. Clarkson, Leeds. Gelding or filly, foaled in or before 1866, for roadsters, T. Clarkson; 2, E. Charlesworth, Bradford. Gelding or filly, foaled in or before 1866, for coaching, W. Dawson and Sons, Otley; 2, Hy. Fawcett, Old Bramhope. Gelding or filly, foaled in 1867, for roadster, Wm. Stead, Cleckheaton; 2, Wm. Lumley, Wetherby. Gelding or filly, foaled in 1867, for coaching, Geo. Turner, Leeds; 2, Wm. Haigh, Lowmoor. Gelding, foaled in 1867, for draught or agricultural purposes, J. Robinson, Laister Dyke; 2, C. G. and W. Cheetham, Horsforth. Filly, foaled in 1867, for draught or agricultural purposes, Mrs. Haddon, Thirsk; 2, J. Wood, Beeston Roysds. Gelding or filly, foaled in 1868, for hunter, W. Ingham, Wortley; 2, E. and W. Pawson, Burley-in-Wharfedale. Gelding or filly, foaled in 1868, for roadster, Jas. Duncan, Otley; 2, D. Newson, Yeadon. Gelding or filly, foaled in 1868, for coaching, E. and W. Pawson, Burley-in-Wharfedale; 2, Chas. Pickard, Weston. Gelding, foaled in 1868, for draught, Mrs. Haddon, Thirsk; 2, Robt. Denison, Barrowby Grange. Filly, foaled in 1868, for draught, Wm. Hartley, Gledhow, Leeds. Colt or filly, foaled in 1869, for draught, B. Long, Kearby, near Wetherby; 2, Steven Fawcett, Burley-in-Wharfedale. Colt or filly, foaled in 1869, for roadster, J. T. Robinson, Leekby Palace, Thirsk; 2, J. W. Yeadon, Fawston. Colt or filly foaled in 1869, for coaching, Jno. Reanison, Thorparch; 2, Joseph Clarke, Beeston, near Leeds.

BROOD MARES.—Brood mares for roadster, Joseph Clarke; 2, W. M. Spence, Deanfield House, Otley. Brood mare for draught or agricultural purposes, Jno. Robinson, Laister Dyke; 2, Thos. Greenwood, Rodney.

HORSES IN HARNESS.—Horse or mare in single harness (cup), Josh. Smith, Bradford; 2, Waller and Son, Bradford. Cart horse or mare of any age, Illingworth, Ingham, and Co., Leeds; 2, James Hammond, Bradford. Pony of any age, not exceeding 13 hands, 1, owner's name not in catalogue; 2, Ann Stachiffe, Haworth Fold, near Burnley. Pony of any age, not exceeding 14 hands, Wm. Ingham, Wortley; 2, J. M. Kendall, Weston, Otley. Leaping pony, not exceeding 14 hands, J. M. Andrew, Dewsbury.

HUNTERS.—Hunter of any age (cup), Henry Crossley,

Broomfield, Halifax. Best leaper (cup), Henry Johnson, Spofforth.

STEEK.—Ram, any age (cup), T. H. Hutchinson, Manor House, Catterick; 2, Joseph Simpson, Spofforth Park. Shearling ram, T. H. Hutchinson; 2, J. Simpson. Tup hog, 1 and 2, T. H. Hutchinson. Pen of three gimmers, T. H. Hutchinson; 2, John Rishworth, South Milford. Pen of three wethers, 1 and 2, W. Thirkill, Aberford. Pen of three ewes and lambs, T. H. Hutchinson. Lonk ram, any age, B. Dobson, Ilkley; 2, John Hoyle, Keighley. Any distinct breed or cross not named above, 1 and 2, Jno. Jowett, Prospect House, near Keighley.

PIGS.—Boar, large breed, 1 and 2, Wilson Lister, Arley. Boar, small breed, J. and W. Sagar, Lister Hills, Bradford. Boar, middle breed, J. E. Fox, Great Horton; 2, J. and W. Sagar. Sow, large breed, Wm. Hatton, Addingham; 2, Wm. Parker, Bradford. Sow, small breed (cup) Wm. Hatton; 2, Wilson Lister. Sow, middle breed, W. Parker; 2, David Spencer, Keighley. Pigs not exceeding nine months old: Boar, large breed, W. Parker; 2, Wilson Lister. Boar, small breed, John Marshall, Yeadon; 2, W. Parker. Boar, middle breed, W. Hatton. Sow, large breed, W. Parker. Sow, small breed, T. Wilson, Crosshills; 2, W. Graham, Leeds. Sow, middle breed, W. Hatton; 2, F. Ambler, Keighley.

BORDER UNION AGRICULTURAL SOCIETY.

The annual spring show was held at Jedburgh. At a meeting of the Society lately held it was agreed that the autumn exhibition should be confined to sheep, and that the principal competitions for cattle, horses, and implements should be held in the spring. The Union includes the counties of Roxburgh, Berwick, and part of Northumberland.

The show of Shorthorn cattle was considerably larger than in previous years; but the stock was, with a few eminent exceptions, not of a superior class. Of bulls calved before 1st January, 1868, the premium was secured by Beverley Lad, third in the Highland Society's show last year. There was a great absence of really good bulls in the yearling class, few being beyond mediocrity out of the thirty-one shown. The cows and heifers were a better class, but the number shown was small.

JUDGES.—For cattle and draught horses: Messrs. Douglas, Athelstaneford; Gibbons, Burnfoot; and Hadden, Honeyburn. For hunting and other horses: Messrs. R. Calder, Kelloe mains; Ford, Hardengreen; and E. H. Maxwell, of Teviotbank.

AWARDS:
SHORTHORNS.

Bulls calved before 1st Jan., 1868.—First prize, Sir T. B. Hepburn, Bart., Smeaton, Prestonkirk. Commended: Mr. Smith, Melkington, Coldstream.

Bulls calved before 1st Jan., 1869.—First prize, Mr. Smith, Melkington, Coldstream. Commended: Mr. J. B. Brownell, East Bitchfield, Belsay, Newcastle-on-Tyne.

Bulls calved after 1st Jan., 1869.—First prize, Mr. Bell, Fans, Earleton (late Cockburn); second, Mr. John Dinning, Belford.

Cows not exceeding ten years old.—First prize, Mr. John Atkinson, Byewell Hall Farm, Stocksfield-on-Tyne; second, Mr. J. Oliver, Hawick.

Heifers, two years old.—Mr. John Atkinson, Byewell Hall Farm.

Heifers, one year old.—First prize, Mr. J. Atkinson, Byewell Hall; second, Mr. R. Richardson, Crailing Nook, Jedburgh.

HORSES.

Cart mares, with foal at foot, or to be in foal at the time of exhibition.—First prize, Mr. Shortreed, Attonburn; second, Mr. J. Lawrie, Mitchelstone, Stow.

Cart mares or geldings, above three years old.—First prize, Mr. J. Lawrie, Mitchelstone, Stow; second, Mr. Oliver, Lochside, Kelso, Sharp.

Colts and fillies for agricultural purposes, two years old.—First prize, Mr. Adam Wilson, Midshields, Hawick; second, Mr. J. Lawrie, Mitchelstone, Stow.

Hackneys (geldings or mares).—Dr. Kynock, Greenlaw, Berwickshire.

Ponies (geldings or mares), under 14 hands.—Mr. J. Johnston, Crailing Hall, Jedburgh.

HUNTING STOCK.

Four year olds, likely to make good hunters.—First prize, Mr. G. Dove, Todahawhaugh, Hawick; second, Mr. J. Fenwick, Northhouse, Hawick.

Three year olds, likely to make good hunters.—First prize, Dr. Kynock, Greenlaw, Berwickshire; second, Mr. Pringle, Cleithaugh, Jedburgh.

Brood mares.—First prize, Mr. Elliot, Hindhope, Jedburgh; second, Mr. Steen, Pilmuir, Hawick.

Four year old hunting colts and fillies.—Mr. G. Dove, Todahawhaugh, Hawick.

Melkington, Coldstream. Commended: Dr. Kynock, Greenlaw, Berwickshire. Three year old hunting colts and fillies.—Prize, Mr. W. Smith, law, Berwickshire.

Made hunters.—First prize, Mr. Dodd, Nisbet, Kelso, Ben West; second, Mr. T. E. Boog, Lanton, Jedburgh.

PIGS.

Boars of the large breed.—Mr. Ross, Newtonlee, Kelso. Boars of the small breed.—Major Dickens, Corahill House, Coldstream.

Brood swine of the large breed.—Mr. Haddon, Honeyburn, Hawick.

Brood swine of the small breed.—Major Dickens, Corahill House, Coldstream.

COTTINGHAM HORSE SHOW.—Judges, Mr. C. Wood, South Dalton; Mr. R. Stephenson, Goodmanham; and Mr. Green, Withernwick. Entire horses for hunting purposes: First prize, Mr. G. Lamplough's Strathern; second, Mr. W. Shaw's Prince Plausible. Coaching stallions: First prize, Mr. W. Laverick's Emperor; second, Mr. G. Holmes' Darlington. Roadster stallions: First prize, Mr. J. Leake's Lord Derby; second, Mr. Brown's President. Agricultural stallions: First prize, Mr. F. Simpkin's Sir William Wallis; second, Mr. T. Carrick's Brown Hero. Hackney mares or geldings: First prize (a silver cup), Mr. Stephenson, Cottingham; second, Mr. Holmes, Beverley. Ponies under fourteen hands: First prize, Mr. Simpkin's Maid of all Work; second, Mr. H. Wilson, Cottingham.

STALLION SHOW AT CARLISLE.—This was a show of entire horses for the prizes offered by the East Cumberland Agricultural Society. Judges: J. Jardine, Dryfeholme, Lockerbie; Laurence Drew, Merryton, Hamilton; J. Davidson, Longbank, Alnwick. Awards: Thorough-bred Stallions—1st, J. Casson's Sincerity, by Red Hart; 2nd, Toppin's Kingfisher. Highly commended—J. Casson's Motley. Cart Stallions—1st, W. & H. Phillip's Clydesdale Tam; 2nd, G. & A. Nichol's North Star. Highly commended—W. Allerdice's Dumbarton. Commended—J. Mouney's Dundonald.

MR. DUCKHAM'S THIRD PERIODICAL SALE OF HEREFORDS AT HEREFORD.—This experiment was

again tried on the last Wednesday in April, but with an equally unsatisfactory result in the way of business. There were some twenty lots of cows and heifers and a dozen or so of bulls offered; but, according to the local journals, "the biddings were by no means of that spirited nature we had hoped to have seen;" and no return of the prices is given.

JUDGES AND JUDGING.—Notwithstanding the confidence which Mr. William Torr is said to have expressed as to carrying his motion it will be found that he considerably modified this on bringing it before the Council of the Royal Agricultural Society, and ultimately withdrew it altogether! We refer our readers to the report of the proceedings, and in doing so would congratulate the members generally of the Society on the clearness and fulness with which these reports of Council meetings are now given. Mr. Milward appears to have been the only other member of the Council who went with Mr. Torr, and his sole argument was directly answered by Mr. Jacob Wilson. The discussion ran mainly on Shorthorns, and there was a very becoming tone about Mr. Booth's observations which went to support all we had advanced as to the chances of younger exhibitors. If a good pedigree be necessary for bulls, and we should be the last to question this, cannot Messrs. Torr and Milward see that the conditions of entry might be made to assimilate very much with those for thorough-bred horses? Let a pedigree be given with each bull, and let the decision over any such qualification rest, not with the judges, but with the Council or stewards of the show.

THE MALT TAX AND "THE ORGAN."—Certain recent appearers in, or rather poachers upon, the newspaper field have of late been trying very hard to make the farmers believe that Mr. Lowe would take off part of the malt tax. We knew better. However large his surplus might be, we felt certain he would do nothing of the kind. Hostility, deadly hostility, to the agricultural interest is the badge of the tribe with whom he is officially connected, and the false prophets have an uncomfortable task in excusing themselves to their dupes as well as they can. We need not refer more particularly to the organs in question, not feeling inclined to advertise mischievous commodities gratis.—*The Herts Guardian*.

LICENSED TO DEAL IN HORSES.—Sir George Cholmondeley, Bart., who exhibits hunting stock so regularly at the Yorkshire shows, and who had the "best of all the hunters" at the Manchester Royal Meeting last year, has just taken out a licence to deal in horses. Mr. Milward has long had a similar sign board stuck up in a tree at Thurgarton, as there are others we know of who might as reasonably announce their "profession" in this way.

CALENDAR OF AGRICULTURE.

The lands to be planted with beetroot and Swedish turnips will receive the last earth working early in this month, and will be thoroughly pulverized and cleared from weeds and stones, and laid into a level condition. Ridglets are formed, 28 inches apart, by a single or double furrow of the common plough, deeply done to throw fresh soil over the tops of the drills. Farmyard dung in a half-rotten condition, short and moist, is spread along the intervals of the drills, in the quantity of 20 loads of one-horse carts and 15 loads of two horses, which must cover the bottom of the hollows without any bare space; and this condition must be held a general rule in the planting of root crops. The ridglets are split and the earth is reversed over the dung by a "bout," or two furrows of the common plough, which throws from opposite sides a deep furrow of earth raised by the narrow point of the one-winged share or sock. On this newly-formed ridglet of fresh soil the seeds of beet are deposited by hand dibble

or sown by machine, and may be previously steeped for 48 hours in solutions of caustic substances and dried with hot lime. This preparation may hasten the germination of the seeds without much aiding the succeeding growth. The drills are rolled by a weight of 5 or 6 cwt. of cast iron. The sowing of beet is best done by the middle of the month, and very beneficially after 20th of April.

Swedish turnips are sown during the whole month, exactly in the manner that has been described, except that in moist seasons the drills may not be rolled after sowing, but left loose on the top. Tankards and early white turnips are sown for use in autumn, and rape on any left grounds or inferior lands, to be consumed on the ground by sheep for a catch crop of wheat. The purple and yellow-topped swedes are yet the best varieties of that most valuable root.

Plant cabbages by the middle of the month, on deep,

strong, clayey loams of the first-rate quality, which have been prepared by the cultivations of ploughing, harrowing, and rolling, hand-picking of weeds and stones, and brought into the condition of a pulverized fitness. The drills must be 80 inches wide to allow the spreading of the heads of the cabbage, and the allowance of farmyard dung must be larger than for any other green crop. The plants pulled from the seed-bed are placed upright in tubs of water that immerse the roots, which have been dressed by hand-cutting into a short and compact neatness from the long fibres. After being in this position for two days, the plants are carried to the field in the tubs, and planted by hand dibble on the ridglets of land, at two feet distance, over the dung and previously rolled, and at the same depth as the plants stood in the seed-bed, as marked by the skin of the stem. The plant requires much moisture, and is best planted in the wettest weather the work can be done. Fill up any blanks that occur in order to produce an even crop on the ground. The drum-head variety is the best cabbage plant yet known, producing very largely and readily under the requisite circumstances of deep strong lands of the very best quality, under a moist climate of frequent rains and warm suns. The management of the crop is costly, but the produce is large, and forms a most invaluable spring food for ewes and lambs at a season the most trying for the use of the green food of the farm.

Khol-rabi and savoys are cultivated in the same manner as cabbages, but claim a small notice, as the first plant is very coarse and fibrous, and the latter yields leaves only and no bulb.

Pare and burn lands during the month, and spread the ashes as produced, in order to cool them.

Prepare the turnip lands for sowing next month, and cross-plough the clay fallows for wheat at every convenience.

Dung heaps must now be turned over by hand forks, and all lumps carefully broken and shaken out, and the heap loosely placed, in order to produce an even fermentation for use.

Watered meadows are now shut up for hay, and all pastures and grass lands must now be carefully protected with fences and gates.

Dig hop grounds, and tie the bine to the poles.

Finish the sowing of grass seeds left from last month.

Put mares to the stallion, and geld colts, though this operation may be more safely done the preceding autumn.

Stall-fed cattle will now be all disposed of, the fat animals to the butcher, and the leaner beasts will go to the pasture fields, to be fattened on grass. Arrange the cattle in the pastures by age, size, and condition, in order to a systematic order of the manufactory of animals, both for pleasure and profit. The colour of a herd of cattle is a point to be regarded, showing a taste which leads to perfection. A shelter shed and copious supply of water are essential to pasture grounds. The milch cows are accommodated with a grazing closely adjoining the homestead, with a short and easy communication with the cow shed, which forms the end of the wing of the farmery, with a door of entrance. This field is the lambing ground, and is enriched by the ewes consuming the roots, by bush-harrowing, and rolling, and by the sowing of seeds of clover and grass at times, as may seem necessary. A shelter shed, with an ample supply of water are necessary, and also an open clump of trees on any knoll or high ground, to afford shelter to the animals from rains and heats.

The oldest calves will be lodged in a grass paddock, provided for the special use, with a shed and water, and have one suckling daily with the green food of clovers and vetches. The calves in the pens should have green meat to accustom the use of such food before being turned out.

The ewes and lambs that are consuming the earliest green meat of the farm, in rye and winter vetches, will require a fresh piece of ground every two days, which is guarded by flakes or bundles, and are folded regularly over the cleaned land, which is thus prepared to be sown with turnips, one furrow of ploughing drilled into the ground with a manure of guano or bone-dust. The green meat may be cut by scythe, and placed in rack for the sheep, with oats and small broken cake placed in troughs, to correct the juicy quality of the very succulent herbage. In the end of the month green meat will be provided for the soiling of horses, cattle, and pigs in the yards, which must be amply littered. Watered meadows will afford a green meat for ewes and lambs in pasture, or in hurdled spaces—a most invaluable production at this most critical season of the year, for the food of animals.

Finish the sowing of grass seeds on barley and wheat tilths. Cover by light harrowing and heavy rolling.

Gather, by hand-picking, stones from the surface of lands to be mown for hay, chiefly the young seeds sown with a grain crop. Lay the stones in a heap, to be broken for road metal, or for drains. This gathering of stones must be done early in the month, or rather in last month, in early situations.

The stubble of strong straws of wheat will remain unbroken during mild winters until the hay harvest, and much impede the scythe. The stubble must be broken before the rise of the grasses, by a heavy bush-harrow of thorns under a heavy weight, as a gate, or a platform of timber, which goes and returns in the same path, to reverse the action of the harrow. This operation is not required in many places, and is much required in others, from various causes.

Fell oak trees for barking; strip the bark by hand, chisel, and mallet, and dry it for use.

Wash sheep by hand in a clear running stream two weeks before the shearing commences, to prevent the maggot-fly depositing the eggs on the animals; sprinkle the bodies from head to tail, from a dredging-box, with a mixture of hellebore-root powder and black brimstone, $\frac{1}{2}$ lb. to $1\frac{1}{2}$ lb. This precaution is seldom required beyond a distance of more than three miles from the sea, the maggot-fly not being inland.

Weed young quickset hedges; pull or cast away the weeds that overtop and hinder the thorns, leaving the root weed to retain moisture and defend from drought without exposing the roots to the sun, as is done by spade-cutting off the soil to remove the weeds.

The grains of last year will be wholly cleared away, unless a portion of the crop be reserved for litter, and thrashed as required. The thrashing may be all performed in March and early in April, and the straw built into a rick for summer use. All grains being carried away from the thrashing barn, the erection of a granary on any farm is restricted to a temporary accommodation of seed corn before being sown, and of wool before being weighed, preventing an unnecessary expense in the building and the cost of repairs. Large erections are the remnants of Saxon "granges," yet visible in the huge and unnecessary flail-thrashing barns of modern time, so obstinately retained by prejudice and vacuity of mind.

CALENDAR OF GARDENING.

KITCHEN GARDEN.

This month includes the late crops, but not the very latest. Commence with kidney beans, dwarf, or Mackie's Monarch for a full crop in July, and repeat the sowing in the third week. Scarlet and variegated runners are first called for, planted over a shallow trench with a layer of moist decayed mixed dung, pressed over with light earth

of three inches in depth, to secure against scorching weather of next months. Dry soils are required, but not arid, and the seeds perish in wet grounds, as in the case with French beans. It is a good policy to be prepared early in April with a stock of beans sown in pots, to be now transplanted into fresh earth with dung, and with open-ground plantings in summer.

Sow peas largely in two divisions in the first and second weeks of the month, the first sowing with the later variety of the early kinds, and the second division with the tallest and latest varieties, as Knight's Marrow, and Adamson's Matchless, with the new names of Abergavenny and Victoria Marrow. To guard against mildew in late crops, trench the ground into a row of three feet wide and one foot deep, with rotten dung in the bottom spits. Water profusely by the rose; fill up with the soil and raise it to a flat ridge a few inches high along the centre; water again, that the ground may be thoroughly wetted; a few days after sow the peas an inch asunder. By following these directions fine late peas may be secured at Michaelmas, even when sown in July.

Plant the late crops of potatoes, and if practicable plant the rows north and south to admit an equable diffusion of sunlight.

Sow cucumbers on a ridge over manure.

Repeat all the sowings of last month, except the tap-rooted plants, to afford a succession of supplies.

Sow dwarf Indian corn about the 15th.

Suffer no weeds to prevail, and where there is time to Dutch hoe and finely rake every portion of uncropped land the extreme neatness of the garden will amply repay the trouble.

FRUIT DEPARTMENT.

Water strawberries if the ground and weather be dry; the first bloom perishes under a scorching of May and

June. Fruits of trees and shrubs grow unmolested during this month.

FLOWER GARDEN.

Sow annual seeds in the borders; biennials in a nursery plot for the next season, thus for Brompton, Queen, and German stocks. Propagate by slips and cuttings. Wall-flowers, rockets, &c., put a glass over to shade them.

Roses must be watched. The worm in the bud is a sore enemy. Stir the surface of the ground when nearly dry after heavy rains. It is a great thing to know how to use a Dutch hoe and a rake adroitly.

Attend to air and water in any glass structures.

In the end of the month the more elegant flowers, as pelargoniums, verbenas, and nemophilas, are bedded-out on the parterre system in plots on lawns. The mixed collections require some little taste and judgment, to be got from experience, and attention on a small scale.

Shrubberies may be littered by the falling of laurel and other evergreen leaves: let such be removed to the compost grounds. Eradicate lilac suckers and keep all shrubs in figure by judicious thinning back to larger branches. Attend to every office of neatness and order as respects weeds and rubbish of any kind, the rolling of gravels, and the lawns prior to mowing.

Never cease to collect manure in the liquid pit and in the dry compost heap. Fine earths, the droppings of animals, scrapings of roads and paths, the tender turf of short grass from road sides, with vegetable refuse of all kinds afford a never-failing source of materials, assisted by the liquids of the dwelling house that are urinary, soapy, and in washings of a mixed composition. The solid fæces are caught into boxes to be largely mixed with fine earths to form a most powerful manure for the root crops of the garden, as onions, leeks, and similar plants of the succulent nature.

AGRICULTURAL REPORTS.

GENERAL AGRICULTURAL REPORT FOR APRIL.

The past month has been characterised by great inactivity in the wheat trade, though as we write a decidedly firm tone prevails, and the currency shows an upward tendency. Up to very recently millers have continued to act with extreme caution, and values have with difficulty been maintained, but a very sensible diminution has taken place in the stocks of foreign wheat on hand, while the holding of English wheat has been much reduced. Millers accordingly now show some anxiety to purchase at present prices, their stocks being very low, but the more immediate cause of the late rise in values has been the shortness of the supplies of English wheat on offer at Mark Lane. The navigation is now re-opened in Europe, while the American canals are again free from ice, and shipments are already being resumed with some activity in both quarters. The intelligence of the late rise in prices on this side will probably stimulate this movement, though the quotations current here are still too high to admit of much margin of profit on imported produce. The return of several steamers from the Baltic may be looked for at an early date, but some time must elapse before the receipts of foreign wheat can again be on any very great scale, and the firm tone now prevailing in the market may, therefore, be expected to be maintained. The average price of wheat, as shown in the *Gazette* returns, has not materially varied throughout the month.

The weather, which was disappointing and unseasonable at the opening of the month, suddenly changed at about the third week, and since then we have had a spell of brilliant weather, unusually warm for the time of year. The early-sown wheats are well above ground, and are looking strong and healthy, but the plants are not forward as the lengthened winter greatly checked vegetation. This, however, is not to be regretted as it may now be hoped that the plants have

obtained a firm hold in the ground and will be able to stand any moderate reverses of fortune.

There has been an active demand for feeding stuffs throughout the month, and all kinds have tended upwards in value. The arrivals of oats have been somewhat small, and sound corn has advanced about 1s. to 1s. 6d. per qr. both on the spot and afloat.

Maize has also been in good request, and the stock being light has commanded more money. The utility of this article as feed is becoming very generally recognized.

Beans and peas have ruled very firm in value, but barley has been somewhat inactive.

In the hop market there has been scarcely anything doing, and where sales have been pressed lower prices have been submitted to. The holding of American hops is very large, and a disposition was at one time shown to force the market, which led to a considerable reduction in values. Present quotations are nominal, especially as regards foreign hops and yearlings, which have recently been altogether neglected.

The markets have been only moderately supplied with hay and clover, and although the demand has been far from active prices have been maintained. The quotations for hay have ranged from £3 10s. to £4 4s., and for clover £4 to £6 10s. per load.

The imports of foreign potatoes have been rather liberal, but the quality has not been generally good. With home-grown produce the market has been fairly supplied, but there has been less anxiety to force sales as it has been found that the roots will keep better than was at one time anticipated. Prices of both flukes and regents have tended upwards, and, on the whole, the trade has been of a more satisfactory character than for some time past.

On the continent the grain trade has not varied greatly.

Very little has been passing on English account, owing to the dull state of the market here; but shipments are usually interrupted during the winter season. From New York the exports of all kinds of grain have been on an extensive scale for the time of year, shippers having been encouraged by a decline both in gold and ocean freights.

REVIEW OF THE CATTLE TRADE DURING THE MONTH OF APRIL.

The cattle trade during the past month has differed in no material degree from the preceding month. The receipts of stock have been on a full average scale, and have included some prime breeds; in fact, the actual weight of meat exhibited has been above the average. The Norfolk beasts have come to hand in prime condition, and although the animals from Scotland have continued limited, the quality of the beasts has gone far to compensate for the shortness of the supply. Included in the foreign supply have been some servicable French and Spanish beasts. The former, although they are still far short of the perfection attained by home-bred stock, have considerably improved of late, and have become much more saleable. As regards trade, the tendency generally has been towards quietness; but prices at the same time have not been subjected to any severe fluctuations. At the commencement of the month, influenced by the cool weather, the demand ruled steady, and the best Scots and crosses realised 4s. 10d. to 5s. per 8lbs. Subsequently a fall of 2d. took place; but this was almost immediately recovered, and at the present moment the extreme value for the best Scots and crosses is 5s. per 8lbs.

A fresh outbreak of the foot-and-mouth disease has occurred in some districts, and some losses have been entailed on graziers; but the ravages have not as yet attained important dimensions, neither have the losses been heavy. It is to be hoped, however, that it will act as a warning to the authorities to be vigilant to prevent a recurrence of last year's distress.

As regards sheep, the supplies have been about an average, both as regards number and condition. The trade on the whole has been quiet; but prices have been without movement of importance. At one period the best shorn sheep were selling at 4s. 10d.; but the price now is 5s. per 8lbs.

The market has been fairly supplied with lambs, for which the demand has been steady, at from 7s. 6d. to 8s. per 8lbs.

Calves have been quiet, and pigs have sold slowly.

The continued drought has caused a scarcity of grass in the pastures, and the wheat at the same time being very backward, a strong demand has necessarily been promoted for artificial food.

The annexed figures show the total supplies exhibited and disposed of at the Metropolitan Market during the month:

Beasts	19,528	Head.
Sheep and Lambs	164,553	
Calves	1,800	
Pigs	430	

Total 186,311

COMPARISON OF SUPPLIES.

	Beasts.	Sheep and Lambs.	Calves.	Pigs.
April	18,849	144,760	1,320	885
1869	16,280	138,600	1,403	1,765
1868	16,250	113,770	977	1,805
1867	11,350	120,180	208	3,331
1866	19,670	92,850	1,279	2,602
1865	22,200	107,010	1,596	3,100
1864	19,290	113,080	1,341	2,540
1863	19,000	110,500	1,077	3,055
1862	17,140	102,630	497	2,662
1861	18,512	114,450	1,848	2,140
1860	16,850	110,114	480	1,990
1859	17,950	104,380	1,332	2,097
1858				

The arrivals of beasts from our own grazing districts, as well as from Scotland and Ireland, thus compare with the three previous years:

	April, 1870.	April, 1869.	April, 1868.	April, 1867.
From—				
Norfolk, Suffolk, &c.	8,431	4,820	6,800	6,200
Other parts of England	2,542	2,666	4,020	2,150
Scotland	1,479	571	1,337	670
Ireland	725	353	290	130

The total imports of foreign stock into London during the past month have been as under:

	Head.
Beasts	5,196
Sheep and Lambs	22,173
Calves	1,372
Pigs	1,387

Total 37,668

Imports at corresponding periods:

In the dead-meat markets fair supplies have come to hand. The trade has been quiet, as follows: Beef from 3s. 4d. to 4s. 8d., mutton 3s. 4d. to 4s. 8d., lamb 6s. 8d. to 7s. 4d., veal 4s. 4d. to 5s. 2d., and pork 3s. 8d. to 5s. 6d. per 8lbs., by the carcase.

NOTTINGHAMSHIRE.

We have completed as favourable a spring seed-time as we could desire. All our heavy soils have worked admirably. The very variable weather we have had during the winter has so finely reduced the texture of the soils that there is every prospect of spring-sown crops being good. The breadth sown of all spring corn is above the average; the low value of wheat has deterred a many on our light soils from sowing that grain during the winter months, consequently the additional breadth of barley and oats. The wheat plant is backward, and in some places thin of plant, but with a change of weather may soon present a different aspect. Spring appearances are very deceptive, and some of the best crops we have known have been bare in the spring months. A good deal of rolling has been done, the motive being to consolidate the soil and give the roots of the plants a firmer hold. We very much doubt the wisdom of the act, for the soils are invariably light when the farmer is tempted to compress, thinking that a contrary state of things would be best. Now, as far as our experience goes we never had very favourable results when the soils were soddened and stiff and hide-bound by long-continued rains; such a state of things in spring we remember have always brought on much labour, and very irregular crops. The lightness of soils (we speak now of strong loams) should, we think, never be counteracted, but looked upon as being a state which very much facilitates the rootlets of the plants, and when rains come are so remarkable for their rapid growth. We much rather prefer harrowing, which generally promotes tillering, and leaves the soils as far as tenacity is concerned in much the same state. There is a damage done by the roller which many do not observe, the action of which is easy to be seen. A great many of them are not more than some 14 to 18 inches in diameter, consequently the centre being so near the ground the resistance, which is equal to the power applied,

pushes forward the light earth for some inches before the roll, and so with the earth the plants are driven forward, and the roots broken, and irreparable damage done. Many a crop we have seen destroyed in trying to improve it, instead of patiently waiting. If rollers must be used, they should be of large diameter, or they must injure the crop, and if the soils want consolidating feed sheep or cattle upon them, the action of whose feet give a direct downward pressure. We have put on lands subject to wire-worm live stock, and fed them with cake and other food, and what with the trampling and the deposits in the shape of manure and urine, the crops have recovered wonderfully, care being taken that the weather be favourable. We make these cursory remarks because the roller has been so freely used this spring, and we doubt not in many cases to much hurt. The lands intended for the growth of turnips are in a favourable state, and drilling will no doubt be early, for early sowing after all is the safest; late crops last year were nearly a failure. As far as the application of farm-yard manures are concerned we perceive a marked improvement among the farmers. That is, its early application to the soil, so that it may be well incorporated and subject to those chemical changes which take place in our compost heaps of soil we prepare for our grass lands. Plants cannot derive immediate benefit from fresh manures out of the fold-yard, and the manpold and turnip plant need a prior preparation to ensure safe growth. We manured a field of clay land rather heavy (it was drained) in December last, and ploughed it in, and now it is in beautiful condition for the good crop which we intend putting in the beginning of next month. Potatoes have kept well, and the time for setting will soon be at hand. The low prices of bread have checked consumption, so that we may expect them reasonable in prices. The sales of farming stock, live and dead, have been good, and realized more than for some years. Horses, cattle, and sheep have been in request, and in some instances made high figures. Pigs, short vacillating animals, are very dear and very scarce. We should not be surprised if within twelve months they were to hop down. Our corn markets are very tame, and devoid of animation; any attempt at an advance is soon met by liberal supplies. Labour is more plentiful, and meets the continued demand from our mining districts. With high farming we could easily employ our redundant population, but that will not be without security for capital; and when will the English farmer get that? Impoverished farms are to let, and in too many instances are taken by those of limited means; while men of means are driven to employ their money in other channels. For the good of both landlord and tenant we must eventually have the capital of the cultivator protected.—18th April.

NORTH NORTHUMBERLAND.

At this advanced period of the season we are in no favourable position to report. Early vegetation, field and garden alike, show a blank of the green leaf, quite three weeks later than ordinary seasons. Nor do we recollect any ordinary season presenting so little life on the autumn sown wheat, particularly on the loamy clay land, cropped after a naked fallow. We had fields looking well planted, presenting a favourable aspect until the end of February. Alternate severe frosts, fresh, hail and sleeting rain seem to have damaged the plant; the land, to walk over, now feels soft and floury under foot. Many of the plants weak and sickly, or dead out, inasmuch as at a distance no green blade is seen, except a piece near a hedge-row or furrow edge; rolling and harrowing (when the land will bear it) has been the rule. Land very dry and dusty. Whether the plant may recover or not is problematical. At any rate we can only look for a late harvest. Spring sown wheats and all cereals, barley and oats, have gone in well, and the braird very promising. Beans also have a favourable appearance. Potatoes are being planted in large breadths under favourable auspices, the late crop being used liberally for pig and cattle feeding; our late fine turnip crop being about a finish. We have experienced about two weeks of very fine weather for all field work, and spring sowing, including clover and grass seeds, all about a finale. The days hot, with generally spring wind—nights a little chilly or raw frost, which checks vegetation, consequently grass and all green herbage very backward. Hence the ewe and lamb are as usual really *welters*, as in other seasons a deal of oats, bran, and other artificial food has been and still

is consuming. Our butcher markets have always had good supplies, and seem now over-stocked with foreign supplies. There may be a large market supply from the north side of the Tweed, yet such does not appear in the demand for grazing land. The lots by auction nearly all fall far short of last year's rents, varying from $2\frac{1}{2}$ to upwards of 30 per cent. in some instances. The snow seems now all melting off the mountain, which enables the mountain sheep to pick up their nibble on their native domain. Farm labour has been well worked up since the last week in March, and we are quite up with ordinary seasons. Draining has not been so general as on some former years, yet the able-bodied have been fully employed.—22nd April.

NORTH WALES.

We are now sadly in want of rain to set the pastures growing, and give a cheerful look to the face of nature. The north and north-east winds which have prevailed for two or three weeks, and the brilliant sunshine of the past ten days have caused everything to look parched. The nights have generally been a little frosty, so that vegetation is decidedly backward. But, as the wind has within the past 24 hours veered round to the south, and as the mercury has gradually fallen during the last two or three days, we are in hope that before this will be in print some soaking showers will have refreshed the thirsty fields. We have been waiting for the past fortnight to sow guano on some meadow land, for, as there were no indications of rain, we thought it best to bide our time. As we write we are preparing, however, for sowing to-morrow, believing that rain is not far off. The spring tillage though late before it was commenced, owing to the heavy rain fall which succeeded the frosts of the latter part of the winter, has proceeded without a check. The land was in first rate condition to receive the seed, the winter frosts having caused the soil to pulverise easily with less than the ordinary amount of rolling and harrowing. The wheats have gathered together lately, and some fields have a capital appearance, with a full plant, strong, and healthy; but, generally, they are thin and weak, giving no good promise. The winter was a most trying one to them, and, remembering the vicissitudes they have encountered, they are perhaps just in as good a state as we could have expected. We passed through some midland and northern counties last week, and were sorry to observe the wheats in our line of travel looking anything but well. A large breadth of potatoes has been planted in excellent condition, and, except in our high mountain farms, this work is nearly over. Last year's crop kept much better than was anticipated, and the price throughout the winter has been low; now it is of course somewhat higher. The lambing season was, on the whole, very favourable, and a good fall of lambs is everywhere spoken of. Some of our flocks on the mountain farms have been reduced by the severity of the winter; but where a little care and attention were paid to them the losses have been but slight. We have a good demand for fat sheep, with a high price, and mutton is scarce. There is little feed in the pastures yet, and winter fodder is well nigh exhausted; unless, therefore, we get rain soon, the cattle must have short commons. We are sorry to report that there is a good deal of scab amongst the sheep in various parts; at the same time it is a matter for congratulation that our herds are free from disease of any kind.—April 20.

SOMERSETSHIRE.

It is several years since we had two such dry months as the past and present. For the past six months north and north-east winds have taken the place of the more westerly ones usually most prevalent. The wheat plant is backward, and shows a deficiency in plant. Some rain next week will no doubt greatly alter the complaint now observant in the wheat. There is the appearance of tillering out, and the amount of this required to make up for the thinness of the plant will greatly depend on early rain. There has been a great deal more re-sowing than usual, especially on the light soils; the wheat looks best on the stone rock. Oats and barley sown last month have come up nicely. We have not had for years so fine a season for preparing the land. Mangolds are much more forward than usual, and a large quantity of these useful roots will be cultivated this year. Beans have come up well,

but a considerable portion of the winter-sown are thin; some pieces very promising, others hardly worth working. There has been almost a failure in winter oats and barley for feeding. Vetches backward. Sheep-keep very scarce, which has brought down their value considerably. The supply being beyond the demand, there is not that brisk sale amongst other stock. Most of the dairies are filled up. Cows and calves have sold very high this season. The dairies are consuming much more hay than was expected, and with present prospects it must continue some time into next month. There is very little doing in wool; prices have little altered. Beef still ranges from 11s. to 12s. per score, and pigs 10s. to 11s. Mutton and lamb to this time firm, at late prices; not so much on offer as some

seasons, and the supply will probably be shorter during the next month. Wheat has been more steady in value lately: best white 5s. 6d., red and nursery 5s. to 5s. 3d. per 62½ lbs.; flour 30s. to 31s. per 280½ lbs.; beans 5s. to 5s. 1½d., few offering; barley, little left in farmers' hands; oats have sold better, at 21s. to 24s. There is a good deal of unthrashed wheat on hand, waiting for better prices, and the supplies are short. Millers are lessening their stocks, and they are freer buyers, but cannot get up the price of flour. There is the appearance of a general blossom of fruit trees; peaches and apricots well set; plums in general blossom; pears and apples bid fair to follow in the same luxuriance. The frosts this month, beyond retarding, appear to have had no injurious effect.

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

The month of April has passed without the customary genial showers. Some fell at the close of the first week, but the temperature was low and nights frosty for more than a fortnight, when a burst of mid-summer came, still with very little rain. The Lent corn has been well got in, but that lately sown cannot emerge from the hard crust where it is deposited, and should seasonable weather be long withheld there will be a short crop of grass, and most of our corn also. But the clouds have a Ruler whose goodness never fails, and, though deferred, we would yet expect the needful blessing. There has, however, been sun and heat enough for all deeply-rooted things, so that the fruit-trees have become suddenly charged with abundant blossom, and the wheat-plant that has outlived the late fluctuations has made some advance, and shows a brighter green. But the misplant is only the more apparent. Raised by repeated frosts, and dried afterwards by cutting winds, some fields present a very sorry aspect, and but few pieces look thoroughly well. Some take it for certain that at least we shall have a late crop, and others prophecy a poor one, but we would yet hope better things. As respects prices, there has been very little change, but on the whole there has been a gain of fully 1s. per qr. It is remarkable that, though the averages for the last two months were 6s. below last year, there has been a reported increase in the deliveries for the same time on the deficient crop to the amount of over 68,000 qrs.; we therefore infer that the produce of last season must be much reduced; and when we find that London has had no portion of this increase, but has been very freely delivering from granary stores, and that prices since the opening of the Baltic have been rising there with a similar state of things in France, it would seem to indicate that we have about touched our lowest, a feeling that seems spreading in the country as well as in the metropolis. Indeed, it is a long lane that has no turning, and though foreign stores abroad, more especially in Southern Russia and America, are known to be heavy, better accounts of prices in England, and worse prospects, will very probably influence the rates there, as both countries complain of the late depression in the grain trade, and with a chance of doing better by waiting they may restrain their shipments; and should a drought set in the rise in spring corn must occasion a more liberal use of wheat for cattle food as proportionately cheaper. We have now come to the period of weather markets, and with prices so low there seems a much greater chance of amendment than otherwise. The following rates were recently quoted at the several places named: white wheat at Paris to 51s., red 47s., white at Bordeaux 47s. In Belgium the range for wheat was from 45s. to 47s.

Rotterdam quoted 44s.; for white Zealand, Polish, at Amsterdam, 51s. Holstein wheat at Hambro 40s. Rostock 44s., white, 48s. At Stettin quotations ruled from 36s. to 42s. Fine wheat at Danzig had become so scarce that there were no offers on the London market, and fine new was worth 51s., cost, freight, and insurance included. At Cologne, good quality red was worth 42s. At Peath, in Hungary, heavy Banat or Theiss was quoted at 38s., inferior sorts 34s.; red at Vienna 42s., fine at Venice 47s., Berdianaki at Genoa 40s., the best at Porrentruy, Switzerland, 48s., at Romanahorn 50s. No. 1 red spring wheat, at New York, 38s. per 480 lbs.; No 2 36s., winter 38s. 6d.

The first Monday in Mark Lane commenced on a moderate supply of English wheat, and only one cargo of foreign. The show of fresh samples from Essex and Kent was scanty, and fine qualities fully maintained their previous value, but did not go off very freely, the remainder being difficult to quit. A rather better inquiry was experienced for foreign, but holders were not able to establish any advance, buyers operating with great caution. But few floating cargoes remaining for sale, prices were unaltered. Though the weather, which commenced very cold, became more general as the week advanced, there was generally very little change. The earlier markets mostly were unaltered, but those held later in several instances were 1s. down. Among those were Birmingham, Newcastle, Sheffield, and St. Ives, and several others on Saturday. Liverpool was down 2d. to 4d. for the week. Scotland had quiet markets. The tendency at Glasgow was rather in favour of buyers. The show of Irish wheat at Dublin being very limited, prices were up 6d. per barrel; but there was no improvement in foreign qualities.

On the second Monday the arrivals, both English and foreign, were moderate. The show of samples from the near counties was limited, and with the weather more general, accompanied with showers, more difficulty was found in placing English samples. Kentish factors, who generally are most desirous of selling, in some instances accepted a reduction of 1s. per qr. on former rates; but those of Essex would not submit, so but little was done. The foreign trade was also dull, and to sell low descriptions, such as Russian and inferior spring American, some holders were content to take 1s. per qr. less, but the higher Baltic qualities were steady as to value. Though the arrivals of floating cargoes were small, prices tended downwards. Dull accounts from London, the commencement of the holidays, and improved weather all contributed to make markets heavy in the country. Though several places noted no change, it was chiefly from want of bu-

iness. The following markets were all 1s. per qr. cheaper, viz., Bourn, Barnley, Ipswich, Melton Mowbray, Rugby, Rotherham, Stockton, Sleaford, and Sheffield. Liverpool gave way 2d. per cental on Tuesday. Edinburgh was down 6d. per qr., and Glasgow 3d. to 6d. per boll, with a limited inquiry. No change was noted in the value of wheat at Dublin, or indeed in any of the provincial towns.

The third Monday in Mark Lane had about the usual supply of English wheat, with a moderate increase from the Continent. The show of fresh samples from Kent and Essex was very small, and it being Easter Monday the attendance was equally so, and also business transacted. With so little passing the former rates were unaltered for English qualities, and it was the same with foreign, only needy buyers making their appearance. With few cargoes afloat unsold, prices were fully supported. Though scarcely emerged from the holidays, and with an outbreak of summer weather, the country trade throughout the week was unusually firm, scarcely any markets complained of dulness; many were slightly in sellers' favour, and some were about 1s. higher—among these were Boston, Newark, Birmingham, Manchester, and most of the markets held on Saturday, Liverpool throughout the week being firm. Glasgow exhibited an upward tendency, and foreign wheat in Dublin was more in demand, at fully the previous rates.

The fourth Monday commenced with a moderate arrival of English wheat and increased supplies of foreign, half being from the Baltic and a fair quantity from New York. The show of fresh samples from Kent and Essex was scanty; and as several of the later country advices noted an improvement, 2s. per qr. advance was at first demanded, but only 1s. was eventually paid, and that reluctantly. There was a moderate inquiry for good American and Russian at a similar improvement, and Baltic sorts were held for more money.

The imports into London for four weeks were 20,273 qrs. English and 42,829 qrs. foreign, against 19,966 qrs. English, 70,725 qrs. foreign for the same period in 1869: exports 4,555 qrs. The imports into the United Kingdom for four weeks, ending 16th April, were 1,905,633 cwt. wheat, 456,655 cwt. flour, against 1,621,404 cwt. wheat, 303,009 cwt. flour in 1869. The general averages commenced at 42s. 5d., and closed at 42s. 10d.: those of London began at 45s. 4d., and ended with 44s. 2d. per qr.

The flour trade has been quiet throughout the month. Country sorts improved 1s. per sack on the fourth Monday, and American barrels, notwithstanding a fair supply, realized rather more money; the former closed at 30s. per sack, the latter at 23s., with something beyond for any extra fine qualities, such being scarce. Town flour has kept to the former price of 40s. for the best make. The imports into London for four weeks were 78,091 sacks English, 4,372 sacks 80,804 barrels foreign, against 85,338 sacks English, 11,006 sacks 7,506 barrels in 1869.

Maize, which was unduly depressed in January, has been steadily rising ever since, so that, from the lowest point, 5s. per qr. has been gained, 2s. of which were made in the last four weeks. But the final market, though not oppressed with arrivals, exhibited symptoms of dulness or possible reaction; but as the best white is only worth 31s. to 32s., and yellow 30s. to 31s., there is little probability of its declining much more, which increases the value of Springcorn. The supplies for the month were 26,101 qrs. against 38,554 qrs. in 1869; and, as prices in America are much higher than here from the failure of the crop, nothing from that quarter can be expected.

The making season drawing to its close, the best qualities have been in very limited demand, at unaltered

rates, and indeed prices have become nominal; but the increased supplies of grinding foreign have not prevented a rise of about 6d. to 1s. per qr.; good qualities can still be had at 22s. 6d. to 24s. The imports into London for four weeks have been 6,178 qrs. British, of which very little was from Scotland, and 44,227 qrs. foreign; against 6,328 qrs. British and 24,580 qrs. foreign in 1869.

Of oats we have this month, as well as the last, been without a single shipment from Scotland or Ireland, and a mere bagatelle of home growth has come to hand; but the foreign supplies since the opening of the Baltic have trebled the previous quantities. On the first market the increase, when no fear of drought was entertained, reduced values 6d. per qr.; but they have since recovered fully 1s. 6d. per qr., leaving the gain quite 1s. per qr., though the last market, showing the heaviest arrivals, was comparatively dull, from the fact that dealers were fairly in stock. 58lb. Swedes were then worth 20s., and 40lb. per bushel 21s. The imports for four weeks were 1,757 qrs. English, 153,977 qrs. foreign, against 1,743 qrs. English, 114 qrs. Scotch, 3,480 qrs. Irish, 100,617 qrs. foreign, for the same period in 1869. Future rates must be governed by the weather. Should plentiful rains come down, and further heavy arrivals appear simultaneously, we may see a decline of 1s.; but there seems more room for an advance than otherwise.

Beans have been rather hardening in value, farmers' stocks being pretty well exhausted, and foreign arrivals not free; so prices have risen for the month about 1s. per qr., Egyptian being worth 36s., and good French 38s. If maize should further advance, the value of this pulse would also be enhanced, though the demand naturally falls off in warm weather. The arrivals into London for four weeks were 2,491 qrs. English, 5,356 qrs. foreign, against 1,636 qrs. English, 2,097 qrs. foreign, for the same period in 1869.

Peas, though not much inquired for, have fully maintained their previous value, from the falling-off in the supplies, good white being worth 35s. to 36s., and grey 32s. to 33s.

The supply of linseed has been very short, and values have improved about 1s. But very little is now expected from Russia, the growth having been short, and crops inferior; so there is no chance at present of its returning to the easy rates which ruled many years ago.

The value of linseed cake has also been increased about 5s. per ton, the want of herbage for the lambs and cattle greatly increasing its use.

The cloverseed trade this season has been disappointingly small; but values have been well maintained, from the deficiency of our own crop and light foreign supplies. The late very rough and cold weather materially delayed the commencement of sowing; and, now much has been sown, farmers are waiting for showers, when doubtless a fresh demand would spring up both for this seed and tares, the latter being only partially planted.

Rapeseed, from reported failures abroad, has been almost daily rising in value.

LEEDS (ENGLISH AND FOREIGN) WOOL MARKET. (Friday last).—The demand for English wool runs parallel with the actual requirements of the manufacturers, and, in the face of an early clip, should the weather be favourable, no one is disposed to buy old wool on speculation. Prices for most qualities are maintained with difficulty. The demand for colonial wool is expending itself mainly at the public sales in London. Prices are quite up to last sales, but the strength and soundness of wool from Victoria is defective. For worsted purposes this is a serious matter, and also for some kinds of clothing.

PRICE CURRENT OF GUANO, &c.
